Creación de reglas AWS Config administradas con AWS CloudFormation plantillas

> **Important**
>
> Primero debe crear e iniciar el grabador de AWS Config configuración para poder crear reglas AWS Config administradas con AWS CloudFormation. Para obtener más información, consulte Administración del registrador de configuración.

Si necesita reglas AWS Config administradas compatibles, puede usar las CloudFormation plantillas para crear la regla para su cuenta o actualizar una CloudFormation pila existente. Una pila de es una colección de recursos relacionados que usted aprovisiona y actualiza como una única unidad. Al

iniciar una pila con una plantilla, la regla administrada por AWS Config se crea automáticamente. Las plantillas crean solo la regla y no crean AWS recursos adicionales.

> **Note**
>
> Cuando se actualizan las reglas AWS Config administradas, las plantillas se actualizan para adaptarse a los cambios más recientes. Para guardar una versión específica de una plantilla para una regla, descargue la plantilla y cárguela en su bucket de S3.

Para obtener más información sobre cómo trabajar con AWS CloudFormation plantillas, consulte Introducción a ellas AWS CloudFormation en la Guía del AWS CloudFormation usuario.

Para lanzar una CloudFormation pila de una regla AWS Config gestionada

1. Ve a la CloudFormationconsola y crea una pila nueva.
2. En Specify template (Especificar plantilla):
   - Si ha descargado la plantilla Upload a template file (Cargue un archivo de plantilla) y, a continuación, Choose file (Seleccionar archivo) para cargar la plantilla.
   - También puede elegir Amazon S3 URL y especificar la URL de ejemplo `http://s3.amazonaws.com/aws-configservice-us-east-1/cloudformation-templates-for-managed-rules/THE_RULE_IDENTIFIER.template`.

   > **Note**
   >
   > El identificador de la regla debe escribirse en ALL_CAPS_WITH_UNDERSCORES. Por ejemplo, CLOUDWATCH_LOG_GROUP_ENCRYPTED en lugar de. cloudwatch-log-group-encrypted
   > En algunas reglas, el identificador de la regla es diferente del nombre de la regla. Asegúrese de usar el identificador de la regla. Por ejemplo, el identificador de la regla de restricted-ssh es INCOMING_SSH_DISABLED.

3. Elija Siguiente.
4. En Especificar los detalles de la pila, escriba un nombre de pila e introduzca los valores de los parámetros de la regla. AWS Config Por ejemplo, si utiliza la plantilla de reglas administradas `DESIRED_INSTANCE_TYPE`, puede especificar el tipo de instancia, como "m4.large".

5. Elija Siguiente.
6. En Options, puede crear etiquetas o configurar otras opciones avanzadas. Estas opciones no son obligatorias.
7. Elija Siguiente.
8. En Review (Revisar), compruebe que la plantilla, los parámetros y otras opciones son correctos.
9. Seleccione Crear. La pila se crea en unos minutos. Puede ver la regla creada en la consola de AWS Config.

Puede usar las plantillas para crear una pila única para las reglas AWS Config administradas o actualizar una pila existente en su cuenta. Si elimina una pila, las reglas administradas que se hayan creado a partir de esa pila también se eliminarán. Para obtener más información, consulte Trabajo con pilas en la Guía del usuario de AWS CloudFormation .

AWS Config Reglas personalizadas

AWS Config Las reglas personalizadas son reglas que se crean desde cero. Hay dos formas de crear reglas AWS Config personalizadas: con funciones de Lambda (Guía para AWS Lambda desarrolladores) y con Guard (Guard GitHub Repository), un policy-as-code lenguaje.

AWS Config las reglas personalizadas creadas con Lambda se denominan reglas AWS Config Lambda AWS Config personalizadas y las reglas personalizadas creadas con Guard se denominan AWS Config reglas de políticas personalizadas.

Antes de utilizar reglas personalizadas, consulte Consideraciones.

AWS Config Reglas de políticas personalizadas

Las reglas escritas con Guard se pueden crear desde la AWS Config consola o mediante la AWS Config regla APIs. AWS Config Las reglas de políticas personalizadas le permiten crear reglas AWS Config personalizadas sin necesidad de usar Java o Python para desarrollar funciones Lambda para administrar sus reglas personalizadas. AWS Config Las reglas de políticas personalizadas se inician mediante cambios en la configuración. Para obtener más información sobre Guard, consulte el GitHubrepositorio de Guard.

AWS Config Reglas Lambda personalizadas

Las reglas Lambda personalizadas ofrecen la opción de usar Java o Python para crear una función Lambda para una regla personalizada. AWS Config Una función Lambda es un código personalizado

en el que se carga y se invoca mediante eventos publicados en ella por una fuente de eventos. AWS Lambda Si la función Lambda está asociada a una AWS Config regla, la AWS Config invoca cuando se inicia la regla. A continuación, la función Lambda evalúa la información de configuración que envía y devuelve los AWS Config resultados de la evaluación. Para obtener más información sobre las funciones de Lambda, consulte Function and Event Sources en la Guía para desarrolladores de AWS Lambda .

Diferencias de formato para las reglas personalizadas AWS Config

En la siguiente tabla se muestran las diferencias de formato en los campos del tipo de ConfigurationItemdatos y de las reglas AWS Config personalizadas.

ConfigurationItem	AWS Config Regla personalizada
`version`	`configurationItemVersion`
`accountId`	`awsAccountId`
`arn`	`ARN`
`configurationItemMD5Hash`	`configurationStateMd5Hash`

Temas

- Creación de reglas de políticas AWS Config personalizadas
- Creación de AWS Config reglas Lambda personalizadas
- Administración de recursos eliminados para AWS Config reglas Lambda personalizadas

Creación de reglas de políticas AWS Config personalizadas

Puede crear reglas de política AWS Config personalizadas desde la Consola de administración de AWS AWS CLI, o la AWS Config API.

Añadir reglas de política AWS Config personalizadas

Using the console

1. Inicia sesión en la AWS Config consola de https://console.aws.amazon.com/config/tu casa Consola de administración de AWS y ábrela.

2. En el Consola de administración de AWS menú, compruebe que el selector de regiones esté configurado en una AWS región que admita AWS Config reglas. Para ver una lista de las regiones admitidas, consulte AWS Config Regions and Endpoints en la Referencia general de Amazon Web Services.
3. En el panel de navegación izquierdo, seleccione Rules (Reglas).
4. En la página Rules (Reglas), seleccione Add rule (Añadir regla).
5. En la página Especificar tipo de regla, elija Crear una regla personalizada con Guard.
6. En la página Configurar regla, cree la regla siguiendo estos pasos:
   a. En Nombre, escriba un nombre único para la regla.
   b. En Descripción, escriba una descripción para la regla.
   c. Para la versión de tiempo de ejecución de Guard, elija el sistema de tiempo de ejecución para su regla de política AWS Config personalizada.
   d. Para Contenido de la regla, puede indicar la política personalizada de Guard correspondiente a su regla.
   e. Para el modo de evaluación, elija en qué momento del proceso de creación y administración de recursos AWS Config desea evaluar sus recursos. Según la regla, AWS Config puede evaluar las configuraciones de sus recursos antes de aprovisionar un recurso, después de aprovisionar un recurso o ambas cosas.
      i. Elija Active la evaluación proactiva para ejecutar evaluaciones de los valores de configuración de sus recursos antes de que se implementen.

         Una vez que hayas activado la evaluación proactiva, puedes usar la StartResourceEvaluationAPI y la GetResourceEvaluationSummaryAPI para comprobar si los recursos que especificas en estos comandos se marcarán como NO CONFORMES según las reglas proactivas de tu cuenta en tu región.

