[CT.RDS.PR.7] Require Amazon RDS database instances to have IAM authentication configured

This control checks whether an Amazon RDS database (DB) instance has AWS Identity and Access Management (IAM) database authentication activated.

- **Control objective:** Use strong authentication
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBInstance`
- **AWS CloudFormation guard rule:** CT.RDS.PR.7 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.7 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.7 example templates

Explanation

IAM database authentication allows authentication to database instances with an authentication token instead of a password. Network traffic to and from the database is encrypted with SSL.

Usage considerations

- This control applies only to Amazon RDS DB engine types `mariadb`, `mysql` and `postgres`.
- This control applies only when the `Engine` property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an `Engine` has not been set explicitly.

Remediation for rule failure

Set `EnableIAMDatabaseAuthentication` to `true`.

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example

Amazon RDS DB instance configured with IAM database authentication. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "EnableIAMDatabaseAuthentication": true
```

```
        },
        "DeletionPolicy": "Delete"
    }
}
```

YAML example

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    EnableIAMDatabaseAuthentication: true
  DeletionPolicy: Delete
```

CT.RDS.PR.7 rule specification

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   rds_instance_iam_authentication_enabled_check
#
# Description:
#   This control checks whether an Amazon RDS database (DB) instance has AWS Identity
 and Access Management (IAM) database authentication activated.
#
# Reports on:
#   AWS::RDS::DBInstance
#
# Evaluates:
#   AWS CloudFormation, AWS CloudFormation hook
```

```
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any RDS DB instance resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is not in-scope database engines - 'mariadb', 'mysql', 'postgres'
#      Then: SKIP
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is in-scope database engines - 'mariadb', 'mysql', 'postgres'
#       And: 'EnableIAMDatabaseAuthentication' has not been specified
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is in-scope database engines - 'mariadb', 'mysql', 'postgres'
#       And: 'EnableIAMDatabaseAuthentication' has been specified
#       And: 'EnableIAMDatabaseAuthentication' has been set to bool(false)
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is in-scope database engines - 'mariadb', 'mysql', 'postgres'
#       And: 'EnableIAMDatabaseAuthentication' has been specified
#       And: 'EnableIAMDatabaseAuthentication' has been set to bool(true)
#      Then: PASS

    DeletionPolicy: Delete
```

[CT.RDS.PR.8] Require an Amazon RDS database instance to have automatic backups configured

This control checks whether Amazon RDS database (DB) instances have automated backups enabled, and verifies that the backup retention period is greater than or equal to seven (7) days.

- **Control objective:** Improve resiliency
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBInstance`
- **AWS CloudFormation guard rule:** CT.RDS.PR.8 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.8 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.8 example templates

Explanation

Backups help you recover more quickly from a security incident, and they strengthen the resilience of your systems. Amazon RDS provides an easy way to configure daily, full-instance volume snapshots.

Usage considerations

- This control applies only to Amazon RDS DB engine types `mariadb`, `mysql`, `oracle-ee`, `oracle-ee-cdb`, `oracle-se2`, `oracle-se2-cdb`, `postgres`, `sqlserver-ee`, `sqlserver-se`, `sqlserver-ex` and `sqlserver-web`.

- This control applies only when the `Engine` property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an `Engine` has not been set explicitly.

Remediation for rule failure

Set `BackupRetentionPeriod` to an integer value between 7 and 35 days (inclusive).

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example

Amazon RDS DB instance configured with automated backups configured and a backup retention period of 14 days. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "BackupRetentionPeriod": 14
        },
        "DeletionPolicy": "Delete"
    }
}
```

YAML example

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    BackupRetentionPeriod: 14
  DeletionPolicy: Delete
```

CT.RDS.PR.8 rule specification

```

[CT.RDS.PR.9] Require an Amazon RDS database cluster to copy tags to snapshots

This control checks whether an Amazon RDS database (DB) cluster is configured to copy all tags to snapshots created.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBCluster`
- **AWS CloudFormation guard rule:** CT.RDS.PR.9 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.9 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.9 example templates

Explanation

Identification and inventory of your infrastructure assets is a crucial aspect of governance and security. With visibility into all your Amazon RDS DB clusters, you can assess their security posture and take action on potential areas of weakness. We recommend that you tag snapshots in the same way as their parent RDS database clusters. Activating this setting ensures that snapshots inherit the tags of their parent database clusters.

Usage considerations

- This control applies only to Amazon RDS DB cluster engine types `aurora`, `aurora-mysql`, and `aurora-postgresql`.

Remediation for rule failure

Set `CopyTagsToSnapshot` to `true`.

The examples that follow show how to implement this remediation.

Amazon RDS DB Cluster - Example

Amazon RDS DB cluster configured to copy tags to snapshots. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBCluster": {
        "Type": "AWS::RDS::DBCluster",
        "Properties": {
            "Engine": "aurora-mysql",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::username}}"
```

```
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
            },
            "DBSubnetGroupName": {
                "Ref": "DBSubnetGroup"
            },
            "CopyTagsToSnapshot": true
        }
    }
}
```

YAML example

```
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: aurora-mysql
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::password}}'
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
    CopyTagsToSnapshot: true
```

CT.RDS.PR.9 rule specification

[CT.RDS.PR.10] Require an Amazon RDS database instance to copy tags to snapshots

This control checks whether Amazon RDS database (DB) instances are configured to copy all tags to snapshots created.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBInstance`
- **AWS CloudFormation guard rule:** CT.RDS.PR.10 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.10 rule specification

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.10 example templates

Explanation

Identification and inventory of your IT assets is a crucial aspect of governance and security. With visibility of all your RDS DB instances, you can assess their security posture and take action on potential areas of weakness. Snapshots should be tagged to match their parent RDS database instances. Enabling this setting ensures that snapshots inherit the tags from their parent database instances.

Usage considerations

- This control applies only to Amazon RDS DB engine types `mariadb`, `mysql`, `oracle-ee`, `oracle-ee-cdb`, `oracle-se2`, `oracle-se2-cdb`, `postgres`, `sqlserver-ee`, `sqlserver-se`, `sqlserver-ex` and `sqlserver-web`.
- This control applies only when the `Engine` property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an `Engine` has not been set explicitly.

Remediation for rule failure

Set `CopyTagsToSnapshot` to `true`.

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example

Amazon RDS DB instance configured to copy all tags to snapshots created. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
```

```
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "CopyTagsToSnapshot": true
        },
        "DeletionPolicy": "Delete"
    }
}
```

YAML example

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    CopyTagsToSnapshot: true
  DeletionPolicy: Delete
```

CT.RDS.PR.10 rule specification

```

    DeletionPolicy: Delete
```

[CT.RDS.PR.11] Require an Amazon RDS database instance to have a VPC configuration

This control checks whether an Amazon RDS database (DB) instance is deployed in a VPC (that is, with an EC2-VPC instance).

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBInstance`

- **AWS CloudFormation guard rule:** CT.RDS.PR.11 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.11 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.11 example templates

Explanation

Amazon Virtual Private Cloud (Amazon VPC) provides a number of network controls to create secure access to RDS resources. These controls include VPC endpoints, network ACLs, and security groups. To take advantage of these controls, create your Amazon RDS instances as EC2 VPC instances.

Usage considerations

- This control applies only to Amazon RDS DB engine types `mariadb`, `mysql`, `oracle-ee`, `oracle-ee-cdb`, `oracle-se2`, `oracle-se2-cdb`, `postgres`, `sqlserver-ee`, `sqlserver-se`, `sqlserver-ex` and `sqlserver-web`.
- This control applies only when the `Engine` property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an `Engine` has not been set explicitly.

Remediation for rule failure

Set a `DBSubnetGroupName`.

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example

Amazon RDS DB instance configured to deploy in an Amazon VPC with an RDS DB subnet group. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "DBSubnetGroupName": {
                "Ref": "DBSubnetGroup"
            }
        },

    }
}
```

YAML example

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
  DeletionPolicy: Delete
```

CT.RDS.PR.11 rule specification

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   rds_instance_deployed_in_vpc_check
#
# Description:
#   This control checks whether an Amazon RDS database (DB) instance is deployed in a
 VPC (that is, an EC2 VPC instance).
#
# Reports on:
#   AWS::RDS::DBInstance
#
# Evaluates:
#   AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any RDS DB instance resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is not one of 'mariadb', 'mysql', 'oracle-ee', 'oracle-ee-cdb',
 'oracle-se2',
#            'oracle-se2-cdb', 'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-
ex', 'sqlserver-web'
#      Then: SKIP
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is one of 'mariadb', 'mysql', 'oracle-ee', 'oracle-ee-cdb',
 'oracle-se2',
```

```
#            'oracle-se2-cdb', 'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-
ex', 'sqlserver-web'
#       And: 'DBSubnetGroupName' has not been specified
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is one of 'mariadb', 'mysql', 'oracle-ee', 'oracle-ee-cdb',
 'oracle-se2',
#            'oracle-se2-cdb', 'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-
ex', 'sqlserver-web'
#       And: 'DBSubnetGroupName' has been specified but is an empty string
#            or invalid local reference to a DB Subnet Group
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is one of 'mariadb', 'mysql', 'oracle-ee', 'oracle-ee-cdb',
 'oracle-se2',
#            'oracle-se2-cdb', 'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-
ex', 'sqlserver-web'
#       And: 'DBSubnetGroupName' has been specified but is a non-empty string
#            or valid local reference to a DB Subnet Group
#      Then: PASS

```

[CT.RDS.PR.12] Require an Amazon RDS event subscription to have critical cluster events configured

This control checks whether your Amazon RDS event subscriptions for RDS clusters are configured to notify on event categories of `maintenance` and `failure`.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::EventSubscription`
- **AWS CloudFormation guard rule:** CT.RDS.PR.12 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.12 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.12 example templates

Explanation

Amazon RDS event notifications uses Amazon SNS to make you aware of changes in the availability or configuration of your RDS resources. These notifications allow for rapid response.

Usage considerations

- This control applies only to Amazon RDS event subscriptions for RDS clusters (`SourceType` of `db-cluster`).

Remediation for rule failure

When `SourceType` is set to `db-cluster`, set `Enabled` to true and ensure that `EventCategories` contains both `maintenance` and `failure` values.

The examples that follow show how to implement this remediation.

Amazon RDS Event Subscription - Example One

Amazon RDS event subscription for RDS clusters configured to notify on all event categories. The example is shown in JSON and in YAML.

JSON example

```
{
    "RDSEventSubscription": {
        "Type": "AWS::RDS::EventSubscription",
        "Properties": {
            "SnsTopicArn": {
                "Ref": "SnsTopic"
            },
            "SourceType": "db-cluster",
            "Enabled": true
        }
    }
}
```

YAML example

```
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn: !Ref 'SnsTopic'
    SourceType: db-cluster
    Enabled: true
```

The examples that follow show how to implement this remediation.

Amazon RDS Event Subscription - Example Two

Amazon RDS event subscription for RDS clusters configured to notify on `maintenance` and `failure` event categories. The example is shown in JSON and in YAML.

JSON example

```
{
    "RDSEventSubscription": {
        "Type": "AWS::RDS::EventSubscription",
        "Properties": {
            "SnsTopicArn": {
                "Ref": "SnsTopic"
            },
            "EventCategories": [
                "maintenance",
                "failure"
            ],
            "SourceType": "db-cluster",
            "Enabled": true
        }
    }
}
```

YAML example

```
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
```

```
    SnsTopicArn: !Ref 'SnsTopic'
    EventCategories:
      - maintenance
      - failure
    SourceType: db-cluster
    Enabled: true
```

CT.RDS.PR.12 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  SNSTopic:
    Type: AWS::SNS::Topic
    Properties: {}
  RDSEventSubscription:
    Type: AWS::RDS::EventSubscription
    Properties:
      SnsTopicArn:
        Ref: SNSTopic
```

```
      SourceType: db-cluster
      Enabled: true
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  SNSTopic:
    Type: AWS::SNS::Topic
    Properties: {}
  RDSEventSubscription:
    Type: AWS::RDS::EventSubscription
    Properties:
      SnsTopicArn:
        Ref: SNSTopic
      EventCategories:
      - maintenance
      - deletion
      SourceType: db-cluster
      Enabled: true
```

[CT.RDS.PR.13] Require any Amazon RDS instance to have deletion protection configured

This control checks whether an Amazon Relational Database Service (Amazon RDS) instance has deletion protection activated.

- **Control objective:** Improve availability
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBInstance`
- **AWS CloudFormation guard rule:** CT.RDS.PR.13 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.13 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.13 example templates

Explanation

When active, instance deletion protection provides an additional layer of protection against accidental database deletion, or deletion by an unauthorized entity.

While deletion protection is active, an RDS DB instance cannot be deleted. Before a deletion request can succeed, deletion protection must be turned off.

Usage considerations

- This control applies only to Amazon RDS DB engine types `mariadb`, `mysql`, `oracle-ee`, `oracle-ee-cdb`, `oracle-se2`, `oracle-se2-cdb`, `postgres`, `sqlserver-ee`, `sqlserver-se`, `sqlserver-ex` and `sqlserver-web`.
- This control applies only when the `Engine` property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an `Engine` has not been set explicitly.

Remediation for rule failure

Set `DeletionProtection` to `true`.

The examples that follow show how to implement this remediation.

Amazon RDS DB instance - Example

Amazon RDS DB instance configured with deletion protection active. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
```

```
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 5.7,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "StorageEncrypted": true,
            "DeletionProtection": true
        },
        "DeletionPolicy": "Delete"
    }
}
```

YAML example

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 5.7
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    StorageEncrypted: true
    DeletionProtection: true
  DeletionPolicy: Delete
```

        Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
      DeletionProtection: false
    DeletionPolicy: Delete
```

[CT.RDS.PR.14] Require an Amazon RDS database instance to export logs to Amazon CloudWatch Logs by means of the EnableCloudwatchLogsExports property

This rule checks whether Amazon Relational Database Service (RDS) instances have all available log types configured for export to Amazon CloudWatch Logs.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBInstance`
- **AWS CloudFormation guard rule:** CT.RDS.PR.14 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.14 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.14 example templates

Explanation

AWS Control Tower recommends that you enable th export of relevant logs for all Amazon RDS databases to Amazon CloudWatch Logs. Database logging provides detailed records of requests made to RDS. Database logs can assist with security and access audits, and they can help you diagnose availability issues.

Usage considerations

- This control applies only to Amazon RDS DB engine types `mariadb`, `mysql`, `postgres`, `sqlserver-ee`, `sqlserver-se`, `sqlserver-ex`, `sqlserver-web`, `oracle-ee`, `oracle-se2`, `oracle-se1`, and `oracle-se`.
- This control applies only when the `Engine` property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an `Engine` has not been set explicitly.
- Additional prerequisites may exist for enabling logging based on your selected database engine type. Refer to Monitoring Amazon RDS log files in the *Amazon RDS User Guide* for more information.

Remediation for rule failure

Specify `EnableCloudwatchLogsExports` with a list of all supported log types for the Amazon RDS database instance engine.

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example One

Amazon RDS DB instance configured with an engine type of `mysql` and all supported log types, for the `mysql` engine type. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "mysql",
            "EngineVersion": 5.7,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "StorageEncrypted": true,
            "EnableCloudwatchLogsExports": [
                "error",
                "general",
                "slowquery",
                "audit"
            ]
        },
        "DeletionPolicy": "Delete"
    }
}
```

YAML example

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: mysql
    EngineVersion: 5.7
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    StorageEncrypted: true
    EnableCloudwatchLogsExports:
      - error
      - general
      - slowquery
      - audit
  DeletionPolicy: Delete
```

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example Two

Amazon RDS DB instance configured with an engine type of `postgres` and all supported log types, for the `postgres` engine type. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
```

```
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "EnableCloudwatchLogsExports": [
                "postgresql",
                "upgrade"
            ]
        },
        "DeletionPolicy": "Delete"
    }
}
```

YAML example

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    EnableCloudwatchLogsExports:
      - postgresql
      - upgrade
  DeletionPolicy: Delete
```

CT.RDS.PR.14 rule specification

```
# ##################################
##       Rule Specification        ##
#####################################
#
# Rule Identifier:
#   rds_instance_logging_enabled_check
#
```

```
# Description:
#   This rules checks whether Amazon Relational Database Service (RDS) instances have
 all available log types configured for export to Amazon CloudWatch Logs.
#
# Reports on:
#   AWS::RDS::DBInstance
#
# Evaluates:
#   AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any RDS DB instance resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is not one of 'mariadb', 'mysql',
#            'oracle-ee', 'oracle-se2', 'oracle-ee-cdb', 'oracle-se2-cdb',
#            'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-
web'
#      Then: SKIP
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is one of 'mariadb', 'mysql',
#            'oracle-ee', 'oracle-se2', 'oracle-ee-cdb', 'oracle-se2-cdb',
#            'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-
web'
#       And: 'EnableCloudwatchLogsExports' has not been specified or has been specified
#             and is an empty list
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is one of 'mariadb', 'mysql',
```

```
#            'oracle-ee', 'oracle-se2', 'oracle-ee-cdb', 'oracle-se2-cdb',
#            'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-
web'
#       And: 'EnableCloudwatchLogsExports' has been specified and is a non-empty list
#       And: One or more log types in 'EnableCloudwatchLogsExports' are not supported
 by the specified 'Engine'
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is one of 'mariadb', 'mysql',
#            'oracle-ee', 'oracle-se2', 'oracle-ee-cdb', 'oracle-se2-cdb',
#            'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-
web'
#       And: 'EnableCloudwatchLogsExports' has been specified and is a non-empty list
#       And: 'EnableCloudwatchLogsExports' does not contain all log types supported by
 the specified 'Engine'
#      Then: FAIL
#   Scenario: 6
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine'  is one of 'mariadb', 'mysql'
#       And: 'EnableCloudwatchLogsExports' has been specified
#       And: 'EnableCloudwatchLogsExports' value is a non-empty and all supported log
 types
#             are enabled - 'audit', 'error', 'general', 'slowquery'
#      Then: PASS
#   Scenario: 7
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is 'postgres'
#       And: 'EnableCloudwatchLogsExports' has been specified
#       And: 'EnableCloudwatchLogsExports' value is a non-empty and all supported log
 types
#             are enabled - 'postgresql', 'upgrade'
#      Then: PASS
#   Scenario: 8
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is one of 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex',
```

```
#            'sqlserver-web'
#       And: 'EnableCloudwatchLogsExports' has been specified
#       And: 'EnableCloudwatchLogsExports' value is a non-empty and all supported log
 types
#             are enabled - 'agent', 'error'
#      Then: PASS
#   Scenario: 9
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is one of 'oracle-ee', 'oracle-se2', 'oracle-ee-cdb', 'oracle-
se2-cdb',
#       And: 'EnableCloudwatchLogsExports' has been specified
#       And: 'EnableCloudwatchLogsExports' value is a non-empty and all supported log
 types

[CT.RDS.PR.15] Require that an Amazon RDS instance does not create DB security groups

This control checks whether any Amazon Relational Database Service (RDS) database (DB) security groups are created by, or associated to, an RDS DB instance, because DB security groups are intended for the EC2-Classic platform only.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBInstance`, `AWS::RDS::DBSecurityGroup`
- **AWS CloudFormation guard rule:** CT.RDS.PR.15 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.15 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.15 example templates

Explanation

We recommend that all Amazon Relational Database Service (RDS) databases use Amazon VPC security groups to secure their access. Amazon DB security groups are for the EC2-Classic platform only, and they are not recommended for use.

Remediation for rule failure

Omit the `DBSecurityGroups` property. Instead, configure Amazon VPC security groups by means of the `VPCSecurityGroups` property.

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example

Amazon RDS DB instance configured with an Amazon VPC security group. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "mysql",
```

```
            "EngineVersion": 5.7,
            "DBInstanceClass": "db.t3.small",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "StorageEncrypted": true,
            "Port": 6733,
            "DBSubnetGroupName": {
                "Ref": "DBSubnetGroup"
            },
            "VPCSecurityGroups": [
                {
                    "Ref": "SecurityGroup"
                }
            ]
        }
    }
}
```

YAML example

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: mysql
    EngineVersion: 5.7
    DBInstanceClass: db.t3.small
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    StorageEncrypted: true
    Port: 6733
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
    VPCSecurityGroups:
      - !Ref 'SecurityGroup'
```

CT.RDS.PR.15 rule specification

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   rds_db_security_group_not_allowed_check
#
# Description:
#   This control checks whether any Amazon Relational Database Service (RDS) database
 (DB) security groups are created by, or associated to, an RDS DB instance, because DB
 security groups are intended for the EC2-Classic platform only.
#
# Reports on:
#   AWS::RDS::DBSecurityGroup, AWS::RDS::DBInstance
#
# Evaluates:
#   AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#      Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#        And: The input document does not contain any DB security group resources
#        And: The input document does not contain any RDS DB instance resources
#       Then: SKIP
#   Scenario: 2
#      Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#        And: The input document contains a DB security group resource
#       Then: FAIL
#   Scenario: 3
#      Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#        And: The input document does not contain any DBsecurity group resources
```

```
#        And: The input document contains an RDS DB instance resource
#        And: 'DBSecurityGroups' has been specified on the RDS DB instance as a non
 empty list
#       Then: FAIL
#   Scenario: 4
#      Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#        And: The input document does not contain any DB security group resources
#        And: The input document contains an RDS DB instance resource
#        And: 'DBSecurityGroups' has not been specified on the RDS DB instance or
 specified as an empty list
#       Then: PASS

```

[CT.RDS.PR.16] Require an Amazon RDS database cluster to have encryption at rest configured

This control checks whether the storage encryption is configured on Amazon Relational Database Service (RDS) database (DB) clusters that are not being restored from an existing cluster.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation Guard Rule

- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBCluster`
- **AWS CloudFormation guard rule:** CT.RDS.PR.16 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.16 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.16 example templates

Explanation

We recommend that you configure your Amazon RDS DB clusters to be encrypted at rest, to give an added layer of security for your sensitive data. To encrypt your RDS DB clusters and snapshots at rest, enable the encryption option for your RDS DB clusters. Data that is encrypted at rest includes the underlying storage for DB clusters, its automated backups, read replicas, and snapshots.

Encrypted RDS DB clusters use the open standard AES-256 encryption algorithm to encrypt your data on the server that hosts the clusters. After your data is encrypted, Amazon RDS handles authentication of access and decryption of your data with a minimal impact on performance. You do not need to modify your database client applications to use encryption.

Usage considerations

- This control applies only to Amazon RDS DB clusters that are not being restored from an existing cluster or created as a read replica. (For example, when `SourceDBClusterIdentifier` or `ReplicationSourceIdentifier` properties have been provided.)

Remediation for rule failure

Set `StorageEncrypted` to `true`.

The examples that follow show how to implement this remediation.

Amazon RDS DB Cluster - Example

Amazon RDS DB cluster configured with storage encryption enabled. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBCluster": {
        "Type": "AWS::RDS::DBCluster",
        "Properties": {
            "Engine": "aurora-mysql",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
            },
            "StorageEncrypted": true
        }
    }
}
```

YAML example

```
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: aurora-mysql
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::password}}'
    StorageEncrypted: true
```

CT.RDS.PR.16 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  DBClusterSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: RDS Cluster secret
      GenerateSecretString:
        SecretStringTemplate: '{"username": "examplemasteruser"}'
        GenerateStringKey: password
        PasswordLength: 16
        ExcludeCharacters: '"@/\'
  DBCluster:
    Type: AWS::RDS::DBCluster
    Properties:
      Engine: aurora-mysql
      MasterUsername:
        Fn::Sub: '{{resolve:secretsmanager:${DBClusterSecret}::username}}'
      MasterUserPassword:
        Fn::Sub: '{{resolve:secretsmanager:${DBClusterSecret}::password}}'
      StorageEncrypted: true
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  DBClusterSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: RDS Cluster secret
      GenerateSecretString:
        SecretStringTemplate: '{"username": "examplemasteruser"}'
        GenerateStringKey: password
        PasswordLength: 16
```

```
        ExcludeCharacters: '"@/\'
  DBCluster:
    Type: AWS::RDS::DBCluster
    Properties:
      Engine: aurora-mysql
      MasterUsername:
        Fn::Sub: '{{resolve:secretsmanager:${DBClusterSecret}::username}}'
      MasterUserPassword:
        Fn::Sub: '{{resolve:secretsmanager:${DBClusterSecret}::password}}'
      StorageEncrypted: false
```

[CT.RDS.PR.17] Require an Amazon RDS event notification subscription to have critical database instance events configured

This control checks whether your Amazon RDS event subscriptions for RDS instances are configured to notify on event categories of `maintenance`, `failure`, and `configuration change`.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::EventSubscription`
- **AWS CloudFormation guard rule:** CT.RDS.PR.17 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.17 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.17 example templates

Explanation

Amazon RDS event notifications use Amazon SNS to make you aware of changes in the availability or configuration of your RDS resources. These notifications allow for rapid response.

Usage considerations

- This control applies only to Amazon RDS Event Subscriptions for RDS instances (`SourceType` of `db-instance`).

Remediation for rule failure

When `SourceType` is set to `db-instance`, set `Enabled` to true and ensure that the parameter `EventCategories` contains `maintenance`, `failure`, and `configuration change` values.

The examples that follow show how to implement this remediation.

Amazon RDS Event Subscription - Example One

Amazon RDS Event Subscription for RDS instances configured to notify on all event categories. The example is shown in JSON and in YAML.

JSON example

```
{
    "RDSEventSubscription": {
        "Type": "AWS::RDS::EventSubscription",
        "Properties": {
            "SnsTopicArn": {
                "Ref": "SnsTopic"
            },
            "SourceType": "db-instance",
            "Enabled": true
        }
    }
}
```

YAML example

```
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
```

```
    SnsTopicArn: !Ref 'SnsTopic'
    SourceType: db-instance
    Enabled: true
```

The examples that follow show how to implement this remediation.

Amazon RDS Event Subscription - Example Two

Amazon RDS Event Subscription for RDS instances configured to notify on `maintenance`, `failure`, and `configuration change` event categories. The example is shown in JSON and in YAML.

JSON example

```
{
    "RDSEventSubscription": {
        "Type": "AWS::RDS::EventSubscription",
        "Properties": {
            "SnsTopicArn": {
                "Ref": "SnsTopic"
            },
            "EventCategories": [
                "maintenance",
                "failure",
                "configuration change"
            ],
            "SourceType": "db-instance",
            "Enabled": true
        }
    }
}
```

YAML example

```
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
```

```
    SnsTopicArn: !Ref 'SnsTopic'
    EventCategories:
      - maintenance
      - failure
      - configuration change
    SourceType: db-instance
    Enabled: true
```

CT.RDS.PR.17 rule specification

CT.RDS.PR.17 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  SNSTopic:
    Type: AWS::SNS::Topic
    Properties: {}
```

```
  RDSEventSubscription:
    Type: AWS::RDS::EventSubscription
    Properties:
      SnsTopicArn:
        Ref: SNSTopic
      SourceType: db-instance
      Enabled: true
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  SNSTopic:
    Type: AWS::SNS::Topic
    Properties: {}
  RDSEventSubscription:
    Type: AWS::RDS::EventSubscription
    Properties:
      SnsTopicArn:
        Ref: SNSTopic
      EventCategories:
      - maintenance
      - failure
      SourceType: db-instance
      Enabled: true
```

[CT.RDS.PR.18] Require an Amazon RDS event notification subscription to have critical database parameter group events configured

This control checks whether your Amazon RDS event subscriptions for RDS parameter groups are configured to notify on event categories of `configuration change`.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::EventSubscription`

- **AWS CloudFormation guard rule:** CT.RDS.PR.18 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.18 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.18 example templates

Explanation

Amazon RDS event notifications use Amazon SNS to make you aware of changes in the availability or configuration of your RDS resources. These notifications allow for rapid response.

Usage considerations

- This control applies only to Amazon RDS event subscriptions for RDS parameter groups (`SourceType` of `db-parameter-group`).

Remediation for rule failure

When `SourceType` is set to `db-parameter-group`, set `Enabled` to true and ensure that the parameter `EventCategories` contains `configuration change` as a value.

The examples that follow show how to implement this remediation.

Amazon RDS Event Subscription - Example One

Amazon RDS event subscription for RDS parameter groups configured to notify on all event categories. The example is shown in JSON and in YAML.

JSON example

```
{
    "RDSEventSubscription": {
        "Type": "AWS::RDS::EventSubscription",
        "Properties": {
            "SnsTopicArn": {
```

```
                "Ref": "SnsTopic"
            },
            "SourceType": "db-parameter-group",
            "Enabled": true
        }
    }
}
```

YAML example

```
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn: !Ref 'SnsTopic'
    SourceType: db-parameter-group
    Enabled: true
```

The examples that follow show how to implement this remediation.

Amazon RDS Event Subscription - Example Two

Amazon RDS event subscription for RDS parameter groups configured to notify on the `configuration change` event category. The example is shown in JSON and in YAML.

JSON example

```
{
    "RDSEventSubscription": {
        "Type": "AWS::RDS::EventSubscription",
        "Properties": {
            "SnsTopicArn": {
                "Ref": "SnsTopic"
            },
            "EventCategories": [
                "configuration change"
            ],
            "SourceType": "db-parameter-group",
            "Enabled": true
```

```
        }
    }
}
```

YAML example

```
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn: !Ref 'SnsTopic'
    EventCategories:
      - configuration change
    SourceType: db-parameter-group
    Enabled: true
```

CT.RDS.PR.19 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  SNSTopic:
    Type: AWS::SNS::Topic
    Properties: {}
  RDSEventSubscription:
    Type: AWS::RDS::EventSubscription
    Properties:
      SnsTopicArn:
        Ref: SNSTopic
      SourceType: db-security-group
      Enabled: true
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  SNSTopic:
    Type: AWS::SNS::Topic
    Properties: {}
  RDSEventSubscription:
    Type: AWS::RDS::EventSubscription
    Properties:
      SnsTopicArn:
        Ref: SNSTopic
      EventCategories:
      - failure
      SourceType: db-security-group
      Enabled: true
```

[CT.RDS.PR.20] Require an Amazon RDS database instance not to use a database engine default port

This control checks whether Amazon Relational Database Service (RDS) database instances are configured for default database port for their specific engine types.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBInstance`
- **AWS CloudFormation guard rule:** CT.RDS.PR.20 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.20 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.20 example templates

Explanation

If you use a known port to deploy an Amazon RDS cluster or instance, an attacker can guess information about the cluster or instance. The attacker can use this information in conjunction with other information to connect to an Amazon RDS cluster or instance, or to gain additional information about your application.

When you change the port, you must also update the existing connection strings that were used to connect to the old port. You also should check the security group of the DB instance to ensure that it includes an ingress rule that allows connectivity on the new port.

Usage considerations

- This control applies only to Amazon RDS DB engine types `mariadb`, `mysql`, `oracle-ee`, `oracle-se2`, `oracle-ee-cdb`, `oracle-se2-cdb`, `postgres`, `sqlserver-ee`, `sqlserver-se`, `sqlserver-ex` and `sqlserver-web`.

- This control applies only when the `Engine` property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an `Engine` has not been set explicitly.

Remediation for rule failure

Set a value for `Port` that is different than the default value for the Amazon RDS DB instance engine type.

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example One

Amazon RDS DB instance configured with a port that's different than the `mysql` engine default port. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "mysql",
            "EngineVersion": 5.7,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "StorageEncrypted": true,
            "Port": 6733
        },
        "DeletionPolicy": "Delete"
    }
}
```

YAML example

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: mysql
    EngineVersion: 5.7
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    StorageEncrypted: true
    Port: 6733
  DeletionPolicy: Delete
```

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example Two

Amazon RDS DB instance configured with a port that's different than the `postgres` engine default port. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
```

```
            },
            "Port": 5723
        },
        "DeletionPolicy": "Delete"
    }
}
```

YAML example

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    Port: 5723
  DeletionPolicy: Delete
```

CT.RDS.PR.20 rule specification

```
# ####################################
##       Rule Specification        ##
#####################################
#
# Rule Identifier:
#   rds_instance_no_default_ports_check
#
# Description:
#   This control checks whether Amazon Relational Database Service (RDS) database
 instances are configured for default database port for their specific engine types.

        Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
      Port: 3306
    DeletionPolicy: Delete
```

[CT.RDS.PR.21] Require an Amazon RDS DB cluster to have a unique administrator username

This control checks whether an Amazon Relational Database Service (RDS) database (DB) cluster has changed the administrator username from its default value.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBCluster`
- **AWS CloudFormation guard rule:** CT.RDS.PR.21 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.21 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.21 example templates

Explanation

When you create an Amazon RDS database, we recommend that you change the default administrator username to a unique value. Default user names are public knowledge, and they should be changed, because changing these user names reduces the risk of unintended access.

Usage considerations

- This control applies only to Amazon RDS DB clusters that set the `MasterUsername` property.

Remediation for rule failure

Set `MasterUsername` to a value other than `admin` or `postgres`.

The examples that follow show how to implement this remediation.

Amazon RDS DB Cluster - Example

Amazon RDS DB cluster configured with a unique administrator username. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBCluster": {
        "Type": "AWS::RDS::DBCluster",
        "Properties": {
            "Engine": "aurora-mysql",
            "MasterUsername": "samplemasteruser",
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RDSClusterSecret}::password}}"
            },
            "DBSubnetGroupName": {
```

```
                "Ref": "DBSubnetGroup"
            }
        }
    }
}
```

YAML example

```
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: aurora-mysql
    MasterUsername: samplemasteruser
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RDSClusterSecret}::password}}'
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
```

CT.RDS.PR.21 rule specification

```

[CT.RDS.PR.22] Require an Amazon RDS database instance to have a unique administrator username

This control checks whether an Amazon Relational Database Service (RDS) database has changed the adminstrator username from its default value.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBInstance`
- **AWS CloudFormation guard rule:** CT.RDS.PR.22 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.22 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.22 example templates

Explanation

Default administrative usernames on Amazon RDS databases are public knowledge. When creating an Amazon RDS database, you should change the default administrative username to a unique value, thereby reducing the risk of unintended access.

Usage considerations

- This control applies only to Amazon RDS DB engine types `mariadb`, `mysql`, `oracle-ee`, `oracle-ee-cdb`, `oracle-se2`, `oracle-se2-cdb`, `postgres`, `sqlserver-ee`, `sqlserver-se`, `sqlserver-ex`, and `sqlserver-web`.

