All global identifiers for AWS Control Tower controls

A *global identifier* for a control is a unique identifer, independent of the Region in which a control is deployed. Global identifiers are associated with controls that are included in AWS Control Catalog, which is a compendium of controls from several AWS services.

Last updated on April 11, 2025.

This section contains a reference list of global identifiers that are assigned to AWS Control Tower controls. The global identifier fulfills the final portion of the Amazon Resource Name (ARN), which is of the following form:

```
arn:{PARTITION}:controlcatalog:::control/{CONTROL_CATALOG_OPAQUE_ID}
```

The {CONTROL_CATALOG_OPAQUE_ID} values for the controls are shown in the list that follows.

To obtain the complete global identifer programmatically, with the full ARN, you can call the `GetControl` and `ListControls` APIs. You also can view the complete global ARN in the AWS Control Tower console, on the **Control details** page.

> **Note**
>
> Some controls may also have an AWS Control Tower identifier, a Regional identifier, which is of the form
>
> ```
> arn:{PARTITION}:controltower:{REGION}::control/{CONTROL_TOWER_OPAQUE_ID}
> ```
>
> In most cases, the value for {PARTITION} is `aws`.
> These Regional identifiers are associated with an `EnabledControl` resource, especially if the control was enabled by calling that Regional identifier initially.