         Para obtener más información sobre el uso de estos comandos, consulta Cómo evaluar tus recursos con reglas. AWS Config Para obtener una lista de reglas administradas que admiten una evaluación proactiva, consulte la Lista de reglas AWS Config administradas por modo de evaluación.
      ii. Seleccione Active la evaluación de detectives para evaluar los ajustes de la configuración de los recursos existentes.

Para una evaluación detectivesca, las reglas de política AWS Config personalizadas se inician mediante cambios en la configuración. Esta opción estará preseleccionada.

- Recursos: cuando se crea, cambia o elimina un recurso específico que coincide con un tipo de recurso específico o con un tipo más el identificador.
- Etiquetas: cuando se crea, cambia o elimina un recurso con la etiqueta especificada.
- Todos los cambios: cuando AWS Config se crea, modifica o elimina un recurso registrado por.

AWS Config ejecuta la evaluación cuando detecta un cambio en un recurso que coincide con el alcance de la regla. Puede utilizar el ámbito para restringir qué recursos inician evaluaciones. De lo contrario, las evaluaciones se inician cuando se produce un cambio en un recurso aprovisionado posteriormente.

f. Si su regla incluye Parámetros, puede personalizar los valores de las claves proporcionadas. Un parámetro es un atributo que deben cumplir los recursos para que se considere que cumplen la regla.

7. En la página Revisar y crear, revise todas las selecciones antes de añadir la regla a la Cuenta de AWS.
8. Cuando termine de revisar las reglas, seleccione Agregar regla.

Using the AWS CLI

Utilice el comando `put-config-rule`.

El campo `Owner` debe ser `CUSTOM_POLICY`. Los siguientes campos adicionales son obligatorios para las reglas de política AWS Config personalizada:

- `Runtime`: El sistema de ejecución de sus reglas de política AWS Config personalizada.
- `PolicyText`: definición de la política que contiene la lógica de las reglas de políticas personalizadas de AWS Config .
- `EnableDebugLogDelivery`: La expresión booleana para habilitar el registro de depuración para la regla de política AWS Config personalizada. El valor predeterminado es `false`.

Using the API Reference

Utilice la acción PutConfigRule.

El campo `Owner` debe ser `CUSTOM_POLICY`. Los siguientes campos adicionales son obligatorios para las reglas de política AWS Config personalizada:

- `Runtime`: El sistema de ejecución de sus reglas de política AWS Config personalizada.
- `PolicyText`: definición de la política que contiene la lógica de las reglas de políticas personalizadas de AWS Config .
- `EnableDebugLogDelivery`: La expresión booleana para habilitar el registro de depuración para la regla de política AWS Config personalizada. El valor predeterminado es `false`.

Escribir el contenido de las reglas de las políticas personalizadas AWS Config

Con las reglas de políticas AWS Config personalizadas, puede usar el lenguaje específico de dominio (DSL) de AWS CloudFormation Guard para evaluar las configuraciones de los recursos. En este tema se proporcionan patrones y prácticas recomendadas para escribir reglas de políticas personalizadas.

Para obtener más información sobre cómo escribir reglas con Guard, consulte Cómo escribir reglas de Guard en la Guía del usuario de AWS CloudFormation Guard y los modos de funcionamiento de AWS CloudFormation Guard 2.0 en el repositorio de Guard. GitHub

Estructura básica de reglas

Utilice el siguiente formato básico para crear reglas:

```
# Basic rule format
rule <rule_name> when
    resourceType == "<AWS::Service::Resource>" {
    # Evaluation clauses
}

# Example with filtering
let resources_of_type = Resources.*[ Type == 'AWS::Service::Resource' ]
rule check_resources when %resources_of_type !empty {
    %resources_of_type.configuration.property == expected_value
}
```

Componentes principales

configuración

Incluye el contenido de la configuración de recursos.

supplementaryConfiguration

Contiene contenido adicional para la configuración de recursos. AWS Config devuelve este campo para determinados tipos de recursos a fin de complementar la información devuelta para el campo de configuración.

resourceType

AWS tipo de recurso que se está evaluando.

resourceId

ID del recurso (por ejemplo, `sg-xxxxxx`).

accountId

El Cuenta de AWS identificador de 12 dígitos asociado al recurso.

Patrones comunes

Status checks

```
let allowed_status = ['ACTIVE', 'RUNNING']
rule check_resource_status when
    resourceType == "AWS::Service::Resource" {
    configuration.status IN %allowed_status
}
```

Required properties

```
rule check_required_properties when
    resourceType == "AWS::Service::Resource" {
    configuration.propertyName exists
    configuration.propertyName is_string  # or is_list, is_struct
}
```

Query blocks

```
configuration.Properties {
```

```
    property1 exists
    property2 is_string
    property3 IN [allowed_value1, allowed_value2]
}
```

Conditional evaluation

```
when configuration.feature_enabled == true {
    configuration.feature_settings exists
    configuration.feature_settings is_struct
}
```

Custom messages

```
rule check_compliance when
    resourceType == "AWS::Service::Resource" {
    configuration.property == expected_value <<Custom error message explaining the
 requirement>>
}}
```

Características avanzadas

Range checks

```
rule check_numeric_limits {
    # Inclusive range (lower_limit <= value <= upper_limit)
    configuration.value IN r[minimum_value, maximum_value]

    # Exclusive range (lower_limit < value < upper_limit)
    configuration.value IN r(exclusive_min, exclusive_max)

    # Left inclusive, right exclusive (lower_limit <= value < upper_limit)
    configuration.value IN r[minimum_value, exclusive_max)

    # Left exclusive, right inclusive (lower_limit < value <= upper_limit)
    configuration.value IN r(exclusive_min, maximum_value]
}
```

Combining conditions

```
# AND conditions (implicit through new lines)
```

```
condition_1
condition_2

# OR conditions (explicit)
condition_3 OR
condition_4
```

Chaining rules

```
rule check_prerequisites {
    configuration.required_setting exists
}

rule check_details when check_prerequisites {
    configuration.required_setting == expected_value
}
```

Prácticas recomendadas

- Utilice variables con instrucciones `let` para mejorar la legibilidad.
- Agrupe comprobaciones relacionadas mediante bloques de reglas con nombre.
- Incluya comentarios descriptivos.
- Utilice operadores adecuados (`exists`, `is_string`, `is_list`).
- Utilice patrones de expresiones regulares sin distinción entre mayúsculas y minúsculas.

Ejemplo: dynamodb-pitr-enabled

El siguiente ejemplo muestra la definición de política para una versión de regla de política AWS Config personalizada de la regla AWS Config dynamodb-pitr-enabled administrada. Esta regla comprueba si las tablas Point-in-Time de DynamoDB tienen habilitada la recuperación.

```
# Check if DynamoDB tables have Point-in-Time Recovery enabled
let status = ['ACTIVE']

rule tableisactive when
    resourceType == "AWS::DynamoDB::Table" {
    configuration.tableStatus == %status
}
```

```
rule checkcompliance when
    resourceType == "AWS::DynamoDB::Table"
    tableisactive {
    let pitr =
 supplementaryConfiguration.ContinuousBackupsDescription.pointInTimeRecoveryDescription.pointIn
    %pitr == "ENABLED" <<DynamoDB tables must have Point-in-Time Recovery enabled>>
}
```

Creación de AWS Config reglas Lambda personalizadas

Puede desarrollar reglas personalizadas y añadirlas AWS Config con AWS Lambda funciones.