Remediation for rule failure

Set `MasterUsername` to a value other than `postgres` or `admin`.

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example

Amazon RDS DB instance configured with a custom administrator username. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": "testUser",
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            }
        },
        "DeletionPolicy": "Delete"
    }
}
```

YAML example

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: testUser
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
  DeletionPolicy: Delete
```

CT.RDS.PR.22 rule specification

    DeletionPolicy: Delete
```

[CT.RDS.PR.23] Require an Amazon RDS database instance to not be publicly accessible

This rule checks whether Amazon Relational Database Service (RDS) database (DB) instances are publicly accessible, as determined by checking the `PubliclyAccessible` configuration property.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBInstance`
- **AWS CloudFormation guard rule:** CT.RDS.PR.23 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.23 rule specification

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.23 example templates

Explanation

The `PubliclyAccessible` property in the RDS instance CloudFormation resource indicates whether the DB instance is publicly accessible. When the DB instance is configured with `PubliclyAccessible` set to `true`, it is an internet-facing instance with a publicly resolvable DNS name, which resolves to a public IP address. When the DB instance isn't publicly accessible, it is an internal instance with a DNS name that resolves to a private IP address.

Unless you intend for your RDS instance to be publicly accessible, do not configure the RDS instance with the `PubliclyAccessible` value set to `true`, because this configuration may allow unwanted traffic to your database instance.

Remediation for rule failure

Set the value of `PubliclyAccessible` to `false`.

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example

Amazon RDS DB instance configured as an internal instance, by mmeans of a publicly accessible configuration. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
```

```
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "PubliclyAccessible": false
        },
        "DeletionPolicy": "Delete"
    }
}
```

YAML example

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    PubliclyAccessible: false
  DeletionPolicy: Delete
```

        Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
      PubliclyAccessible: true
    DeletionPolicy: Delete
```

[CT.RDS.PR.24] Require an Amazon RDS database instance to have encryption at rest configured

This control checks whether storage encryption is enabled for your Amazon RDS database (DB) instance.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBInstance`

- **AWS CloudFormation guard rule:** CT.RDS.PR.24 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.24 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.24 example templates

Explanation

For an added layer of security for your sensitive data in Amazon RDS DB instances, you should configure your RDS DB instances to be encrypted at rest. To encrypt your RDS DB instances and snapshots at rest, enable the encryption option for your RDS DB instances. Data that is encrypted at rest includes the underlying storage for DB instances, its automated backups, read replicas, and snapshots.

Encrypted Amazon RDS DB instances use the open standard AES-256 encryption algorithm to encrypt your data on the server that hosts your RDS DB instances. After your data is encrypted, Amazon RDS handles authentication of access and decryption of your data transparently with a minimal impact on performance. You do not need to modify your database client applications to use encryption.

Amazon RDS encryption currently is available for all database engines and storage types. Amazon RDS encryption is available for most DB instance classes.

Usage considerations

- This control applies only to Amazon RDS DB engine types `mariadb`, `mysql`, `oracle-ee`, `oracle-ee-cdb`, `oracle-se2`, `oracle-se2-cdb`, `postgres`, `sqlserver-ee`, `sqlserver-se`, `sqlserver-ex` and `sqlserver-web`
- This control applies only when the `Engine` property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an `Engine` has not been set explicitly.

Remediation for rule failure

The parameter `StorageEncrypted` must be set to true for RDS DB Instances.

The examples that follow show how to implement this remediation.

Amazon RDS DB instance - Example

Amazon RDS DB instance with storage encryption enabled. The example is shown in JSON and in YAML.

JSON example

```
{
    "RDSDBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:
${RDSDBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:
${RDSDBInstanceSecret}::password}}"
            },
            "StorageEncrypted": true
        }
    }
}
```

YAML example

```
RDSDBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
```

```
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${RDSDBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:
${RDSDBInstanceSecret}::password}}'
    StorageEncrypted: true
```

CT.RDS.PR.24 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  DBInstanceSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: RDS instance secret
      GenerateSecretString:
        SecretStringTemplate: '{"username": "exampleuser"}'
        GenerateStringKey: password
```

```
        PasswordLength: 22
        ExcludeCharacters: "/@\""
  DBInstance:
    Type: AWS::RDS::DBInstance
    Properties:
      Engine: postgres
      EngineVersion: 14.2
      DBInstanceClass: db.m5.large
      StorageType: gp2
      AllocatedStorage: 5
      MasterUsername:
        Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
      MasterUserPassword:
        Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
      StorageEncrypted: true
    DeletionPolicy: Delete
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  DBInstanceSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: RDS instance secret
      GenerateSecretString:
        SecretStringTemplate: '{"username": "exampleuser"}'
        GenerateStringKey: password
        PasswordLength: 22
        ExcludeCharacters: "/@\""

```

```
      MasterUserPassword:
        Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
      StorageEncrypted: false
    DeletionPolicy: Delete
```

[CT.RDS.PR.25] Require an Amazon RDS database cluster to export logs to Amazon CloudWatch Logs by means of the EnableCloudwatchLogsExports property

This control checks whether Amazon RDS database clusters have all available log types enabled for export to Amazon CloudWatch Logs.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBCluster`
- **AWS CloudFormation guard rule:** CT.RDS.PR.25 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.25 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.25 example templates

Explanation

AWS Control Tower recommends that you enable the export of relevant logs for all Amazon RDS database clusters to Amazon CloudWatch Logs. Database logging provides detailed records of requests made to RDS. Database logs can assist with security and access audits, and they can help you diagnose availability issues.

Usage considerations

- This control applies only to Amazon RDS DB cluster engine types `aurora`, `aurora-mysql`, `aurora-postgresql`, `mysql` and `postgres`.
- Additional prerequisites may exist for enabling logging based on your selected database engine type. Refer to Monitoring Amazon Aurora log files in the *Amazon Aurora User Guide* for more information.

Remediation for rule failure

Specify `EnableCloudwatchLogsExports` with a list of all supported log types for the Amazon RDS database cluster engine.

The examples that follow show how to implement this remediation.

Amazon RDS database (DB) Cluster - Example One

Amazon RDS Aurora DB cluster configured with all available log types enabled for export to Amazon CloudWatch Logs. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBCluster": {
        "Type": "AWS::RDS::DBCluster",
        "Properties": {
            "Engine": "aurora",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
            },
            "DBSubnetGroupName": {
                "Ref": "DBSubnetGroup"
            },
            "EnableCloudwatchLogsExports": [
                "audit",
                "error",
                "general",
```

```
                "slowquery"
            ]
        }
    }
}
```

YAML example

```
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: aurora
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::password}}'
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
    EnableCloudwatchLogsExports:
      - audit
      - error
      - general
      - slowquery
```

The examples that follow show how to implement this remediation.

Amazon RDS DB Cluster - Example Two

Amazon RDS Multi-AZ Postgres DB cluster configured with all available log types enabled for export to Amazon CloudWatch Logs. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBCluster": {
        "Type": "AWS::RDS::DBCluster",
        "Properties": {
            "Engine": "aurora",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::username}}"
            },
```

```
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
            },
            "DBSubnetGroupName": {
                "Ref": "DBSubnetGroup"
            },
            "EnableCloudwatchLogsExports": [
                "audit",
                "error",
                "general",
                "slowquery"
            ]
        }
    }
}
```

YAML example

```
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: aurora
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::password}}'
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
    EnableCloudwatchLogsExports:
      - audit
      - error
      - general
      - slowquery
```

CT.RDS.PR.25 rule specification

CT.RDS.PR.25 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  DBCluster:
    Type: AWS::RDS::DBCluster
    Properties:
      MasterUsername: exampleusername
      MasterUserPassword: example-password
      DBSubnetGroupName: example-db-subnet-group
      Engine: aurora
      EnableCloudwatchLogsExports:
        - audit
        - error
        - general
        - slowquery
```

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  DBCluster:
    Type: AWS::RDS::DBCluster
    Properties:
      DBClusterInstanceClass: db.m6gd.large
      MasterUsername: exampleusername
      MasterUserPassword: example-password
      DBSubnetGroupName: example-db-subnet-group
      Engine: postgres
      AllocatedStorage: 100
      StorageType: io1
      Iops: 3000
      EnableCloudwatchLogsExports:
        - postgresql
        - upgrade
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  DBCluster:
    Type: AWS::RDS::DBCluster
    Properties:
      MasterUsername: exampleusername
      MasterUserPassword: example-password
      DBSubnetGroupName: example-db-subnet-group
      Engine: aurora
```

[CT.RDS.PR.26] Require an Amazon Relational Database Service DB Proxy to require Transport Layer Security (TLS) connections

This control checks whether an Amazon Relational Database Service DB Proxy is configured to require Transport Layer Security (TLS) for connections to the proxy.

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBProxy`
- **AWS CloudFormation guard rule:** CT.RDS.PR.26 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.26 rule specification
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: CT.RDS.PR.26 example templates

Explanation

Amazon RDS Proxy can act as an additional layer of security between client applications and the underlying database. For example, you can connect to the proxy using TLS 1.2, even if the underlying DB instance supports an older version of TLS. You can connect to the proxy using an IAM role, even if the proxy connects to the database with the native user and password authentication method. With this technique, you can enforce strong authentication requirements for database applications without a costly migration effort for the DB instances themselves.

Usage considerations

- For general information about Amazon RDS proxy limitations, see Quotas and limitations for RDS Proxy in the *Amazon Relational Database Service User Guide*.

Remediation for rule failure

Set the value of the RequireTLS property to true.

The examples that follow show how to implement this remediation.

Amazon RDS DB Proxy - Example

An Amazon RDS DB Proxy configured to require TLS connections to the proxy. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBProxy": {
        "Type": "AWS::RDS::DBProxy",
        "Properties": {
            "DBProxyName": "sample-db-proxy",
            "EngineFamily": "MYSQL",
            "IdleClientTimeout": 120,
            "RoleArn": {
                "Fn::GetAtt": "ProxySecretAccessRole.Arn"
            },
            "Auth": [
                {
                    "AuthScheme": "SECRETS",
                    "SecretArn": {
                        "Ref": "DBInstanceSecret"
                    },
                    "IAMAuth": "DISABLED"
                }
            ],
            "VpcSubnetIds": [
                {
                    "Ref": "SubnetOne"
                },
                {
                    "Ref": "SubnetTwo"
                }
            ],
            "RequireTLS": true
        }
    }
}
```

YAML example

```
DBProxy:
  Type: AWS::RDS::DBProxy
  Properties:
    DBProxyName: sample-db-proxy
```

```
    EngineFamily: MYSQL
    IdleClientTimeout: 120
    RoleArn: !GetAtt 'ProxySecretAccessRole.Arn'
    Auth:
      - AuthScheme: SECRETS
        SecretArn: !Ref 'DBInstanceSecret'
        IAMAuth: DISABLED
    VpcSubnetIds:
      - !Ref 'SubnetOne'
      - !Ref 'SubnetTwo'
    RequireTLS: true
```

[CT.RDS.PR.27] Require an Amazon Relational Database Service DB cluster parameter group to require Transport Layer Security (TLS) connections for supported engine types

This control checks whether an Amazon Relational Database Service DB cluster parameter group requires Transport Layer Security (TLS) connections for supported engine types.

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBClusterParameterGroup`
- **AWS CloudFormation guard rule:** CT.RDS.PR.27 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.27 rule specification
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: CT.RDS.PR.27 example templates

Explanation

You can use Secure Socket Layer (SSL) or Transport Layer Security (TLS) from your application to encrypt a connection to a DB cluster running Aurora MySQL, Aurora PostgreSQL, MySQL, or PostgreSQL. SSL/TLS connections provide a layer of security by encrypting data that moves between your client and DB cluster.

Usage considerations

- This control applies only to Amazon RDS DB cluster parameter groups with families `aurora-mysql`, `aurora-postgresql`, `postgres`, or `mysql`.

Remediation for rule failure

For Amazon RDS DB cluster parameter groups with `aurora-mysql` and `mysql` families, in the Parameters property, set the value of `require_secure_transport` to true. For Amazon RDS DB cluster parameter groups with `aurora-postgresql` amd `postgres` families, in the Parameters property, set the value of `rds.force_ssl` to true.

The examples that follow show how to implement this remediation.

Amazon RDS DB Cluster Parameter Group - Example One

An Amazon RDS DB cluster parameter group configured to require TLS/SSL for all connections to Aurora MySQL DB clusters. The example is shown in JSON and in YAML.

JSON example

```
{
    "RDSDBClusterParameterGroup": {
        "Type": "AWS::RDS::DBClusterParameterGroup",
        "Properties": {
            "Description": "sample-db-parameter-group",
            "Family": "aurora-mysql5.7",
            "Parameters": {
                "require_secure_transport": "ON"
            }
        }
    }
}
```

YAML example

```
RDSDBClusterParameterGroup:
  Type: AWS::RDS::DBClusterParameterGroup
  Properties:
    Description: sample-db-parameter-group
    Family: aurora-mysql5.7
    Parameters:
      require_secure_transport: 'ON'
```

The examples that follow show how to implement this remediation.

Amazon RDS DB Cluster Parameter Group - Example Two

An Amazon RDS DB cluster parameter group configured to require TLS/SSL for all connections to PostgreSQL DB clusters. The example is shown in JSON and in YAML.

JSON example

```
{
    "RDSDBClusterParameterGroup": {
        "Type": "AWS::RDS::DBClusterParameterGroup",
        "Properties": {
            "Description": "sample-db-parameter-group",
            "Family": "postgres14",
            "Parameters": {
                "rds.force_ssl": true
            }
        }
    }
}
```

YAML example

```
RDSDBClusterParameterGroup:
  Type: AWS::RDS::DBClusterParameterGroup
  Properties:
    Description: sample-db-parameter-group
    Family: postgres14
    Parameters:
      rds.force_ssl: true
```

CT.RDS.PR.27 rule specification

```
# ##################################
```

```
##       Rule Specification        ##
#####################################
#
# Rule Identifier:
#   rds_db_cluster_parameter_group_tls_check
#
# Description:
#   This control checks whether an Amazon RDS DB cluster parameter group requires
 Transport Layer Security (TLS) connections for supported engine types.
#
# Reports on:
#   AWS::RDS::DBClusterParameterGroup
#
# Evaluates:
#   AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any Amazon RDS DB cluster parameter
 group resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon RDS DB cluster parameter group
 resource
#       And: 'Family' has not been provided or has been provided and set to an RDS DB
 cluster
#            parameter group family other than 'aurora-mysql', 'aurora-postgresql',
 'postgres',
#            or 'mysql' families
#      Then: SKIP
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon RDS DB cluster parameter group
 resource
#       And: 'Family' has been provided and set to an 'aurora-mysql' Amazon RDS DB
 cluster parameter
```

```
#            group family
#       And: In 'Parameters', 'require_secure_transport' has not been provided, or
#            has been provided and set to a value other than 'ON'
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon RDS DB cluster parameter group
 resource
#       And: 'Family' has been provided and set to a 'mysql' Amazon RDS DB cluster
 parameter
#            group family
#       And: In 'Parameters', 'require_secure_transport' has not been provided, or
#            has been provided and set to a value other than a boolean true value
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon RDS DB cluster parameter group
 resource
#       And: 'Family' has been provided and set to an 'aurora-postgresql' or 'postgres'
#            Amazon RDS DB cluster parameter group family
#       And: In 'Parameters', 'rds.force_ssl' has not been provided, or has been
 provided
#            and set to a value other than a boolean true value
#      Then: FAIL
#   Scenario: 6
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon RDS DB cluster parameter group
 resource
#       And: 'Family' has been provided and set to an 'aurora-mysql' RDS DB cluster
 parameter
#            group family
#       And: In 'Parameters', 'require_secure_transport' has been provided and set
#            to 'ON'
#      Then: PASS
#   Scenario: 7
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon RDS DB cluster parameter group
 resource
#       And: 'Family' has been provided and set to a 'mysql' Amazon RDS DB cluster
 parameter group family
```

```
#       And: In 'Parameters', 'require_secure_transport' has been provided and set
#            to a boolean true value
#      Then: PASS
#   Scenario: 8
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon RDS DB cluster parameter group
 resource
#       And: 'Family' has been provided and set to an 'aurora-postgresql' or 'postgres'
 RDS DB
#            cluster parameter group family
#       And: In 'Parameters', 'rds.force_ssl' has been provided and set
#            to a boolean true value
#      Then: PASS

```

[CT.RDS.PR.28] Require an Amazon Relational Database Service DB parameter group to require Transport Layer Security (TLS) connections for supported engine types

This control checks whether an Amazon Relational Database Service DB parameter group requires Transport Layer Security (TLS) connections, for supported engine types.

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBParameterGroup`
- **AWS CloudFormation guard rule:** CT.RDS.PR.28 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.28 rule specification
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: CT.RDS.PR.28 example templates

Explanation

You can use Secure Socket Layer (SSL) or Transport Layer Security (TLS) from your application to encrypt a connection to a DB instance running MariaDB, Microsoft SQL Server, MySQL, Oracle, or PostgreSQL. SSL/TLS connections provide a layer of security by encrypting data that moves between your client and DB instance.

Usage considerations

- This control applies only to Amazon RDS DB parameter groups with families `postgres`, `sqlserver`, `mariadb` (excluding `mariadb10.0` to `mariadb10.4`), and `mysql` (excluding `mysql5.5` to `mysql5.6`)

Remediation for rule failure

For Amazon RDS DB instance parameter groups with `mysql` and `mariadb` families, in `Parameters`, set `require_secure_transport` to `true`. For Amazon RDS DB instance parameter groups with `postgres` and `sqlserver` families, in `Parameters`, set `rds.force_ssl` to `true`.

The examples that follow show how to implement this remediation.

Amazon RDS DB Parameter Group - Example One

An Amazon RDS DB parameter group configured to require TLS/SSL for all connections to MariaDB DB instances. The example is shown in JSON and in YAML.

JSON example

```
{
    "RDSDBParameterGroup": {
        "Type": "AWS::RDS::DBParameterGroup",
        "Properties": {
```

```
            "Description": "sample-db-parameter-group",
            "Family": "mariadb10.6",
            "Parameters": {
                "require_secure_transport": true
            }
        }
    }
}
```

YAML example

```
RDSDBParameterGroup:
  Type: AWS::RDS::DBParameterGroup
  Properties:
    Description: sample-db-parameter-group
    Family: mariadb10.6
    Parameters:
      require_secure_transport: true
```

The examples that follow show how to implement this remediation.

Amazon RDS DB Parameter Group - Example Two

An Amazon RDS DB parameter group configured to require TLS/SSL for all connections to PostgreSQL DB instances. The example is shown in JSON and in YAML.

JSON example

```
{
    "RDSDBParameterGroup": {
        "Type": "AWS::RDS::DBParameterGroup",
        "Properties": {
            "Description": "sample-db-parameter-group",
            "Family": "postgres14",
            "Parameters": {
                "rds.force_ssl": true
            }
        }
```

```
    }
}
```

YAML example

```
RDSDBParameterGroup:
  Type: AWS::RDS::DBParameterGroup
  Properties:
    Description: sample-db-parameter-group
    Family: postgres14
    Parameters:
      rds.force_ssl: true
```

CT.RDS.PR.28 rule specification

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   rds_db_parameter_group_tls_check
#
# Description:
#   This control checks whether an Amazon RDS DB parameter group requires Transport
 Layer Security (TLS) connections, for supported engine types.
#
# Reports on:

```

[CT.RDS.PR.29] Require an Amazon RDS cluster not be configured to be publicly accessible by means of the 'PubliclyAccessible' property

This control checks whether an Amazon Relational Database Service database cluster is configured to be publicly accessible, or not, as determined by the setting of the PubliclyAccessible property.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBCluster`
- **AWS CloudFormation guard rule:** CT.RDS.PR.29 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.29 rule specification
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: CT.RDS.PR.29 example templates

Explanation

The PubliclyAccessible property in the Amazon RDS DB cluster AWS CloudFormation resource indicates whether the DB cluster is publicly accessible. When the DB instance is configured with the PubliclyAccessible property set to true, its Domain Name System (DNS) endpoint resolves to the public IP address from outside of the DB cluster's virtual private cloud (VPC), and it also resolves to the private IP address from within the DB cluster's VPC.

Unless you intend for your Amazon RDS DB cluster to be publicly accessible, do not configure the Amazon RDS DB cluster with the PubliclyAccessible value set to true, because this configuration may allow unwanted traffic to your database instance.

Remediation for rule failure

Set the value of the PubliclyAccessible property to false.

The examples that follow show how to implement this remediation.

Amazon RDS DB Cluster - Example

An Amazon RDS Multi-AZ Postgres DB cluster configured not to be publicly accessible. The example is shown in JSON and in YAML.

JSON example

```
{
    "DBCluster": {
        "Type": "AWS::RDS::DBCluster",
        "Properties": {
            "Engine": "postgres",
            "DBClusterInstanceClass": "db.m6gd.large",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
            },
            "DBSubnetGroupName": {
                "Ref": "DBSubnetGroup"
            },
            "AllocatedStorage": 100,
            "StorageType": "io1",
            "Iops": 3000,
            "PubliclyAccessible": false
        }
    }
}
```

YAML example

```
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: postgres
    DBClusterInstanceClass: db.m6gd.large
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::password}}'
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
    AllocatedStorage: 100
    StorageType: io1
    Iops: 3000
    PubliclyAccessible: false
```

        Fn::Sub: "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
      Engine: mysql
      AllocatedStorage: 100
      StorageType: io1
      Iops: 1000
      PubliclyAccessible: true
```

[CT.RDS.PR.30] Require that an Amazon RDS database instance has encryption at rest configured to use a KMS key that you specify for supported engine types

This control checks whether storage encryption is enabled for your Amazon RDS database (DB) instance, and that the encryption uses a KMS key that you specify for supported engine types.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBInstance`
- **AWS CloudFormation guard rule:** CT.RDS.PR.30 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.30 rule specification
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: CT.RDS.PR.30 example templates

Explanation

As an added layer of security for your sensitive data in Amazon RDS DB instances, you can configure your Amazon RDS DB instances to be encrypted at rest. To encrypt your Amazon RDS DB instances and snapshots at rest, enable the encryption option for your Amazon RDS DB instances. Data that is encrypted at rest includes the underlying storage for DB instances, its automated backups, read replicas, and snapshots.

Amazon RDS-encrypted DB instances use the open standard AES-256 encryption algorithm to encrypt your data residing on the server that hosts your Amazon RDS DB instances. After your data is encrypted, Amazon RDS handles authentication of access and decryption of your data transparently, with a minimal impact on performance. You do not need to modify your database client applications to use encryption.

Amazon RDS encryption is available for all database engines and storage types. Amazon RDS encryption is available for most DB instance classes.

Usage considerations

- This control applies only to Amazon RDS DB engine types `mariadb`, `mysql`, `oracle-ee`, `oracle-ee-cdb`, `oracle-se2`, `oracle-se2-cdb`, `postgres`, `sqlserver-ee`, `sqlserver-se`, and `sqlserver-web`
- This control applies only when the `Engine` property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an `Engine` has not been set explicitly.
- This control requires that a KMS key is specified for Amazon RDS DB instance resources. It does not check the properties of the KMS key used, such as whether the KMS key is customer-managed or service-managed.
- Consider using a customer-managed key if you want full control over the KMS key, which includes establishing and maintaining the key's policies, IAM policies, and grants, as well as enabling and disabling the key, rotating its cryptographic material, adding tags, creating aliases that refer to the KMS key, and scheduling the KMS key for deletion.

Remediation for rule failure

Set the KmsKeyId property to the ARN of an AWS KMS key that is configured to grant key usage permissions to Amazon RDS.

The examples that follow show how to implement this remediation.

Amazon RDS DB instance - Example

An Amazon RDS DB instance with storage encryption enabled. The example is shown in JSON and in YAML.

JSON example

```
{
    "RDSDBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
```

```
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "StorageEncrypted": true,
            "KmsKeyId": {
                "Ref": "KMSKey"
            }
        }
    }
}
```

YAML example

```
RDSDBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    StorageEncrypted: true
    KmsKeyId: !Ref 'KMSKey'
```

CT.RDS.PR.30 rule specification

```
# ##################################
##       Rule Specification        ##
```

```
####################################
#
# Rule Identifier:
#   rds_storage_encrypted_kms_key_check
#
# Description:
#   This control checks whether storage encryption is enabled for your Amazon RDS
 database (DB) instance, and that the encryption uses a KMS key that you specify for
 supported engine types.
#
# Reports on:
#   AWS::RDS::DBInstance
#
# Evaluates:
#   AWS CloudFormation, AWS CloudFormation Hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any Amazon RDS DB instance resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Amazon RDS DB instance resource
#       And: 'Engine' is not one of 'mariadb', 'mysql', 'oracle-ee', 'oracle-ee-cdb',
#            'oracle-se2', 'oracle-se2-cdb', 'postgres', 'sqlserver-ee', 'sqlserver-
se',
#            'sqlserver-web'
#      Then: SKIP
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Amazon RDS DB instance resource
#       And: 'Engine' is one of 'mariadb', 'mysql', 'oracle-ee', 'oracle-ee-cdb',
#            'oracle-se2', 'oracle-se2-cdb', 'postgres', 'sqlserver-ee', 'sqlserver-
se',
#            'sqlserver-web'
#       And: 'KmsKeyId' has not been provided
#      Then: FAIL
```

```
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Amazon RDS DB instance resource
#       And: 'Engine' is one of 'mariadb', 'mysql', 'oracle-ee', 'oracle-ee-cdb',
#            'oracle-se2', 'oracle-se2-cdb', 'postgres', 'sqlserver-ee', 'sqlserver-
se',
#            'sqlserver-web'
#       And: 'KmsKeyId' has been provided as an empty string or invalid local reference
#            to a KMS key ID or alias or ARN
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Amazon RDS DB instance resource
#       And: 'Engine' is one of 'mariadb', 'mysql', 'oracle-ee', 'oracle-ee-cdb',

Amazon Redshift controls

Topics

- [CT.REDSHIFT.PR.1] Require an Amazon Redshift cluster to prohibit public access
- [CT.REDSHIFT.PR.2] Require an Amazon Redshift cluster to have automatic snapshots configured
- [CT.REDSHIFT.PR.3] Require an Amazon Redshift cluster to have audit logging configured
- [CT.REDSHIFT.PR.4] Require an Amazon Redshift cluster to have automatic upgrades to major versions configured
- [CT.REDSHIFT.PR.5] Require an Amazon Redshift cluster to have enhanced VPC routing
- [CT.REDSHIFT.PR.6] Require an Amazon Redshift cluster to have a unique administrator username
- [CT.REDSHIFT.PR.7] Require an Amazon Redshift cluster to have a unique database name
- [CT.REDSHIFT.PR.8] Require an Amazon Redshift cluster to be encrypted
- [CT.REDSHIFT.PR.9] Require that an Amazon Redshift cluster parameter group is configured to use Secure Sockets Layer (SSL) for encryption of data in transit

[CT.REDSHIFT.PR.1] Require an Amazon Redshift cluster to prohibit public access

This control checks whether Amazon Redshift clusters are configured to prohibit public access.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::Redshift::Cluster`
- **AWS CloudFormation guard rule:** CT.REDSHIFT.PR.1 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.REDSHIFT.PR.1 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.REDSHIFT.PR.1 example templates

Explanation

The PubliclyAccessible attribute of the Amazon Redshift cluster configuration indicates whether the cluster is publicly accessible. When the cluster is configured with the `PubliclyAccessible` parameter set to `true`, it is an internet-facing instance that has a publicly resolvable DNS name, which resolves to a public IP address.

When the cluster is not publicly accessible, it is an internal instance with a DNS name that resolves to a private IP address. Unless you intend for your cluster to be publicly accessible, the cluster should not be configured with `PubliclyAccessible` set to `true`.

Remediation for rule failure

Set `PubliclyAccessible` to `false`.

The examples that follow show how to implement this remediation.

Amazon Redshift Cluster - Example

Amazon Redshift cluster configured to prohibit public access. The example is shown in JSON and in YAML.

JSON example

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:
${RedshiftClusterSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:
${RedshiftClusterSecret}::password}}"
            },
            "NodeType": "ds2.xlarge",
            "PubliclyAccessible": false
        }
    }
}
```

YAML example

```
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:
${RedshiftClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:
${RedshiftClusterSecret}::password}}'
    NodeType: ds2.xlarge
    PubliclyAccessible: false
```

      NodeType: dc2.large
      PubliclyAccessible: true
```

[CT.REDSHIFT.PR.2] Require an Amazon Redshift cluster to have automatic snapshots configured

This control checks whether Amazon Redshift clusters have automated snapshots enabled, and that the clusters are set with an automated snapshot retention period greater than or equal to seven (7) days.

- **Control objective:** Improve resiliency
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::Redshift::Cluster`
- **AWS CloudFormation guard rule:** CT.REDSHIFT.PR.2 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.REDSHIFT.PR.2 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.REDSHIFT.PR.2 example templates

Explanation

Backups help you to recover more quickly from a security incident. They strengthen the resilience of your systems. Amazon Redshift takes periodic snapshots by default. This control checks whether automatic snapshots are created and retained for at least seven days.

Remediation for rule failure

Set `AutomatedSnapshotRetentionPeriod` to an integer value greater than or equal to 7 days.

The examples that follow show how to implement this remediation.

Amazon Redshift Cluster - Example

Amazon Redshift cluster configured with automatic snapshots active. The example is shown in JSON and in YAML.

JSON example

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::password}}"
            },
            "NodeType": "ds2.xlarge",
            "AutomatedSnapshotRetentionPeriod": 7
        }
    }
}
```

YAML example

```
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
```

```
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: ds2.xlarge
    AutomatedSnapshotRetentionPeriod: 7
```

CT.REDSHIFT.PR.2 rule specification

CT.REDSHIFT.PR.2 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  RedshiftSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: Redshift cluster secret
      GenerateSecretString:
        SecretStringTemplate: '{"username": "examplemasterusername"}'
        GenerateStringKey: password
        PasswordLength: 16
        ExcludeCharacters: "'\"@/\\"
  RedshiftCluster:
    Type: AWS::Redshift::Cluster
    Properties:
      ClusterType: single-node
      DBName: exampledb
      MasterUsername:
        Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
      MasterUserPassword:
        Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
      NodeType: dc2.large
      PubliclyAccessible: false
      AutomatedSnapshotRetentionPeriod: 7
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  RedshiftSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: Redshift cluster secret
      GenerateSecretString:
```

```
        SecretStringTemplate: '{"username": "examplemasterusername"}'
        GenerateStringKey: password
        PasswordLength: 16
        ExcludeCharacters: "'\"@/\\"
  RedshiftCluster:

        Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
      NodeType: dc2.large
      PubliclyAccessible: false
      AutomatedSnapshotRetentionPeriod: 5
```

[CT.REDSHIFT.PR.3] Require an Amazon Redshift cluster to have audit logging configured

This control checks whether an Amazon Redshift cluster has audit logging activated.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::Redshift::Cluster`
- **AWS CloudFormation guard rule:** CT.REDSHIFT.PR.3 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.REDSHIFT.PR.3 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.REDSHIFT.PR.3 example templates

Explanation

Amazon Redshift audit logging provides additional information about connections and user activities in your cluster. This data can be stored and secured in Amazon S3, and it can be helpful for security audits and investigations.

Remediation for rule failure

Provide a `LoggingProperties` configuration and set `BucketName` to the name of an Amazon S3 bucket configured to receive Amazon Redshift audit logs.

The examples that follow show how to implement this remediation.

Amazon Redshift Cluster - Example

Amazon Redshift cluster configured with audit logging enabled. The example is shown in JSON and in YAML.

JSON example

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::password}}"
            },
            "NodeType": "dc2.large",
            "PubliclyAccessible": false,
            "LoggingProperties": {
                "BucketName": {
                    "Ref": "S3Bucket"
                },
                "S3KeyPrefix": "sample-cluster-logs"
            }
        }
    }
}
```

YAML example

```
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: dc2.large
    PubliclyAccessible: false
    LoggingProperties:
      BucketName: !Ref 'S3Bucket'
      S3KeyPrefix: sample-cluster-logs
```

CT.REDSHIFT.PR.3 rule specification

```
# ####################################

```

[CT.REDSHIFT.PR.4] Require an Amazon Redshift cluster to have automatic upgrades to major versions configured

This control checks whether automatic major version upgrades are enabled for your Amazon Redshift cluster.

- **Control objective:** Manage vulnerabilities
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::Redshift::Cluster`
- **AWS CloudFormation guard rule:** CT.REDSHIFT.PR.4 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.REDSHIFT.PR.4 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.REDSHIFT.PR.4 example templates

Explanation

Enabling automatic major version upgrades ensures that the latest major version updates to Amazon Redshift clusters are installed during the maintenance window. These updates might include security patches and bug fixes. Keeping up to date with patch installation is an important step in securing systems.

Remediation for rule failure

Set the `AllowVersionUpgrade` property to true or do not specify it (default).

The examples that follow show how to implement this remediation.

Amazon Redshift Cluster - Example One

Amazon Redshift cluster with automatic major version upgrades enabled through AWS CloudFormation defaults. The example is shown in JSON and in YAML.