Cada regla personalizada se asocia a una función Lambda, que contiene la lógica que evalúa si los AWS recursos cumplen con la regla. Se asocia esta función a la regla y la regla invoca la función en respuesta a los cambios de configuración, o bien de forma periódica. A continuación, la función evalúa si los recursos cumplen con la regla y envía los resultados de la evaluación a. AWS Config

AWS Kit de desarrollo de reglas (RDK)

El kit de desarrollo de AWS reglas (RDK) está diseñado para respaldar un flujo de trabajo basado en el «cumplimiento según el código», que es intuitivo y productivo. Elimina gran parte del trabajo pesado e indiferenciado asociado a la implementación de AWS Config reglas respaldadas por funciones Lambda personalizadas y proporciona un proceso iterativo simplificado. develop-deploy-monitor

Para obtener step-by-step instrucciones, consulte la documentación del kit de desarrollo de AWS reglas (RDK).

Ejemplos de AWS Lambda funciones para AWS Config reglas (Node.js)

AWS Lambda ejecuta funciones en respuesta a eventos publicados por los AWS servicios. La función de una regla Lambda AWS Config personalizada recibe un evento publicado por y AWS Config, a continuación, utiliza los datos que recibe del evento y que recupera de la AWS Config API para evaluar el cumplimiento de la regla. Las operaciones que hay en una función de una regla de configuración son diferentes en función de si realiza una evaluación que se activa por los cambios en la configuración o se activa de forma periódica.

Para obtener información sobre los patrones comunes dentro de AWS Lambda las funciones, consulte el Modelo de programación en la Guía AWS Lambda para desarrolladores.

Example Function for Evaluations Triggered by Configuration Changes

AWS Config invocará una función como la del ejemplo siguiente cuando detecte un cambio en la configuración de un recurso que esté dentro del ámbito de una regla personalizada.

Si usa la AWS Config consola para crear una regla asociada a una función como en este ejemplo, elija Cambios de configuración como tipo de activación. Si usa la AWS Config API o AWS CLI para crear la regla, defina el `MessageType` atributo en `ConfigurationItemChangeNotification` y`OversizedConfigurationItemChangeNotification`. Estos ajustes permiten que la regla se active cada vez que se AWS Config genere un elemento de configuración o un elemento de configuración sobredimensionado como resultado de un cambio de recurso.

En este ejemplo, se evalúan los recursos y se comprueba si las instancias coinciden con el tipo de recurso: `AWS::EC2::Instance`. La regla se activa cuando AWS Config genera un elemento de configuración o una notificación de un elemento de configuración sobredimensionado.

```
'use strict';

import { ConfigServiceClient, GetResourceConfigHistoryCommand,
 PutEvaluationsCommand } from "@aws-sdk/client-config-service";

const configClient = new ConfigServiceClient({});

// Helper function used to validate input
function checkDefined(reference, referenceName) {
    if (!reference) {
        throw new Error(`Error: ${referenceName} is not defined`);
    }
    return reference;
}

// Check whether the message type is OversizedConfigurationItemChangeNotification,
function isOverSizedChangeNotification(messageType) {
    checkDefined(messageType, 'messageType');
    return messageType === 'OversizedConfigurationItemChangeNotification';
}

// Get the configurationItem for the resource using the getResourceConfigHistory
 API.
async function getConfiguration(resourceType, resourceId, configurationCaptureTime,
 callback) {
```

```
    const input = { resourceType, resourceId, laterTime: new
 Date(configurationCaptureTime), limit: 1 };
    const command = new GetResourceConfigHistoryCommand(input);
    await configClient.send(command).then(
        (data) => {
            callback(null, data.configurationItems[0]);
        },
        (error) => {
            callback(error, null);
        }
    );

}

// Convert the oversized configuration item from the API model to the original
 invocation model.
function convertApiConfiguration(apiConfiguration) {
    apiConfiguration.awsAccountId = apiConfiguration.accountId;
    apiConfiguration.ARN = apiConfiguration.arn;
    apiConfiguration.configurationStateMd5Hash =
 apiConfiguration.configurationItemMD5Hash;
    apiConfiguration.configurationItemVersion = apiConfiguration.version;
    apiConfiguration.configuration = JSON.parse(apiConfiguration.configuration);
    if ({}.hasOwnProperty.call(apiConfiguration, 'relationships')) {
        for (let i = 0; i < apiConfiguration.relationships.length; i++) {
            apiConfiguration.relationships[i].name =
 apiConfiguration.relationships[i].relationshipName;
        }
    }
    return apiConfiguration;
}

// Based on the message type, get the configuration item either from the
 configurationItem object in the invoking event or with the getResourceConfigHistory
 API in the getConfiguration function.
async function getConfigurationItem(invokingEvent, callback) {
    checkDefined(invokingEvent, 'invokingEvent');
    if (isOverSizedChangeNotification(invokingEvent.messageType)) {
        const configurationItemSummary =
 checkDefined(invokingEvent.configurationItemSummary, 'configurationItemSummary');
        await getConfiguration(configurationItemSummary.resourceType,
 configurationItemSummary.resourceId,
 configurationItemSummary.configurationItemCaptureTime, (err, apiConfigurationItem)
 => {
```

```
            if (err) {
                callback(err);
            }
            const configurationItem = convertApiConfiguration(apiConfigurationItem);
            callback(null, configurationItem);
        });
    } else {
        checkDefined(invokingEvent.configurationItem, 'configurationItem');
        callback(null, invokingEvent.configurationItem);
    }
}

// Check whether the resource has been deleted. If the resource was deleted, then
 the evaluation returns not applicable.
function isApplicable(configurationItem, event) {
    checkDefined(configurationItem, 'configurationItem');
    checkDefined(event, 'event');
    const status = configurationItem.configurationItemStatus;
    const eventLeftScope = event.eventLeftScope;
    return (status === 'OK' || status === 'ResourceDiscovered') && eventLeftScope
 === false;
}

// In this example, the resource is compliant if it is an instance and its type
 matches the type specified as the desired type.
// If the resource is not an instance, then this resource is not applicable.
function evaluateChangeNotificationCompliance(configurationItem, ruleParameters) {
    checkDefined(configurationItem, 'configurationItem');
    checkDefined(configurationItem.configuration,
 'configurationItem.configuration');
    checkDefined(ruleParameters, 'ruleParameters');

                    ComplianceResourceType: configurationItem.resourceType,
                    ComplianceResourceId: configurationItem.resourceId,
                    ComplianceType: compliance,
                    OrderingTimestamp: new
Date(configurationItem.configurationItemCaptureTime),
                },
            ];
        }
        putEvaluationsRequest.ResultToken = event.resultToken;

        // Sends the evaluation results to AWS Config.
        await configClient.send(new PutEvaluationsCommand(putEvaluationsRequest));
    });
```

```
};
```

Operaciones de funciones

La función realiza las siguientes operaciones en tiempo de ejecución:

1. La función se ejecuta cuando AWS Lambda pasa el `event` objeto a la `handler` función. En este ejemplo, la función acepta el `callback` parámetro opcional, que utiliza para devolver información a la persona que llama. AWS Lambda también pasa un `context` objeto, que contiene información y métodos que la función puede utilizar mientras se ejecuta. Tenga en cuenta que en las versiones más recientes de Lambda, el contexto ya no se usa.
2. La función comprueba si el `messageType` del evento es un elemento de configuración o un elemento de configuración sobredimensionado y, a continuación, devuelve el elemento de configuración.
3. El controlador llama a la función `isApplicable` para determinar si el recurso se ha eliminado.

   > **Note**
   >
   > Las reglas que informen sobre los recursos eliminados deben devolver el resultado de la evaluación de `NOT_APPLICABLE` para evitar evaluaciones innecesarias de las reglas.

4. El controlador llama a la `evaluateChangeNotificationCompliance` función y pasa los `ruleParameters` objetos `configurationItem` y AWS Config publicados en el evento.

   La función evalúa primero si el recurso es una instancia EC2. Si el recurso no es una instancia EC2, la función devuelve un valor de conformidad de `NOT_APPLICABLE`.