JSON example

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "exampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::password}}"
            },
            "NodeType": "ds2.xlarge"
        }
    }
}
```

YAML example

```
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: exampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: ds2.xlarge
```

The examples that follow show how to implement this remediation.

Amazon Redshift Cluster - Example Two

Amazon Redshift cluster configured with automatic major version upgrades enabled through the `AllowVersionUpgrade` property. The example is shown in JSON and in YAML.

JSON example

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "exampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::password}}"
            },
            "NodeType": "ds2.xlarge",
            "AllowVersionUpgrade": true
        }
    }
}
```

YAML example

```
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: exampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: ds2.xlarge
    AllowVersionUpgrade: true
```

CT.REDSHIFT.PR.4 rule specification

```

[CT.REDSHIFT.PR.5] Require an Amazon Redshift cluster to have enhanced VPC routing

This control checks whether an Amazon Redshift cluster has enhanced VPC routing configured.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule

- **Control behavior:** Proactive
- **Resource types:** `AWS::Redshift::Cluster`
- **AWS CloudFormation guard rule:** CT.REDSHIFT.PR.5 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.REDSHIFT.PR.5 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.REDSHIFT.PR.5 example templates

Explanation

Enhanced VPC routing forces all `copy` and `unload` traffic between the cluster and the data repositories to go through your VPC. With enhanced routing active, you can use VPC features, such as security groups and network access control lists, to secure network traffic. You can also use VPC Flow Logs to monitor network traffic.

Remediation for rule failure

Set `EnhancedVpcRouting` to `true`.

The examples that follow show how to implement this remediation.

Amazon Redshift Cluster - Example

Amazon Redshift cluster configured with enhanced VPC routing. The example is shown in JSON and in YAML.

JSON example

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::username}}"
            },
```

```
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::password}}"
            },
            "NodeType": "ds2.xlarge",
            "EnhancedVpcRouting": true
        }
    }
}
```

YAML example

```
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: ds2.xlarge
    EnhancedVpcRouting: true
```

CT.REDSHIFT.PR.5 rule specification

```
# ####################################

      PubliclyAccessible: false
      EnhancedVpcRouting: false
```

[CT.REDSHIFT.PR.6] Require an Amazon Redshift cluster to have a unique administrator username

This control checks whether an Amazon Redshift cluster has changed the administrator username from its default value.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::Redshift::Cluster`
- **AWS CloudFormation guard rule:** CT.REDSHIFT.PR.6 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.REDSHIFT.PR.6 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.REDSHIFT.PR.6 example templates

Explanation

When creating an Amazon Redshift cluster, you should change the default administrator username to a unique value. Default usernames are public knowledge, so they should be changed upon configuration. Changing the default username reduces the risk of unintended access.

Remediation for rule failure

Set `MasterUsername` to a value other than `awsuser`.

The examples that follow show how to implement this remediation.

Amazon Redshift Cluster - Example

Amazon Redshift cluster configured with an administrator username different from the default value of `awsuser`. The example is shown in JSON and in YAML.

JSON example

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": "samplemasterusername",
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:
${RedshiftClusterSecret}::password}}"
            },
            "NodeType": "ds2.xlarge"
        }
    }
}
```

YAML example

```
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: samplemasterusername
    MasterUserPassword: !Sub '{{resolve:secretsmanager:
${RedshiftClusterSecret}::password}}'
    NodeType: ds2.xlarge
```

CT.REDSHIFT.PR.6 rule specification

      MasterUserPassword:
        Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
      NodeType: dc2.large
      PubliclyAccessible: false
```

[CT.REDSHIFT.PR.7] Require an Amazon Redshift cluster to have a unique database name

This control checks whether an Amazon Redshift cluster has changed its database name from the default value.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::Redshift::Cluster`
- **AWS CloudFormation guard rule:** CT.REDSHIFT.PR.7 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.REDSHIFT.PR.7 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.REDSHIFT.PR.7 example templates

Explanation

When creating a Redshift cluster, you should change the default database name to a unique value. Default names are public knowledge, so they should be changed upon configuration. For example, a well-known name can lead to inadvertent access, if included in IAM policy conditions.

Remediation for rule failure

Set `DBName` to a database name that is different from the default value of `dev`.

The examples that follow show how to implement this remediation.

Amazon Redshift Cluster - Example

Amazon Redshift cluster configured with a database name different from the default value of `dev`. The example is shown in JSON and in YAML.

JSON example

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:
${RedshiftClusterSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:
${RedshiftClusterSecret}::password}}"
            },
            "NodeType": "dc2.large",
            "PubliclyAccessible": false
        }
    }
}
```

YAML example

```
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:
${RedshiftClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:
${RedshiftClusterSecret}::password}}'
    NodeType: dc2.large
    PubliclyAccessible: false
```

      MasterUserPassword:
        Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
      NodeType: dc2.large
      PubliclyAccessible: false
      DBName: dev
```

[CT.REDSHIFT.PR.8] Require an Amazon Redshift cluster to be encrypted

This control checks whether an Amazon Redshift cluster is encrypted.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::Redshift::Cluster`
- **AWS CloudFormation guard rule:** CT.REDSHIFT.PR.8 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.REDSHIFT.PR.8 rule specification

- For examples of PASS and FAIL CloudFormation templates related to this control, see: CT.REDSHIFT.PR.8 example templates

Explanation

In Amazon Redshift, you can enable database encryption for your clusters, which helps protect data at rest. When you enable encryption for a cluster, the data blocks and system metadata are encrypted for the cluster and its snapshots.

Remediation for rule failure

Set the value of the `Encrypted` property to true.

The examples that follow show how to implement this remediation.

Amazon Redshift Cluster - Example

An Amazon Redshift cluster configured with encryption enabled. The example is shown in JSON and in YAML.

JSON example

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::password}}"
            },
            "NodeType": "dc2.large",
            "PubliclyAccessible": false,
            "Encrypted": true
        }
    }
}
```

YAML example

```
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: dc2.large
    PubliclyAccessible: false
    Encrypted: true
```

CT.REDSHIFT.PR.8 rule specification

```
# ####################################

[CT.REDSHIFT.PR.9] Require that an Amazon Redshift cluster parameter group is configured to use Secure Sockets Layer (SSL) for encryption of data in transit

This control checks whether an Amazon Redshift cluster parameter group is configured to require encryption by means of Secure Sockets Layer (SSL), for data in transit.

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::Redshift::ClusterParameterGroup`
- **AWS CloudFormation guard rule:** CT.REDSHIFT.PR.9 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.REDSHIFT.PR.9 rule specification
- For examples of PASS and FAIL CloudFormation templates related to this control, see: CT.REDSHIFT.PR.9 example templates

Explanation

In Amazon Redshift, you can enable encryption of data in transit between an Amazon Redshift cluster and SQL clients over JDBC/ODBC. To support SSL connections, Amazon Redshift creates and installs certificates on each cluster, which are issued by AWS Certificate Manager (ACM).

Remediation for rule failure

Set an entry in `Parameters` with a `ParameterName` of `require_ssl` and a `ParameterValue` of true.

The examples that follow show how to implement this remediation.

Amazon Redshift cluster parameter group - Example

An Amazon Redshift cluster parameter group, configured to require encryption of data in transit. The example is shown in JSON and in YAML.

JSON example

```
{
    "ClusterParameterGroup": {
        "Type": "AWS::Redshift::ClusterParameterGroup",
        "Properties": {
            "Description": "Example parameter group",
            "ParameterGroupFamily": "redshift-1.0",
            "Parameters": [
                {
                    "ParameterName": "require_ssl",
                    "ParameterValue": true
                }
            ]
        }
    }
}
```

YAML example

```
ClusterParameterGroup:
  Type: AWS::Redshift::ClusterParameterGroup
  Properties:
    Description: Example parameter group
    ParameterGroupFamily: redshift-1.0
    Parameters:
      - ParameterName: require_ssl
```

```
        ParameterValue: true
```

CT.REDSHIFT.PR.9 rule specification

```
# ####################################

CT.REDSHIFT.PR.9 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  ClusterParameterGroup:
    Type: AWS::Redshift::ClusterParameterGroup
```

```
    Properties:
      Description: Example parameter group
      ParameterGroupFamily: redshift-1.0
      Parameters:
      - ParameterName: require_ssl
        ParameterValue: true
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  ClusterParameterGroup:
    Type: AWS::Redshift::ClusterParameterGroup
    Properties:
      Description: Example parameter group
      ParameterGroupFamily: redshift-1.0
```

Amazon Simple Storage Service (Amazon S3) controls

Topics

- [CT.S3.PR.1] Require an Amazon S3 bucket to have block public access settings configured
- [CT.S3.PR.2] Require an Amazon S3 bucket to have server access logging configured
- [CT.S3.PR.3] Require an Amazon S3 buckets to have versioning configured and a lifecycle policy
- [CT.S3.PR.4] Require an Amazon S3 bucket to have event notifications configured
- [CT.S3.PR.5] Require that an Amazon S3 bucket does not manage user access with an access control list (ACL)
- [CT.S3.PR.6] Require an Amazon S3 bucket to have lifecycle policies configured
- [CT.S3.PR.8] Require that Amazon S3 bucket requests use Secure Socket Layer
- [CT.S3.PR.9] Require that an Amazon S3 bucket has S3 Object Lock activated
- [CT.S3.PR.10] Require an Amazon S3 bucket to have server-side encryption configured using an AWS KMS key
- [CT.S3.PR.11] Require an Amazon S3 bucket to have versioning enabled

- [CT.S3.PR.12] Require an Amazon S3 access point to have a Block Public Access (BPA) configuration with all options set to true

[CT.S3.PR.1] Require an Amazon S3 bucket to have block public access settings configured

This control checks whether your Amazon Simple Storage Service (Amazon S3) bucket has a bucket-level Block Public Access (BPA) configuration.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::S3::Bucket`
- **AWS CloudFormation guard rule:** CT.S3.PR.1 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.S3.PR.1 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.S3.PR.1 example templates

Explanation

Block Public Access at the Amazon S3 bucket level provides controls to ensure that objects never have public access. Public access is granted to buckets and objects through access control lists (ACLs), bucket policies, or both.

Unless you intend to have your S3 buckets publicly accessible, you should configure the bucket level Amazon S3 Block Public Access feature.

Usage considerations

- This control is incompatible with Amazon S3 buckets that require a public access configuration.

Remediation for rule failure

The parameters `BlockPublicAcls`, `BlockPublicPolicy`, `IgnorePublicAcls`, `RestrictPublicBuckets` must be set to true under the bucket-level `PublicAccessBlockConfiguration`.

The examples that follow show how to implement this remediation.

Amazon S3 Bucket - Example

Amazon S3 bucket with a bucket level Block Public Access configuration that ensures objects never have public access. The example is shown in JSON and in YAML.

JSON example

```
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "PublicAccessBlockConfiguration": {
                "BlockPublicAcls": true,
                "BlockPublicPolicy": true,
                "IgnorePublicAcls": true,
                "RestrictPublicBuckets": true
            }
        }
    }
}
```

YAML example

```
S3Bucket:
  Type: AWS::S3::Bucket
  Properties:
    PublicAccessBlockConfiguration:
      BlockPublicAcls: true
      BlockPublicPolicy: true
      IgnorePublicAcls: true
      RestrictPublicBuckets: true
```

CT.S3.PR.1 rule specification

```
# ####################################
##       Rule Specification        ##

```

CT.S3.PR.1 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  S3Bucket:
    Type: AWS::S3::Bucket
    Properties:
      PublicAccessBlockConfiguration:
        BlockPublicAcls: true
        BlockPublicPolicy: true
        IgnorePublicAcls: true
        RestrictPublicBuckets: true
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  S3Bucket:
```

```
    Type: AWS::S3::Bucket
    Properties:
      PublicAccessBlockConfiguration:
        BlockPublicAcls: false
        BlockPublicPolicy: false
        IgnorePublicAcls: false
        RestrictPublicBuckets: false
```

[CT.S3.PR.2] Require an Amazon S3 bucket to have server access logging configured

This control checks whether server access logging is enabled for your Amazon S3 bucket.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::S3::Bucket`
- **AWS CloudFormation guard rule:** CT.S3.PR.2 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.S3.PR.2 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.S3.PR.2 example templates

Explanation

Server access logging provides detailed records of requests made to a bucket. Server access logs can assist in security and access audits.

Remediation for rule failure

Set a `LoggingConfiguration` on the S3 bucket and optionally set `DestinationBucketName` to an S3 bucket configured to receive S3 Access Logs.

The examples that follow show how to implement this remediation.

Amazon S3 Bucket - Example

Amazon S3 bucket with a server access logging configuration. The example is shown in JSON and in YAML.

JSON example

```
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "LoggingConfiguration": {
                "DestinationBucketName": {
                    "Ref": "LoggingBucket"
                }
            }
        }
    }
}
```

YAML example

```
S3Bucket:
  Type: AWS::S3::Bucket
  Properties:
    LoggingConfiguration:
      DestinationBucketName: !Ref 'LoggingBucket'
```

CT.S3.PR.2 rule specification

```
# ##################################
##       Rule Specification        ##
#####################################
#
# Rule Identifier:
#   s3_bucket_logging_enabled_check
#
```

```
# Description:
#   This control checks whether server access logging is enabled for Amazon S3 buckets.
#
# Reports on:
#   AWS::S3::Bucket
#
# Evaluates:
#   AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or CloudFormation hook
 document
#       And: The input document does not contain any Amazon S3 bucket resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or CloudFormation hook
 document
#       And: The input document contains an Amazon S3 bucket resource
#       And: 'LoggingConfiguration' has not been provided
#      Then: FAIL
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or CloudFormation hook
 document
#       And: The input document contains an Amazon S3 bucket resource
#       And: 'LoggingConfiguration' has been provided
#       And: 'LoggingConfiguration.DestinationbucketName' has been provided with an
 empty string or non-valid local
#            reference
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or CloudFormation hook
 document
#       And: The input document contains an Amazon S3 bucket resource
#       And: 'LoggingConfiguration' has been provided
#      Then: PASS
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or CloudFormation hook
 document
#       And: The input document contains an Amazon S3 bucket resource
#       And: 'LoggingConfiguration' has been provided
```

```
#       And: 'LoggingConfiguration.DestinationBucketName' has been provided with a non-
empty string or valid local
#            reference
#      Then: PASS

```

CT.S3.PR.2 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties:
      LoggingConfiguration: {}
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties: {}
```

[CT.S3.PR.3] Require an Amazon S3 buckets to have versioning configured and a lifecycle policy

This control checks whether your Amazon Simple Storage Service (Amazon S3) version-enabled bucket has a lifecycle policy configured.

- **Control objective:** Optimize costs
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::S3::Bucket`
- **AWS CloudFormation guard rule:** CT.S3.PR.3 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.S3.PR.3 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.S3.PR.3 example templates

Explanation

We recommend that you configure lifecycle rules on your Amazon S3 bucket, because these rules help you define actions that you want Amazon S3 to take during an object's lifetime.

Usage considerations

- This control applies only to Amazon S3 buckets with versioning enabled.

Remediation for rule failure

Configure versioning-enabled buckets with at least one active lifecycle rule.

The examples that follow show how to implement this remediation.

Amazon S3 Bucket - Example One

Amazon S3 bucket with versioning enabled and an active lifecycle rule. The example is shown in JSON and in YAML.

JSON example

```
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "VersioningConfiguration": {
                "Status": "Enabled"
            },
            "LifecycleConfiguration": {
                "Rules": [
                    {
                        "Status": "Enabled",
                        "ExpirationInDays": 1,
                        "Id": "FirstRule"
                    }
                ]
            }
        }
    }
}
```

YAML example

```
S3Bucket:
  Type: AWS::S3::Bucket
  Properties:
    VersioningConfiguration:
      Status: Enabled
    LifecycleConfiguration:
      Rules:
        - Status: Enabled
          ExpirationInDays: 1
          Id: FirstRule
```

CT.S3.PR.3 rule specification

CT.S3.PR.3 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties:
      VersioningConfiguration:
        Status: Enabled
      LifecycleConfiguration:
        Rules:
        - Status: Enabled
          ExpirationInDays: 1
          Id: FirstRule
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties:
      VersioningConfiguration:
        Status: Enabled
      LifecycleConfiguration:
        Rules:
        - Status: Disabled
          ExpirationInDays: 1
          Id: FirstRule
```

[CT.S3.PR.4] Require an Amazon S3 bucket to have event notifications configured

This control checks whether Amazon S3 events notifications are enabled on your Amazon S3 bucket.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::S3::Bucket`
- **AWS CloudFormation guard rule:** CT.S3.PR.4 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.S3.PR.4 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.S3.PR.4 example templates

Explanation

By enabling event notifications, you receive alerts on your Amazon S3 buckets when specific events occur. For example, you can be notified of object creation, object removal, and object restoration.

These notifications can alert relevant teams to accidental or intentional modifications that may lead to unauthorized data access.

Remediation for rule failure

Set a `NotificationConfiguration` parameter on your bucket with one of `EventBridgeConfiguration`, `LambdaConfigurations`, `QueueConfigurations` or `TopicConfigurations.`

The examples that follow show how to implement this remediation.

Amazon S3 Bucket - Example One

Amazon S3 bucket with Amazon EventBridge notifications configured. The example is shown in JSON and in YAML.

JSON example

```
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "NotificationConfiguration": {
                "EventBridgeConfiguration": {
                    "EventBridgeEnabled": true
                }
            }
        }
    }
}
```

YAML example

```
S3Bucket:
  Type: AWS::S3::Bucket
  Properties:
    NotificationConfiguration:
      EventBridgeConfiguration:
        EventBridgeEnabled: true
```

The examples that follow show how to implement this remediation.

Amazon S3 Bucket - Example Two

Amazon S3 bucket with SNS topic notifications configured. The example is shown in JSON and in YAML.

JSON example

```
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "NotificationConfiguration": {
                "TopicConfigurations": [
                    {
                        "Topic": {
                            "Ref": "SnsTopic"
                        },
                        "Event": "s3:ReducedRedundancyLostObject"
                    }
                ]
            }
        }
    }
}
```

YAML example

```
S3Bucket:
  Type: AWS::S3::Bucket
  Properties:
    NotificationConfiguration:
      TopicConfigurations:
        - Topic: !Ref 'SnsTopic'
          Event: s3:ReducedRedundancyLostObject
```

CT.S3.PR.4 rule specification

CT.S3.PR.4 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties:
      NotificationConfiguration:
        EventBridgeConfiguration:
          EventBridgeEnabled: true
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties:
      NotificationConfiguration: {}
```

[CT.S3.PR.5] Require that an Amazon S3 bucket does not manage user access with an access control list (ACL)

This control checks whether your Amazon Simple Storage Service (Amazon S3) bucket allows user permissions through access control lists.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::S3::Bucket`
- **AWS CloudFormation guard rule:** CT.S3.PR.5 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.S3.PR.5 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.S3.PR.5 example templates

Explanation

ACLs are legacy access control mechanisms that predate IAM. Instead of ACLs, we recommend using IAM policies or Amazon S3 bucket policies to more easily manage access to your S3 buckets.

Remediation for rule failure

Manage access to Amazon S3 buckets with bucket resource policies and IAM identity policies instead.

The examples that follow show how to implement this remediation.

Amazon S3 Bucket - Example

Amazon S3 bucket that does not allow user permissions through access control lists by omitting the `AccessControl` property. The example is shown in JSON and in YAML.

JSON example

```
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {}
    }
}
```

YAML example

```
S3Bucket:
  Type: AWS::S3::Bucket

CT.S3.PR.5 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties: {}
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties:
      AccessControl: Private
```

[CT.S3.PR.6] Require an Amazon S3 bucket to have lifecycle policies configured

This control checks whether a lifecycle rule is configured for Amazon S3 buckets.

- **Control objective:** Optimize costs, Improve availability
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::S3::Bucket`
- **AWS CloudFormation guard rule:** CT.S3.PR.6 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.S3.PR.6 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.S3.PR.6 example templates

Explanation

Configuring lifecycle rules on your Amazon S3 bucket defines actions that you want S3 to take during an object's lifetime. For example, you can transition objects to another storage class, archive them, or delete them after a specified period of time.

Remediation for rule failure

Configure at least one active lifecycle rule in `LifecycleConfiguration.Rules` by setting `Status` on a rule to `Enabled`.

The examples that follow show how to implement this remediation.

Amazon S3 Bucket - Example

Amazon S3 bucket configured with an active lifecycle rule. The example is shown in JSON and in YAML.

JSON example

```
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "LifecycleConfiguration": {
                "Rules": [
                    {
                        "Status": "Enabled",
                        "ExpirationInDays": 1,
                        "Id": "FirstRule"
                    }
                ]
            }
        }
    }
}
```

YAML example

```
S3Bucket:
  Type: AWS::S3::Bucket
```

```
  Properties:
    LifecycleConfiguration:
      Rules:
        - Status: Enabled
          ExpirationInDays: 1
          Id: FirstRule
```

CT.S3.PR.6 rule specification

CT.S3.PR.6 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  S3Bucket:
    Type: AWS::S3::Bucket
    Properties:
      LifecycleConfiguration:
        Rules:
        - Status: Enabled
          ExpirationInDays: 1
          Id: FirstRule
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  S3Bucket:
    Type: AWS::S3::Bucket
    Properties:
      LifecycleConfiguration:
        Rules:
        - Status: Disabled
          ExpirationInDays: 1
          Id: FirstRule
```

[CT.S3.PR.8] Require that Amazon S3 bucket requests use Secure Socket Layer

This control checks whether Amazon S3 bucket policies require requests to use Secure Socket Layer (SSL).

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::S3::BucketPolicy`
- **AWS CloudFormation guard rule:** CT.S3.PR.8 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.S3.PR.8 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.S3.PR.8 example templates

Explanation

Amazon S3 buckets should have policies that require all requests (`Action: S3:*`) to accept transmission of data over HTTPS in the S3 resource policy only, as indicated by the condition key `aws:SecureTransport`.

Remediation for rule failure

Configure an Amazon S3 bucket policy statement that denies access to all principals and actions for the S3 bucket and bucket objects when a secure transport protocol is not in use.

The examples that follow show how to implement this remediation.

Amazon S3 Bucket Policy - Example

Amazon S3 bucket policy configured to deny all access to the bucket and bucket objects when transmission of data is not over HTTPS. The example is shown in JSON and in YAML.

JSON example

```
{
    "S3BucketPolicy": {
        "Type": "AWS::S3::BucketPolicy",
        "Properties": {
            "Bucket": {
                "Ref": "S3Bucket"
            },
            "PolicyDocument": {
                "Version": "2012-10-17",
                "Statement": [
                    {
                        "Effect": "Deny",
                        "Action": "s3:*",
                        "Resource": [
                            {
                                "Fn::GetAtt": [
                                    "S3Bucket",
                                    "Arn"
                                ]
                            },
                            {
                                "Fn::Join": [
                                    "",
                                    [
                                        {
                                            "Fn::GetAtt": [
                                                "S3Bucket",
                                                "Arn"
                                            ]
                                        },
                                        "/*"
                                    ]
                                ]
                            }
                        ],
                        "Principal": "*",
                        "Condition": {
                            "Bool": {
                                "aws:SecureTransport": "false"
                            }
                        }
                    }
                ]
            }
```

```
        }
    }
}
```

YAML example

```
S3BucketPolicy:
  Type: AWS::S3::BucketPolicy
  Properties:
    Bucket: !Ref 'S3Bucket'
    PolicyDocument:
      Version: 2012-10-17

[CT.S3.PR.9] Require that an Amazon S3 bucket has S3 Object Lock activated

This control checks whether an Amazon Simple Storage Service (Amazon S3) bucket has been configured to use S3 Object Lock.

- **Control objective:** Protect data integrity
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::S3::Bucket`
- **AWS CloudFormation guard rule:** CT.S3.PR.9 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.S3.PR.9 rule specification
- For examples of PASS and FAIL CloudFormation templates related to this control, see: CT.S3.PR.9 example templates

Explanation

S3 Object Lock allows you to store objects using a write-once-read-many (WORM) model. Object Lock can help prevent objects from being deleted or overwritten for a fixed amount of time, or indefinitely. You can use S3 Object Lock to meet regulatory requirements that require WORM storage, or to add an extra layer of protection against object changes and deletion.

Usage considerations

- When you create an Amazon S3 bucket with object lock activated, S3 automatically enables versioning for the bucket.

Remediation for rule failure

Set `ObjectLockEnabled` to `true`.

The examples that follow show how to implement this remediation.

S3 bucket - Example

An Amazon S3 bucket configured with S3 object lock enabled. The example is shown in JSON and in YAML.

JSON example

```
{
    "Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "ObjectLockEnabled": true
        }
    }
}
```

YAML example

```
Bucket:
  Type: AWS::S3::Bucket
  Properties:
    ObjectLockEnabled: true
```

CT.S3.PR.9 rule specification

```
# ####################################
##       Rule Specification        ##

    Type: AWS::S3::Bucket
    Properties:
      ObjectLockEnabled: true
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties:
      ObjectLockEnabled: false
```

[CT.S3.PR.10] Require an Amazon S3 bucket to have server-side encryption configured using an AWS KMS key

This control checks whether default server-side encryption is enabled on an Amazon S3 bucket using AWS KMS.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::S3::Bucket`
- **AWS CloudFormation guard rule:** CT.S3.PR.10 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.S3.PR.10 rule specification
- For examples of PASS and FAIL CloudFormation templates related to this control, see: CT.S3.PR.10 example templates

Explanation

Server-side encryption (SSE) is the encryption of data at its destination by the application or service that receives the data. Unless you specify otherwise, Amazon S3 buckets use SSE-S3 by default to encrypt objects. However, for added control, you can choose to configure buckets to use server-side encryption with AWS KMS keys (SSE-KMS) instead. Amazon S3 encrypts your data at the object level as it writes data to disks in AWS data centers, and then decrypts the data for you, when you require access to it.

Remediation for rule failure

Set an encryption rule in `BucketEncryption.ServerSideEncryptionConfiguration` with a `ServerSideEncryptionByDefault.SSEAlgorithm` configuration of `aws:kms` or `aws:kms:dsse`

The examples that follow show how to implement this remediation.

S3 Bucket - Example

An Amazon S3 bucket configured with AWS Key Management Service (AWS KMS) (SSE-KMS) default server-side encryption. The example is shown in JSON and in YAML.

JSON example

```
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "BucketEncryption": {
                "ServerSideEncryptionConfiguration": [
                    {
                        "ServerSideEncryptionByDefault": {
                            "SSEAlgorithm": "aws:kms"
                        }
                    }
                ]
            }
        }
    }
}
```

YAML example

```
S3Bucket:
  Type: AWS::S3::Bucket
  Properties:
    BucketEncryption:
      ServerSideEncryptionConfiguration:
        - ServerSideEncryptionByDefault:
            SSEAlgorithm: aws:kms
```

CT.S3.PR.10 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties:
      BucketEncryption:
        ServerSideEncryptionConfiguration:
        - ServerSideEncryptionByDefault:
```

```
            SSEAlgorithm: aws:kms
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties: {}
```

[CT.S3.PR.11] Require an Amazon S3 bucket to have versioning enabled

This control checks whether an Amazon Simple Storage Service (Amazon S3) bucket has versioning enabled.

- **Control objective:** Improve availability
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::S3::Bucket`
- **AWS CloudFormation guard rule:** CT.S3.PR.11 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.S3.PR.11 rule specification
- For examples of PASS and FAIL CloudFormation templates related to this control, see: CT.S3.PR.11 example templates

Explanation

Versioning keeps multiple variants of an object in the same Amazon S3 bucket. You can use versioning to preserve, retrieve, and restore every version of every object stored in your S3 bucket. With versioning, you can recover more easily from unintended user actions and application failures.

Usage considerations

- If you have an unversioned bucket with an object expiration lifecycle configuration, and if you want to maintain the same permanent delete behavior when you enable versioning, you must set an expiration configuration for noncurrent objects. The noncurrent expiration configuration lifecycle manages deletion of noncurrent object versions in the version-enabled bucket. (A version-enabled bucket maintains one current, and zero or more noncurrent, object versions.)

Remediation for rule failure

Set the `Status` in `VersioningConfiguration` to Enabled.

The examples that follow show how to implement this remediation.

S3 Bucket - Example One

An Amazon S3 bucket with versioning enabled. The example is shown in JSON and in YAML.

JSON example

```
{
    "Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "VersioningConfiguration": {
                "Status": "Enabled"
            }
        }
    }
}
```

YAML example

```
Bucket:
  Type: AWS::S3::Bucket
  Properties:
```

```
    VersioningConfiguration:
      Status: Enabled
```

[CT.S3.PR.12] Require an Amazon S3 access point to have a Block Public Access (BPA) configuration with all options set to true

This control checks whether an Amazon S3 access point has been configured with a Block Public Access (BPA) configuration that has all options set to true.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::S3::AccessPoint`
- **AWS CloudFormation guard rule:** CT.S3.PR.12 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.S3.PR.12 rule specification
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: CT.S3.PR.12 example templates

Explanation

Amazon S3 access points support independent access settings that allow each access point to block public access. When you create an access point, you can specify block public access settings that apply to that access point. For any request made through an access point, Amazon S3 evaluates the block public access settings for that access point, the underlying bucket, and the bucket owner's account. If any of these settings indicate that the request should be blocked, Amazon S3 rejects the request.

Usage considerations

- This control is incompatible with Amazon S3 access points that require a public access configuration.
- Amazon S3 currently doesnt `support changing an access points` block public access settings after the access point is created.
- Adding an Amazon S3 access point to a bucket doesn't change the bucket's behavior when you access the bucket directly through the bucket's name or Amazon Resource Name (ARN). See Configuring IAM policies for using access points in the *Amazon S3 User Guide* for informaiton on options to configure the underlying bucket's policy for use with Amazon S3 access points.

Remediation for rule failure

In the PublicAccessBlockConfiguration field, set the values of BlockPublicAcls, BlockPublicPolicy, IgnorePublicAcls, and RestrictPublicBuckets to true, or omit the PublicAccessBlockConfiguration field to adopt the default value of true for these properties.

The examples that follow show how to implement this remediation.

Amazon S3 Access Point - Example

An Amazon S3 access point with a Block Public Access configuration that ensures public access requests by means of the access point are rejected. The example is shown in JSON and in YAML.

JSON example

```
{
```

```
    "S3AccessPoint": {
        "Type": "AWS::S3::AccessPoint",
        "Properties": {
            "Bucket": "sample-bucket",
            "Name": "sample-access-point",
            "Policy": {
                "Version": "2012-10-17",
                "Statement": [
                    {
                        "Action": [
                            "s3:GetObject",
                            "s3:PutObject"
                        ],
                        "Effect": "Allow",
                        "Resource": [
                            {
                                "Fn::Sub": "arn:${AWS::Partition}:s3:${AWS::Region}:
${AWS::AccountId}:accesspoint/sample-access-point/object/*"
                            }
                        ],
                        "Principal": {
                            "AWS": "arn:aws:iam::123456789012:role/SampleRole"
                        }
                    }
                ]
            },
            "PublicAccessBlockConfiguration": {
                "BlockPublicAcls": true,
                "BlockPublicPolicy": true,
                "IgnorePublicAcls": true,
                "RestrictPublicBuckets": true
            }
        }
    }
}
```

YAML example

```
S3AccessPoint:
  Type: AWS::S3::AccessPoint
  Properties:
```

```
    Bucket: sample-bucket
    Name: sample-access-point
    Policy:
      Version: '2012-10-17'
      Statement:
        - Action:
            - s3:GetObject
            - s3:PutObject
          Effect: Allow
          Resource:
            - !Sub 'arn:${AWS::Partition}:s3:${AWS::Region}:
${AWS::AccountId}:accesspoint/sample-access-point/object/*'
          Principal:
            AWS: arn:aws:iam::123456789012:role/SampleRole
    PublicAccessBlockConfiguration:
      BlockPublicAcls: true
      BlockPublicPolicy: true
      IgnorePublicAcls: true
      RestrictPublicBuckets: true
```

Amazon SageMaker AI controls

Topics

- [CT.SAGEMAKER.PR.1] Require an Amazon SageMaker AI notebook instance to prevent direct internet access
- [CT.SAGEMAKER.PR.2] Require Amazon SageMaker AI notebook instances to be deployed within a custom Amazon VPC
- [CT.SAGEMAKER.PR.3] Require Amazon SageMaker AI notebook instances to have root access disallowed

[CT.SAGEMAKER.PR.1] Require an Amazon SageMaker AI notebook instance to prevent direct internet access

This control checks that direct internet access is not allowed for an Amazon SageMaker AI notebook instance.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::SageMaker::NotebookInstance`
- **AWS CloudFormation guard rule:** CT.SAGEMAKER.PR.1 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.SAGEMAKER.PR.1 rule specification
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: CT.SAGEMAKER.PR.1 example templates

Explanation

When you configure your SageMaker AI notebook instance without a VPC, direct internet access is allowed for your instance, by default. Instead, you should configure your instance with a VPC and change the default setting to `Disable - Access the internet through a VPC`.

To train or host models from a notebook, you require internet access. To set up internet access, make sure that your VPC has a NAT gateway, and that your security group allows outbound connections.

Ensure that access to your SageMaker configuration is limited to authorized users. Restrict users' IAM permissions for modifying SageMaker settings and resources.

Usage considerations

- To set up outbound internet access for Amazon SageMaker AI notebook instances when this control is activated - First, associate the notebook instance with a private subnet that has access to the internet, through a default route to a NAT gateway instance. Also, be sure that the security groups assigned to the notebook instance, and the network access control list (NACL) of the private subnet, allow outbound traffic to the internet.

Remediation for rule failure

Set `DirectInternetAccess` to `Disabled` and provide a `SubnetId` and one or more `SecurityGroupIds`.

The examples that follow show how to implement this remediation.

Amazon SageMaker AI Notebook Instance - Example

Amazon SageMaker AI notebook instance configured with direct internet access deactivated. The example is shown in JSON and in YAML.

JSON example

```
{
    "SageMakerNoteBookInstance": {
        "Type": "AWS::SageMaker::NotebookInstance",
        "Properties": {
            "InstanceType": "ml.t2.medium",
            "RoleArn": {
                "Fn::GetAtt": [
                    "ExecutionRole",
                    "Arn"
                ]
```

```
            },
            "DirectInternetAccess": "Disabled",
            "SubnetId": {
                "Ref": "Subnet"
            },
            "SecurityGroupIds": [
                {
                    "Fn::GetAtt": [
                        "SecurityGroup",
                        "GroupId"
                    ]
                }
            ]
        }
    }
}
```

YAML example

```
SageMakerNoteBookInstance:
  Type: AWS::SageMaker::NotebookInstance
  Properties:
    InstanceType: ml.t2.medium
    RoleArn: !GetAtt 'ExecutionRole.Arn'
    DirectInternetAccess: Disabled
    SubnetId: !Ref 'Subnet'
    SecurityGroupIds:
      - !GetAtt 'SecurityGroup.GroupId'
```

CT.SAGEMAKER.PR.1 rule specification

      DirectInternetAccess: Enabled
```

[CT.SAGEMAKER.PR.2] Require Amazon SageMaker AI notebook instances to be deployed within a custom Amazon VPC

This control checks whether an Amazon SageMaker AI notebook instance is configured to launch within a custom Amazon VPC.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::SageMaker::NotebookInstance`
- **AWS CloudFormation guard rule:** CT.SAGEMAKER.PR.2 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.SAGEMAKER.PR.2 rule specification
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: CT.SAGEMAKER.PR.2 example templates

Explanation

As a best practice, we recommend that you keep your resources contained inside a VPC whenever possible, to ensure the secure network protection of your infrastructure.

Remediation for rule failure

Set `SubnetId` to the identifier of an Amazon EC2 subnet and set `SecurityGroupIds` to a list containing one or more EC2 security group identifiers.

The examples that follow show how to implement this remediation.

Amazon SageMaker AI Notebook Instance - Example

Amazon SageMaker AI notebook instance configured with Amazon VPC connectivity. The example is shown in JSON and in YAML.

JSON example

```
{
    "NotebookInstance": {
        "Type": "AWS::SageMaker::NotebookInstance",
        "Properties": {
            "InstanceType": "ml.t2.large",
            "RoleArn": {
                "Fn::GetAtt": [
                    "ExecutionRole",
                    "Arn"
                ]
            },
            "SubnetId": {
                "Fn::GetAtt": [
                    "Subnet",
                    "SubnetId"
                ]
            },
            "SecurityGroupIds": [
                {
                    "Fn::GetAtt": [
                        "SecurityGroup",
                        "GroupId"
                    ]
                }
            ]
        }
```

```
    }
}
```

YAML example

```
NotebookInstance:
  Type: AWS::SageMaker::NotebookInstance
  Properties:
    InstanceType: ml.t2.large
    RoleArn: !GetAtt 'ExecutionRole.Arn'
    SubnetId: !GetAtt 'Subnet.SubnetId'
    SecurityGroupIds:
      - !GetAtt 'SecurityGroup.GroupId'
```

CT.SAGEMAKER.PR.2 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  NotebookInstance:
    Type: AWS::SageMaker::NotebookInstance
    Properties:
      InstanceType: ml.t2.large
      RoleArn: example-role-arn
      SubnetId: example-subnet-id
      SecurityGroupIds:
        - example-sg-id
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  NotebookInstance:
    Type: AWS::SageMaker::NotebookInstance
    Properties:
      InstanceType: ml.t2.large
```

```
    RoleArn: example-role-arn
```

[CT.SAGEMAKER.PR.3] Require Amazon SageMaker AI notebook instances to have root access disallowed

This control checks whether Amazon SageMaker AI notebook instances allow root access.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::SageMaker::NotebookInstance`
- **AWS CloudFormation guard rule:** CT.SAGEMAKER.PR.3 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.SAGEMAKER.PR.3 rule specification
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: CT.SAGEMAKER.PR.3 example templates

Explanation

By default, when you create a notebook instance, users that log into that notebook instance have root access. Because users with root access have administrator privileges, users have access to edit all files on a notebook instance with root access enabled. In adherence to the principle of least privilege, for security reasons, we recommend that you restrict root access to instance resources whenever possible, to avoid unintentional over-provisioning of permissions.

Usage considerations

- Lifecycle configurations associated with an Amazon SageMaker AI notebook instance always run with root access, even if you turn off root access for users.

Remediation for rule failure

Set `RootAccess` to `Disabled`.

The examples that follow show how to implement this remediation.

Amazon SageMaker AI Notebook Instance - Example

Amazon SageMaker AI notebook instance configured with root access turned off. The example is shown in JSON and in YAML.

JSON example

```
{
    "NotebookInstance": {
        "Type": "AWS::SageMaker::NotebookInstance",
        "Properties": {
            "InstanceType": "ml.t2.large",
            "RoleArn": {
                "Fn::GetAtt": [
                    "ExecutionRole",
                    "Arn"
                ]
            },
            "RootAccess": "Disabled"
        }
    }
}
```

YAML example

```
NotebookInstance:
  Type: AWS::SageMaker::NotebookInstance
  Properties:
    InstanceType: ml.t2.large
    RoleArn: !GetAtt 'ExecutionRole.Arn'
    RootAccess: Disabled
```

CT.SAGEMAKER.PR.3 rule specification

CT.SAGEMAKER.PR.3 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  NotebookInstance:
    Type: AWS::SageMaker::NotebookInstance
    Properties:
      InstanceType: ml.t2.large
      RoleArn: example-role-arn
      RootAccess: Disabled
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  NotebookInstance:
    Type: AWS::SageMaker::NotebookInstance
    Properties:
      InstanceType: ml.t2.large
      RoleArn: example-role-arn
      RootAccess: Enabled
```

Amazon Simple Queue Service (Amazon SQS) controls

Topics

- [CT.SQS.PR.1] Require any Amazon SQS queue to have a dead-letter queue configured
- [CT.SQS.PR.2] Require any Amazon SQS queue to have encryption at rest configured

[CT.SQS.PR.1] Require any Amazon SQS queue to have a dead-letter queue configured

This control checks whether an Amazon SQS queue is configured with a dead-letter queue.

- **Control objective:** Improve resiliency
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::SQS::Queue`
- **AWS CloudFormation guard rule:** CT.SQS.PR.1 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.SQS.PR.1 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.SQS.PR.1 example templates

Explanation

The main task of a dead-letter queue is to handle the lifecycle of unconsumed messages. A dead-letter queue lets you set aside and isolate messages that cant be processed correctly, so you can determine why their processing didnt succeed.

Usage considerations

- This control applies only to Amazon SQS queues that are not configured as a dead-letter queue with a `RedriveAllowPolicy` property.

Remediation for rule failure

Create a `RedrivePolicy` with a `deadLetterTargetArn` value thats set to the ARN of an Amazon SQS dead-letter queue. For Amazon SQS dead-letter queues, instead provide a redrive configuration in the RedriveAllowPolicy' property.

The examples that follow show how to implement this remediation.

Amazon SQS Queue - Example

Amazon SQS queue configured to send messages to a dead-letter queue, if the messages can't be processed (consumed) successfully. The example is shown in JSON and in YAML.

JSON example

```
{
    "SQSQueue": {
        "Type": "AWS::SQS::Queue",
        "Properties": {
            "RedrivePolicy": {
                "deadLetterTargetArn": {
                    "Fn::GetAtt": [
                        "DLQQueue",
                        "Arn"
                    ]
                },
                "maxReceiveCount": 3
            }
        }
    }
}
```

YAML example

```
SQSQueue:
  Type: AWS::SQS::Queue
  Properties:
    RedrivePolicy:
      deadLetterTargetArn: !GetAtt 'DLQQueue.Arn'
      maxReceiveCount: 3
```

CT.SQS.PR.1 rule specification

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#    sqs_dlq_check
#
# Description:
#   This control checks whether an Amazon SQS queue is configured with a dead-letter
 queue.
#
# Reports on:
#    AWS::SQS::Queue
#
# Evaluates:
#    AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#     None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any SQS queue resources
#      Then: SKIP
```

```
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an SQS queue resource
#       And: 'RedriveAllowPolicy' has been provided on the SQS queue
#       And: 'RedriveAllowPolicy.redrivePermission' is set to 'allowAll' or 'byQueue'
#      Then: SKIP
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an SQS queue resource
#       And: 'RedriveAllowPolicy' has not been provided on the SQS queue or
 'RedriveAllowPolicy.redrivePermission'
#            has been provided and is set to a value other than 'allowAll' or 'byQueue'
#       And: 'RedrivePolicy' has not been provided
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an SQS queue resource
#       And: 'RedriveAllowPolicy' has not been provided on the SQS queue or
 'RedriveAllowPolicy.redrivePermission'
#            has been provided and is set to a value other than 'allowAll' or 'byQueue'
#       And: 'RedrivePolicy' has been provided
#       And: 'RedrivePolicy.deadLetterTargetArn' has not been provided or has been
 provided as an empty string or
#            invalid local reference to an SQS queue
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an SQS queue resource
#       And: 'RedriveAllowPolicy' has not been provided on the SQS queue or
 'RedriveAllowPolicy.redrivePermission' has
#            been provided and is set to a value other than 'allowAll' or 'byQueue'
#       And: 'RedrivePolicy' has been provided
#       And: 'RedrivePolicy.deadLetterTargetArn' has been provided as a non-empty
 string or valid local reference to
#             an SQS queue
#      Then: PASS

CT.SQS.PR.1 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  SQSQueue:
    Type: AWS::SQS::Queue
    Properties:
      RedrivePolicy:
        deadLetterTargetArn:
          Fn::GetAtt: [DLQQueue, Arn]
        maxReceiveCount: 3
  DLQQueue:
    Type: AWS::SQS::Queue
    Properties:
```

```
      RedriveAllowPolicy:
        redrivePermission: allowAll
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  SQSQueue:
    Type: AWS::SQS::Queue
    Properties: {}
```

[CT.SQS.PR.2] Require any Amazon SQS queue to have encryption at rest configured

This control checks whether an Amazon SQS queue is encrypted at rest.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::SQS::Queue`
- **AWS CloudFormation guard rule:** CT.SQS.PR.2 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.SQS.PR.2 rule specification
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: CT.SQS.PR.2 example templates

Explanation

Server-side encryption (SSE) allows you to transmit sensitive data in encrypted queues. To protect the content of messages in queues, SSE uses KMS keys.

Remediation for rule failure

Set `SqsManagedSseEnabled` to `true` or set an AWS KMS key identifier in the `KmsMasterKeyId` property.

The examples that follow show how to implement this remediation.

Amazon SQS Queue - Example One

Amazon SQS queue configured to encrypt data at rest with server-side encryption enabled, by means of SQS managed encryption keys (SSE-SQS). The example is shown in JSON and in YAML.

JSON example

```
{
    "SQSQueue": {
        "Type": "AWS::SQS::Queue",
        "Properties": {
            "SqsManagedSseEnabled": true
        }
    }
}
```

YAML example

```
SQSQueue:
  Type: AWS::SQS::Queue
  Properties:
    SqsManagedSseEnabled: true
```

The examples that follow show how to implement this remediation.

Amazon SQS Queue - Example Two

Amazon SQS queue configured to encrypt data at rest with server-side encryption enabled, by means of AWS KMS (SSE-KMS). The example is shown in JSON and in YAML.

JSON example

```
{
    "SQSQueue": {
        "Type": "AWS::SQS::Queue",
        "Properties": {
            "KmsMasterKeyId": {
                "Ref": "KMSKey"
            }
        }
    }
}
```

YAML example

```
SQSQueue:
  Type: AWS::SQS::Queue
  Properties:
    KmsMasterKeyId: !Ref 'KMSKey'
```

CT.SQS.PR.2 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  KMSKey:
    Type: AWS::KMS::Key
    Properties:
      KeyPolicy:
        Version: 2012-10-17
        Id: key-default-1
        Statement:
        - Sid: Enable IAM User Permissions
          Effect: Allow
          Principal:
```

```
            AWS: '*'
          Action: 'kms:*'
          Resource: '*'
  SQSQueue:
    Type: AWS::SQS::Queue
    Properties:
      KmsMasterKeyId:
        Ref: KMSKey
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  SQSQueue:
    Type: AWS::SQS::Queue
    Properties: {}
```

AWS Step Functions controls

Topics

- [CT.STEPFUNCTIONS.PR.1] Require an AWS Step Functions state machine to have logging activated
- [CT.STEPFUNCTIONS.PR.2] Require an AWS Step Functions state machine to have AWS X-Ray tracing activated

[CT.STEPFUNCTIONS.PR.1] Require an AWS Step Functions state machine to have logging activated

This control checks whether an AWS Step Functions state machine has logging enabled.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive

- **Resource types:** `AWS::StepFunctions::StateMachine`
- **AWS CloudFormation guard rule:** CT.STEPFUNCTIONS.PR.1 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.STEPFUNCTIONS.PR.1 rule specification
- For examples of PASS and FAIL CloudFormation templates related to this control, see: CT.STEPFUNCTIONS.PR.1 example templates

Explanation

Defining a logging configuration for your state machines allows you to track their execution history and results. This configuration allows you to track failed events that occur on a state machine, and this insight into errors can assist you when you're troubleshooting issues.

Remediation for rule failure

In `LoggingConfiguration`, set `Level` to `ERROR` or `ALL`, and set `Destinations` to a list with one or more valid Amazon CloudWatch Logs log group ARNs.

The examples that follow show how to implement this remediation.

AWS Step Functions State Machine - Example

AWS Step Functions state machine configured to send logs to Amazon CloudWatch Logs. The example is shown in JSON and in YAML.

JSON example

```
{
    "StateMachine": {
        "Type": "AWS::StepFunctions::StateMachine",
        "Properties": {
            "StateMachineType": "STANDARD",
            "DefinitionString": "{\"StartAt\": \"Sample\",\"States\":
 {\"Sample\": {\"Type\": \"Task\", \"Resource\":\"arn:aws:lambda:us-
east-1:111122223333:function:SampleFunction\", \"End\": true}}}",
            "RoleArn": {
```

```
                "Fn::GetAtt": [
                    "StepFunctionExecutionRole",
                    "Arn"
                ]
            },
            "LoggingConfiguration": {
                "Level": "ALL",
                "Destinations": [
                    {
                        "CloudWatchLogsLogGroup": {
                            "LogGroupArn": {
                                "Fn::GetAtt": [
                                    "LogGroup",
                                    "Arn"
                                ]
                            }
                        }
                    }
                ]
            }
        }
    }
}
```

YAML example

```
StateMachine:
  Type: AWS::StepFunctions::StateMachine
  Properties:
    StateMachineType: STANDARD
    DefinitionString: '{"StartAt": "Sample","States": {"Sample": {"Type": "Task",
      "Resource":"arn:aws:lambda:us-east-1:111122223333:function:SampleFunction",
      "End": true}}}'
    RoleArn: !GetAtt 'StepFunctionExecutionRole.Arn'
    LoggingConfiguration:
      Level: ALL
      Destinations:
        - CloudWatchLogsLogGroup:
            LogGroupArn: !GetAtt 'LogGroup.Arn'
```

[CT.STEPFUNCTIONS.PR.2] Require an AWS Step Functions state machine to have AWS X-Ray tracing activated

This control checks whether an AWS Step Functions state machine has AWS X-Ray tracing enabled.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation guard rule

- **Control behavior:** Proactive
- **Resource types:** `AWS::StepFunctions::StateMachine`
- **AWS CloudFormation guard rule:** CT.STEPFUNCTIONS.PR.2 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.STEPFUNCTIONS.PR.2 rule specification
- For examples of PASS and FAIL CloudFormation templates related to this control, see: CT.STEPFUNCTIONS.PR.2 example templates

Explanation

A tracing configuration allows your state machine to send tracing data to AWS X-Ray, so you can visualize the components of your state machine, identify performance bottlenecks, and troubleshoot requests that resulted in errors.

Remediation for rule failure

In the `TracingConfiguration` property, set the value of `Enabled` to true.

The examples that follow show how to implement this remediation.

AWS Step Functions State Machine - Example

An AWS Step Functions state machine configured to send trace data to AWS X-Ray. The example is shown in JSON and in YAML.

JSON example

```
{
    "StateMachine": {
        "Type": "AWS::StepFunctions::StateMachine",
        "Properties": {
            "StateMachineType": "STANDARD",
            "DefinitionString": "{\"StartAt\": \"Sample\",\"States\":
 {\"Sample\": {\"Type\": \"Task\", \"Resource\":\"arn:aws:lambda:us-
east-1:111122223333:function:SampleFunction\", \"End\": true}}}",
            "RoleArn": {
```

```
                "Fn::GetAtt": [
                    "StepFunctionExecutionRole",
                    "Arn"
                ]
            },
            "LoggingConfiguration": {
                "Level": "ALL",
                "Destinations": [
                    {
                        "CloudWatchLogsLogGroup": {
                            "LogGroupArn": {
                                "Fn::GetAtt": [
                                    "LogGroup",
                                    "Arn"
                                ]
                            }
                        }
                    }
                ]
            },
            "TracingConfiguration": {
                "Enabled": true
            }
        }
    }
}
```

YAML example

```
StateMachine:
  Type: AWS::StepFunctions::StateMachine
  Properties:
    StateMachineType: STANDARD
    DefinitionString: '{"StartAt": "Sample","States": {"Sample": {"Type": "Task",
      "Resource":"arn:aws:lambda:us-east-1:111122223333:function:SampleFunction",
      "End": true}}}'
    RoleArn: !GetAtt 'StepFunctionExecutionRole.Arn'
    LoggingConfiguration:
      Level: ALL
      Destinations:
        - CloudWatchLogsLogGroup:
```

```
            LogGroupArn: !GetAtt 'LogGroup.Arn'
    TracingConfiguration:
      Enabled: true
```

CT.STEPFUNCTIONS.PR.2 rule specification

```
# ####################################
##       Rule Specification        ##
#####################################
#
# Rule Identifier:
#   step_functions_state_machine_tracing_enabled_check
#
# Description:
#   This control checks whether an AWS Step Functions state machine has AWS X-Ray
 tracing enabled.
#
# Reports on:
#   AWS::StepFunctions::StateMachine
#
# Evaluates:
#   AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any StepFunctions state machine
 resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a StepFunctions state machine resource
#       And: 'TracingConfiguration' has not been provided
#      Then: FAIL
#   Scenario: 3
```

```
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a StepFunctions state machine resource
#       And: 'TracingConfiguration' has been provided
#       And: In 'TracingConfiguration', 'Enabled' has not been provided or provided and
 set to a value other
#            than bool(true)
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a StepFunctions state machine resource
#       And: 'TracingConfiguration' has been provided
#       And: In 'TracingConfiguration', 'Enabled' has been provided and set to
 bool(true)
#      Then: PASS

AWS WAF regional controls

Topics

- [CT.WAF-REGIONAL.PR.1] Require any AWS WAF regional rule to have a condition
- [CT.WAF-REGIONAL.PR.2] Require any AWS WAF regional web access control list (ACL) to have a rule or rule group

[CT.WAF-REGIONAL.PR.1] Require any AWS WAF regional rule to have a condition

This control checks whether an AWS WAF Classic Regional rule contains any conditions.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::WAFRegional::Rule`
- **AWS CloudFormation guard rule:** CT.WAF-REGIONAL.PR.1 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.WAF-REGIONAL.PR.1 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.WAF-REGIONAL.PR.1 example templates

Explanation

An AWS WAF (web application firewall) Regional rule can contain multiple conditions. The rule count's conditions allow for traffic inspection, based on a defined action, such as `allow`, `block`, or `count`. Without any conditions, the traffic passes without inspection. An AWS WAF Regional rule with no conditions, but with a name or tag suggesting `allow`, `block`, or `count`, could lead to the inaccurate assumption that one of those actions is occurring.

Remediation for rule failure

Provide one or more AWS WAF rule conditions within the `Predicates` property.

The examples that follow show how to implement this remediation.

AWS WAF Classic Regional Rule - Example

AWS WAF Classic Regional rule configured with an IP match predicate. The example is shown in JSON and in YAML.

JSON example

```
{
    "WafRegionalRule": {
        "Type": "AWS::WAFRegional::Rule",
        "Properties": {
            "Name": "SampleRule",
            "MetricName": "SampleRuleMetric",
            "Predicates": [
                {
                    "DataId": {
                        "Ref": "IPSet"
                    },
                    "Negated": false,
                    "Type": "IPMatch"
                }
            ]
        }
    }
}
```

YAML example

```
WafRegionalRule:
  Type: AWS::WAFRegional::Rule
  Properties:
    Name: SampleRule
    MetricName: SampleRuleMetric
    Predicates:
      - DataId: !Ref 'IPSet'
        Negated: false
        Type: IPMatch
```

CT.WAF-REGIONAL.PR.1 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  IPSetDenylist:
    Type: AWS::WAFRegional::IPSet
    Properties:
      Name: IPSet for deny listed IP addresses
      IPSetDescriptors:
      - Type: IPV4
        Value: 192.0.2.44/32
  WafRegionalRule:
    Type: AWS::WAFRegional::Rule
    Properties:
```

```
      Name: ExampleRule
      MetricName: ExampleRuleMetric
      Predicates:
      - DataId:
          Ref: IPSetDenylist
        Negated: false
        Type: "IPMatch"
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  WafRegionalRule:
    Type: AWS::WAFRegional::Rule
    Properties:
      Name: ExampleRule
      MetricName: ExampleRuleMetric
```

[CT.WAF-REGIONAL.PR.2] Require any AWS WAF regional web access control list (ACL) to have a rule or rule group

This control checks whether an AWS WAF Classic Regional web ACL contains any WAF rules or rule groups.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::WAFRegional::WebACL`
- **AWS CloudFormation guard rule:** CT.WAF-REGIONAL.PR.2 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.WAF-REGIONAL.PR.2 rule specification

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.WAF-REGIONAL.PR.2 example templates

Explanation

An AWS WAF Regional web access control list (ACL) can contain a collection of rules and rule groups that inspect and control web requests. If a web ACL is empty, the web traffic can pass without being detected or acted upon by WAF, depending on the default action.

Remediation for rule failure

Provide one or more AWS WAF rules within the `Rules` property.

The examples that follow show how to implement this remediation.

AWS WAF Classic Regional web ACL - Example

AWS WAF Classic Regional web ACL configured with a rule to block requests based on an IP set match. The example is shown in JSON and in YAML.

JSON example

```
{
    "WafRegionalWebAcl": {
        "Type": "AWS::WAFRegional::WebACL",
        "Properties": {
            "Name": "SampleWebACL",
            "DefaultAction": {
                "Type": "ALLOW"
            },
            "MetricName": "SampleWebACLMetric",
            "Rules": [
                {
                    "Action": {
                        "Type": "BLOCK"
                    },
                    "Priority": 1,
                    "RuleId": {
                        "Ref": "IPSetRule"
                    }
                }
            ]
```

```
        }
    }
}
```

YAML example

```
WafRegionalWebAcl:
  Type: AWS::WAFRegional::WebACL
  Properties:
    Name: SampleWebACL
    DefaultAction:
      Type: ALLOW
    MetricName: SampleWebACLMetric
    Rules:
      - Action:
          Type: BLOCK
        Priority: 1
        RuleId: !Ref 'IPSetRule'
```

CT.WAF-REGIONAL.PR.2 rule specification

      MetricName: ExampleWebACLMetric
```

AWS WAF controls

Topics

- [CT.WAF.PR.1] Require any AWS WAF global rule to have a condition
- [CT.WAF.PR.2] Require any AWS WAF global web ACL to have a rule or rule group

[CT.WAF.PR.1] Require any AWS WAF global rule to have a condition

This control checks whether an AWS WAF Classic global rule contains any conditions.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::WAF::Rule`
- **AWS CloudFormation guard rule:** CT.WAF.PR.1 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.WAF.PR.1 rule specification

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.WAF.PR.1 example templates

Explanation

A WAF global rule can contain multiple conditions. A rule's conditions allow for traffic inspection and take a defined action (allow, block, or count). Without any conditions, the traffic passes without inspection. A WAF global rule with no conditions, but with a name or tag suggesting allow, block, or count, could lead to the wrong assumption that one of those actions is occurring.

Remediation for rule failure

Provide one or more AWS WAF rule conditions within the `Predicates` property.

The examples that follow show how to implement this remediation.

AWS WAF Classic Global Rule - Example

AWS WAF Classic global rule configured with an IP match predicate. The example is shown in JSON and in YAML.

JSON example

```
{
    "WAFRule": {
        "Type": "AWS::WAF::Rule",
        "Properties": {
            "Name": "SampleWAFRule",
            "MetricName": "SampleWAFRuleMetric",
            "Predicates": [
                {
                    "DataId": {
                        "Ref": "IPSet"
                    },
                    "Negated": false,
                    "Type": "IPMatch"
                }
            ]
        }
    }
}
```

YAML example

```
WAFRule:
  Type: AWS::WAF::Rule
  Properties:
    Name: SampleWAFRule
    MetricName: SampleWAFRuleMetric
    Predicates:
      - DataId: !Ref 'IPSet'
        Negated: false
        Type: IPMatch
```

CT.WAF.PR.1 rule specification

```

```

[CT.WAF.PR.2] Require any AWS WAF global web ACL to have a rule or rule group

This control checks whether an AWS WAF Classic global web ACL contains any WAF rules or rule groups.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::WAF::WebACL`
- **AWS CloudFormation guard rule:** CT.WAF.PR.2 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.WAF.PR.2 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.WAF.PR.2 example templates

Explanation

A WAF global web ACL can contain a collection of rules and rule groups that inspect and control web requests. If a web ACL is empty, the web traffic can pass without being detected or acted upon by WAF depending on the default action.

Remediation for rule failure

Provide one or more AWS WAF rules within the `Rules` property.

The examples that follow show how to implement this remediation.

AWS WAF Classic Global Web ACL - Example

AWS WAF Classic global web ACL configured with a rule to block requests based on an IP set match. The example is shown in JSON and in YAML.

JSON example

```
{
    "WafGlobalWebAcl": {
        "Type": "AWS::WAF::WebACL",
        "Properties": {
            "Name": "SampleWebACL",
            "DefaultAction": {
                "Type": "ALLOW"
```

```
            },
            "MetricName": "SampleWebACLMetric",
            "Rules": [
                {
                    "Action": {
                        "Type": "BLOCK"
                    },
                    "Priority": 1,
                    "RuleId": {
                        "Ref": "IPSetRule"
                    }
                }
            ]
        }
    }
}
```

YAML example

```
WafGlobalWebAcl:
  Type: AWS::WAF::WebACL
  Properties:
    Name: SampleWebACL
    DefaultAction:
      Type: ALLOW
    MetricName: SampleWebACLMetric
    Rules:
      - Action:
          Type: BLOCK
        Priority: 1
        RuleId: !Ref 'IPSetRule'
```

AWS WAFV2 controls

Topics

- [CT.WAFV2.PR.1] Require an AWS WAFV2 web ACL to be non-empty
- [CT.WAFV2.PR.2] Require an AWS WAFV2 rule group to be non-empty

[CT.WAFV2.PR.1] Require an AWS WAFV2 web ACL to be non-empty

This control checks whether an AWS WAFV2 web ACL contains any WAF rules or WAF rule groups.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule

- **Control behavior:** Proactive
- **Resource types:** `AWS::WAFv2::WebACL`
- **AWS CloudFormation guard rule:** CT.WAFV2.PR.1 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.WAFV2.PR.1 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.WAFV2.PR.1 example templates

Explanation

A web access control list (ACL) attached to WAFv2 can contain a collection of rules and rule groups. The rules are designed to inspect and control web requests. If a web ACL is empty, the web traffic passes without being detected or acted upon by the web application firewall (WAF).

Remediation for rule failure

Provide one or more AWS WAFV2 rules within the `Rules` property.

The examples that follow show how to implement this remediation.

AWS WAFV2 web ACL - Example

AWS WAFV2 web ACL configured with a rule to block requests based on a cross-site scripting (XSS) match. statement. The example is shown in JSON and in YAML.

JSON example

```
{
    "WAFv2WebACL": {
        "Type": "AWS::WAFv2::WebACL",
        "Properties": {
            "Scope": "REGIONAL",
            "Description": "Sample WebACL",
            "DefaultAction": {
                "Allow": {}
            },
```

```
            "VisibilityConfig": {
                "SampledRequestsEnabled": true,
                "CloudWatchMetricsEnabled": true,
                "MetricName": "SampleWebACLMetric"
            },
            "Rules": [
                {
                    "Name": "SampleXssRule",
                    "Priority": 0,
                    "Action": {
                        "Block": {}
                    },
                    "VisibilityConfig": {
                        "SampledRequestsEnabled": true,
                        "CloudWatchMetricsEnabled": true,
                        "MetricName": "SampleXssMatchMetric"
                    },
                    "Statement": {
                        "XssMatchStatement": {
                            "FieldToMatch": {
                                "AllQueryArguments": {}
                            },
                            "TextTransformations": [
                                {
                                    "Priority": 1,
                                    "Type": "NONE"
                                }
                            ]
                        }
                    }
                }
            ]
        }
    }
}
```

YAML example

```

CT.WAFV2.PR.1 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  WAFv2WebACL:
    Type: AWS::WAFv2::WebACL
    Properties:
      Scope: REGIONAL
      Description: Example WebACL
      DefaultAction:
        Allow: {}
      VisibilityConfig:
        SampledRequestsEnabled: true
        CloudWatchMetricsEnabled: true
        MetricName: ExampleWebACLMetric
      Rules:
      - Name: ExampleXssRule
        Priority: 0
        Action:
          Block: {}
        VisibilityConfig:
          SampledRequestsEnabled: true
          CloudWatchMetricsEnabled: true
          MetricName: ExampleXssMatchMetric
        Statement:
          XssMatchStatement:
            FieldToMatch:
              AllQueryArguments: {}
            TextTransformations:
            - Priority: 1
              Type: NONE
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  WAFv2WebACL:
    Type: AWS::WAFv2::WebACL
    Properties:
      Scope: REGIONAL
      Description: Example WebACL
      DefaultAction:
        Allow: {}
      VisibilityConfig:
        SampledRequestsEnabled: true
        CloudWatchMetricsEnabled: true
        MetricName: ExampleWebACLMetric
```

[CT.WAFV2.PR.2] Require an AWS WAFV2 rule group to be non-empty

This control checks whether AWS WAFV2 rule groups contain rules.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::WAFv2::RuleGroup`
- **AWS CloudFormation guard rule:** CT.WAFV2.PR.2 rule specification

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.WAFV2.PR.2 rule specification
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.WAFV2.PR.2 example templates

Explanation

An AWS WAFV2 rule group can contain multiple rules. The rules are designed to inspect and control web requests. When an empty AWS WAFV2 rule group is associated with a web ACL, and the web ACL is not associated with any other rules or rule groups, the web traffic passes without being detected or acted upon by the web application firewall (WAF).

Remediation for rule failure

Provide one or more AWS WAFV2 rules within the `Rules` property.

The examples that follow show how to implement this remediation.

AWS WAFV2 Rule Group - Example

AWS WAFV2 rule group configured with a rule to block requests based on a cross-site scripting (XSS) match. statement. The example is shown in JSON and in YAML.

JSON example

```
{
    "WAFv2RuleGroup": {
        "Type": "AWS::WAFv2::RuleGroup",
        "Properties": {
            "Scope": "REGIONAL",
            "Description": "Sample Rule Group",
            "VisibilityConfig": {
                "SampledRequestsEnabled": true,
                "CloudWatchMetricsEnabled": true,
                "MetricName": "SampleRuleGroupMetric"
            },
            "Capacity": 1000,
            "Rules": [
                {
                    "Name": "XssRule",
                    "Priority": 0,
                    "Action": {
                        "Block": {}

CT.WAFV2.PR.2 rule specification

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   wafv2_rulegroup_not_empty_check
#
# Description:
#   This control checks whether AWS WAFV2 rule groups contain rules.
#
# Reports on:
#   AWS::WAFv2::RuleGroup
#
# Evaluates:
#   AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any AWS WAFV2 rule group resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an AWS WAFV2 rule group resource
#       And: 'Rules' has not been provided
#      Then: FAIL
```

```
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an AWS WAFV2 rule group resource
#       And: 'Rules' has been provided as an empty list
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an AWS WAFV2 rule group resource
#       And: 'Rules' has been provided as a non-empty list
#      Then: PASS

#
# Constants
#

CT.WAFV2.PR.2 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  WAFv2RuleGroup:
    Type: AWS::WAFv2::RuleGroup
    Properties:
      Scope: REGIONAL
      Description: Example Rule Group
```