   Luego, la función evalúa si el atributo `instanceType` del elemento de configuración es igual al valor del parámetro `desiredInstanceType`. Si los valores son iguales, la función devuelve `COMPLIANT`. Si los valores no son iguales, la función devuelve `NON_COMPLIANT`.
5. El controlador se prepara para enviar los resultados de la evaluación AWS Config inicializando el objeto. `putEvaluationsRequest` Este objeto incluye el parámetro `Evaluations`, que identifica el resultado de conformidad, el tipo de recurso y el ID del recurso que se ha evaluado. El `putEvaluationsRequest` objeto también incluye el token de resultados del evento, que identifica la regla y el evento. AWS Config
6. El controlador envía los resultados de la evaluación pasando el objeto al `putEvaluations` método del `config` cliente. AWS Config

Example Function for Periodic Evaluations

AWS Config invocará una función como la del siguiente ejemplo para las evaluaciones periódicas. Las evaluaciones periódicas se producen con la frecuencia que especifique al definir la regla en AWS Config.

Si usa la AWS Config consola para crear una regla asociada a una función como en este ejemplo, elija Periódico como tipo de activación. Si usa la AWS Config API o AWS CLI para crear la regla, defina el `MessageType` atributo en`ScheduledNotification`.

En este ejemplo, se comprueba si el número total de un recurso especificado supera un máximo especificado.

```
'use strict';
import { ConfigServiceClient, ListDiscoveredResourcesCommand,
 PutEvaluationsCommand } from "@aws-sdk/client-config-service";

const configClient = new ConfigServiceClient({});

// Receives the event and context from AWS Lambda.
export const handler = async (event, context, callback) => {
    // Parses the invokingEvent and ruleParameters values, which contain JSON
 objects passed as strings.
    var invokingEvent = JSON.parse(event.invokingEvent),
        ruleParameters = JSON.parse(event.ruleParameters),
        numberOfResources = 0;

    if (isScheduledNotification(invokingEvent) &&
 hasValidRuleParameters(ruleParameters, callback)) {
        await countResourceTypes(ruleParameters.applicableResourceType, "",
 numberOfResources, async function (err, count) {
            if (err === null) {
                var putEvaluationsRequest;
                const compliance = evaluateCompliance(ruleParameters.maxCount,
 count);
                var annotation = '';
                if (compliance === "NON_COMPLIANT") {
                    annotation = "Description of why the resource is not
 compliant.";
                }
                // Initializes the request that contains the evaluation results.
                if (annotation) {
                    putEvaluationsRequest = {
```

```
                        Evaluations: [{
                            // Applies the evaluation result to the AWS account
 published in the event.
                            ComplianceResourceType: 'AWS::::Account',
                            ComplianceResourceId: event.accountId,
                            ComplianceType: compliance,
                            OrderingTimestamp: new Date(),
                            Annotation: annotation
                        }],
                        ResultToken: event.resultToken
                    };
                } else {
                    putEvaluationsRequest = {
                        Evaluations: [{
                            // Applies the evaluation result to the AWS account
 published in the event.
                            ComplianceResourceType: 'AWS::::Account',
                            ComplianceResourceId: event.accountId,
                            ComplianceType: compliance,
                            OrderingTimestamp: new Date()
                        }],
                        ResultToken: event.resultToken
                    };
                }

                // Sends the evaluation results to AWS Config.
                try {
                    await configClient.send(new
 PutEvaluationsCommand(putEvaluationsRequest));
                }
                catch (e) {
                    callback(e, null);
                }
            } else {
                callback(err, null);
            }
        });
    } else {
        console.log("Invoked for a notification other than Scheduled Notification...
 Ignoring.");
    }
};

// Checks whether the invoking event is ScheduledNotification.
```

```
function isScheduledNotification(invokingEvent) {
    return (invokingEvent.messageType === 'ScheduledNotification');
}

// Checks the rule parameters to see if they are valid
function hasValidRuleParameters(ruleParameters, callback) {
    // Regular express to verify that applicable resource given is a resource type
    const awsResourcePattern = /^AWS::(\w*)::(\w*)$/;
    const isApplicableResourceType =
 awsResourcePattern.test(ruleParameters.applicableResourceType);
    // Check to make sure the maxCount in the parameters is an integer
    const maxCountIsInt = !isNaN(ruleParameters.maxCount) &&
 parseInt(Number(ruleParameters.maxCount)) == ruleParameters.maxCount && !
isNaN(parseInt(ruleParameters.maxCount, 10));
    if (!isApplicableResourceType) {
        callback("The applicableResourceType parameter is not a valid resource
 type.", null);
    }
    if (!maxCountIsInt) {
        callback("The maxCount parameter is not a valid integer.", null);
    }
    return isApplicableResourceType && maxCountIsInt;
}

// Checks whether the compliance conditions for the rule are violated.
function evaluateCompliance(maxCount, actualCount) {
    if (actualCount > maxCount) {
        return "NON_COMPLIANT";
    } else {
        return "COMPLIANT";
    }
}

// Counts the applicable resources that belong to the AWS account.
async function countResourceTypes(applicableResourceType, nextToken, count,
 callback) {
    const input = { resourceType: applicableResourceType, nextToken: nextToken };
    const command = new ListDiscoveredResourcesCommand(input);
    try {
        const response = await configClient.send(command);
        count = count + response.resourceIdentifiers.length;
        if (response.nextToken !== undefined && response.nextToken != null) {
            countResourceTypes(applicableResourceType, response.nextToken, count,
 callback);
```

```
        }
        callback(null, count);
    } catch (e) {
        callback(e, null);
    }
    return count;
}
```

Operaciones de funciones

La función realiza las siguientes operaciones en tiempo de ejecución:

1. La función se ejecuta cuando AWS Lambda pasa el `event` objeto a la `handler` función. En este ejemplo, la función acepta el `callback` parámetro opcional, que utiliza para devolver información a la persona que llama. AWS Lambda también pasa un `context` objeto, que contiene información y métodos que la función puede utilizar mientras se ejecuta. Tenga en cuenta que en las versiones más recientes de Lambda, el contexto ya no se usa.
2. Para contar los recursos del tipo especificado, el controlador llama a la función `countResourceTypes` y pasa el parámetro `applicableResourceType` que ha recibido del evento. La función `countResourceTypes` llama al método `listDiscoveredResources` del cliente `config`, que devuelve una lista de identificadores para los recursos aplicables. La función utiliza la longitud de esta lista para determinar el número de recursos aplicables y devuelve este número al controlador.
3. El controlador se prepara para enviar los resultados de la evaluación AWS Config inicializando el `putEvaluationsRequest` objeto. Este objeto incluye el `Evaluations` parámetro, que identifica el resultado de conformidad y el Cuenta de AWS que se publicó en el evento. Puede utilizar el parámetro `Evaluations` para aplicar el resultado a cualquier tipo de recurso admitido por AWS Config. El `putEvaluationsRequest` objeto también incluye el token de resultado del evento, que identifica la regla y el evento AWS Config.
4. En el objeto `putEvaluationsRequest`, el controlador llama a la función `evaluateCompliance`. Esta función comprueba si el número de recursos aplicables supera el máximo asignado al parámetro `maxCount`, proporcionado anteriormente por el evento. Si el número de recursos supera el máximo, la función devuelve `NON_COMPLIANT`. Si el número de recursos no supera el máximo, la función devuelve `COMPLIANT`.
5. El controlador envía los resultados de la evaluación pasando el objeto al `putEvaluations` método del `config` cliente. AWS Config

Ejemplos de AWS Lambda funciones para AWS Config reglas (Python)

AWS Lambda ejecuta funciones en respuesta a eventos publicados por los AWS servicios. La función de una regla Lambda AWS Config personalizada recibe un evento publicado por y AWS Config, a continuación, utiliza los datos que recibe del evento y que recupera de la AWS Config API para evaluar el cumplimiento de la regla. Las operaciones que hay en una función de una regla de configuración son diferentes en función de si realiza una evaluación que se activa por los cambios en la configuración o se activa de forma periódica.