```
      VisibilityConfig:
        SampledRequestsEnabled: true
        CloudWatchMetricsEnabled: true
        MetricName: SampleRuleGroupMetrics
      Capacity: 1000
      Rules:
      - Name: TestXssRule
        Priority: 0
        Action:
          Block: {}
        VisibilityConfig:
          SampledRequestsEnabled: true
          CloudWatchMetricsEnabled: true
          MetricName: ExampleXssMatchMetric
        Statement:
          XssMatchStatement:
            FieldToMatch:
              AllQueryArguments: {}
            TextTransformations:
            - Priority: 1
              Type: NONE
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  WAFv2RuleGroup:
    Type: AWS::WAFv2::RuleGroup
    Properties:
      Scope: REGIONAL
      Description: Example Rule Group
      VisibilityConfig:
        SampledRequestsEnabled: true
        CloudWatchMetricsEnabled: true
        MetricName: ExampleRuleGroupMetric
      Capacity: 1000
      Rules: []
```

Preventive controls

A preventive control ensures that your accounts maintain compliance, because it disallows actions that lead to policy violations. The status of a preventive control is either **enforced** or **not enabled**. Preventive controls are supported in all AWS Regions.

- Preventive controls are implemented using service control policies (SCPs), or resource control policies (RCPs), each of which are part of AWS Organizations.
- Regarding nested OUs, preventive controls enabled on any OUs higher in the tree will apply to unregistered OUs in that tree.
- When you enable controls on an organizational unit (OU) that is registered with AWS Control Tower, preventive controls apply to all member accounts under the OU, enrolled and unenrolled.

> **Note**
>
> **The AWS Control Tower mandatory controls have preventive behavior, except three that are detective. See Mandatory controls.**
>
> - Detect Public Read Access Setting for Log Archive
> - Detect Public Write Access Setting for Log Archive
> - Detect whether shared accounts under the Security organizational unit have AWS CloudTrail or CloudTrail Lake enabled

Topics

- Controls implemented with resource control policies (RCPs)
- Controls implemented with declarative policies
- Controls for AWS Backup
- Digital sovereignty controls

Controls implemented with resource control policies (RCPs)

This section provides information about AWS Control Tower controls that are implemented by resource control policies (RCPs). RCPs are a type of policy, which can enforce preventive controls on resources in your AWS Control Tower landing zone.

RCPs complement service control policies (SCPs)

- SCPs offer control over the maximum permissions for IAM roles and users in your landing zone.
- RCPs offer control over the maximum permissions on AWS resources in your landing zone.

RCPs are similar to SCPs, because they each contain explicit and implicit *allow* and *deny* capabilities, expressed in their policies. For more information, see the AWS Organizations documentation about RCPs.

Individual RCP controls apply to specific resources associated with the following AWS services:

- Amazon S3
- AWS Security Token Service (STS)
- AWS Key Management Service KMS)
- Amazon Simple Queue Service (SQS)
- AWS Secrets Manager

RCP-based controls are configurable. For more information, see Controls with parameters.

When to apply RCP controls

With RCP controls, you can establish a *data perimeter* for your landing zone.

- For example, you can limit access to resources so that only the principals in your organization can manage them, such as with control **[CT.S3.PV.4] Require that the organization's Amazon S3 resources are accessible only by IAM principals that belong to the organization or by an AWS service**.
- Similarly, you can restrict access to resources so that certain requirements must be met, such as with **[CT.S3.PV.3] Require requests to Amazon S3 resources to use a minimum TLS version of 1.3**.

AWS Control Tower RCP controls

AWS Control Tower offers multiple RCP-based controls that each focus on a single type of resource associated with a specific service, such as Amazon S3 buckets.

Topics

- [CT.KMS.PV.7] Require that the organization's AWS Key Management Service resources are accessible only by IAM principals that belong to the organization, or by an AWS service
- [CT.S3.PV.2] Require all requests to Amazon S3 resources use authentication based on an Authorization header
- [CT.S3.PV.3] Require requests to Amazon S3 resources to use a minimum TLS version of 1.3
- [CT.S3.PV.4] Require that the organization's Amazon S3 resources are accessible only by IAM principals that belong to the organization or by an AWS service
- [CT.S3.PV.5] Require encryption of data in transit for calls to Amazon S3 resources
- [CT.S3.PV.6] Require all object uploads to Amazon S3 buckets to use server-side encryption with an AWS KMS key (SSE-KMS)
- [CT.SECRETSMANAGER.PV.1] Require that the organization's AWS Secrets Manager resources are accessible only by IAM principals that belong to the organization or by an AWS service
- [CT.SQS.PV.1] Require that the organization's Amazon SQS resources are accessible only by IAM principals that belong to the organization, or by an AWS service
- [CT.STS.PV.1] Require that the organization's AWS Security Token Service resources are accessible only by IAM principals that belong to the organization, or by an AWS service

[CT.KMS.PV.7] Require that the organization's AWS Key Management Service resources are accessible only by IAM principals that belong to the organization, or by an AWS service

This control disallows AWS Key Management Service API operations for your organization's AWS Key Management Service (KMS) resources by an AWS IAM principal, when the principal is outside of the organization and is not an AWS service principal.

This is a preventive control with elective guidance, based on resource control policies (RCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or through the AWS Control Tower APIs.

AWS service: AWS Key Management Service (AWS KMS)

Control metadata

- **Control objective:** Enforce least privilege
- **Implementation:** Resource control policy (RCP)
- **Control behavior:** Preventive

- **Control owner:** AWS Control Tower
- **Resource types:** `Multiple`

Usage considerations

- When you enable this control, AWS Control Tower populates the template RCP with the ID of the organization that your AWS Control Tower landing zone governs.
- Choose the Organizational Unit (OU) to which this control will apply. If AWS Key Management Service resources in that OU must be accessible by a trusted party besides your organization or an AWS service (for instance, another organization or specific IAM role), this control causes requests by that trusted party to be denied. Consider which principals need access to the AWS Key Management Service resources in your OU before you enable this control on that OU.
- This control does not provide protection for cross-service confused deputy scenarios. Consider enabling the related control for AWS Key Management Service, which applies an RCP to govern direct AWS service access to the organization's AWS Key Management Service resources. For more information about cross-service confused deputy prevention, see Cross-service confused deputy prevention in the *AWS Identity and Access Management User Guide*.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: ExemptedPrincipalArns. For more information, see Configure controls with parameters.

The artifact for this control is the following resource control policy (RCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTKMSPV7",
            "Effect": "Deny",
            "Principal": "*",
            "Action": "kms:*",
            "Resource": "*",
```

```
            "Condition": {
                "BoolIfExists": {
                    "aws:PrincipalIsAWSService": "false"
                },
                "StringNotEqualsIfExists": {
                    "aws:PrincipalOrgID": {{OrganizationIds}}
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[CT.S3.PV.2] Require all requests to Amazon S3 resources use authentication based on an Authorization header

This control disallows requests to your Amazon S3 resources that use an authentication method other than HTTP `Authorization` header-based authentication (presigned URL or HTTP POST requests).

This is a preventive control with elective guidance, based on resource control policies (RCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon S3

Control metadata

- **Control objective:** Limit network access
- **Implementation:** Resource control policy (RCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Resource types:** `Multiple`

Usage considerations

- This control disallows authenticated operations on your S3 resources where authentication information has been provided in a location other than the HTTP `Authorization` header, which means that the `s3:authType` field in the request context is set to a value other than `REST-HEADER`. This approach prevents the use of S3-presigned URL or HTTP POST requests. For more information on available authentication methods for Amazon S3, see Authenticating Requests (AWS Signature Version 4) in the *Amazon S3 User Guide*.
- If you need to use presigned URL or HTTP POST requests with your S3 resources, do not enable this control.
- This control does not help you manage public access to Amazon S3 resources. AWS Control Tower recommends using the Amazon S3 Block Public Access field to help manage public access to your Amazon S3 resources. For more information on **S3 Block Public Access**, see Blocking public access to your Amazon S3 storage in the *Amazon S3 User Guide*.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following resource control policy (RCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTS3PV2",
            "Effect": "Deny",
            "Principal": "*",
            "Action": "s3:*",
            "Resource": "*",
            "Condition": {
                "StringNotEquals": {
                    "s3:authType": "REST-HEADER"
                }{% if ExemptedPrincipalArns %},
```

```
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[CT.S3.PV.3] Require requests to Amazon S3 resources to use a minimum TLS version of 1.3

This control requires connections to Amazon S3 resources in your organization use TLS version 1.3 or higher.

This is a preventive control with elective guidance, based on resource control policies (RCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon S3

Control metadata

- **Control objective:** Encrypt data in transit
- **Implementation:** Resource control policy (RCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Resource types:** `Multiple`

Usage considerations

- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following resource control policy (RCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTS3PV3",
            "Effect": "Deny",
            "Principal": "*",
            "Action": "s3:*",
            "Resource": "*",
            "Condition": {
                "NumericLessThan": {
                    "s3:TlsVersion": "1.3"
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[CT.S3.PV.4] Require that the organization's Amazon S3 resources are accessible only by IAM principals that belong to the organization or by an AWS service

This control disallows Amazon S3 API operations for your organization's Amazon S3 resources by an AWS IAM principal, when the principal is outside of the organization and is not an AWS service principal.

This is a preventive control with elective guidance, based on resource control policies (RCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon S3

Control metadata

- **Control objective:** Enforce least privilege
- **Implementation:** Resource control policy (RCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower

- **Resource types:** `Multiple`

Usage considerations

- When you enable this control, AWS Control Tower populates the template RCP with the ID of the organization that your AWS Control Tower landing zone governs.
- Choose the Organizational Unit (OU) to which this control will apply. If Amazon S3 resources in that OU must be accessible by a trusted party besides your organization or an AWS service (for instance, another organization or specific IAM role), this control causes requests by that trusted party to be denied. Consider which principals need access to the Amazon S3 resources in your OU before you enable this control on that OU.
- This control does not provide protection for cross-service confused deputy scenarios. Consider enabling the related control for Amazon S3, which applies an RCP to govern direct AWS service access to the organization's Amazon S3 resources. For more information about cross-service confused deputy prevention, see Cross-service confused deputy prevention in the *AWS Identity and Access Management User Guide*.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following resource control policy (RCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTS3PV4",
            "Effect": "Deny",
            "Principal": "*",
            "Action": "s3:*",
            "Resource": "*",
            "Condition": {
               "BoolIfExists": {
                    "aws:PrincipalIsAWSService": "false"
                },
```

```
                "StringNotEqualsIfExists": {
                    "aws:PrincipalOrgID": {{OrganizationIds}}
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[CT.S3.PV.5] Require encryption of data in transit for calls to Amazon S3 resources

This control prevents unencrypted connections to Amazon S3 resources in your organization, by using the `aws:SecureTransport` condition.

This is a preventive control with elective guidance, based on resource control policies (RCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon S3

Control metadata

- **Control objective:** Encrypt data in transit
- **Implementation:** Resource control policy (RCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Resource types:** `Multiple`

Usage considerations

- If you currently make HTTP connections to Amazon S3 endpoints, be sure that you migrate to HTTPS connections before you enable this control.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports

the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following resource control policy (RCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTS3PV5",
            "Effect": "Deny",
            "Principal": "*",
            "Action": "s3:*",
            "Resource": "*",
            "Condition": {
                "Bool": {
                  "aws:SecureTransport": "false"
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[CT.S3.PV.6] Require all object uploads to Amazon S3 buckets to use server-side encryption with an AWS KMS key (SSE-KMS)

This control prevents object uploads to your Amazon S3 buckets if the request does not include an `x-amz-server-side-encryption-aws-kms-key-id` header, unless the bucket is configured with default SSE-KMS encryption.

This is a preventive control with elective guidance, based on resource control policies (RCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon S3

Control metadata

- **Control objective:** Encrypt data at rest
- **Implementation:** Resource control policy (RCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Resource types:** `Multiple`

Usage considerations

- During landing zone setup, AWS Control Tower creates Amazon S3 buckets. Optionally, you can configure AWS Control Tower to orchestrate other AWS services, such as AWS CloudTrail and AWS Config, to send log entries to these buckets. When you configure your landing zone, AWS Control Tower provides the option that the objects created by those other services are encrypted with an AWS KMS key that you manage. If you have not configured your landing zone to use a KMS key with those other services,this control prevents those other services from logging to the S3 buckets that AWS Control Tower created, for any targets, such as OUs, that contain these buckets.

  As a best practice, configure AWS Control Tower to use KMS keys before you enable this control. Otherwise, this control could block `PutObject` requests from services that AWS Control Tower configures, such as AWS CloudTrail and AWS Config. To learn more about the resources that AWS Control Tower creates during landing zone setup, see Resources created in the shared accounts in the *AWS Control Tower User Guide*. To learn more about how AWS Control Tower uses KMS keys with other services, see Optionally configure AWS KMS keys in the *AWS Control Tower User Guide*.
- After you enable this control, if you try to upload an S3 object without the `x-amz-server-side-encryption-aws-kms-key-id` header in the request, the upload will fail for buckets that do not have default SSE-KMS encryption configured. Before enabling this control on a target, consider whether all Amazon S3 buckets in the target environment are configured with default SSE-KMS encryption. Alternatively, if you upload objects to buckets that are not configured with default SSE-KMS encryption, check that all clients set the `x-amz-server-side-encryption-aws-kms-key-id` explicitly.

The artifact for this control is the following resource control policy (RCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTS3PV6",
            "Effect": "Deny",
            "Principal": "*",
            "Action": "s3:PutObject",
            {% if ExemptedResourceArns %}
            "NotResource": {{ExemptedResourceArns}}
            {% else %}
            "Resource": "*"
            {% endif %},
            "Condition": {
                "Null": {
                    "s3:x-amz-server-side-encryption-aws-kms-key-id": "true"
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[CT.SECRETSMANAGER.PV.1] Require that the organization's AWS Secrets Manager resources are accessible only by IAM principals that belong to the organization or by an AWS service

This control disallows AWS Secrets Manager API operations for your organization's AWS Secrets Manager resources by an AWS IAM principal, when the principal is outside of the organization and is not an AWS service principal.

This is a preventive control with elective guidance, based on resource control policies (RCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: AWS Secrets Manager

Control metadata

- **Control objective:** Enforce least privilege
- **Implementation:** Resource control policy (RCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Resource types:** `Multiple`

Usage considerations

- When you enable this control, AWS Control Tower populates the template RCP with the ID of the organization that your AWS Control Tower landing zone governs.
- Choose the Organizational Unit (OU) to which this control will apply. If AWS Secrets Manager resources in that OU must be accessible by a trusted party besides your organization or an AWS service (for instance, another organization or specific IAM role), this control causes requests by that trusted party to be denied. Consider which principals need access to the AWS Secrets Manager resources in your OU before you enable this control on that OU.
- This control does not provide protection for cross-service confused deputy scenarios. Consider enabling the related control for AWS Secrets Manager, which applies an RCP to govern direct AWS service access to the organization's AWS Secrets Manager resources. For more information about cross-service confused deputy prevention, see Cross-service confused deputy prevention in the *AWS Identity and Access Management User Guide*.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following resource control policy (RCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
```

```
            "Sid": "CTSECRETSMANAGERPV1",
            "Effect": "Deny",
            "Principal": "*",
            "Action": "secretsmanager:*",
            "Resource": "*",
            "Condition": {
                "BoolIfExists": {
                    "aws:PrincipalIsAWSService": "false"
                },
                "StringNotEqualsIfExists": {
                    "aws:PrincipalOrgID": {{OrganizationIds}}
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[CT.SQS.PV.1] Require that the organization's Amazon SQS resources are accessible only by IAM principals that belong to the organization, or by an AWS service

This control disallows Amazon SQS API operations for your organization's Amazon SQS resources by an AWS IAM principal, when the principal is outside of the organization and is not an AWS service principal.

This is a preventive control with elective guidance, based on resource control policies (RCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon SQS

Control metadata

- **Control objective:** Enforce least privilege
- **Implementation:** Resource control policy (RCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower

- **Resource types:** `Multiple`

Usage considerations

- When you enable this control, AWS Control Tower populates the template RCP with the ID of the organization that your AWS Control Tower landing zone governs.
- Choose the Organizational Unit (OU) to which this control will apply. If Amazon SQS resources in that OU must be accessible by a trusted party besides your organization or an AWS service (for instance, another organization or specific IAM role), this control causes requests by that trusted party to be denied. Consider which principals need access to the Amazon SQS resources in your OU before you enable this control on that OU.
- This control does not provide protection for cross-service confused deputy scenarios. Consider enabling the related control for Amazon SQS, which applies an RCP to govern direct AWS service access to the organization's Amazon SQS resources. For more information about cross-service confused deputy prevention, see Cross-service confused deputy prevention in the *AWS Identity and Access Management User Guide*.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following resource control policy (RCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTSQSPV1",
            "Effect": "Deny",
            "Principal": "*",
            "Action": "sqs:*",
            "Resource": "*",
            "Condition": {
                "BoolIfExists": {
                    "aws:PrincipalIsAWSService": "false"
                },
```

```
                "StringNotEqualsIfExists": {
                    "aws:PrincipalOrgID": {{OrganizationIds}}
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[CT.STS.PV.1] Require that the organization's AWS Security Token Service resources are accessible only by IAM principals that belong to the organization, or by an AWS service

This control disallows select AWS Security Token Service (STS) API operations by an AWS IAM principal for your organization's AWS Security Token Service resources, when the principal is outside of the organization and is not an AWS service principal.

This is a preventive control with elective guidance, based on resource control policies (RCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: AWS Security Token Service

Control metadata

- **Control objective:** Enforce least privilege
- **Implementation:** Resource control policy (RCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Resource types:** `Multiple`

Usage considerations

- When you enable this control, AWS Control Tower populates the template RCP with the ID of the organization that your AWS Control Tower landing zone governs.
- Choose the Organizational Unit (OU) to which this control will apply. If AWS Security Token Service (STS) resources in that OU must be accessible by a trusted party besides

your organization or an AWS service (for instance, another organization or specific IAM role), this control causes requests by that trusted party to be denied. Consider which principals need access to the AWS Security Token Service resources in your OU before you enable this control on that OU.

- This control does not include `sts:AssumeRoleWithSAML` and `sts:AssumeRoleWithWebIdentity` permissions in its scope, as the respective STS operations do not use AWS security credentials, and therefore do not include the `aws:PrincipalOrgID` condition key value in the request context. To ensure that `AssumeRoleWithSAML` and `AssumeRoleWithWebIdentity` operations are not denied by this control, `sts:SetSourceIdentity` and `sts:TagSession` permissions are also excluded from the controls scope.
- This control does not include `sts:GetCallerIdentity` permissions in its scope. No permissions are required to perform the respective STS operation.
- This control includes only actions that have resources listed in the **Resource type** column of the *AWS Security Token Service Authorization Reference* that can be invoked from outside the organization. For more information about the behavior of IAM actions that do not have associated resource types, see RCP Effects on Permissions in the *AWS Organizations User Guide*
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following resource control policy (RCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTSTSPV1",
            "Effect": "Deny",
            "Principal": "*",
            "Action": [
                "sts:AssumeRole",
                "sts:SetContext"
            ],
```

```
            "Resource": "*",
            "Condition": {
                "BoolIfExists": {
                    "aws:PrincipalIsAWSService": "false"
                },
                "StringNotEqualsIfExists": {
                    "aws:PrincipalOrgID": {{OrganizationIds}}
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

Controls implemented with declarative policies

This section provides information about AWS Control Tower controls that are implemented by *declarative policies* from AWS Organizations. These are *preventive* controls. For more information about how declarative policies work as preventive controls in AWS Control Tower, see Declarative policies in the AWS Organizations documentation.

Declarative policies help you define and enforce your required configuration for specified AWS services, across your entire organization, at the OU level. When a declarative policy is applied, the configuration is maintained continuously.

Declarative policies are enforced in each AWS service's control plane, which is an important distinction from controls implemented by service control policies (SCPs). While SCPs regulate access to APIs, declarative policies are applied directly at the service level. This approach ensures that the specified configuration is enforced, even when new features or APIs are introduced by the service.

Available controls

Topics

- [CT.EC2.PV.7] Disallow all public sharing of Amazon EBS snapshots

- [CT.EC2.PV.8] Disallow inbound and outbound internet connections to your VPCs through an internet gateway (IGW) or egress-only internet gateway (EIGW)
- [CT.EC2.PV.9] Disallow access to the EC2 serial console for all EC2 instances
- [CT.EC2.PV.11] Disallow public sharing of Amazon Machine Images (AMIs)

[CT.EC2.PV.7] Disallow all public sharing of Amazon EBS snapshots

This control blocks the public sharing of your Amazon EBS snapshots by configuring block public access for Amazon EBS snapshot settings at an account level. This setting has the effect of preventing all public sharing of your EBS snapshots, so that snapshots that previously were publicly shared are treated as private, and are no longer publicly available.

This is a preventive control with elective guidance, based on declarative policies. By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon EC2

Control metadata

- **Control objective:** Enforce least privilege
- **Implementation:** Declarative policy for EC2
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Resource types:** `AWS::::Account`

Usage considerations

- Enabling this control does not change the permissions for snapshots that are publicly shared already. Instead, it prevents snapshots from being publicly visible and publicly accessible. Therefore, the attributes for these snapshots still indicate that they are publicly shared, even though they are not publicly available. If you later disable this control or adopt the related control to block new sharing in place of this control, these snapshots will become publicly available again.
- Enabling this control on an AWS account means that users in the account can no longer request new public sharing of EBS snapshots.

- This control includes an AWS Organizations inheritance operator for each policy setting that applies to child policies (`@@operators_allowed_for_child_policies` with a value of `@@all`). This operator allows you to add to, negate, or override each policy setting in this control, when it is applied to child OUs and accounts, by using the AWS Organizations declarative policy syntax. For more information on policy inheritance for AWS Organizations policies, see Inheritance operators in the *AWS Organizations User Guide*.

The artifact for this control is the following declarative policy.

```
{
    "ec2_attributes": {
        "snapshot_block_public_access": {
            "state": {
                "@@assign": "block_all_sharing",
                "@@operators_allowed_for_child_policies": ["@@all"]
            }
        }
    }
}
```

[CT.EC2.PV.8] Disallow inbound and outbound internet connections to your VPCs through an internet gateway (IGW) or egress-only internet gateway (EIGW)

This control blocks direct ingress and egress traffic from the internet to your VPCs through an IGW or EIGW, by configuring block public access for VPCs (VPC BPA) at an account level. This control also disallows configuration of any VPC BPA exclusions, which means that if you enable it, you cannot exclude VPCs or subnets from the effects of this control.

This is a preventive control with elective guidance, based on declarative policies. By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon EC2

Control metadata

- **Control objective:** Limit network access
- **Implementation:** Declarative policy for EC2
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Resource types:** `AWS::::Account`

Usage considerations

- This control does not block traffic to your VPC when the traffic originates from locations other than an internet gateway or an egress-only internet gateway, such as traffic from a peered VPC or other VPC attached gateway (for example, an AWS Transit Gateway network gateway or virtual private gateway). Traffic from these locations may have a public network origin; therefore, AWS Control Tower recommends using EC2 security groups to set least-privilege network access controls, and to ensure that only the required network connections are allowed.
- This control does not affect inbound traffic from serverless services, such as API Gateway and Lambda, in your VPCs (for example, traffic that arrives by means of Elastic network interfaces or API Gateway private integration). However, VPC BPA will block traffic to or from these services, if that traffic occurs through an IGW or EIGW, in a governed VPC.
- This control governs Amazon EC2 VPC block public access settings that are configured by means of EC2 `ModifyVpcBlockPublicAccessOptions`, `CreateVpcBlockPublicAccessExclusion`, and `ModifyVpcBlockPublicAccessExclusion` operations. If you apply this control, you cannot use these operations to modify these settings within an enrolled AWS account.
- For an overview of VPC connectivity options and recommendations for creating scalable and secure network architectures, see Building a Scalable and Secure Multi-VPC AWS Network Infrastructure in the *Building a Scalable and Secure Multi-VPC AWS Network Infrastructure - AWS Whitepaper*.
- This control includes an AWS Organizations inheritance operator for each policy setting that applies to child policies (`@@operators_allowed_for_child_policies` with a value of `@@all`). This operator allows you to add to, negate, or override each policy setting in this control, when it is applied to child OUs and accounts, by using the AWS

Organizations declarative policy syntax. For more information on policy inheritance for AWS Organizations policies, see Inheritance operators in the *AWS Organizations User Guide*.

The artifact for this control is the following declarative policy.

```
{
    "ec2_attributes": {
        "vpc_block_public_access": {
            "internet_gateway_block": {
                "mode": {
                    "@@assign": "block_bidirectional",
                    "@@operators_allowed_for_child_policies": ["@@all"]
                },
                "exclusions_allowed": {
                    "@@assign": "disabled",
                    "@@operators_allowed_for_child_policies": ["@@all"]
                }
            }
        }
    }
}
```

[CT.EC2.PV.9] Disallow access to the EC2 serial console for all EC2 instances

This control prevents access to the Amazon EC2 serial console of all EC2 instances for your account.

This is a preventive control with elective guidance, based on declarative policies. By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon EC2

Control metadata

- **Control objective:** Limit network access
- **Implementation:** Declarative policy for EC2
- **Control behavior:** Preventive

- **Control owner:** AWS Control Tower
- **Resource types:** `AWS::::Account`

Usage considerations

- With the EC2 serial console, you have access to your Amazon EC2 instance's serial port, which you can use to troubleshoot boot, network configuration, and other issues. If you require EC2 serial console access, do not enable this control.
- This control governs Amazon EC2 Serial Console for instance settings that are configured by means of EC2 `EnableSerialConsoleAccess` and `DisableSerialConsoleAccess` operations. If you apply this control, you cannot use these operations to modify these settings within an enrolled AWS account.
- This control includes an AWS Organizations inheritance operator for each policy setting that applies to child policies (`@@operators_allowed_for_child_policies` with a value of `@@all`). This operator allows you to add to, negate, or override each policy setting in this control, when it is applied to child OUs and accounts, by using the AWS Organizations declarative policy syntax. For more information on policy inheritance for AWS Organizations policies, see Inheritance operators in the *AWS Organizations User Guide*.

The artifact for this control is the following declarative policy.

```
{
    "ec2_attributes": {
        "serial_console_access": {
            "status": {
                "@@assign": "disabled",
                "@@operators_allowed_for_child_policies": ["@@all"]
            }
        }
    }
}
```

[CT.EC2.PV.11] Disallow public sharing of Amazon Machine Images (AMIs)

This control prevents the public sharing of your AMIs by configuring block public access for AMIs at an account level. If you already have public AMIs, they remain publicly available.

This is a preventive control with elective guidance, based on declarative policies. By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon EC2

Control metadata

- **Control objective:** Enforce least privilege
- **Implementation:** Declarative policy for EC2
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Resource types:** `AWS::::Account`

Usage considerations

- This control disallows new public sharing of AMIs. It does not restrict access to AMIs that have been shared publicly before this control was enabled.
- This control governs Amazon EC2 AMI Block Public Access (BPA) settings that are configured by means of EC2 `EnableImageBlockPublicAccess` and `DisableImageBlockPublicAccess` operations. If you apply this control, you cannot use these operations to modify these settings within an enrolled AWS account.
- This control includes an AWS Organizations inheritance operator for each policy setting that applies to child policies (`@@operators_allowed_for_child_policies` with a value of `@@all`). This operator allows you to add to, negate, or override each policy setting in this control, when it is applied to child OUs and accounts, by using the AWS Organizations declarative policy syntax. For more information on policy inheritance for AWS Organizations policies, see Inheritance operators in the *AWS Organizations User Guide*.

The artifact for this control is the following declarative policy.

```
{
    "ec2_attributes": {
        "image_block_public_access": {
            "state": {
                "@@assign": "block_new_sharing",
                "@@operators_allowed_for_child_policies": ["@@all"]
            }
        }
    }
}
```

Controls for AWS Backup

When you enable AWS Backup in your AWS Control Tower landing zone, some preventive controls are activated in your environment. These controls protect the resources that AWS Backup needs to operate with AWS Control Tower. You cannot enable these controls if AWS Backup is not enabled for your landing zone.

Topics

- [CT.BACKUP.PV.1] Disallow modification of a tag that AWS Control Tower applies to AWS Backup resources
- [CT.BACKUP.PV.2] Disallow modification of an AWS Backup report plan that AWS Control Tower manages
- [CT.BACKUP.PV.3] Disallow modification of an AWS Backup resource that AWS Control Tower manages
- [CT.IAM.PV.1] Disallow modification of an AWS IAM role that AWS Control Tower utilizes to manage AWS Backup resources
- [CT.S3.PV.1] Disallow modification of an Amazon S3 bucket that stores AWS Backup reports for AWS Control Tower

[CT.BACKUP.PV.1] Disallow modification of a tag that AWS Control Tower applies to AWS Backup resources

This control limits changes to tags that AWS Control Tower applies to AWS Backup resources.

This is a preventive control with elective guidance. By default, this control is not enabled. Although you can see the control in the console, you can enable it only by activating AWS Backup capabilities for your landing zone.

AWS service: AWS Backup

Control metadata

- **Control objective:** Protect configurations
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control group:**
- **Resource types:** `Multiple`

Usage considerations

- AWS Backup resources managed by AWS Control Tower should be modified using the AWS Control Tower API or console. API read actions for AWS Backup, such as `ListBackupPlans` and `GetBackupVaultAccessPolicy`, can be utilized directly.
- If you apply a tag with the key `aws-control-tower` to an AWS Backup resource created independently of AWS Control Tower, the resource becomes subject to this SCP.

The artifact for this control is the following service control policy (SCP).

JSON

```
{
    "Version": "2012-10-17",
    "Statement": [
      {
        "Sid": "CTBACKUPPV1",
        "Effect": "Deny",
        "Action": [
          "backup:TagResource",
```

```
          "backup:UntagResource"
        ],
        "Resource": "*",
        "Condition": {
          "ArnNotLike": {
            "aws:PrincipalARN": "arn:*:iam::*:role/AWSControlTowerExecution"
          },
          "ForAnyValue:StringEquals": {
            "aws:TagKeys": "aws-control-tower"
          }
        }
      }
    ]
  }
```

[CT.BACKUP.PV.2] Disallow modification of an AWS Backup report plan that AWS Control Tower manages

This control limits changes to the AWS Backup report plan that AWS Control Tower manages.

This is a preventive control with elective guidance. By default, this control is not enabled. Although you can see the control in the console, you can enable it only by activating AWS Backup capabilities for your landing zone.

AWS service: AWS Backup

Control metadata

- **Control objective:** Protect configurations
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control group:**
- **Resource types:** `AWS::Backup::ReportPlan`

Usage considerations

- AWS Backup resources managed by AWS Control Tower should be modified using the AWS Control Tower API or console. API read actions for AWS Backup, such as `ListBackupPlans` and `GetBackupVaultAccessPolicy`, can be utilized directly.

The artifact for this control is the following service control policy (SCP).

JSON

```
{
    "Version": "2012-10-17",
    "Statement": [
      {
        "Sid": "CTBACKUPPV2",
        "Effect": "Deny",
        "Action": [
          "backup:CreateReportPlan",
          "backup:DeleteReportPlan",
          "backup:UpdateReportPlan"
        ],
        "Resource": "arn:*:backup:*:*:report-plan:aws_controltower_*",
        "Condition": {
          "ArnNotLike": {
            "aws:PrincipalARN": [
              "arn:*:iam::*:role/AWSControlTowerExecution"
            ]
          }
        }
      }
    ]
  }
```

[CT.BACKUP.PV.3] Disallow modification of an AWS Backup resource that AWS Control Tower manages

This control limits creation or modification of AWS Backup resources that AWS Control Tower manages.

This is a preventive control with elective guidance. By default, this control is not enabled. Although you can see the control in the console, you can enable it only by activating AWS Backup capabilities for your landing zone.

AWS service: AWS Backup

Control metadata

- **Control objective:** Protect configurations
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control group:**
- **Resource types:** `AWS::Backup::BackupPlan`, `AWS::Backup::BackupVault`

Usage considerations

- AWS Backup resources managed by AWS Control Tower should be modified using the AWS Control Tower API or console. API read actions for AWS Backup, such as `ListBackupPlans` and `GetBackupVaultAccessPolicy`, can be utilized directly.
- If you apply a tag with the key `aws-control-tower` to an AWS Backup resource created independently of AWS Control Tower, the resource becomes subject to this SCP.

The artifact for this control is the following service control policy (SCP).

JSON

```
{
    "Version": "2012-10-17",
```

```
    "Statement": [
      {
        "Sid": "CTBACKUPPV3",
        "Effect": "Deny",
        "Action": [
          "backup:CreateBackupPlan",
          "backup:CreateBackupSelection",
          "backup:CreateBackupVault",
          "backup:CreateLogicallyAirGappedBackupVault",
          "backup:DeleteBackupPlan",
          "backup:DeleteBackupSelection",
          "backup:DeleteBackupVault",
          "backup:DeleteBackupVaultAccessPolicy",
          "backup:DeleteBackupVaultLockConfiguration",
          "backup:DeleteBackupVaultSharingPolicy",
          "backup:PutBackupVaultAccessPolicy",
          "backup:PutBackupVaultLockConfiguration",
          "backup:PutBackupVaultSharingPolicy",
          "backup:UpdateBackupPlan"
        ],
        "Resource": [
          "arn:*:backup:*:*:backup-plan:*",
          "arn:*:backup:*:*:backup-vault:*"
        ],
        "Condition": {
          "ArnNotLike": {
            "aws:PrincipalARN": "arn:*:iam::*:role/AWSControlTowerExecution"
          },
          "Null": {
            "aws:ResourceTag/aws-control-tower": false
          }
        }
      }
    ]
  }
```

[CT.IAM.PV.1] Disallow modification of an AWS IAM role that AWS Control Tower utilizes to manage AWS Backup resources

This control limits modification of the AWS IAM role (aws-controltower-BackupRole) that AWS Control Tower utilizes for management of AWS Backup resources.

This is a preventive control with elective guidance. By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: AWS Identity and Access Management (IAM)

Control metadata

- **Control objective:** Protect configurations
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control group:**
- **Resource types:** `AWS::IAM::Role`

Usage considerations

- AWS Backup resources managed by AWS Control Tower should be modified using the AWS Control Tower API or console. API read actions for AWS Backup, such as `ListBackupPlans` and `GetBackupVaultAccessPolicy`, can be utilized directly.

The artifact for this control is the following service control policy (SCP).

JSON

```
{
    "Version": "2012-10-17",
    "Statement": [
      {
        "Sid": "CTIAMPV1",
        "Effect": "Deny",
        "Action": [
          "iam:AttachRolePolicy",
          "iam:CreateRole",
          "iam:DeleteRole",
```

```
          "iam:DeleteRolePermissionsBoundary",
          "iam:DeleteRolePolicy",
          "iam:DetachRolePolicy",

```

[CT.S3.PV.1] Disallow modification of an Amazon S3 bucket that stores AWS Backup reports for AWS Control Tower

This control limits modification of the Amazon S3 buckets that AWS Control Tower utilizes as a destination for storing AWS Backup reports.

This is a preventive control with elective guidance. By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon S3

Control metadata

- **Control objective:** Protect configurations
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control group:**
- **Resource types:** `AWS::S3::Bucket`

Usage considerations

- AWS Backup resources managed by AWS Control Tower should be modified using the AWS Control Tower API or console. API read actions for AWS Backup, such as `ListBackupPlans` and `GetBackupVaultAccessPolicy`, can be utilized directly.

The artifact for this control is the following service control policy (SCP).

Digital sovereignty controls

Digital sovereignty means control over digital assets. AWS Control Tower offers a group of controls that are designed to enhance your digital sovereignty governance posture. The pillars of this posture are as follows:

- *Data residency:* Control over the location of your data.

  For more information, see Controls that enhance data residency protection.
- *Granular access:* Access restrictions that limit all access to your data, unless the access is requested by you, or by a partner whom you trust.

  For more information, see Region deny control applied to the OU.
- *Encryption:* Features and controls that help you encrypt data, whether in transit, at rest, or in memory.

  For example, see the control CT.APPSYNC.PR.5: Require an AWS AppSync GraphQL API cache to have encryption at rest enabled.
- *Resiliency:* Ability to sustain operations through disruption or disconnection, which is essential in the case of events such as supply chain disruption, network interruption, and natural disaster.

  For example see the control CT.NETWORK-FIREWALL.PR.5: Require an AWS Network Firewall firewall to be deployed across multiple Availability Zones.

You can read more about digital sovereignty and AWS in the blog: AWS Digital Sovereignty Pledge: Control without compromise.

> **The Data residency subgroup**
>
> Although the digital sovereignty group is primarily a group of preventive controls, it includes *preventive* and *detective* controls in the **Data residency** subgroup.

Deny access to AWS based on the requested AWS Region

This control is commonly referred to as the Region deny control, or landing zone *Region deny control.*

This control disallows access to unlisted operations in global and regional services outside of the specified Regions. That includes all Regions where AWS Control Tower is not available, as well as all Regions not selected for governance in the **Landing zone settings** page. Actions are allowed as usual in Regions with **Governed** status.

You may wish to review the information at Configure the Region deny control in the *AWS Control Tower User Guide* before you enable this control.

> **Note**
>
> Certain global AWS services, such as AWS Identity and Access Management (IAM) and AWS Organizations, are exempt from data residency controls. Those services are specified in the SCP example code that follows.

This is an elective control with preventive guidance. It is the top-level control associated with the **Region deny** action.

The format for this control is based on the following SCP.

JSON

```
{
    "Version": "2012-10-17",
    "Statement": [
        {

                "s3:PutAccountPublicAccessBlock",
                "s3:PutMultiRegionAccessPointPolicy",
                "savingsplans:*",
                "shield:*",
                "sso:*",
                "sts:*",
                "support:*",
                "supportapp:*",
                "supportplans:*",
                "sustainability:*",
                "tag:GetResources",
                "tax:*",
                "trustedadvisor:*",
                "vendor-insights:ListEntitledSecurityProfiles",
                "waf-regional:*",
                "waf:*",
                "wafv2:*"
            ],
            "Resource": "*",
            "Condition": {
```

```
                "StringNotEquals": {
                    "aws:RequestedRegion": []
                },
                "ArnNotLike": {
                    "aws:PrincipalARN": [
                        "arn:aws:iam::*:role/AWSControlTowerExecution"
                    ]
                }
            }
        }
    ]
}
```

Based on this example SCP format, AWS Control Tower adds your governed Regions into the `aws:RequestedRegion` statement. You cannot exclude your home Region. Actions not listed in the SCP are not permitted.

> **Limitations**
>
> The OU Region deny control is subject to limitations of the `aws:RequestedRegion` global condition key and Service Control Policies (SCPs) in general.

Region deny control applied to the OU

This control is commonly referred to as the OU Region deny control, or the configurable Region deny control.

This control disallows access to unlisted operations in global and regional AWS services, outside of the specified Regions for an organizational unit (OU). You can apply this control to any subset of the Regions that are governed by your AWS Control Tower landing zone.

You may wish to review the information at Configure the Region deny control before you enable this control.

If you enforce this control, the configurations for the OU can conflict with the landing zone version of this control. For more information, see the section called "Policy evaluation of SCP controls" in this chapter, and SCP evaluation in the AWS Organizations doumentation.

CT.MULTISERVICE.PV.1: Deny access to AWS based on the requested AWS Region for an organizational unit

Service: Multiple AWS services

- **Control objective:** Protect configurations
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Groups:** Digital sovereignty

> **Limitations**
>
> The OU Region deny control is subject to limitations of the `aws:RequestedRegion` global condition key and Service Control Policies (SCPs) in general.

Enable this control from the console

In the AWS Control Tower console, you can view the OUs on which this control is enabled, if any, by navigating to the **Control details** page for this control.

To enable this control from the Control details page

1. Select **Enable control** in the upper right
2. Select the target OU, then select **Next** to continue.
3. Select the Regions you wish to activate. You must select at least one Region.
4. You can add **NotAction** elements, IAM principals, and tags.
5. You'll be able to see a summary of your selected values before you enable the control.
6. Select **Enable control** at the lower right.

CT.MULTISERVICE.PV.1: Deny access to AWS based on the requested AWS Region for an organizational unit

The OU Region deny control, **CT.MULTISERVICE.PV.1**, is configurable. You can select specific OUs to which it applies, rather than applying it to your entire AWS Control Tower landing zone. This

control accepts one or more parameters, such as **AllowedRegions**, **ExemptedPrincipalARNs**, and **ExemptedActions**, which describe operations that are allowed for accounts that are part of this OU.

- **AllowedRegions**: Specifies the Regions selected, in which the OU is allowed to operate. This parameter is **mandatory**.
- **ExemptedPrincipalARNs**: Specifies the IAM principals that are exempt from this control, so that they are allowed to operate certain AWS services globally.
- **ExemptedActions**: Specifies actions that are exempt from this control, so that the actions are allowed.

Interactions between the separate Region deny controls for the landing zone and the OU can be complicated to predict. They are predictable with the logic by which SCPs are evaluated by AWS.

Policy evaluation of SCP controls

The policy evaluation process involves checking all applicable policies, starting from the most permissive and gradually moving towards the most restrictive. Any SCP applied at the Root level will impact all accounts and OUs, unless it is overridden by a more specific policy.

Evaluation Logic: When a request is made to perform an action (for example, launching an Amazon EC2 instance), AWS evaluates policies to determine whether the action is allowed or denied. The evaluation logic follows these rules:

- *Explicit Deny Overrides All:* If any policy explicitly denies the requested action, that denial takes precedence over all other policies.
- *Explicit Allow Overrides Implicit Deny:* If a policy explicitly allows the action and no higher-level policy explicitly denies it, the action is allowed.
- *Inherited Allow and No Explicit Deny:* If there is no explicit allow or deny at the requested level, AWS looks at higher-level policies. If there is an inherited allow and no explicit deny, the action is allowed.
- *Explicit Deny at a Higher Level:* If there's an explicit deny in a higher-level policy, but no explicit allow or deny at the requested level, the action is denied.

For more information about the evaluation logic, see SCP evaluation in the AWS Organizations documentation.

> **Note**
>
> With this control, you can allow any AWS Region at the OU level, even if your landing zone does not govern that Region, by design. We recommend that you use caution when allowing Regions that your AWS Control Tower landing zone does not govern.

CLI Example

This example shows how to enable this control, with parameters, from the CLI.

```
aws controltower enable-control \
    --target-identifier arn:aws:organizations::01234567890:ou/o-EXAMPLE/ou-zzxx-
zzx0zzz2 \
    --control-identifier arn:aws:controltower:us-east-1::control/EXAMPLE_NAME \
    --parameters '[{"key":"AllowedRegions","value":["us-east-1","us-
west-2"]},{"key":"ExemptedPrincipalArns","value":["arn:aws:iam::*:role/
ReadOnly","arn:aws:sts::*:assumed-role/ReadOnly/*"]},{"key":"ExemptedActions","value":
["logs:DescribeLogGroups","logs:StartQuery","logs:GetQueryResults"]}]'
```

Validating parameters

When you enter a parameter into the OU Region deny control, AWS Control Tower validates the parameter's syntax and checks it against JSON datatypes. AWS Control Tower does not make semantic validations for domain-specific correctness. This is the same approach that is followed by AWS Organizations.

Parameters for this control are entered by means of a JSON schema.

Here is the SCP template of an example JSON schema for the OU-level Region deny control. In the AWS Control Tower console, you can view it on the **Artifacts** tab of the **Control details** page.

This short example schema shows that the **AllowedRegions**, **ExemptedActions** and **ExemptedPrincipalArns** parameters accept a list of strings. Also, you can add descriptions to the schema, or restrict allowed values to be a subset of pre-defined values, using enumerated types (enums).

```
{
    "Version": "2012-10-17",
    "Statement": [
```

```
        {
            "Sid": "CTMULTISERVICEPV1",
            "Effect": "Deny",
            "NotAction": [
                {{ExemptedActions}}
                ...
                "s3:CreateMultiRegionAccessPoint",
                "s3:DeleteMultiRegionAccessPoint",
                "s3:DescribeMultiRegionAccessPointOperation",
                "s3:GetAccountPublicAccessBlock",
                "s3:GetBucketLocation"
                ...
            ],
            "Resource": "*",
            "Condition": {
                "StringNotEquals": {
                    "aws:RequestedRegion": {{AllowedRegions}}
                },
                "ArnNotLike": {
                    "aws:PrincipalARN": [
                        "arn:aws:iam::*:role/AWSControlTowerExecution",
                        {{ExemptedPrincipalARNs}}
                    ]
                }
            }
        }
    ]
}
```

The following example shows a full SCP artifact for the control. It shows the actions and principals that are exempted by default when you apply this control to an OU. Remember that **AllowedRegions** is a mandatory parameter for this control. You can view the most recent version of this SCP in the AWS Control Tower console.

```

                    ]
                }
            }
        }
    ]
}
```

Preventive controls that assist with digital sovereignty

These preventive controls are designed to assist you with your digital sovereignty governance posture.

This group of controls helps you comply with digital sovereignty regulatory requirements because they prevent actions, enforce configurations, and detect resource changes that affect data residency, granular access restriction, encryption, and resilience capabilities.

- These controls are configurable. For more information about configurable controls, see Controls with parameters.
- These are optional controls with Preventive guidance, implemented with AWS service control policies (SCPs). They are not deployed on any OU by default. You can enable them through the AWS Control Tower console, or through the AWS Control Tower APIs

In the AWS Control Tower console, you can view these controls together under the **Groups** tab on the **Categories** page.

Topics

- [CT.APPSYNC.PV.1] Require an AWS AppSync GraphQL API to be configured with private visibility

- [CT.EC2.PV.1] Require an Amazon EBS snapshot to be created from an encrypted EC2 volume
- [CT.EC2.PV.2] Require that an attached Amazon EBS volume is configured to encrypt data at rest
- [CT.EC2.PV.3] Require that an Amazon EBS snapshot cannot be publicly restorable
- [CT.EC2.PV.4] Require that Amazon EBS direct APIs are not called
- [CT.EC2.PV.5] Disallow the use of Amazon EC2 VM import and export
- [CT.EC2.PV.6] Disallow the use of deprecated Amazon EC2 RequestSpotFleet and RequestSpotInstances API actions
- [CT.KMS.PV.1] Require an AWS KMS key policy to have a statement that limits creation of AWS KMS grants to AWS services
- [CT.KMS.PV.2] Require that an AWS KMS asymmetric key with RSA key material used for encryption does not have a key length of 2048 bits
- [CT.KMS.PV.3] Require that an AWS KMS key is configured with the bypass policy lockout safety check enabled
- [CT.KMS.PV.4] Require that an AWS KMS customer-managed key (CMK) is configured with key material originating from AWS CloudHSM
- [CT.KMS.PV.5] Require that an AWS KMS customer-managed key (CMK) is configured with imported key material
- [CT.KMS.PV.6] Require that an AWS KMS customer-managed key (CMK) is configured with key material originating from an external key store (XKS)
- [CT.LAMBDA.PV.1] Require an AWS Lambda function URL to use AWS IAM-based authentication
- [CT.LAMBDA.PV.2] Require an AWS Lambda function or AWS Lambda function URL to be configured for access only to principals within your AWS account

[CT.APPSYNC.PV.1] Require an AWS AppSync GraphQL API to be configured with private visibility

This control disallows creation of public AWS AppSync APIs by requiring APIs to be configured with private visibility.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: AWS AppSync

Control metadata

- **Control objective:** Limit network access
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control groups:** digital-sovereignty
- **Resource types:** `AWS::AppSync::GraphQLApi`

Usage considerations

- This control requires AppSync GraphQL APIs to be created with a private API configuration to ensure that the API is accessible only from a VPC.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTAPPSYNCPV1",
            "Effect": "Deny",
            "Action": "appsync:CreateGraphqlApi",
            "Resource": "*",
            "Condition": {
                "StringNotEquals": {
                    "appsync:Visibility": "PRIVATE"
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
```

```
        }
    ]
}
```

[CT.EC2.PV.1] Require an Amazon EBS snapshot to be created from an encrypted EC2 volume

This control disallows creation of new snapshots that are based on unencrypted EBS volumes.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon EC2

Control metadata

- **Control objective:** Encrypt data at rest
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control groups:** digital-sovereignty
- **Resource types:** `AWS::::Account`

Usage considerations

- This control does not prevent creation of unencrypted EBS snapshots that are created by means of the `CopySnapshot` operation. AWS Control Tower recommends that you enable EBS encryption by default, so that encryption is applied to copies of unencrypted snapshots. See Encryption scenarios in the *Amazon EC2 User Guide for Linux Instances* for more information.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTEC2PV1",
            "Effect": "Deny",
            "Action": [
                "ec2:CreateSnapshot",
                "ec2:CreateSnapshots"
            ],
            "Resource": "arn:*:ec2:*:*:volume/*",
            "Condition": {
                "Bool": {
                    "ec2:Encrypted": "false"
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[CT.EC2.PV.2] Require that an attached Amazon EBS volume is configured to encrypt data at rest

This control disallows attaching an unencrypted EBS volume to a running or stopped EC2 instance.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon EC2

Control metadata

- **Control objective:** Encrypt data at rest
- **Implementation:** Service control policy (SCP)

- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control groups:** digital-sovereignty
- **Resource types:** `AWS::EC2::Volume`

Usage considerations

- This control does not prevent replacing an EBS-backed root volume for a running instance with an unencrypted volume, by means of the `CreateReplaceRootVolumeTask` operation.
- AWS Control Tower recommends that you enable EBS encryption by default. For information about EBS encryption by default, see Encryption by default in the *Amazon EC2 User Guide for Linux Instances*.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTEC2PV2",
            "Effect": "Deny",
            "Action": "ec2:AttachVolume",
            "Resource": "arn:*:ec2:*:*:volume/*",
            "Condition": {
                "Bool": {
                    "ec2:Encrypted": "false"
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
```

```
        }
    ]
}
```

[CT.EC2.PV.3] Require that an Amazon EBS snapshot cannot be publicly restorable

This control disallows sharing of an EBS snapshot with all AWS accounts.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon EC2

Control metadata

- **Control objective:** Enforce least privilege
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control groups:** digital-sovereignty
- **Resource types:** `AWS::::Account`

Usage considerations

- This control prevents unencrypted EBS snapshots from being made public, by disallowing sharing of EBS snapshots with all AWS accounts. Encrypted snapshots and snapshots with AWS Marketplace product codes cannot be made public.
- To prevent the public sharing of snapshots, AWS Control Tower recommends enabling block public access for snapshots. For more information, see Block public access for snapshots in the *Amazon EC2 User Guide for Linux Instances*.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTEC2PV3",
            "Effect": "Deny",
            "Action": "ec2:ModifySnapshotAttribute",
            "Resource": "arn:*:ec2:*::snapshot/*",
            "Condition": {
                "StringEquals": {
                    "ec2:Add/group": "all"
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[CT.EC2.PV.4] Require that Amazon EBS direct APIs are not called

This control disallows usage of all EBS direct APIs.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon EC2

Control metadata

- **Control objective:** Enforce least privilege
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower

- **Control groups:** digital-sovereignty
- **Resource types:** `AWS::::Account`

Usage considerations

- Do not enable this control if you use EBS direct APIs, either directly or through an AWS Backup partner product.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTEC2PV4",
            "Effect": "Deny",
            "Action": "ebs:*",
            "Resource": "*"{% if ExemptedPrincipalArns %},
            "Condition": {
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }
            }{% endif %}
        }
    ]
}
```

[CT.EC2.PV.5] Disallow the use of Amazon EC2 VM import and export

This control disallows use of EC2 VM Import/Export APIs that can be used to import and export EC2 instance, snapshot, image and volume data.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon EC2

Control metadata

- **Control objective:** Enforce least privilege, Protect configurations
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control groups:** digital-sovereignty
- **Resource types:** `AWS::::Account`

Usage considerations

- This control disallows the use of VM Import/Export APIs that can be used to import and export EC2 image, snapshot, instance and volume data. If you need to use VM Import/Export functionality, do not enable this control.
- This control does not prevent cancelling existing VM Import/Export import, export or conversion tasks.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTEC2PV5",
            "Effect": "Deny",
            "Action": [
                "ec2:CreateInstanceExportTask",
                "ec2:ExportImage",
                "ec2:ImportImage",
```

```
                "ec2:ImportSnapshot",
                "ec2:ImportInstance",
                "ec2:ImportVolume"
            ],
            "Resource": "*"{% if ExemptedPrincipalArns %},
            "Condition": {
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }
            }{% endif %}
        }
    ]
}
```

[CT.EC2.PV.6] Disallow the use of deprecated Amazon EC2 RequestSpotFleet and RequestSpotInstances API actions

This control disallows usage of EC2 `RequestSpotFleet` and `RequestSpotInstances` APIs, because they are legacy APIs with no planned investment.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon EC2

Control metadata

- **Control objective:** Enforce least privilege, Protect configurations
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control groups:** digital-sovereignty
- **Resource types:** `AWS::EC2::SpotFleet`

Usage considerations

- This control denies `ec2:RequestSpotFleet` and `ec2:RequestSpotInstances` actions for all IAM principals. If you need to use these actions, do not enable this control.
- This control does not prevent cancelling or modifying an existing spot fleet or spot instance request.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTEC2PV6",
            "Effect": "Deny",
            "Action": [
                "ec2:RequestSpotFleet",
                "ec2:RequestSpotInstances"
            ],
            "Resource": "*"{% if ExemptedPrincipalArns %},
            "Condition": {
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }
            }{% endif %}
        }
    ]
}
```

[CT.KMS.PV.1] Require an AWS KMS key policy to have a statement that limits creation of AWS KMS grants to AWS services

This control requires that KMS grants are issued only to AWS services that are integrated with AWS KMS, or to an AWS service principal.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: AWS Key Management Service (AWS KMS)

Control metadata

- **Control objective:** Enforce least privilege
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control groups:** digital-sovereignty
- **Resource types:** `AWS::KMS::Key`

Usage considerations

- This control disallows the creation of AWS KMS grants for your KMS keys if the request does not originate from an AWS service that's integrated with AWS KMS, or from an AWS service principal.
- If you need to issue AWS KMS grants directly to your IAM principals for a customer-managed key, do not enable this control.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTKMSPV1",
```

```
            "Effect": "Deny",
            "Action": "kms:CreateGrant",
            "Resource": "*",
            "Condition": {
                "BoolIfExists": {
                    "kms:GrantIsForAWSResource": "false",
                    "aws:PrincipalIsAWSService": "false"
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[CT.KMS.PV.2] Require that an AWS KMS asymmetric key with RSA key material used for encryption does not have a key length of 2048 bits

This control disallows the creation of KMS keys used for encryption and decryption that also have a key spec of `RSA_2048`.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: AWS Key Management Service (AWS KMS)

Control metadata

- **Control objective:** Encrypt data at rest, Encrypt data in transit
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control groups:** digital-sovereignty
- **Resource types:** `AWS::KMS::Key`

Usage considerations

- This control requires that you use a `KeySpec` other than `RSA_2048` when creating asymmetric KMS keys used for encryption and decryption.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTKMSPV2",
            "Effect": "Deny",
            "Action": "kms:CreateKey",
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "kms:KeyUsage": "ENCRYPT_DECRYPT",
                    "kms:KeySpec": "RSA_2048"
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PprincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[CT.KMS.PV.3] Require that an AWS KMS key is configured with the bypass policy lockout safety check enabled

This control disallows bypassing the KMS key policy lockout safety check when creating a KMS key or updating its key policy.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: AWS Key Management Service (AWS KMS)

Control metadata

- **Control objective:** Enforce least privilege, Protect configurations
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control groups:** digital-sovereignty
- **Resource types:** `AWS::KMS::Key`

Usage considerations

- This control disallows bypassing the policy lockout safety check, because bypassing this check increases the risk that a KMS key becomes unmanageable.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
```

```
    "Statement": [
        {
            "Sid": "CTKMSPV3",
            "Effect": "Deny",
            "Action": [
                "kms:CreateKey",
                "kms:PutKeyPolicy"
            ],
            "Resource": "*",
            "Condition": {
                "Bool": {
                    "kms:BypassPolicyLockoutSafetyCheck": "true"
                }{% if ExemptedPrprincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[CT.KMS.PV.4] Require that an AWS KMS customer-managed key (CMK) is configured with key material originating from AWS CloudHSM

This control disallows creation of KMS keys that do not have a key origin of `AWS_CLOUDHSM`.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: AWS Key Management Service (AWS KMS)

Control metadata

- **Control objective:** Encrypt data at rest, Encrypt data in transit
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control groups:** digital-sovereignty

- **Resource types:** `AWS::KMS::Key`

Usage considerations

- This control restricts creation of AWS KMS keys to those that use a specific key material origin. It is suitable when enforcing a KMS key management strategy that requires all KMS keys to an AWS CloudHSM based custom key store.
- Before enforcing the exclusive use of keys whose key material resides in an AWS CloudHSM cluster, carefully evaluate the trade-offs documented in the AWS CloudHSM key stores section of the *AWS KMS Developer Guide*.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTKMSPV4",
            "Effect": "Deny",
            "Action": "kms:CreateKey",
            "Resource": "*",
            "Condition": {
                "StringNotEquals": {
                    "kms:KeyOrigin": "AWS_CLOUDHSM"
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[CT.KMS.PV.5] Require that an AWS KMS customer-managed key (CMK) is configured with imported key material

This control disallows creation of KMS keys that do not have a key origin of `EXTERNAL`.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: AWS Key Management Service (AWS KMS)

Control metadata

- **Control objective:** Encrypt data at rest, Encrypt data in transit
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control groups:** digital-sovereignty
- **Resource types:** `AWS::KMS::Key`

Usage considerations

- This control restricts creation of KMS keys to those that use a specific key material origin. It is suitable when enforcing a KMS key management strategy that requires all KMS keys to use imported key material.
- Before enforcing the exclusive use of keys with imported key material, carefully evaluate the trade-offs documented in the Importing key material for AWS KMS keys section of the *AWS KMS Developer Guide*.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTKMSPV5",
            "Effect": "Deny",
            "Action": "kms:CreateKey",
            "Resource": "*",
            "Condition": {
                "StringNotEquals": {
                    "kms:KeyOrigin": "EXTERNAL"
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[CT.KMS.PV.6] Require that an AWS KMS customer-managed key (CMK) is configured with key material originating from an external key store (XKS)

This control disallows creation of KMS keys that do not have a key origin of `EXTERNAL_KEY_STORE`.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: AWS Key Management Service (AWS KMS)

Control metadata

- **Control objective:** Encrypt data at rest, Encrypt data in transit
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower

- **Control groups:** digital-sovereignty
- **Resource types:** `AWS::KMS::Key`

Usage considerations

- This control restricts creation of AWS KMS keys to those that use a specific key material origin. It is suitable when enforcing a KMS key management strategy that requires all KMS keys to an external key store custom key store.
- Before enforcing the exclusive use of keys whose key material resides in an external key store, carefully evaluate the trade-offs documented in the External key stores section of the *AWS KMS Developer Guide*.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTKMSPV6",
            "Effect": "Deny",
            "Action": "kms:CreateKey",
            "Resource": "*",
            "Condition": {
                "StringNotEquals": {
                    "kms:KeyOrigin": "EXTERNAL_KEY_STORE"
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[CT.LAMBDA.PV.1] Require an AWS Lambda function URL to use AWS IAM-based authentication

Require an AWS Lambda function URL to restrict access to authenticated users by using `AWS_IAM` based authentication.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: AWS Lambda

Control metadata

- **Control objective:** Enforce least privilege
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control groups:** digital-sovereignty
- **Resource types:** `AWS::Lambda::Url`

Usage considerations

- This control disallows creation and update of AWS Lambda function URL configurations. It does not prevent deletion of Lambda function URL configurations.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
```

```
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTLAMBDAPV1",
            "Effect": "Deny",
            "Action": [
                "lambda:CreateFunctionUrlConfig",
                "lambda:UpdateFunctionUrlConfig"
            ],
            "Resource": "arn:*:lambda:*:*:function:*",
            "Condition": {
                "StringNotEquals": {
                    "lambda:FunctionUrlAuthType": "AWS_IAM"
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[CT.LAMBDA.PV.2] Require an AWS Lambda function or AWS Lambda function URL to be configured for access only to principals within your AWS account

This control requires an AWS Lambda function resource-based policy to grant access only to IAM principals that reside in your AWS account.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: AWS Lambda

Control metadata

- **Control objective:** Enforce least privilege
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower

- **Control groups:** digital-sovereignty
- **Resource types:** `AWS::Lambda::Url`, `AWS::Lambda::Function`

Usage considerations

- This control limits cross-account access to AWS Lambda functions by restricting the allowed IAM principals in a Lambda function resource policy to those in the same account as the Lambda function. Allow listing AWS service principals is not supported by this control.
- Permissions to AWS Lambda functions and related URL(s) are governed by this control.
- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTLAMBDAPV2",
            "Effect": "Deny",
            "Action": "lambda:AddPermission",
            "Resource": "arn:*:lambda:*:*:function:*",
            "Condition": {
                "StringNotLike": {
                    "lambda:Principal": [
                        "arn:*:iam::${aws:PrincipalAccount}:*",
                        "${aws:PrincipalAccount}"
                    ]
                },
                "ArnNotLike": {
                    "aws:PrincipalArn": [
                        {{ExemptedPrincipalArns}}
                        "arn:*:iam::*:role/AWSControlTowerExecution"
                    ]
```

```
                }
            }
        }
    ]
}
```

Controls that enhance data residency protection

These elective controls complement your enterprise's data residency posture. By applying these controls together, you can set up your multi-account environment to help detect and inhibit the purposeful or accidental creation, sharing, or copying of data, outside of your selected AWS Region or Regions.

These controls take effect at the OU level, and they apply to all member accounts within the OU.

> **Important**
>
> Certain global AWS services, such as AWS Identity and Access Management (IAM) and AWS Organizations, are exempt from these controls. You can identify the services that are exempt by reviewing the **Region deny SCP**, shown in the example code. Services with "*" after their identifier are exempt, because all actions are permitted when the "*" notation is given. This SCP essentially contains a list of explicitly permitted actions, and all other actions are denied. You cannot deny access to your home Region.

Video: Enable data residency controls

This video (5:58) describes how to enable data residency controls with AWS Control Tower controls. For better viewing, select the icon at the lower right corner of the video to enlarge it to full screen. Captioning is available.

> **Note**
>
> AWS Control Tower no longer supports searching the controls list by *Category*, as shown in this video. To easily identify the Data Residency controls, we recommend you sort the controls list by *Release Date*. Controls with a release date of November 30, 2021 are the same controls in the Data Residency category shown in the video.

This video includes the term *guardrail*, an older term AWS Control Tower used for *control*. We updated the term to better align with industry usage and other AWS services. These terms are synonymous for our purposes.

Video Walkthrough of Enabling Data Residency Controls in AWS Control Tower.

Topics

- Data residency controls with preventive behavior
- Data residency controls with detective behavior

Data residency controls with preventive behavior

The following data residency controls have preventive behavior.

Topics

- Disallow internet access for an Amazon VPC instance managed by a customer
- Disallow Amazon Virtual Private Network (VPN) connections
- Disallow cross-region networking for Amazon EC2, Amazon CloudFront, and AWS Global Accelerator

Disallow internet access for an Amazon VPC instance managed by a customer

This control disallows internet access for an Amazon Virtual Private Cloud (VPC) instance managed by a customer, rather than by an AWS service.

> **Important**
>
> If you provision Account Factory accounts with VPC internet access settings enabled, that Account Factory setting overrides this control. To avoid enabling internet access for newly provisioned accounts, you must change the setting in Account Factory. For more information, see Configure AWS Control Tower Without a VPC.

- This control does not apply to VPCs managed by AWS services.
- Existing VPCs that have internet access retain their internet access. It applies to new instances only. After this control is applied, access cannot be changed.

This is a preventive control with elective guidance. By default, this control isn't enabled on any OUs.

The artifact for this control is the following service control policy (SCP).

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GRDISALLOWVPCINTERNETACCESS",
      "Effect": "Deny",
      "Action": [
        "ec2:CreateInternetGateway",
        "ec2:AttachInternetGateway",
        "ec2:CreateEgressOnlyInternetGateway",
        "ec2:AttachEgressOnlyInternetGateway",
        "ec2:CreateDefaultVpc",
        "ec2:CreateDefaultSubnet",
        "ec2:CreateCarrierGateway"
      ],
      "Resource": [
        "*"
      ],
      "Condition": {
        "ArnNotLike": {
          "aws:PrincipalArn": [
            "arn:aws:iam::*:role/AWSControlTowerExecution"
          ]
        }
      }
    }
  ]
}
```

Disallow Amazon Virtual Private Network (VPN) connections

This control prevents Virtual Private Network (VPN) connections (Site-to-Site VPN and Client VPN) to an Amazon Virtual Private Cloud (VPC).

> **Note**
>
> Existing VPCs that have internet access retain their internet access.

This is a preventive control with elective guidance. By default, this control isn't enabled on any OUs.

The artifact for this control is the following service control policy (SCP).

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GRDISALLOWVPNCONNECTIONS",
      "Effect": "Deny",
      "Action": [
        "ec2:CreateVPNGateway",
        "ec2:AttachVPNGateway",

        "ec2:CreateClientVpnEndpoint",
        "ec2:ModifyClientVpnEndpoint",
        "ec2:AssociateClientVpnTargetNetwork",
        "ec2:AuthorizeClientVpnIngress"
      ],
      "Resource": [
        "*"
      ]
    }
  ]
}
```

Disallow cross-region networking for Amazon EC2, Amazon CloudFront, and AWS Global Accelerator

This control prevents configuring cross-region networking connections from Amazon EC2, Amazon CloudFront, and AWS Global Accelerator services. It prevents VPC peering and transit gateway peering.

> **Note**
>
> This control prevents Amazon EC2 VPC peering and Amazon EC2 transit gateway peering within a single Region, as well as across Regions. For this reason, this control may affect certain workloads in addition to your data residency posture.

This is a preventive control with elective guidance. By default, this control isn't enabled on any OUs.

The artifact for this control is the following service control policy (SCP).

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GRDISALLOWCROSSREGIONNETWORKING",
      "Effect": "Deny",
      "Action": [
        "ec2:CreateVpcPeeringConnection",
        "ec2:AcceptVpcPeeringConnection",
        "ec2:CreateTransitGatewayPeeringAttachment",
        "ec2:AcceptTransitGatewayPeeringAttachment",
        "cloudfront:CreateDistribution",
        "cloudfront:UpdateDistribution",
        "globalaccelerator:Create*",
        "globalaccelerator:Update*"
      ],
      "Resource": [
        "*"
      ]
    }
```

```
  ]
}
```

Data residency controls with detective behavior

The following data residency controls have detective behavior.

Topics

- Detect whether public IP addresses for Amazon EC2 autoscaling are enabled through launch configurations
- Detect whether replication instances for AWS Database Migration Service are public
- Detect whether Amazon EBS snapshots are restorable by all AWS accounts
- Detect whether any Amazon EC2 instance has an associated public IPv4 address
- Detect whether Amazon S3 settings to block public access are set as true for the account
- Detects whether an Amazon EKS endpoint is blocked from public access
- Detect whether an Amazon OpenSearch Service domain is in Amazon VPC
- Detect whether any Amazon EMR cluster master nodes have public IP addresses
- Detect whether the AWS Lambda function policy attached to the Lambda resource blocks public access
- Detect whether public routes exist in the route table for an Internet Gateway (IGW)
- Detect whether Amazon Redshift clusters are blocked from public access
- Detect whether an Amazon SageMaker notebook instance allows direct internet access
- Detect whether any Amazon VPC subnets are assigned a public IP address
- Detect whether AWS Systems Manager documents owned by the account are public

Detect whether public IP addresses for Amazon EC2 autoscaling are enabled through launch configurations

This control detects whether Amazon EC2 Auto Scaling groups have public IP addresses enabled through launch configurations.

This is a detective control with elective guidance. By default, this control isn't enabled on any OUs.

In the console:

- The rule shows **Non-compliant** status if the launch configuration for an autoscaling group sets the value of the field `AssociatePublicIpAddress` set as **True**.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rule to detect whether public IP addresses for Amazon
 EC2 Auto Scaling are enabled through launch configurations

Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'

Resources:
  AutoscalingLaunchConfigPublicIpDisabled:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Detects whether Amazon EC2 Auto Scaling groups have public IP
 addresses enabled through launch configurations. This rule is NON_COMPLIANT if
 the launch configuration for an Auto Scaling group has the value of the field
 AssociatePublicIpAddress set as True.
      Scope:
        ComplianceResourceTypes:
          - AWS::AutoScaling::LaunchConfiguration
      Source:
        Owner: AWS
        SourceIdentifier: AUTOSCALING_LAUNCH_CONFIG_PUBLIC_IP_DISABLED
```

Detect whether replication instances for AWS Database Migration Service are public

This control detects whether AWS Database Migration Service replication instances are public.

This is a detective control with elective guidance. By default, this control isn't enabled on any OUs.

In the console:

- The rule shows **Non-compliant** status if the value of the `PubliclyAccessible` field is set as **True**.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rule to detect whether replication instances for AWS
 Database Migration Service are public

Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'

  MaximumExecutionFrequency:
    Type: String
    Default: 24hours
    Description: The frequency at which AWS Config will run evaluations for the rule.
    AllowedValues:
      - 1hour
      - 3hours
      - 6hours
      - 12hours
      - 24hours

Mappings:
  Settings:
    FrequencyMap:
      1hour   : One_Hour
      3hours  : Three_Hours
      6hours  : Six_Hours
      12hours : Twelve_Hours
      24hours : TwentyFour_Hours

Resources:
  DmsReplicationNotPublic:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Detects whether AWS Database Migration Service replication instances
 are public. The rule is NON_COMPLIANT if the value of the PubliclyAccessible field is
 set as True.
      Source:
        Owner: AWS
        SourceIdentifier: DMS_REPLICATION_NOT_PUBLIC
      MaximumExecutionFrequency:
        !FindInMap
```

```
        - Settings
        - FrequencyMap
        - !Ref MaximumExecutionFrequency
```

Detect whether Amazon EBS snapshots are restorable by all AWS accounts

This control detects whether all AWS accounts have access to restore Amazon EBS snapshots.

This is a detective control with elective guidance. By default, this control isn't enabled on any OUs.