Para obtener información sobre los patrones comunes dentro de AWS Lambda las funciones, consulte el Modelo de programación en la Guía AWS Lambda para desarrolladores.

Example Function for Evaluations Triggered by Configuration Changes

AWS Config invocará una función como la del ejemplo siguiente cuando detecte un cambio en la configuración de un recurso que esté dentro del ámbito de una regla personalizada.

Si usa la AWS Config consola para crear una regla asociada a una función como en este ejemplo, elija Cambios de configuración como tipo de activación. Si usa la AWS Config API o AWS CLI para crear la regla, defina el `MessageType` atributo en `ConfigurationItemChangeNotification` y`OversizedConfigurationItemChangeNotification`. Estos ajustes permiten que la regla se active cada vez que se AWS Config genere un elemento de configuración o un elemento de configuración sobredimensionado como resultado de un cambio de recurso.

resource_type=DEFAULT_RESOURCE_TYPE))
    response = AWS_CONFIG_CLIENT.put_evaluations(Evaluations=evaluations,
ResultToken=event['resultToken'])
```

Operaciones de funciones

La función realiza las siguientes operaciones en tiempo de ejecución:

1. La función se ejecuta cuando AWS Lambda pasa el `event` objeto a la `handler` función. En este ejemplo, la función acepta el `callback` parámetro opcional, que utiliza para devolver información a la persona que llama. AWS Lambda también pasa un `context` objeto, que contiene información y métodos que la función puede utilizar mientras se ejecuta. Tenga en cuenta que en las versiones más recientes de Lambda, el contexto ya no se usa.
2. Para contar los recursos del tipo especificado, el controlador llama a la función `countResourceTypes` y pasa el parámetro `applicableResourceType` que ha recibido del evento. La función `countResourceTypes` llama al método `listDiscoveredResources` del cliente `config`, que devuelve una lista de identificadores para los recursos aplicables. La función utiliza la longitud de esta lista para determinar el número de recursos aplicables y devuelve este número al controlador.
3. El controlador se prepara para enviar los resultados de la evaluación AWS Config inicializando el `putEvaluationsRequest` objeto. Este objeto incluye el `Evaluations` parámetro, que identifica el resultado de conformidad y el Cuenta de AWS que se publicó en el evento. Puede utilizar el parámetro `Evaluations` para aplicar el resultado a cualquier tipo de recurso admitido por AWS Config. El `putEvaluationsRequest` objeto también incluye el token de resultado del evento, que identifica la regla y el evento AWS Config.
4. En el objeto `putEvaluationsRequest`, el controlador llama a la función `evaluateCompliance`. Esta función comprueba si el número de recursos aplicables supera el máximo asignado al parámetro `maxCount`, proporcionado anteriormente por el evento. Si el número de recursos supera el máximo, la función devuelve `NON_COMPLIANT`. Si el número de recursos no supera el máximo, la función devuelve `COMPLIANT`.

5. El controlador envía los resultados de la evaluación pasando el objeto al `putEvaluations` método del `config` cliente. AWS Config

Ejemplos de eventos para reglas AWS Config

Cuando se produce el desencadenador de una regla, AWS Config invoca la AWS Lambda función de la regla publicando un evento. A continuación, AWS Lambda ejecuta la función pasando el evento al controlador de la función.

Example Event for Evaluations Triggered by Configuration Changes

AWS Config publica un evento cuando detecta un cambio en la configuración de un recurso que está dentro del ámbito de una regla. El siguiente ejemplo de evento muestra que la regla se ha activado por un cambio de configuración en una instancia EC2.

```
{
    "invokingEvent": "{\"configurationItem\":{\"configurationItemCaptureTime
\":\"2016-02-17T01:36:34.043Z\",\"awsAccountId\":\"123456789012\",
\"configurationItemStatus\":\"OK\",\"resourceId\":\"i-00000000\",\"ARN
\":\"arn:aws:ec2:us-east-2:123456789012:instance/i-00000000\",\"awsRegion
\":\"us-east-2\",\"availabilityZone\":\"us-east-2a\",\"resourceType\":
\"AWS::EC2::Instance\",\"tags\":{\"Foo\":\"Bar\"},\"relationships\":[{\"resourceId
\":\"eipalloc-00000000\",\"resourceType\":\"AWS::EC2::EIP\",\"name\":\"Is
 attached to ElasticIp\"}],\"configuration\":{\"foo\":\"bar\"}},\"messageType\":
\"ConfigurationItemChangeNotification\"}",
    "ruleParameters": "{\"myParameterKey\":\"myParameterValue\"}",
    "resultToken": "myResultToken",
    "eventLeftScope": false,
    "executionRoleArn": "arn:aws:iam::123456789012:role/config-role",
    "configRuleArn": "arn:aws:config:us-east-2:123456789012:config-rule/config-
rule-0123456",
    "configRuleName": "change-triggered-config-rule",
    "configRuleId": "config-rule-0123456",
    "accountId": "123456789012",
    "version": "1.0"
}
```

Example Event for Evaluations Triggered by Oversized Configuration Changes

Algunos cambios de recursos generan elementos de configuración sobredimensionados. El siguiente ejemplo de evento muestra que la regla se ha activado por un cambio de configuración sobredimensionado en una instancia EC2.

```
{
        "invokingEvent": "{\"configurationItemSummary\": {\"changeType\":
 \"UPDATE\",\"configurationItemVersion\": \"1.2\",\"configurationItemCaptureTime
\":\"2016-10-06T16:46:16.261Z\",\"configurationStateId\": 0,\"awsAccountId
\":\"123456789012\",\"configurationItemStatus\": \"OK\",\"resourceType
\": \"AWS::EC2::Instance\",\"resourceId\":\"i-00000000\",\"resourceName
\":null,\"ARN\":\"arn:aws:ec2:us-west-2:123456789012:instance/i-00000000\",
\"awsRegion\": \"us-west-2\",\"availabilityZone\":\"us-west-2a\",
\"configurationStateMd5Hash\":\"8f1ee69b287895a0f8bc5753eca68e96\",
\"resourceCreationTime\":\"2016-10-06T16:46:10.489Z\"},\"messageType\":
\"OversizedConfigurationItemChangeNotification\"}",
        "ruleParameters": "{\"myParameterKey\":\"myParameterValue\"}",
        "resultToken": "myResultToken",
        "eventLeftScope": false,
        "executionRoleArn": "arn:aws:iam::123456789012:role/config-role",
        "configRuleArn": "arn:aws:config:us-east-2:123456789012:config-rule/config-
rule-ec2-managed-instance-inventory",
        "configRuleName": "change-triggered-config-rule",
        "configRuleId": "config-rule-0123456",
        "accountId": "123456789012",
        "version": "1.0"
    }
```

Example Event for Evaluations Triggered by Periodic Frequency

AWS Config publica un evento cuando evalúa sus recursos con la frecuencia que especifique (por ejemplo, cada 24 horas). El siguiente evento de ejemplo muestra que la regla se ha activado por una frecuencia periódica.