In the console:

- The rule shows **Non-compliant** status if any snapshots have the `RestorableByUserIds` field set to the value **All**. In that case, the Amazon EBS snapshots are public.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rule to detect whether Amazon EBS snapshots are
 restorable by all AWS accounts

Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'

  MaximumExecutionFrequency:
    Type: String
    Default: 24hours
    Description: The frequency at which AWS Config will run evaluations for the rule.
    AllowedValues:
      - 1hour
      - 3hours
      - 6hours
      - 12hours
      - 24hours

Mappings:
  Settings:
    FrequencyMap:
      1hour   : One_Hour
      3hours  : Three_Hours
      6hours  : Six_Hours
```

```
      12hours : Twelve_Hours
      24hours : TwentyFour_Hours

Resources:
  EbsSnapshotPublicRestorableCheck:
    Type: AWS::Config::ConfigRule

    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Detects whether all AWS accounts have access to restore Amazon EBS
 snapshots. The rule is NON_COMPLIANT if any snapshots have the RestorableByUserIds
 field set to the value All. In that case, the Amazon EBS snapshots are public.
      Source:
        Owner: AWS
        SourceIdentifier: EBS_SNAPSHOT_PUBLIC_RESTORABLE_CHECK
      MaximumExecutionFrequency:
        !FindInMap
        - Settings
        - FrequencyMap
        - !Ref MaximumExecutionFrequency
```

Detect whether any Amazon EC2 instance has an associated public IPv4 address

This control detects whether an Amazon Elastic Compute Cloud (Amazon EC2) instance has an associated public IPv4 address. This control applies only to IPv4 addresses.

This is a detective control with elective guidance. By default, this control isn't enabled on any OUs.

In the console:

- The rule shows **Non-compliant** status if the public IP field is present in the Amazon EC2 instance configuration item.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rule to detect whether any Amazon EC2 instance has an
 associated public IPv4 address

Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
```

```
Resources:
  Ec2InstanceNoPublicIp:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Detects whether an Amazon Elastic Compute Cloud (Amazon EC2)
 instance has an associated public IPv4 address. The rule is NON_COMPLIANT if the
 public IP field is present in the Amazon EC2 instance configuration item.
      Scope:
        ComplianceResourceTypes:
        - AWS::EC2::Instance
      Source:
        Owner: AWS
        SourceIdentifier: EC2_INSTANCE_NO_PUBLIC_IP
```

Detect whether Amazon S3 settings to block public access are set as true for the account

This control periodically detects whether the required Amazon S3 settings to block public access are configured as true for the account, rather than for a bucket or an access point.

In the console:

- The rule shows **Non-compliant** status if at least one of the settings is false.

This is a detective control with elective guidance. By default, this control isn't enabled on any OUs.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rule to check whether Amazon S3 settings to block
 public access are set as true for the account.

Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
  PublicAccessBlockSetting:
    Type: 'String'
    Default: 'True'
  MaximumExecutionFrequency:
    Type: String
    Default: 24hours
```

```
    Description: The frequency at which AWS Config will run evaluations for the rule.
    AllowedValues:
      - 1hour
      - 3hours
      - 6hours
      - 12hours
      - 24hours

Mappings:
  Settings:
    FrequencyMap:
      1hour   : One_Hour
      3hours  : Three_Hours
      6hours  : Six_Hours

Detects whether an Amazon EKS endpoint is blocked from public access

This control detects whether an Amazon Elastic Kubernetes Service (Amazon EKS) endpoint is blocked from public access.

This is a detective control with elective guidance. By default, this control isn't enabled on any OUs.

In the console:

- The rule shows **Non-compliant** status if the endpoint is publicly accessible.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rule to detect whether an Amazon EKS endpoint is
 blocked from public access

Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'

  MaximumExecutionFrequency:
    Type: String
    Default: 24hours
    Description: The frequency at which AWS Config will run evaluations for the rule.
    AllowedValues:
      - 1hour
      - 3hours
      - 6hours
      - 12hours
      - 24hours

```

Detective controls

A detective control detects noncompliance of resources within your accounts, such as policy violations, and provides alerts through the dashboard. The status of a detective control is either **clear**, **in violation**, or **not enabled**. Detective controls apply only in those AWS Regions supported by AWS Control Tower.

- Detective controls are implemented using AWS Config rules. Most of the **Strongly recommended** controls, and many of the **Elective** controls, that are owned by AWS Control Tower are detective controls. The name of these controls typically begins with the word *Detect*, to denote a detective control.
- The integrated, detective Security Hub controls are implemented using AWS Config rules, similarly to all Security Hub controls. These controls are owned by the **Service-Managed Standard: AWS Control Tower**, which is part of Security Hub.

- Certain AWS Config controls are manageable directly from the AWS Control Tower console, implemented with AWS Config rules.
- When you enable controls on an organizational unit (OU) that is registered with AWS Control Tower, detective controls apply to enrolled accounts only, not to all member accounts in the OU, if some accounts are not enrolled in AWS Control Tower.

> **Note**
>
> For information about how detective controls are applied to nested OUs, in AWS Control Tower, see Nested Ous and controls.

More about detective controls

Most of the AWS Control Tower **Strongly recommended** controls are detective. By default, **Strongly recommended** controls are not enabled. For more information, see Strongly recommended controls.

Three of the AWS Control Tower **Elective** controls are detective. By default, **Elective** controls are not enabled. For more information, see Elective controls.

>
> - Detect Whether MFA is Enabled for AWS IAM Users
> - Detect Whether MFA is Enabled for AWS IAM Users of the AWS Console
> - Detect Whether Versioning for Amazon S3 Buckets is Enabled

The integrated AWS Config controls in AWS Control Tower have **Elective** guidance. For more information, see Integrated AWS Config controls available in AWS Control Tower.

Topics

- The Security Hub standard
- Integrated AWS Config controls available in AWS Control Tower

The Security Hub standard

AWS Control Tower is integrated with AWS Security Hub to provide detective controls that help you monitor your AWS environment. The integration is accomplished with a Security Hub standard, called the **Service-Managed Standard: AWS Control Tower**.

The **Service-Managed Standard: AWS Control Tower** supports a subset of controls in the **AWS Foundational Security Best Practices (FSBP)** standard. To learn more about this standard and to view the available controls, see Service-Managed Standard: AWS Control Tower. For more general information about Security Hub standards, see Security standards and controls in Security Hub, in the *AWS Security Hub User Guide*.

This standard is available only for AWS Control Tower customers who have created the standard in the AWS Control Tower console. AWS Control Tower creates the standard for you when you enable the first Security Hub control in the AWS Control Tower console. When you enable the first control, if you haven't already enabled Security Hub, AWS Control Tower also enables Security Hub for you.

After you create this standard, you can view the Security Hub detective controls alongside other AWS Control Tower controls, in the AWS Control Tower console and in Security Hub.

Control behavior

- No controls are enabled automatically when you create this standard in AWS Control Tower.
- The Security Hub controls are active at the OU level only, not for all AWS Control Tower OUs (if not enabled for all), and not for individual accounts.
- When Security Hub adds new controls, the new controls are not added to the **Security Hub Service-Managed Standard: AWS Control Tower** automatically.

Enable or remove controls for the Service-Managed Standard

To avoid drift, always enable and remove controls for the Service-Managed Standard by means of the AWS Control Tower service, either in the console or by calling the AWS Control Tower APIs, `EnableControl` and `DisableControl`. When you change the enablement status of a control in AWS Control Tower, the change also is reflected in Security Hub.

If you deactivate a Service-Managed Standard control by means of the Security Hub console, the AWS Control Tower member account enters a state of control drift. In this situation, AWS Control

Tower is not receiving the Security Hub findings for the control that you deactivated. You must resolve this drift before AWS Control Tower can apply the control successfully to your registered organizational units and member accounts.

You can delete this standard in the AWS Control Tower console by deactivating all controls in the standard. This deletes the standard for all managed accounts and governed Regions in AWS Control Tower. Deleting the standard does not deactivate Security Hub for your account.

Deprecated controls

The control named **[SH.S3.4] S3 buckets should have server-side encryption enabled** is deprecated, effective July 18, 2023. It was removed from the controls library on August 18, 2023. For more information, see AWS Control Tower deprecates two controls.

Security Hub score and findings

Based on control status, Security Hub calculates a security score for the **Service-Managed Standard: AWS Control Tower**. This security score and the control findings are available only in Security Hub. These items aren't available in AWS Control Tower.

> **Note**
>
> When you create **Service-Managed Standard: AWS Control Tower** and enable controls for it, Security Hub may take up to 18 hours to generate findings for controls that use the same underlying AWS Config service-linked rule as controls from other enabled Security Hub standards. For more information, see Schedule for running security checks in the AWS Security Hub User Guide.

Security Hub control drift reporting

When reporting drift for controls that are part of the AWS Security Hub Service-Managed Standard, AWS Control Tower receives a daily status update from Security Hub. If no update is received, AWS Control Tower verifies whether drift has occurred. If so, AWS Control Tower reports drift. If a control shows drift, AWS Control Tower sends an Amazon SNS notification to the AWS Control Tower `security-aggregate-notification` channel. You must subscribe to this SNS notification to receive information about which specific account is affected by Security Hub control drift. For more information about Security Hub control drift in AWS Control Tower, see Security Hub control drift.

Although controls are active in every governed Region, AWS Control Tower sends the AWS Security Hub **Finding** events to the AWS Control Tower home Region only.

Remediate drift

When drift is reported, you can remediate the situation by choosing **Re-register OU** on the **Organizations** page in the AWS Control Tower console, or by deactivating and re-activating the control that's in a drifted state, either by means of the console, or through the AWS Control Tower API.

Manage controls

You can enable and manage some Security Hub controls from AWS Control Tower, with the Security Hub Service-managed Standard: AWS Control Tower.

Unsupported Regions

It is important to know that some Security Hub controls do not operate in certain AWS Regions where AWS Control Tower is available, because those Regions do not support the required underlying functionality. As a result, when you deploy an Security Hub control through AWS Control Tower, the control may not be operating in all Regions that you govern with AWS Control Tower. For more information about the Security Hub controls that cannot be deployed in certain Regions, see the Security Hub controls reference documentation.

You can view the most updated list of the Regions for each control in the AWS Control Tower console, or by calling the `GetControl` API.

Certain **AWS Security Hub Service-Managed Standard: AWS Control Tower** controls have specific, unsupported Regions, as shown in the following table.

Control identifier	Non-deployable Regions
`SH.ACM.1`	af-south-1, ap-northeast-3, ap-south-2, ap-southeast-4, ap-southeast-5, ap-southeast-7, ca-west-1, eu-central-2, eu-south-1, eu-south-2, il-central-1, mx-central-1
`SH.ACM.2`	ap-south-2, ap-southeast-4, ap-southeast-5, ap-southeast-7, ca-west-1, eu-central-2, eu-

Control identifier	Non-deployable Regions
	south-2, il-central-1, me-central-1, mx-central-1

Integrated AWS Config controls available in AWS Control Tower

AWS Control Tower is integrated with AWS Config to provide over 500 selected additional detective controls that help you monitor and manage your AWS environment. These AWS Config controls are available in the AWS Control Tower console and the Control Catalog APIs. The **Control owner** or **Implementation** field for these controls is displayed as AWS Config or `AWS::Config::ConfigRule`.

You can use AWS Control Tower to search and discover the AWS Config rules that you need to govern your multi-account environment; and you can enable and manage these controls directly from the AWS Control Tower console. To search from the console, go to the Control Catalog and search for controls with the **Implementation** filter AWS Config. (Example: `Implementation = AWS Config`)

The AWS Control Tower console and AWS Config console each display the same metqdata for these controls.

You can enable and disable the AWS Config controls through the AWS Control Tower console or the `EnableControl` and `DisableControl` APIs. Control details are viewable programmatically by calling the Control Catalog `GetControl` and `ListControls` APIs.

Differences

- In AWS Config, these integrated controls are listed by identifier.
- In the AWS Control Tower console and APIs, the integrated controls are shown with names that summarize their function.

> **Note**
>
> AWS Control Tower documentation does not provide a comprehensive list of integrated AWS Config controls. For more information about these controls, see List of AWS Config managed rules in the *AWS Config Developer Guide*, or view them in the AWS Control Tower console.

Change in drift behavior with service-linked AWS Config rules

Before the introduction of service-linked Config rules in AWS Control Tower, you could modify AWS Config rule configurations or add remediations outside of AWS Control Tower. With the release of service-linked Config rules, this behavior has changed:

- Modifications made to Config rule settings outside of AWS Control Tower are treated as drift.
- External remediation configurations added to these Config rules are treated as drift.
- AWS Control Tower automatically removes these external modifications with the adoption of service-linked Config rules.
- To maintain consistent governance, all updates that AWS Control Tower supports for your service-linked Config rules must be managed through AWS Control Tower.

> **Important**
>
> Before you adopt service-linked Config rules, review the existing customizations, such as remediations, that you have made to Config rules outside of AWS Control Tower, because these customizations will be removed during the transition. The AWS Config APIs do not support adding remediation configurations for service-linked AWS Config rules. See `PutRemediationConfigurations`.

Controls with parameters

In AWS Control Tower, RCP-based and certain SCP-based controls support configuration. These controls contain elements that are included by AWS Control Tower conditionally, based on the configuration you select.

For example, some control policies include inline templating variables, such as the one shown in the example that follows. The example shows the **ExemptedPrincipalArns** parameter.

```
{
          "Sid": "CTEC2PV1",
          "Effect": "Deny",
          "Action": [
              "ec2:CreateSnapshot",
              "ec2:CreateSnapshots"
          ],
          "Resource": "arn:*:ec2:*:*:volume/*",
          "Condition": {
              "Bool": {
                  "ec2:Encrypted": "false"
              }{% if ExemptedPrincipalArns %},
              "ArnNotLike": {
                  "aws:PrincipalArn": {{ExemptedPrincipalArns}}
              }{% endif %}
          }
      }
```

A control may support any of the following four configuration parameters:

- **ExemptedPrincipalArns**: A list of AWS IAM principal ARNs that are exempted from this control.
  - This parameter allows you to exempt IAM Principals from this control by way of an **ArnNotLikeIfExists** condition key operator and **aws:PrincipalArn** condition key that is applied to the control policy by AWS Control Tower when you enable the control. The **ExemptedPrincipalArns** parameter allows you to use the wildcard character (*) in the IAM principal ARNs that you specify. You can use the wildcard character to exempt all IAM principals in an AWS account, or exempt a common principal across multiple AWS accounts.
  - When you use the wildcard character to exempt principals, be sure that you follow the principal of least privilege: include only those IAM principal ARNs that you require to be exempt from a control. Otherwise, if your exemptions are too broad, the control may not come into effect when you intend it to.
- **AllowedRegions**: List of AWS Regions exempted from the control.
- **ExemptedActions**: List of AWS IAM actions exempted from the control.
- **ExemptedResourceArns**: List of resource ARNs exempted from the control.

For more details about configuring controls with parameters, see `ControlParameter` in the *AWS Control Tower API Reference*.

List of parameterized controls

Control identifier	Display name
AWS-GR_AUDIT_BUCKET_ENCRYPTION_ENABLED	Enable encryption at rest for log archive
AWS-GR_AUDIT_BUCKET_LOGGING_ENABLED	Enable access logging for log archive
AWS-GR_AUDIT_BUCKET_POLICY_CHANGES_PROHIBITED	Disallow policy changes to log archive
AWS-GR_AUDIT_BUCKET_RETENTION_POLICY	Set a retention policy for log archive
AWS-GR_DISALLOW_CROSS_REGION_NETWORKING	Disallow cross-region networking for Amazon EC2, Amazon CloudFront, and AWS Global Accelerator
AWS-GR_DISALLOW_VPC_INTERNET_ACCESS	Disallow internet access for an Amazon VPC instance managed by a customer
AWS-GR_DISALLOW_VPN_CONNECTIONS	Disallow AWS Virtual Private Network (VPN) connections
AWS-GR_RESTRICT_ROOT_USER	Disallow actions as a root user
AWS-GR_RESTRICT_ROOT_USER_ACCESS_KEYS	Disallow creation of access keys for the root user
AWS-GR_RESTRICT_S3_CROSS_REGION_REPLICATION	Disallow cross region replication for S3 buckets
AWS-GR_RESTRICT_S3_DELETE_WITHOUT_MFA	Disallow delete actions on S3 buckets without MFA
CT.APPSYNC.PV.1	Require an AWS AppSync GraphQL API to be configured with private visibility

Control identifier	Display name
CT.EC2.PV.1	Require an Amazon EBS snapshot to be created from an encrypted EC2 volume
CT.EC2.PV.2	Require that an attached Amazon EBS volume is configured to encrypt data at rest
CT.EC2.PV.3	Require that an Amazon EBS snapshot cannot be publicly restorable
CT.EC2.PV.4	Require that Amazon EBS direct APIs are not called
CT.EC2.PV.5	Disallow the use of Amazon EC2 VM import and export
CT.EC2.PV.6	Disallow the use of deprecated Amazon EC2 RequestSpotFleet and RequestSpotInstances API actions
CT.KMS.PV.1	Require an AWS KMS key policy to have a statement that limits creation of AWS KMS grants to AWS services
CT.KMS.PV.2	Require that an AWS KMS asymmetric key with RSA key material used for encryption does not have a key length of 2048 bits
CT.KMS.PV.3	Require that an AWS KMS key is configured with the bypass policy lockout safety check enabled
CT.KMS.PV.4	Require that an AWS KMS customer-managed key (CMK) is configured with key material originating from AWS CloudHSM

Control identifier	Display name
CT.KMS.PV.5	Require that an AWS KMS customer-managed key (CMK) is configured with imported key material
CT.KMS.PV.6	Require that an AWS KMS customer-managed key (CMK) is configured with key material originating from an external key store (XKS)
CT.LAMBDA.PV.1	Require an AWS Lambda function URL to use AWS IAM-based authentication
CT.LAMBDA.PV.2	Require an AWS Lambda function or AWS Lambda function URL to be configured for access only to principals within your AWS account
CT.KMS.PV.7	Require that the organization's AWS Key Management Service resources are accessibl e only by IAM principals that belong to the organization, or by an AWS service
CT.S3.PV.2	Require all requests to Amazon S3 resources use authentication based on an Authorization header
CT.S3.PV.3	Require requests to Amazon S3 resources to use a minimum TLS version of 1.3
CT.S3.PV.4	Require that the organization's Amazon S3 resources are accessible only by IAM principals that belong to the organization or by an AWS service
CT.S3.PV.5	Require encryption of data in transit for calls to Amazon S3 resources

Control identifier	Display name
CT.S3.PV.6	Require all object uploads to Amazon S3 buckets to use server-side encryption with an AWS KMS key (SSE-KMS
CT.SECRETSMANAGER.PV.1	Require that the organization's AWS Secrets Manager resources are accessible only by IAM principals that belong to the organization or by an AWS service
CT.SQS.PV.1	Require that the organization's Amazon SQS resources are accessible only by IAM principals that belong to the organization, or by an AWS service
CT.STS.PV.1	Require that the organization's AWS Security Token Service resources are accessible only by IAM principals that belong to the organization, or by an AWS service

Optional controls

Optional controls in AWS Control Tower are applied at the OU level. You can activate and deactivate these optional controls through the AWS Control Tower console, or by means of the control APIs.

AWS Control Tower offers several types of optional controls:

- Proactive controls, which are based on AWS CloudFormation hooks.
- Controls implemented with resource control policies (RCPs), which are based on RCPs from AWS Organizations. For more information, see Resource control policies in the AWS Organizations documentation.
- Controls implemented with declarative policies, which are based on *declarative policies* from AWS Organizations. For more information, see Declarative policies in the AWS Organizations documentation.

- Security Hub controls, which are based on AWS Config rules – these controls are owned by Security Hub and integrated with AWS Control Tower, by means of the **Service-Managed Standard: AWS Control Tower**.
- Digital sovereignty controls, which are elective controls based on SCPs and AWS Config rules, implemented within AWS Control Tower. This group includes the data residency controls.
- Strongly recommended controls, which are based on SCPs and AWS Config rules, implemented within AWS Control Tower.
- Elective controls, which are based on SCPs and AWS Config rules, implemented within AWS Control Tower.

The strongly recommended and elective controls owned by AWS Control Tower are optional, which means that you can customize the level of enforcement for OUs in your landing zone by choosing which ones to enable. Optional controls are not enabled by default. For more information about optional controls, see the following control reference pages in the next sections.

> **Note**
>
> It is important to know that some detective controls in AWS Control Tower do not operate in certain AWS Regions where AWS Control Tower is available, because those Regions do not support the required underlying functionality. As a result, when you deploy a detective control, the control may not be operating in all Regions that you govern with AWS Control Tower. For details, see Control limitations and Security Hub controls.
> You can view the Regions for each control in the AWS Control Tower console, or by calling the `GetControl` API that is part of the Control Catalog namespace.
> For more information about the detective controls that cannot be deployed in certain Regions, see the Regional services list documentation to learn more about the Regions where AWS Config is available. If the detective control is implemented as a managed AWS Config rule, see the Security Hub controls reference documentation.

Strongly recommended controls

Strongly recommended controls are owned by AWS Control Tower. They are based on best practices for well-architected multi-account environments. These controls are not enabled by default, and they can be deactivated through the AWS Control Tower console or the control APIs.

Following, you'll find a reference for each of the strongly recommended controls available in AWS Control Tower.

Topics

- Strongly recommended controls with preventive behavior
- Strongly recommended controls with detective behavior

Strongly recommended controls with preventive behavior

The following strongly recommended controls have preventive behavior.

Topics

- Disallow Creation of Access Keys for the Root User
- Disallow Actions as a Root User

Disallow Creation of Access Keys for the Root User

Secures your AWS accounts by disallowing creation of access keys for the root user. We recommend that you instead create access keys for the IAM users or IAM Identity Center users, which grant limited permissions to interact with your AWS account. This is a preventive control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following SCP.

JSON

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRRESTRICTROOTUSERACCESSKEYS",
            "Effect": "Deny",
            "Action": "iam:CreateAccessKey",
            "Resource": [
                "*"
            ],
            "Condition": {
                "StringLike": {
```

```
                    "aws:PprincipalArn": [
                        "arn:aws:iam::*:root"
                    ]
                }
            }
        }
    ]
}
```

Disallow Actions as a Root User

Secures your AWS accounts by disallowing account access with root user credentials, which are credentials of the account owner that allow unrestricted access to all resources in the account. Instead, we recommend that you create IAM Identity Center users for everyday interaction with your AWS account. This is a preventive control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following SCP.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GRRESTRICTROOTUSER",
      "Effect": "Deny",
      "Action": "*",
      "Resource": [
        "*"
      ],
      "Condition": {
        "StringLike": {
          "aws:PprincipalArn": [
            "arn:aws:iam::*:root"
          ]
        }
      }
    }
  ]
```

```
}
```

Strongly recommended controls with detective behavior

The following strongly recommended controls have detective behavior.

Topics

- Detect Whether Encryption is Enabled for Amazon EBS Volumes Attached to Amazon EC2 Instances
- Detect Whether Unrestricted Incoming TCP Traffic is Allowed
- Detect Whether Unrestricted Internet Connection Through SSH is Allowed
- Detect Whether MFA for the Root User is Enabled
- Detect Whether Public Read Access to Amazon S3 Buckets is Allowed
- Detect Whether Public Write Access to Amazon S3 Buckets is Allowed
- Detect Whether Amazon EBS Volumes are Attached to Amazon EC2 Instances
- Detect Whether Amazon EBS Optimization is Enabled for Amazon EC2 Instances
- Detect Whether Public Access to Amazon RDS Database Instances is Enabled
- Detect Whether Public Access to Amazon RDS Database Snapshots is Enabled
- Detect Whether Storage Encryption is Enabled for Amazon RDS Database Instances
- Detect whether an account has AWS CloudTrail or CloudTrail Lake enabled

Detect Whether Encryption is Enabled for Amazon EBS Volumes Attached to Amazon EC2 Instances

This control detects whether the Amazon EBS volumes attached to an Amazon EC2 instance are encrypted. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control isn't enabled on any OUs.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check for encryption of all storage volumes
 attached to compute
Parameters:
  ConfigRuleName:
```

```
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForEncryptedVolumes:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether EBS volumes that are in an attached state are
 encrypted.
      Source:
        Owner: AWS
        SourceIdentifier: ENCRYPTED_VOLUMES
      Scope:
        ComplianceResourceTypes:
          - AWS::EC2::Volume
```

Detect Whether Unrestricted Incoming TCP Traffic is Allowed

This control helps reduce a server's exposure to risk by detecting whether unrestricted incoming TCP traffic is allowed. It detects whether internet connections are enabled to Amazon EC2 instances through services such as Remote Desktop Protocol (RDP). This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

> **Note**
>
> This control fails if any of the rules in a security group allow ingress traffic from `0.0.0.0/0` or `::/0` for those ports.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether security groups that are in
 use disallow unrestricted incoming TCP traffic to the specified ports.
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
  blockedPort1:
    Type: String
    Default: '20'
```

```
    Description: Blocked TCP port number.
  blockedPort2:
    Type: String
    Default: '21'
    Description: Blocked TCP port number.
  blockedPort3:
    Type: String
    Default: '3389'
    Description: Blocked TCP port number.
  blockedPort4:
    Type: String
    Default: '3306'
    Description: Blocked TCP port number.
  blockedPort5:
    Type: String
    Default: '4333'
    Description: Blocked TCP port number.
Conditions:
  blockedPort1:
    Fn::Not:
    - Fn::Equals:
      - ''
      - Ref: blockedPort1
  blockedPort2:
    Fn::Not:
    - Fn::Equals:
      - ''
      - Ref: blockedPort2
  blockedPort3:
    Fn::Not:
    - Fn::Equals:

          - Ref: AWS::NoValue
      Scope:
        ComplianceResourceTypes:
        - AWS::EC2::SecurityGroup
      Source:
        Owner: AWS
        SourceIdentifier: RESTRICTED_INCOMING_TRAFFIC
```

Detect Whether Unrestricted Internet Connection Through SSH is Allowed

This control detects whether internet connections are allowed through remote services such as the Secure Shell (SSH) protocol. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

> **Note**
>
> This control fails if any of the rules in a security group allow ingress traffic from `0.0.0.0/0` or `::/0` for SSH traffic.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether security groups that are in
 use disallow SSH
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForRestrictedSshPolicy:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether security groups that are in use disallow unrestricted
 incoming SSH traffic.
      Scope:
        ComplianceResourceTypes:
        - AWS::EC2::SecurityGroup
      Source:
        Owner: AWS
        SourceIdentifier: INCOMING_SSH_DISABLED
```

Detect Whether MFA for the Root User is Enabled

This control detects whether multi-factor authentication (MFA) is enabled for the root user of the management account. MFA reduces vulnerability risks from weak authentication by requiring an additional authentication code after the user name and password are successful. This control

does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to require MFA for root access to accounts
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
  MaximumExecutionFrequency:
    Type: String
    Default: 24hours
    Description: The frequency that you want AWS Config to run evaluations for the
 rule.
    AllowedValues:
    - 1hour
    - 3hours
    - 6hours
    - 12hours
    - 24hours

Detect Whether Public Read Access to Amazon S3 Buckets is Allowed

This control detects whether public read access is allowed to Amazon S3 buckets. It helps you maintain secure access to data stored in the buckets. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check that your S3 buckets do not allow
 public access
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForS3PublicRead:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks that your S3 buckets do not allow public read access. If an
 S3 bucket policy or bucket ACL allows public read access, the bucket is noncompliant.
      Source:
        Owner: AWS
        SourceIdentifier: S3_BUCKET_PUBLIC_READ_PROHIBITED
      Scope:
        ComplianceResourceTypes:
          - AWS::S3::Bucket
```

Detect Whether Public Write Access to Amazon S3 Buckets is Allowed

This control detects whether public write access is allowed to Amazon S3 buckets. It helps you maintain secure access to data stored in the buckets. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
```

```
Description: Configure AWS Config rules to check that your S3 buckets do not allow
 public access
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForS3PublicWrite:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks that your S3 buckets do not allow public write access. If an
 S3 bucket policy or bucket ACL allows public write access, the bucket is noncompliant.
      Source:
        Owner: AWS
        SourceIdentifier: S3_BUCKET_PUBLIC_WRITE_PROHIBITED
      Scope:
        ComplianceResourceTypes:
          - AWS::S3::Bucket
```

Detect Whether Amazon EBS Volumes are Attached to Amazon EC2 Instances

This control detects whether an Amazon EBS volume device persists independently from an Amazon EC2 instance. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether EBS volumes are attached to
 EC2 instances
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
  deleteOnTermination:
    Type: 'String'
    Default: 'None'
    Description: 'Check for Delete on termination'
Conditions:
  deleteOnTermination:
    Fn::Not:
```

```
    - Fn::Equals:
      - 'None'
      - Ref: deleteOnTermination
Resources:
  CheckForEc2VolumesInUse:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether EBS volumes are attached to EC2 instances
      InputParameters:
        deleteOnTermination:
          Fn::If:

      Scope:
        ComplianceResourceTypes:
          - AWS::EC2::Volume
```

Detect Whether Amazon EBS Optimization is Enabled for Amazon EC2 Instances

Detects whether Amazon EC2 instances are launched without an Amazon EBS volume that is optimized for performance. Amazon EBS-optimized volumes minimize contention between Amazon EBS I/O and other traffic from your instance. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether EBS optimization is enabled
 for your EC2 instances that can be EBS-optimized
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForEbsOptimizedInstance:
    Type: AWS::Config::ConfigRule
```

```
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether EBS optimization is enabled for your EC2 instances
 that can be EBS-optimized
      Source:
        Owner: AWS
        SourceIdentifier: EBS_OPTIMIZED_INSTANCE
      Scope:
        ComplianceResourceTypes:
          - AWS::EC2::Instance
```

Detect Whether Public Access to Amazon RDS Database Instances is Enabled

Detects whether your Amazon RDS database instances allow public access. You can secure your Amazon RDS database instances by disallowing public access. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether Amazon RDS instances are not
 publicly accessible.
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForRdsPublicAccess:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether the Amazon Relational Database Service
 (RDS) instances are not publicly accessible. The rule is non-compliant if the
 publiclyAccessible field is true in the instance configuration item.
      Source:
        Owner: AWS
        SourceIdentifier: RDS_INSTANCE_PUBLIC_ACCESS_CHECK
      Scope:
        ComplianceResourceTypes:
          - AWS::RDS::DBInstance
```

Detect Whether Public Access to Amazon RDS Database Snapshots is Enabled

Detects whether your Amazon RDS database snapshots have public access enabled. You can protect your information by disabling public access. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Checks if Amazon Relational Database Service (Amazon RDS) snapshots are
 public.
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForRdsStorageEncryption:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks if Amazon Relational Database Service (Amazon RDS) snapshots
 are public. The rule is non-compliant if any existing and new Amazon RDS snapshots are
 public.
      Source:
        Owner: AWS
        SourceIdentifier: RDS_SNAPSHOTS_PUBLIC_PROHIBITED
      Scope:
        ComplianceResourceTypes:
          - AWS::RDS::DBSnapshot
```

Detect Whether Storage Encryption is Enabled for Amazon RDS Database Instances

Detects Amazon RDS database instances that are not encrypted at rest. You can secure your Amazon RDS database instances at rest by encrypting the underlying storage for database instances and their automated backups, Read Replicas, and snapshots. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether storage encryption is enabled
 for your RDS DB instances
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForRdsStorageEncryption:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether storage encryption is enabled for your RDS DB
 instances.
      Source:
        Owner: AWS
        SourceIdentifier: RDS_STORAGE_ENCRYPTED
      Scope:
        ComplianceResourceTypes:
          - AWS::RDS::DBInstance
```

Detect whether an account has AWS CloudTrail or CloudTrail Lake enabled

This control detects whether an account has AWS CloudTrail or CloudTrail Lake enabled. The rule is NON_COMPLIANT if either CloudTrail or CloudTrail Lake is not enabled in an account. This is a detective control with strongly recommended guidance. By default, this control is not enabled on any OUs.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to detect whether an account has AWS CloudTrail
 or CloudTrail Lake enabled.

Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'

Resources:
  CheckForCloudtrailEnabled:
    Type: AWS::Config::ConfigRule
```

```
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Detects whether an account has AWS CloudTrail or CloudTrail Lake
enabled. The rule is NON_COMPLIANT if either CloudTrail or CloudTrail Lake is not
enabled in an account.
      Source:
        Owner: AWS
        SourceIdentifier: CLOUD_TRAIL_ENABLED
```

Elective controls

Elective controls enable you to lock down or track attempts at performing commonly restricted actions in an AWS enterprise environment. These controls are not enabled by default, and can be disabled. Following, you'll find a reference for the elective controls available in AWS Control Tower. The elective controls specifically for data residency are collected into a separate section, Controls that enhance data residency protection.

The elective controls include the data residency controls, which are part of the **Digital sovereignty** group. For more information, see Digital sovereignty controls.

Topics

- Elective controls with detective behavior
- Elective controls with preventive behavior

Elective controls with detective behavior

The following elective controls have detective behavior.

Topics

- Detect Whether MFA is Enabled for AWS IAM Users
- Detect Whether MFA is Enabled for AWS IAM Users of the AWS Console
- Detect Whether Versioning for Amazon S3 Buckets is Enabled

Detect Whether MFA is Enabled for AWS IAM Users

This control detects whether MFA is enabled for AWS IAM users. You can protect your account by requiring MFA for all AWS users in the account. MFA requires an additional authentication code

after the user name and password are successful. This control does not change the status of the account. This is a detective control with elective guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether the IAM users have MFA enabled
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
  MaximumExecutionFrequency:
    Type: String
    Default: 1hour
    Description: The frequency that you want AWS Config to run evaluations for the
 rule.
    AllowedValues:
    - 1hour
    - 3hours
    - 6hours
    - 12hours
    - 24hours
Mappings:
  Settings:
    FrequencyMap:
      1hour   : One_Hour
      3hours  : Three_Hours
      6hours  : Six_Hours
      12hours : Twelve_Hours
      24hours : TwentyFour_Hours
Resources:
  CheckForIAMUserMFA:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether the AWS Identity and Access Management users have
 multi-factor authentication (MFA) enabled. The rule is COMPLIANT if MFA is enabled.
      Source:
        Owner: AWS
        SourceIdentifier: IAM_USER_MFA_ENABLED
      MaximumExecutionFrequency:
        !FindInMap
          - Settings
          - FrequencyMap
```

```
          - !Ref MaximumExecutionFrequency
```

Detect Whether MFA is Enabled for AWS IAM Users of the AWS Console

Protects your account by requiring MFA for all AWS IAM users in the console. MFA reduces vulnerability risks from weak authentication by requiring an additional authentication code after the user name and password are successful. This control detects whether MFA is enabled. This control does not change the status of the account. This is a detective control with elective guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether MFA is enabled for all AWS IAM
 users that use a console password.
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
  MaximumExecutionFrequency:
    Type: String
    Default: 1hour
    Description: The frequency that you want AWS Config to run evaluations for the
 rule.
    AllowedValues:
    - 1hour
    - 3hours
    - 6hours
    - 12hours
    - 24hours
Mappings:
  Settings:
    FrequencyMap:
      1hour   : One_Hour
      3hours  : Three_Hours
      6hours  : Six_Hours
      12hours : Twelve_Hours
      24hours : TwentyFour_Hours
Resources:
  CheckForIAMUserConsoleMFA:
    Type: AWS::Config::ConfigRule
    Properties:
```

```
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether AWS Multi-Factor Authentication (MFA) is enabled for
 all AWS Identity and Access Management (IAM) users that use a console password. The
 rule is COMPLIANT if MFA is enabled.
      Source:
        Owner: AWS
        SourceIdentifier: MFA_ENABLED_FOR_IAM_CONSOLE_ACCESS
      MaximumExecutionFrequency:
        !FindInMap
          - Settings
          - FrequencyMap
          - !Ref MaximumExecutionFrequency
```

Detect Whether Versioning for Amazon S3 Buckets is Enabled

Detects whether your Amazon S3 buckets are enabled for versioning. Versioning allows you to recover objects from accidental deletion or overwrite. This control does not change the status of the account. This is a detective control with elective guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether versioning is enabled for your
 S3 buckets.
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForS3VersioningEnabled:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether versioning is enabled for your S3 buckets.
      Source:
        Owner: AWS
        SourceIdentifier: S3_BUCKET_VERSIONING_ENABLED
      Scope:
        ComplianceResourceTypes:
          - AWS::S3::Bucket
```

Elective controls with preventive behavior

The following elective controls have preventive behavior.

The elective controls with preventive behavior are configurable. For more information about configurable controls, see Controls with parameters.

Topics

- [AWS-GR_AUDIT_BUCKET_ENCRYPTION_ENABLED] Enable encryption at rest for log archive
- [AWS-GR_AUDIT_BUCKET_LOGGING_ENABLED] Enable access logging for log archive
- [AWS-GR_AUDIT_BUCKET_POLICY_CHANGES_PROHIBITED] Disallow policy changes to log archive
- [AWS-GR_AUDIT_BUCKET_RETENTION_POLICY] Set a retention policy for log archive
- [AWS-GR_DISALLOW_CROSS_REGION_NETWORKING] Disallow cross-region networking for Amazon EC2, Amazon CloudFront, and AWS Global Accelerator
- [AWS-GR_DISALLOW_VPC_INTERNET_ACCESS] Disallow internet access for an Amazon VPC instance managed by a customer
- [AWS-GR_DISALLOW_VPN_CONNECTIONS] Disallow Amazon Virtual Private Network (VPN) connections
- [AWS-GR_RESTRICT_ROOT_USER_ACCESS_KEYS] Disallow creation of access keys for the root user
- [AWS-GR_RESTRICT_ROOT_USER] Disallow actions as a root user
- [AWS-GR_RESTRICT_S3_CROSS_REGION_REPLICATION] Disallow cross region replication for S3 buckets
- [AWS-GR_RESTRICT_S3_DELETE_WITHOUT_MFA] Disallow delete actions on S3 buckets without MFA
- [CT.CLOUDFORMATION.PR.1] Disallow management of resource types, modules, and hooks within the AWS CloudFormation registry

[AWS-GR_AUDIT_BUCKET_ENCRYPTION_ENABLED] Enable encryption at rest for log archive

Protect the integrity of your log archive through encryption at rest using server side encryption (SSE) with KMS customer-created master keys (CMK).

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon S3

Control metadata

- **Control objective:** Encrypt data at rest
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control groups:** digital-sovereignty
- **Resource types:** `AWS::S3::Bucket`

Usage considerations

- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRAUDITBUCKETENCRYPTIONENABLED",
            "Effect": "Deny",
            "Action": "s3:PutEncryptionConfiguration",
            "Resource": "*",
            "Condition": {
                "ArnNotLike": {
                    "aws:PrincipalARN": [
                        {{ExemptedPrincipalArns}}
```

```
                        "arn:*:iam::*:role/AWSControlTowerExecution"
                    ]
                }
            }
        }
    ]
}
```

[AWS-GR_AUDIT_BUCKET_LOGGING_ENABLED] Enable access logging for log archive

Track log archive access requests using S3 bucket access logging.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon S3

Control metadata

- **Control objective:** Establish logging and monitoring
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Resource types:** `AWS::S3::Bucket`

Usage considerations

- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRAUDITBUCKETLOGGINGENABLED",
            "Effect": "Deny",
            "Action": "s3:PutBucketLogging",
            "Resource": "*",
            "Condition": {
                "ArnNotLike": {
                    "aws:PrincipalARN": [
                        {{ExemptedPrincipalArns}}
                        "arn:*:iam::*:role/AWSControlTowerExecution"
                    ]
                }
            }
        }
    ]
}
```

[AWS-GR_AUDIT_BUCKET_POLICY_CHANGES_PROHIBITED] Disallow policy changes to log archive

Protect the integrity of your log archive by ensuring no policy changes happen to the S3 bucket by any user.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon S3

Control metadata

- **Control objective:** Protect data integrity
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower

- **Resource types:** `AWS::S3::Bucket`

Usage considerations

- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRAUDITBUCKETPOLICYCHANGESPROHIBITED",
            "Effect": "Deny",
            "Action": "s3:PutBucketPolicy",
            "Resource": "*",
            "Condition": {
                "ArnNotLike": {
                    "aws:PrincipalARN": [
                        {{ExemptedPrincipalArns}}
                        "arn:*:iam::*:role/AWSControlTowerExecution"
                    ]
                }
            }
        }
    ]
}
```

[AWS-GR_AUDIT_BUCKET_RETENTION_POLICY] Set a retention policy for log archive

Limit data retention in the log archive using a retention policy that defaults to 365 days.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon S3

Control metadata

- **Control objective:** Improve resiliency
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Resource types:** `AWS::S3::Bucket`

Usage considerations

- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRAUDITBUCKETRETENTIONPOLICY",
            "Effect": "Deny",
            "Action": "s3:PutLifecycleConfiguration",
            "Resource": "*",
            "Condition": {
                "ArnNotLike": {
                    "aws:PrincipalARN": [
                        {{ExemptedPrincipalArns}}
                        "arn:*:iam::*:role/AWSControlTowerExecution"
                    ]
```

```
                }
            }
        }
    ]
}
```

[AWS-GR_DISALLOW_CROSS_REGION_NETWORKING] Disallow cross-region networking for Amazon EC2, Amazon CloudFront, and AWS Global Accelerator

Disallow cross-region networking connections from Amazon EC2, Amazon CloudFront, and AWS Global Accelerator services.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon CloudFront, Amazon EC2, AWS Global Accelerator

Control metadata

- **Control objective:** Limit network access
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Resource types:** `AWS::CloudFront::Distribution`, `AWS::EC2::VPCPeeringConnection`, `AWS::EC2::TransitGatewayPeeringAttachment`, `AWS::GlobalAccelerator::Accelerator`, `AWS::GlobalAccelerator::EndpointGroup`, `AWS::GlobalAccelerator::Listener`

Usage considerations

- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRDISALLOWCROSSREGIONNETWORKING",
            "Effect": "Deny",
            "Action": [
                "cloudfront:CreateDistribution",
                "cloudfront:UpdateDistribution",

```

[AWS-GR_DISALLOW_VPC_INTERNET_ACCESS] Disallow internet access for an Amazon VPC instance managed by a customer

Disallow internet access for an Amazon Virtual Private Cloud (VPC) instance managed by a customer, rather than by an AWS service.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon EC2

Control metadata

- **Control objective:** Limit network access
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Control groups:** digital-sovereignty
- **Resource types:** `AWS::EC2::InternetGateway`, `AWS::EC2::EgressOnlyInternetGateway`, `AWS::EC2::VPC`, `AWS::EC2::Subnet`, `AWS::EC2::CarrierGateway`

Usage considerations

- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRDISALLOWVPCINTERNETACCESS",
            "Effect": "Deny",
            "Action": [
                "ec2:AttachEgressOnlyInternetGateway",
                "ec2:AttachInternetGateway",
                "ec2:CreateCarrierGateway",
                "ec2:CreateDefaultSubnet",
                "ec2:CreateDefaultVpc",
                "ec2:CreateEgressOnlyInternetGateway",
                "ec2:CreateInternetGateway"
            ],
            "Resource": "*",
```

```
            "Condition": {
                "ArnNotLike": {
                    "aws:PrincipalARN": [
                        {{ExemptedPrincipalArns}}
                        "arn:*:iam::*:role/AWSControlTowerExecution"
                    ]
                }
            }
        }
    ]
}
```

[AWS-GR_DISALLOW_VPN_CONNECTIONS] Disallow Amazon Virtual Private Network (VPN) connections

Disallows Virtual Private Network (VPN) connections (Site-to-Site VPN and Client VPN) to an Amazon Virtual Private Cloud (VPC).

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon EC2

Control metadata

- **Control objective:** Limit network access
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Resource types:** `AWS::EC2::VPNGateway`, `AWS::EC2::CustomerGateway`, `AWS::EC2::VPNConnection`, `AWS::EC2::ClientVpnEndpoint`, `AWS::EC2::ClientVpnTargetNetworkAssociation`, `AWS::EC2::ClientVpnAuthorizationRule`

Usage considerations

- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRDISALLOWVPNCONNECTIONS",
            "Effect": "Deny",
            "Action": [
                "ec2:AssociateClientVpnTargetNetwork",
                "ec2:AttachVPNGateway",
                "ec2:AuthorizeClientVpnIngress",
                "ec2:CreateClientVpnEndpoint",
                "ec2:CreateCustomerGateway",
                "ec2:CreateVPNGateway",
                "ec2:CreateVpnConnection",
                "ec2:ModifyClientVpnEndpoint",
                "ec2:ModifyVpnConnection"
            ],
            "Resource": "*"{% if ExemptedPrincipalArns %},
            "Condition": {
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }
            }{% endif %}
        }
    ]
}
```

[AWS-GR_RESTRICT_ROOT_USER_ACCESS_KEYS] Disallow creation of access keys for the root user

Secure your AWS accounts by disallowing creation of access keys for the root user, which will allow unrestricted access to all resources in the account. We recommend that you instead create access keys for an AWS Identity and Access Management (IAM) user for everyday interaction with your AWS account.

This is a preventive control with strongly-recommended guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: AWS Identity and Access Management (IAM)

Control metadata

- **Control objective:** Enforce least privilege
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Resource types:** `AWS::::Account`, `AWS::IAM::AccessKey`

Usage considerations

- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
```

```
            "Sid": "GRRESTRICTROOTUSERACCESSKEYS",
            "Effect": "Deny",
            "Action": "iam:CreateAccessKey",
            "Resource": "*",
            "Condition": {
                "ArnLike": {
                    "aws:PrincipalArn": [
                        "arn:*:iam::*:root"
                    ]
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[AWS-GR_RESTRICT_ROOT_USER] Disallow actions as a root user

Secure your AWS accounts by disallowing account access with root user credentials, which are credentials of the account owner and allow unrestricted access to all resources in the account. We recommend that you instead create AWS Identity and Access Management (IAM) users for everyday interaction with your AWS account.

This is a preventive control with strongly-recommended guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: AWS Identity and Access Management (IAM)

Control metadata

- **Control objective:** Enforce least privilege
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Resource types:** `AWS::::Account`

Usage considerations

- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRRESTRICTROOTUSER",
            "Effect": "Deny",
            "Action": "*",
            "Resource": "*",
            "Condition": {
                "StringLike": {
                    "aws:PrincipalArn": [
                        "arn:*:iam::*:root"
                    ]
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[AWS-GR_RESTRICT_S3_CROSS_REGION_REPLICATION] Disallow cross region replication for S3 buckets

Contain the location of your S3 data to a single region by disabling any automatic, asynchronous copying of objects across buckets to other AWS Regions.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon S3

Control metadata

- **Control objective:** Improve resiliency
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Resource types:** `AWS::S3::Bucket`

Usage considerations

- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRRESTRICTS3CROSSREGIONREPLICATION",
            "Effect": "Deny",
            "Action": "s3:PutReplicationConfiguration",
            "Resource": "*"{% if ExemptedPrincipalArns %},
            "Condition": {
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }
            }{% endif %}
        }
```

```
    ]
}
```

[AWS-GR_RESTRICT_S3_DELETE_WITHOUT_MFA] Disallow delete actions on S3 buckets without MFA

Protect your S3 buckets by requiring multi-factor authentication (MFA) for delete actions. MFA adds an extra authentication code on top of a user name and password.

This is a preventive control with elective guidance based on service control policies (SCPs). By default, this control is not enabled. You can enable this control through the AWS Control Tower console, or though the AWS Control Tower APIs.

AWS service: Amazon S3

Control metadata

- **Control objective:** Protect data integrity
- **Implementation:** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control owner:** AWS Control Tower
- **Resource types:** `AWS::S3::Bucket`

Usage considerations

- This control supports configuration. It contains elements that are included by AWS Control Tower conditionally, based on the configuration you select. This control supports the following configuration parameters: **ExemptedPrincipalArns**. For more information, see Configure controls with parameters.

The artifact for this control is the following service control policy (SCP).

```
{
```

```
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRRESTRICTS3DELETEWITHOUTMFA",
            "Effect": "Deny",
            "Action": [
                "s3:DeleteObject",
                "s3:DeleteBucket"
            ],
            "Resource": "*",
            "Condition": {
                "BoolIfExists": {
                    "aws:MultiFactorAuthPresent": [
                        "false"
                    ]
                }{% if ExemptedPrincipalArns %},
                "ArnNotLike": {
                    "aws:PrincipalArn": {{ExemptedPrincipalArns}}
                }{% endif %}
            }
        }
    ]
}
```

[CT.CLOUDFORMATION.PR.1] Disallow management of resource types, modules, and hooks within the AWS CloudFormation registry

This elective control disallows management of the following extension types in the AWS CloudFormation registry: resource types, modules, and hooks. For more information about AWS CloudFormation extensions, see Using the AWS CloudFormationregistry.

A typical use case for this control is a situation in which you do not wish to allow your organization to register AWS CloudFormation types. It prevents registration of types, and it prevents disabling existing AWS CloudFormation hooks.

- **Control objective:** Protect configurations
- **Implementation** Service control policy (SCP)
- **Control behavior:** Preventive
- **Control guidance:** Elective

- **Control owner:** AWS Control Tower
- **Control ID:** CT.CLOUDFORMATION.PR.1
- **Severity:** Critical
- **AWS Service:** AWS CloudFormation
- **Resource types:** `AWS::CloudFormation::HookDefaultVersion`, `AWS::CloudFormation::HookTypeConfig`, `AWS::CloudFormation::HookVersion`, `AWS::CloudFormation::ModuleDefaultVersion`, `AWS::CloudFormation::ModuleVersion`, `AWS::CloudFormation::ResourceDefaultVersion`, `AWS::CloudFormation::ResourceVersion`

The following example shows the SCP artifact for this control.

JSON

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRDISALLOWMODIFICATIONCFNREGISTRY",
            "Effect": "Deny",
            "Action": [
                "cloudformation:RegisterType",
                "cloudformation:DeregisterType",
                "cloudformation:SetTypeConfiguration",
                "cloudformation:SetTypeDefaultVersion",
                "cloudformation:PublishType"
            ],
            "Resource": [
                "*"
            ],
            "Condition": {
                "ArnNotLike": {
                    "aws:PrincipalARN": "arn:aws:iam::*:role/
AWSControlTowerExecution"
                }
            }
        }
    ]
```

```
}
```

Search for controls with Amazon Q

When you are logged into the AWS management console, Amazon Q can help you find the controls that you need to manage your AWS Control Tower environment. You can type prompts to Q, and find sumarized information about specific types or use cases for controls, such as these examples:

- What are the Digital Sovereignty controls?
- What controls in AWS Control Tower monitor S3?
- I have an AWS service running that uses Amazon ECS to host it, which controls from AWS Control Tower should I enable?
- What are preventive controls in AWS Control Tower?

Any time you'd like a paraphrase of information from the documentation, and a list of links for further reading, you can *ask Q*.

Amazon Q is more proficient at summarizing information from the documentation than at giving complete lists of controls. The lists of controls you may receive are helpful starting points. Amazon Q also provides tips for security and best practices.

Here's an example answer to the last example prompt.

What are preventive controls in AWS Control Tower?
Preventive controls in AWS Control Tower are an important part of the service's governance and compliance capabilities. Here's an overview of preventive controls in AWS Control Tower:
Purpose: Preventive controls are designed to disallow actions that could lead to policy violations or security risks. They help enforce configurations and prevent non-compliant resource changes.
Implementation: Preventive controls are implemented using Service Control Policies (SCPs), which are part of AWS Organizations.
Scope: These controls apply to entire organizational units (OUs) and affect every AWS account within the OU.
Function: They help express policy intentions and enforce governance rules across your AWS environment.

Examples of preventive controls:

- Requiring encryption at rest for certain services
- Enforcing multi-Availability Zone deployments for improved resiliency
- Restricting access to specific AWS Regions
- Digital Sovereignty: AWS Control Tower offers preventive controls that enhance digital sovereignty governance, covering areas such as data residency, granular access restrictions, encryption, and resiliency

Customization: While some controls are mandatory, others are strongly recommended or elective, allowing you to tailor your governance posture to your specific needs.
Management: You can view and manage these controls in the AWS Control Tower console, including a dedicated group for digital sovereignty-related controls
Exceptions: It's important to note that the root user and administrators in the management account have exceptions to these controls to prevent the account from becoming unusable.
When implementing preventive controls, it's crucial to follow the principle of least privilege and regularly review your control settings to ensure they align with your organization's security and compliance requirements. For the most up-to-date information on available controls and their specific functionalities, please refer to the official AWS Control Tower documentation.

Tagging `EnabledControl` resources in AWS Control Tower

You can add tags to `EnabledControl` resources by means of AWS CloudFormation templates, through the AWS Control Tower console, and by calling the AWS Control Tower APIs.

> **Note**
>
> The AWS Control Tower `GetEnabledControl`, `EnableControl`, and `ListTagsforResource` API operations rely on the `EnabledControl` resource tagging functionality for proper drift reporting.

Required permissions

When you configure resource tags with CloudFormation, you must add the new `ListTagsforResource` IAM permission to the policy for the customer-managed role that you use to update your controls. If you do not add the permission, the CloudFormation template may have the tags, but AWS CloudFormation cannot see them without the ability to call `ListTagsforResource`. If you already have created a role that updates your AWS Control Tower landing zone, that role probably has this permission in place already, because the same permission is required to view tags associated with the landing zone resource.

Step 1: Add the permissions

To tag a resource, update a tag, and enable proper drift reporting, three permissions are required, as shown in the example that follows.

JSON

```
{
 "Version": "2012-10-17",
 "Statement": [
  {
   "Sid": "VisualEditor0",
   "Effect": "Allow",
   "Action": [
    "controltower:TagResource",
```

```
    "controltower:ListTagsForResource",
    "controltower:UntagResource"
   ],
   "Resource": "*"
  }
 ]
}
```

CloudFormation drift

If you do not add the proper permissions, you can experience some side-effects that we refer to as *false positive or false negative CloudFormation drift*. During CloudFormation drift, the **Detect drift** command in the AWS CloudFormation console may not give reliable results. You also can encounter these side effects if you modify your CloudFormation resource outside the AWS CloudFormation console.

> **We strongly recommend**
>
> If you provision a resource, including a tag, with AWS CloudFormation, it is important to update the resource through AWS CloudFormation only.

When you experience *false positive* CloudFormation drift, the AWS CloudFormation console shows a **Modified** status (drifted) for a resource, although you are not aware of making any modifications. In this situation, the status means that you have not added the `ListTagsforResource` permission. When the permission is not present in the role, the `ReadHandler` cannot read the tags. AWS CloudFormation returns an error, because it cannot tell whether the resource actually was modified. The error is surfaced as **Modified** status.

When you experience *false negative drift* the CloudFormation console shows a resource as unmodified, when in fact, it has been modified. This situation means that the AWS Control Tower `EnabledControl` resource has tags, but CloudFormation cannot retrieve those tags. In this case, two things must have occurred: the resource has been modified outside AWS CloudFormation, which is not a recommended practice, and also the `ListTagsforResource` permission was not added to the policy.

Step 2. Add the tags to the resource

Here is an example CloudFormation resource template with tags added.

```
AWSTemplateFormatVersion: 2010-09-09
Resources:
  myEnabledControlTest:
    Type: 'AWS::ControlTower::EnabledControl'
    Properties:
      ControlIdentifier: 'arn:aws:controltower:us-west-2::control/ZTCMZEXAMPLE'
      TargetIdentifier: 'arn:aws:organizations::012345678901:ou/o-exampleou/ou-xxxx-
f35g82v9'
      Tags:
        - Key: "K1"
          Value: "V1"
      Parameters:
        - Key: AllowedRegions
          Value:
            - us-west-2
            - us-west-1
            - us-east-1
```

For more information, see EnabledControl in the *AWS CloudFormation User Guide*.

Controls and compliance

Within AWS Control Tower, compliance refers to the state of a resource, when it is evaluated with respect to a deployed detective control, or a drift detection rule. Compliance in AWS Control Tower is related to drift — usually, a non-compliant resource is in a state of drift. AWS Control Tower controls embody rules of compliance. They help you identify compliant and non-compliant resources by helping identify drift.

When AWS Control Tower evaluates the compliance of resources, it reports the compliance results at the OU, account, and control levels. This section describes compliance status in detail, for controls, OUs, and accounts.

Compliance reporting is intended to let cloud administrators know when the resources associated with the accounts in their organization are compliant with established policies. When the resources are in compliance, builders can provision new AWS accounts quickly in a few clicks.

When we talk about compliance in AWS Control Tower, we do not intend the same meaning as compliance with governmental regulations, such as data privacy or health information standards. However, AWS Control Tower can assist your organization to comply with many governmental regulations, sometimes referred to as *frameworks*.

- For more information about how AWS Control Tower helps you maintain compliance with governmental regulations and industry standards, see Compliance Validation.
- For more information about how you can verify AWS Control Tower resource compliance during AWS CloudFormation stack creation, see this blog post, How AWS Control Tower users can proactively verify compliance in AWS CloudFormationstacks.

For ongoing governance, administrators can enable pre-configured controls—clearly defined rules for security, operations, and compliance. These controls can:

- Prevent deployment of resources that don’t conform to policies (by means of preventive controls, implemented with SCPs, or by means of proactive controls, implemented with AWS CloudFormation hooks).
- Continuously monitor deployed resources for nonconformance (by means of detective controls, implemented with AWS Config rules).

Examples of compliance rules (controls) in AWS Control Tower:

- Detect Whether Public Write Access to Amazon S3 Buckets is Allowed
- Detect Whether Unrestricted Incoming TCP Traffic is Allowed

Examples of governmental compliance regulations (frameworks):

- The U.S. Health Insurance Portability and Accountability Act of 1996 (HIPAA)
- The European Union's General Data Protection Regulation of 2016 (GDPR)

How can administrators review compliance?

Compliance with detective controls is determined according to data retrieved from the AWS Config aggregator in the AWS Control Tower Audit account. You can review compliance status in the AWS Control Tower console, by subscribing to SNS topics that send email messages to the Audit account, or both.

Detective control status

To view the compliance status of detective controls in the AWS Control Tower console, select **Controls** in the left navigation, choose the control name from the controls table, and then scroll to the **Accounts** section on that control details page. Accounts may show a control compliance status of **Unknown** if any detective controls are misconfigured. For example, status **Unknown** often can appear due to account drift, such as **Moved account** drift. The **Unknown** status also can appear as a result of SCP drift.

> **Note**
>
> AWS Control Tower displays the compliance status of all AWS Config rules deployed into organizational units registered with AWS Control Tower, including rules that were activated outside of the AWS Control Tower console. To view the compliance status of all your Config rules, navigate to the **Account details** page in the AWS Control Tower console. You will see a list showing the compliance status of controls managed by AWS Control Tower and Config rules deployed outside of AWS Control Tower. You can identify any non-compliant AWS Config rule.

Preventive control status

The compliance status of preventive controls on an OU may be viewed on the **OU detail** page, by scrolling to the **Enabled controls** section. If any preventive controls are misconfigured for an OU, the **State** field for that OU may show the state of **Registration failed**, in the **Details** section near the top of the page. Preventive control misconfiguration is caused most often by SCP drift, which can occur if the control's SCP is modified or detached from the OU by means of the AWS Organizations console.

Proactive control status

The control compliance status also can be viewed on other pages:

- On the AWS Control Tower **Dashboard** page, by scrolling to the **Controls** section near the bottom of the page.
- On the **Control details** page, which you can view by selecting the name of a control on another page.

> **Note**
>
> The **State** of a control, as viewed in the AWS Control Tower console, reflects only the enabled or de-activated state of the control for a specific OU. This field does not reflect any information about the framework compliance status or the drift status of the landing zone environment. The control **State** and **Status** information is available in the console only. It is not available from the public API. To view the control status, navigate to the **Control details** page in the AWS Control Tower console.

Nested OUs and compliance

When an OU shows a status of **Noncompliant**, it means that one of the accounts directly under the OU contains noncompliant resources. The compliance status of an OU is not influenced by the compliance status of nested OUs under the OU, or the compliance status of any accounts that are not directly under the OU.

Other resources

If an account has any non-compliant resources, that account may be shown with **Noncompliant** status on the **OU** or **Account** page in the AWS Control Tower console. Details about the specific resources that have caused the non-compliant status are shown on the **Account details** page.

If an account shows **Compliant** status, that means it has no resources that are non-compliant; therefore, no resource details are shown on the **Account details** page, only an empty table.

Receive compliance status updates

To receive updates about compliance, you can subscribe to SNS topics that send notifications when resource compliance status changes. See Compliance notifications by SNS in the audit account, later in this chapter.

For more information on how AWS Control Tower collects information about resources, see the AWS Config Aggregator Documentation.

> **Drift changes the compliance status for OU and account resources**
>
> Drifted resources may be shown with status **Unknown** in the **Compliance** status field of the AWS Control Tower console. The **Unknown** state indicates that AWS Control Tower cannot determine the compliance status of the resource, because drift is present. Drift is not necessarily a detective control compliance violation. For more information about drift, see Detect and resolve drift in AWS Control Tower.
> In another case of this type of drift, resources may be shown as compliant when they are not. If you delete an AWS Config rule, or if you turn off the Config recorder, compliance status may be reflected inaccurately in the console, because compliance no longer can be evaluated. For example, if you turn off the Config recorder, the last evaluated status continues to appear in the console. Similarly, if you delete an AWS Config rule, the resources covered by that rule always show to be compliant. In this situation, your environment could have some non-compliant resources that are not reported. Avoid deleting or turning off your AWS Config resources.

AWS Control Tower compliance status for OUs and accounts

Compliance is reported in the AWS Control Tower dashboard for accounts and OUs. This section lists the possible categories of compliance and non-compliance in AWS Control Tower, assuming that controls are enabled for an account or an OU.

- **For an account or OU:** A compliance status of **Compliant**, **Noncompliant**, or **Unknown** is possible. The compliance status refers to the status of the resources associated with a single account, or the status of all accounts in an OU that has multiple controls enabled on it. The account or OU compliance status can be found on the account or OU detail pages.

> **Note**
>
> The **State** of a control, as viewed in the AWS Control Tower console, reflects only the enabled or de-activated state of the control for a specific OU. This field does not reflect any information about the framework compliance status or the drift status of the landing zone environment. The control **State** and **Status** information is available in the AWS Control Tower console. Enabled controls can be viewed through the public API.

The following list gives more information about compliance status as reported specifically for OUs and their member accounts.

- **`Compliant`** – Compliance rules are properly in place. No violations have been detected for any resources. Controls are applied at the OU level, for all enrolled accounts in the OU, and their resources.
  - **Reported for:** Detective controls (AWS Config Rules)
  - **What it checks:**
    - Any individual detective control that's applied to the member accounts in an OU
    - Multiple detective controls that are applied to the member accounts in an OU
- **`Noncompliant`** – Compliance rules are in place. However, non-compliant resources have been detected in one or more member accounts in the OU.
  - **Reported for:** Detective controls (AWS Config Rules)
  - **What it checks:**
    - Any individual detective control that's applied to the member accounts in an OU
    - Multiple detective controls that are applied to the member accounts in an OU

The following status can be reported for any account, control, or OU.

`Unknown` – A compliance rule is broken or compliance cannot be guaranteed.

- **Reported for:**
  - Detective controls (AWS Config Rules)
  - Preventive controls (SCPs)

- **What it checks:**
  - Any detective control that's enabled on any accounts that are members of an OU. Controls are enabled at the OU level.
  - Any preventive control that's enabled on any accounts that are members of an OU. Controls are enabled at the OU level.
  - Basically anything with a compliance status (account, control, resource, or OU).

Drift prevention and notification

You can enable certain controls and subscribe to certain SNS notifications that help you maintain compliance in AWS Control Tower.

Drift monitoring protection

AWS Control Tower provides passive and active methods of drift monitoring protection for preventive controls.

- **Passive protection:** AWS Organizations monitors and logs preventive control (SCP) drift.
- **Active protection:** The AWS Control Tower drift monitoring service actively scans the preventive control SCPs, on a regular basis.

AWS Control Tower notifies you by means of SNS messaging, if drift is detected.

Drift prevention

Some controls prevent modification of compliance reporting mechanisms.

- Disallow Changes to AWS Config Rules Set Up by AWS Control Tower (Mandatory, preventive control)
- Disallow Deletion of AWS Config Aggregation Authorizations Created by AWS Control Tower (Mandatory, preventive control)
- Disallow Changes to Tags Created by AWS Control Tower for AWS Config Resources (Mandatory, preventive control)
- Disallow Configuration Changes to AWS Config (Mandatory, preventive control)

In contrast to preventive controls, detective controls notify you of resources that violate the associated AWS Config rule.

To receive SNS notifications about drift and control compliance

For information about how to receive appropriate drift and control compliance notifications by Amazon SNS, see Compliance notifications by SNS in the audit account.

Publishers and subscribers for SNS topics

The `aws-controltower-AllConfigNotifications` topic:

- The `AWS::Config::DeliveryChannel` resource is configured to send notifications about configuration changes to this topic.
- The possible types of notifications that AWS Config can send are defined in the **Amazon SNS Topic** section of the AWS Config documentation.
- The `AWS::CloudTrail::Trail` resource is configured to send notifications of log file delivery to this topic.
- You may subscribe to this topic.

The `aws-controltower-SecurityNotifications` topic:

- The `AWS::Events::Rule` resource is configured to send notifications about AWS Config Rule compliance changes (one of the SNS notification types) to this topic.
- The `aws-controltower-NotificationForwarder` Lambda function is subscribed to this topic, and it forwards the SNS notifications to the `aws-controltower-AggregateSecurityNotifications` topic.

The `aws-controltower-AggregateSecurityNotifications` topic:

- This topic receives notifications from `aws-controltower-SecurityNotifications`, forwarded by the Lambda function.
- It also receives drift notifications in the home Region.
- When AWS Control Tower creates the topic, a subscription is added for the audit account email address, and you must confirm the subscription.

> **Note**
>
> The endpoint, such as an email address, must confirm each subscription, SNS doesn't send messages to an endpoint until the subscription is confirmed.

Compliance notifications by SNS in the audit account

To receive compliance change notifications in email sent to your audit account, subscribe to this Amazon SNS topic:

`arn:aws:sns:`*`AWSRegion`*`:`*`AuditAccount`*`:aws-controltower-AggregateSecurityNotifications`

When subscribing, substitute your actual AWS Control Tower home Region and audit account information into the topic name shown. You can subscribe to SNS topics that receive notifications about each supported AWS Region in which you run AWS Control Tower.

SNS topics and notifications you can receive

- The `aws-controltower-AllConfigNotifications` topic:

  It receives notifications from AWS Config regarding compliance, noncompliance, and change. It also receives notification from AWS CloudTrail on log file delivery.
- The `aws-controltower-SecurityNotifications` topic:

  One of these topics exists for each supported AWS Region. It receives compliance, noncompliance, and change notifications from AWS Config in that Region. It forwards all incoming notifications to `aws-controltower-AggregateSecurityNotifications`
- The `aws-controltower-AggregateSecurityNotifications` topic:

  This topic exists in each supported AWS Region. It receives compliance change notifications from the region-specific `aws-controltower-SecurityNotifications` topics. Additionally, in the home Region, it also receives drift notifications.

Other considerations about SNS topics:

- All of these topics exist and receive notifications in the Audit account.

- By default, the Audit account email address is subscribed to the `aws-controltower-AggregateSecurityNotifications` SNS topic.
- SNS topics in AWS Control Tower are extremely noisy, by design. For example, AWS Config sends a notification every time AWS Config discovers a new resource.
- Administrators who wish to filter out specific types of notifications from an SNS topic can create an AWS Lambda function and subscribe it to the SNS topic. Alternatively, you can set up an EventBridge rule to filter notifications, as described in this support article, How can I be notified when an AWS resource is non-compliant using AWS Config?
- AWS Config notifications contain a JSON object.
- AWS Control Tower drift notifications appear in plain text.

The AWS Config SNS topic policy

The AWS Config SNS topic policy contains the `aws:SourceOrgID` condition key. The policy is shown in the following example.

```
SNSAllConfigurationTopicPolicy:
   Type: AWS::SNS::TopicPolicy
   Properties:
     Topics:
       - !Ref SNSAllConfigurationTopic
     PolicyDocument:
       Statement:
         - Sid: AWSSNSPolicy
           Action:
             - sns:Publish
           Effect: Allow
           Resource: !Ref SNSAllConfigurationTopic
           Principal:
             Service:
               - cloudtrail.amazonaws.com
               - config.amazonaws.com
           Condition:
             StringEquals:
               aws:SourceOrgID: !Ref OrganizationId
```

AWS Region availability for AWS Control Tower controls

This section contains tables that show the AWS Region availability for controls. Older controls have a unique API identifier for each Region in which AWS Control Tower is available. Each control also has a global identifier. When you are working with the control APIs, you can provide the identifier for the Region in which you are making the API call, or the global identifier. We recommend that you provide the global identifier in most cases.

> **Note**
>
> If the table shows **N/A** in the **ARN** field, the control does not have a regional identifier, only a global identifier. To view global identifiers, see All global identifiers for AWS Control Tower controls.