```
{
    "invokingEvent": "{\"awsAccountId\":\"123456789012\",\"notificationCreationTime
\":\"2016-07-13T21:50:00.373Z\",\"messageType\":\"ScheduledNotification\",
\"recordVersion\":\"1.0\"}",
    "ruleParameters": "{\"myParameterKey\":\"myParameterValue\"}",
    "resultToken": "myResultToken",
    "eventLeftScope": false,
    "executionRoleArn": "arn:aws:iam::123456789012:role/config-role",
    "configRuleArn": "arn:aws:config:us-east-2:123456789012:config-rule/config-
rule-0123456",
    "configRuleName": "periodic-config-rule",
    "configRuleId": "config-rule-6543210",
    "accountId": "123456789012",
    "version": "1.0"
```

```
}
```

Atributos del evento

El objeto JSON de un AWS Config evento contiene los siguientes atributos:

`invokingEvent`

El evento que dispara la evaluación de una regla. Si el evento se publica en respuesta a un cambio de configuración de recurso, el valor de este atributo es una cadena que contiene un `configurationItem` JSON o un `configurationItemSummary` (para elementos de configuración sobredimensionados). El elemento de configuración representa el estado del recurso en el momento en que AWS Config se detectó el cambio. Para ver un ejemplo de un elemento de configuración, consulte el resultado generado por el `get-resource-config-history` AWS CLI comando enVisualización del historial de configuración.

Si el evento se publica para una evaluación periódica, el valor es una cadena que contiene un objeto JSON. El objeto incluye información sobre la evaluación que se ha activado.

Para cada tipo de evento, una función debe analizar la cadena con un analizador JSON para poder evaluar su contenido, tal y como se muestra en el siguiente ejemplo Node.js:

```
var invokingEvent = JSON.parse(event.invokingEvent);
```

`ruleParameters`

Pares clave/valor que la función procesa como parte de su lógica de evaluación. Los parámetros se definen cuando se utiliza la AWS Config consola para crear una regla Lambda personalizada. También puede definir los parámetros con el `InputParameters` atributo de la solicitud de `PutConfigRule` AWS Config API o el `put-config-rule` AWS CLI comando.

El código JSON de los parámetros está almacenado dentro de una cadena, por lo que una función debe analizar la cadena con un analizador JSON para poder evaluar su contenido, tal y como se muestra en el siguiente ejemplo Node.js:

```
var ruleParameters = JSON.parse(event.ruleParameters);
```

`resultToken`

Un token al que la función debe pasar AWS Config con la `PutEvaluations` llamada.

`eventLeftScope`

Un valor booleano que indica si el AWS recurso que se va a evaluar se ha eliminado del ámbito de la regla. Si el valor es `true`, la función indica que la evaluación se puede pasar por alto aprobando `NOT_APPLICABLE` como el valor para el atributo `ComplianceType` en la llamada `PutEvaluations`.

`executionRoleArn`

El ARN de la función de IAM a la que está asignada. AWS Config

`configRuleArn`

El ARN que se AWS Config asignó a la regla.

`configRuleName`

El nombre que asignó a la regla que provocó AWS Config la publicación del evento y la invocación de la función.

`configRuleId`

El ID que se AWS Config asignó a la regla.

`accountId`

El ID del propietario Cuenta de AWS de la regla.

`version`

Un número de versión asignado por AWS. La versión aumentará si AWS agrega atributos a los AWS Config eventos. Si una función requiere un atributo que solo está en eventos que cumplan o superen una versión específica, entonces esa función puede comprobar el valor de este atributo.

La versión actual para los AWS Config eventos es la 1.0.

Administración de recursos eliminados para AWS Config reglas Lambda personalizadas

Las reglas que informen sobre los recursos eliminados deben devolver el resultado de la evaluación de `NOT_APPLICABLE` para evitar evaluaciones innecesarias de las reglas.

Al eliminar un recurso, AWS Config crea un `configurationItem` ancho `ResourceDeleted` para el`configurationItemStatus`. Puede utilizar estos metadatos para comprobar si una

regla informa sobre un recurso eliminado. Para obtener más información sobre los elementos de configuración, consulte Conceptos | Elementos de configuración.

Incluye los siguientes fragmentos de código para comprobar si hay recursos eliminados y establecer el resultado de la evaluación de una regla lambda AWS Config personalizada en `NOT_APPLICABLE` caso de que informe sobre un recurso eliminado:

Custom Lambda Rules (Node.js)

```
// Check whether the resource has been deleted. If the resource was deleted, then
 the evaluation returns not applicable.
function isApplicable(configurationItem, event) {
    checkDefined(configurationItem, 'configurationItem');
    checkDefined(event, 'event');
    const status = configurationItem.configurationItemStatus;
    const eventLeftScope = event.eventLeftScope;
    return (status === 'OK' || status === 'ResourceDiscovered') && eventLeftScope
 === false;
}
```

Custom Lambda Rules (Python)

```
# Check whether the resource has been deleted. If the resource was deleted, then the
 evaluation returns not applicable.
def is_applicable(configurationItem, event):
    try:
        check_defined(configurationItem, 'configurationItem')
        check_defined(event, 'event')
    except:
        return True
    status = configurationItem['configurationItemStatus']
    eventLeftScope = event['eventLeftScope']
    if status == 'ResourceDeleted':
        print("Resource Deleted, setting Compliance Status to NOT_APPLICABLE.")
    return (status == 'OK' or status == 'ResourceDiscovered') and not eventLeftScope
```

> **Note**
>
> AWS Config Las reglas administradas y las reglas de política AWS Config personalizadas controlan este comportamiento de forma predeterminada.

Si crea una regla lambd AWS Config personalizada con Python mediante el kit de AWS Config desarrollo (RDK) y la biblioteca del kit de AWS Config desarrollo (RDKlib), la clase Evaluator importada comprobará este comportamiento. Para obtener información sobre cómo escribir reglas con el RDK RDKlib, consulte Escribir reglas con el RDK y. RDKlib

Roles vinculados a servicios de AWS Config

Una regla vinculada al servicio de AWS Config es un tipo único de regla administrada de AWS Config compatible con otros servicios de AWS para crear reglas de AWS Config en su cuenta. Las reglas vinculadas a servicios están predefinidas para incluir todos los permisos necesarios para llamar a otros servicios de AWS en su nombre. Estas reglas son similares a las normas que un servicio de AWS recomienda en su Cuenta de AWS para una verificación de conformidad.

Estas reglas de AWS Config vinculadas al servicio son propiedad de los equipos del servicio de AWS. El equipo del servicio de AWS crea estas reglas en su Cuenta de AWS. Tiene acceso de solo lectura a estas reglas. No se puede editar ni eliminar estas reglas si se ha suscrito al servicio de AWS al que estas reglas están vinculadas.

Reglas vinculadas a servicios y la AWS Command Line Interface

Con la AWS CLI, las API PutConfigRule, DeleteConfigRule y DeleteEvaluationResults devuelven el acceso denegado con el siguiente mensaje de error:

```
INSUFFICIENT_SLCR_PERMISSIONS = "An AWS service owns
ServiceLinkedConfigRule. You do not have permissions to take action on this
rule."
```

Reglas vinculadas a servicios y la consola de AWS Config

En la consola de AWS Config, las reglas vinculadas al servicio de AWS Config se pueden ver en la página Reglas. Los botones Editar y Eliminar los resultados aparecen en gris en la consola para impedir la edición de la regla. Puede ver los detalles de la regla eligiendo la regla.

Reglas vinculadas a servicios, acciones de corrección y paquetes de conformidad

Para añadir acciones de corrección a las reglas vinculadas a un servicio de un paquete de conformidad, debe añadir la acción de corrección a la propia plantilla del paquete de conformidad y, a continuación, actualizar el paquete de conformidad con la plantilla actualizada. Para obtener

más información sobre la actualización de los paquetes de conformidad, consulte Deploying a Conformance Pack (Console), Deploying a Conformance Pack (AWS CLI) y Managing Organizational Conformance Packs.

Edición y eliminación de roles vinculados a servicios

Para editar o eliminar una regla vinculada a un servicio, póngase en contacto con el servicio de AWS que ha creado la regla. Por ejemplo, en el caso de las reglas vinculadas a servicios creadas por AWS Security Hub CSPM, puede eliminar una regla vinculada a un servicio siguiendo estos pasos en la Guía del usuario de AWS Security Hub CSPM: Disabling a security standard.

Administración de AWS Config reglas en todas las cuentas de su organización

> **Important**
>
> Las reglas de la organización solo se pueden crear con la API o la CLI. Esta operación no es compatible con la AWS Config consola.

AWS Config permite gestionar las AWS Config reglas en todos los Cuentas de AWS ámbitos de una organización. Puede:

- Cree, actualice y elimine AWS Config reglas de forma centralizada en todas las cuentas de su organización.
- Implemente un conjunto común de AWS Config reglas en todas las cuentas y especifique las cuentas en AWS Config las que no se deben crear reglas.
- APIs Utilícelas desde la cuenta de administración AWS Organizations para reforzar la gobernanza, asegurándose de que las cuentas de los miembros de su organización no puedan modificar las AWS Config reglas subyacentes.

Consideraciones

Para implementaciones en diferentes regiones

La llamada a la API para implementar reglas y paquetes de conformidad en todas las cuentas es específica de cada AWS región. En el nivel de organización, debe cambiar el contexto de la llamada

a la API a una región diferente si quiere implementar reglas en otras regiones. Por ejemplo, para implementar una regla en Este de EE. UU. (Norte de Virginia), cambie la región a Este de EE. UU. (Norte de Virginia) y, a continuación, llame a `PutOrganizationConfigRule`.

Para cuentas dentro de una organización

Si una cuenta nueva se une a una organización, la regla o el paquete de conformidad se implementan en esa cuenta. Cuando una cuenta abandona una organización, se elimina la regla o el paquete de conformidad.

Si implementa una regla organizativa o un paquete de conformidad en una cuenta de administrador de la organización y, a continuación, establece un administrador delegado e implementa una regla organizativa o un paquete de conformidad en la cuenta de administrador delegado, no podrá ver la regla organizativa ni el paquete de conformidad en la cuenta de administrador de la organización desde la cuenta de administrador delegado ni ver la regla organizativa ni el paquete de conformidad en la cuenta de administrador delegado desde la cuenta de administrador de la organización. El DescribeOrganizationConfigRulesy solo DescribeOrganizationConformancePacks APIs puede ver e interactuar con los recursos relacionados con la organización que se implementaron desde la cuenta a la que se hace referencia. APIs

Mecanismo de reintento para las cuentas nuevas que se agreguen a una organización

Si no hay ningún registrador disponible, solo se volverán a intentar implementar las reglas organizativas y los paquetes de conformidad existentes durante 7 horas después de añadir una cuenta a su organización. Se espera que cree un registrador si no existe uno dentro de las 7 horas siguientes a la adición de una cuenta a su organización.

Cuentas de administración de la organización, administradores delegados y roles vinculados a servicios

Si utilizas una cuenta de administración de la organización y piensas usar un administrador delegado para el despliegue organizacional, ten en cuenta que eso AWS Config no creará automáticamente el rol vinculado al servicio (SLR). Debe crear el rol vinculado al servicio (SLR) manualmente y por separado, mediante IAM.

Si no tiene un SLR para la cuenta de administración, no podrá implementar recursos en esa cuenta desde una cuenta de administrador delegado. Podrás seguir implementando AWS Config reglas en las cuentas de los miembros desde las cuentas de administración y de administrador delegado. Para obtener más información, consulte Uso de roles vinculados a servicios en la Guía del usuario de AWS Identity and Access Management (IAM).

Implementación

Para obtener información sobre cómo realizar la integración AWS Config con AWS Organizations, consulte AWS Config y AWS Organizations en la Guía del AWS Organizations usuario. Asegúrese de que la AWS Config grabación esté activada antes de utilizar lo siguiente APIs para gestionar AWS Config las reglas Cuentas de AWS en toda la organización:

- PutOrganizationConfigRule, agrega o actualiza la regla de configuración de la organización para toda la organización y evalúa si sus AWS recursos cumplen con las configuraciones deseadas.
- DescribeOrganizationConfigRules, devuelve una lista de reglas de configuración de la organización.
- GetOrganizationConfigRuleDetailedStatus, devuelve el estado detallado de cada cuenta de miembro de una organización para una regla de configuración de la organización determinada.
- GetOrganizationCustomRulePolicy, devuelve la definición de política que contiene la lógica de la regla de política personalizada de configuración de la organización.
- DescribeOrganizationConfigRuleStatuses, proporciona el estado de despliegue de la regla de configuración de la organización para una organización.
- DeleteOrganizationConfigRule, elimina la regla de configuración de la organización especificada y todos los resultados de su evaluación de todas las cuentas de los miembros de esa organización.

Compatibilidad de la región

En las siguientes regiones se admite la implementación de AWS Config reglas en las cuentas de los miembros de una AWS organización.

Nombre de la región	Región	Punto de conexión	Protocolo
Este de EE. UU. (Ohio)	us-east-2	config.us-east-2.amazonaws.com	HTTPS
Este de EE. UU.	us-east-1	config.us-east-1.amazonaws.com	HTTPS

Nombre de la región	Región	Punto de conexión	Protocolo
(Norte de Virginia)			
Oeste de EE. UU. (Norte de California)	us-west-1	config.us-west-1.amazonaws.com	HTTPS
Oeste de EE. UU. (Oregón)	us-west-2	config.us-west-2.amazonaws.com	HTTPS
África (Ciudad del Cabo)	af-south-1	config.af-south-1.amazonaws.com	HTTPS
Asia-Pacífico (Hong Kong)	ap-east-1	config.ap-east-1.amazonaws.com	HTTPS
Asia-Pacífico (Hyderabad)	ap-south-2	config.ap-south-2.amazonaws.com	HTTPS

Añadir AWS Config reglas

Puede utilizar la AWS Config consola o la AWS SDKs para añadir reglas.

Temas

- Adición de reglas (consola)
- Añadir reglas (AWS SDKs)

Adición de reglas (consola)

La página Reglas muestra las reglas y los resultados de conformidad actuales en una tabla. El resultado de cada regla es Evaluando... hasta que AWS Config termine de evaluar sus recursos con respecto a la regla. Puede actualizar los resultados con el botón de actualizar. Cuando AWS Config finalicen las evaluaciones, podrá ver las reglas y los tipos de recursos que cumplen o no. Para obtener más información, consulte Visualización de la información de cumplimiento y los resultados de la evaluación de sus AWS recursos con AWS Config.

> **Note**
>
> Cuando agrega una nueva regla, AWS Config evalúa los recursos aplicables en su inventario de recursos, incluidos los recursos registrados anteriormente. Por ejemplo, si ha registrado `AWS::IoT::Policy` los recursos pero luego los ha excluido del registro, AWS Config conserva los elementos de configuración iniciales (CIs) de su inventario. Aunque ya AWS Config no los actualiza CIs cuando los tipos de recursos asociados no se registran, conserva su último estado registrado y los evalúa al añadir las reglas aplicables.

AWS Config no evalúa los recursos que no estén en el inventario de recursos. Por ejemplo, si agregas la amplify-branch-tagged regla pero no registras ni has registrado nunca `AWS::Amplify::Branch` los recursos, no AWS Config podrás evaluar si las AWS Amplify sucursales de tu cuenta cumplen con las normas o no.
Para obtener más información, consulte Grabación de AWS recursos con AWS Config.

Adición de reglas

Para añadir una regla

1. Inicia sesión en la AWS Config consola de https://console.aws.amazon.com/config/tu casa Consola de administración de AWS y ábrela.
2. En el Consola de administración de AWS menú, compruebe que el selector de región esté configurado en una región que admita AWS Config reglas. Para ver una lista de las regiones admitidas, consulte Regiones y puntos de enlace de AWS Config en la Referencia general de Amazon Web Services.
3. En el panel de navegación izquierdo, seleccione Rules (Reglas).
4. En la página Rules (Reglas), seleccione Add rule (Añadir regla).
5. En la página Especificar tipo de regla, especifique el tipo de regla siguiendo estos pasos:
   a. En el campo de búsqueda para filtrar escriba la lista de las reglas administradas por nombre de regla, descripción y etiqueta. Por ejemplo, escriba EC2 para que devuelva las reglas que evalúan tipos de recursos de EC2 o escriba periodic para que devuelva reglas que se activen periódicamente.
   b. También puede crear sus propia regla personalizada. Elija Crear regla personalizada con Lambda o Crear regla personalizada con Guard y siga el procedimiento descrito en Creación de reglas AWS Config Lambda personalizadas o Creación AWS Config de reglas de políticas personalizadas.
6. En la página Configurar regla, configure la regla siguiendo estos pasos:
   a. En Name (Nombre), escriba un nombre único para la regla.
   b. En Descripción, escriba una descripción para la regla.
   c. Para el modo de evaluación, elija en qué momento del proceso de creación y administración de recursos desea AWS Config evaluar sus recursos. Según la regla, AWS Config puede

evaluar las configuraciones de sus recursos antes de que se haya desplegado un recurso, después de que se haya desplegado un recurso, o ambas cosas.

i. Elija Active la evaluación proactiva para ejecutar evaluaciones de los valores de configuración de sus recursos antes de que se implementen.

   Una vez que hayas activado la evaluación proactiva, puedes usar la StartResourceEvaluationAPI y la GetResourceEvaluationSummaryAPI para comprobar si los recursos que especificas en estos comandos se marcarán como NO CONFORMES según las reglas proactivas de tu cuenta de tu región.

   Para obtener más información sobre el uso de estos comandos, consulta Cómo evaluar tus recursos con reglas. AWS Config Para obtener una lista de reglas administradas que admiten una evaluación proactiva, consulte la Lista de reglas AWS Config administradas por modo de evaluación.

ii. Seleccione Active la evaluación de detectives para evaluar los ajustes de la configuración de los recursos existentes.

   Para la evaluación de detectives, existen dos tipos de desencadenadores: Cuando cambia la configuración y Periódico.

   A. Si los tipos de desencadenadores de la regla incluyen cambios de configuración, especifique una de las siguientes opciones para el alcance de los cambios con la que se AWS Config invoca la función Lambda:

      - Recursos: cuando se crea, cambia o elimina un recurso específico que coincide con un tipo de recurso específico o con un tipo más el identificador.
      - Etiquetas: cuando se crea, cambia o elimina un recurso con la etiqueta especificada.
      - Todos los cambios: cuando AWS Config se crea, modifica o elimina un recurso registrado por.

      AWS Config ejecuta la evaluación cuando detecta un cambio en un recurso que coincide con el alcance de la regla. Puede utilizar el ámbito para definir los recursos que activan evaluaciones.

   B. Si los tipos de desencadenadores de la regla incluyen Periódico, especifique la frecuencia con la que se AWS Config invoca la función Lambda.

d. Si su regla incluye Parámetros, puede personalizar los valores de las claves proporcionadas. Un parámetro es un atributo que deben cumplir los recursos para que se considere que cumplen la regla.

7. En la página Revisar y crear, revise todas las selecciones antes de añadir la regla a la Cuenta de AWS. Si la regla no funciona según lo previsto, puede que vea una de las siguientes opciones para Conformidad:

   - No se informó de ningún resultado: AWS Config evaluó sus recursos según la regla. La regla no se aplicaba a los AWS recursos incluidos en su ámbito, se eliminaron los recursos especificados o se eliminaron los resultados de la evaluación. Para obtener los resultados de la evaluación, actualice la regla, cambie su ámbito o bien seleccione Re-evaluate (Volver a evaluar).

     Este mensaje también puede aparecer si la regla no informa de resultados de evaluación.
   - No hay recursos dentro del alcance: AWS Config no puede evaluar AWS los recursos registrados según esta regla porque ninguno de sus recursos está dentro del alcance de la regla. Para obtener los resultados de la evaluación, edite la regla y cambie su alcance, o añada recursos AWS Config para registrarlos mediante la página de configuración.
   - Evaluations failed (Error en las evaluaciones): para obtener información que le ayude a determinar el problema, elija el nombre de la regla para abrir la página de detalles y ver el mensaje de error.

Añadir reglas (AWS SDKs)

Adición de reglas

Los siguientes ejemplos de código muestran cómo utilizar `PutConfigRule`.

CLI

AWS CLI

Para añadir una regla de Config AWS gestionada

El siguiente comando proporciona código JSON para añadir una regla de Config AWS gestionada:

```
aws configservice put-config-rule --config-rule file://
RequiredTagsForEC2Instances.json
```

`RequiredTagsForEC2Instances.json` es un archivo JSON que contiene la configuración de la regla:

```
{
  "ConfigRuleName": "RequiredTagsForEC2Instances",
  "Description": "Checks whether the CostCenter and Owner tags are applied to EC2
 instances.",
  "Scope": {
    "ComplianceResourceTypes": [
      "AWS::EC2::Instance"
    ]
  },
  "Source": {
    "Owner": "AWS",
    "SourceIdentifier": "REQUIRED_TAGS"
  },
  "InputParameters": "{\"tag1Key\":\"CostCenter\",\"tag2Key\":\"Owner\"}"
}
```

Para el `ComplianceResourceTypes` atributo, este código JSON limita el alcance a los recursos de este `AWS::EC2::Instance` tipo, por lo que AWS Config evaluará solo las instancias de EC2 según la regla. Puesto que la regla es una regla administrada, el atributo `Owner` se establece en `AWS` y el atributo `SourceIdentifier` en el identificador de la regla, `REQUIRED_TAGS`. Para el atributo `InputParameters`, se especifican las claves de etiqueta que requiere la regla, `CostCenter` y `Owner`.

Si el comando se ejecuta correctamente, AWS Config no devuelve ningún resultado. Para verificar la configuración de la regla, ejecute el describe-config-rules comando y especifique el nombre de la regla.

Adición de una regla de configuración administrada por el cliente

En el siguiente comando se proporciona un código JSON para añadir una regla de configuración administrada por el cliente:

```
aws configservice put-config-rule --config-rule file://
InstanceTypesAreT2micro.json
```

`InstanceTypesAreT2micro.json` es un archivo JSON que contiene la configuración de la regla:

```
{
  "ConfigRuleName": "InstanceTypesAreT2micro",
  "Description": "Evaluates whether EC2 instances are the t2.micro type.",
  "Scope": {
    "ComplianceResourceTypes": [
      "AWS::EC2::Instance"
    ]
  },
  "Source": {
    "Owner": "CUSTOM_LAMBDA",
    "SourceIdentifier": "arn:aws:lambda:us-
east-1:123456789012:function:InstanceTypeCheck",
    "SourceDetails": [
      {
        "EventSource": "aws.config",
        "MessageType": "ConfigurationItemChangeNotification"
      }
    ]
  },
  "InputParameters": "{\"desiredInstanceType\":\"t2.micro\"}"
}
```

Para el `ComplianceResourceTypes` atributo, este código JSON limita el alcance a los recursos de este `AWS::EC2::Instance` tipo, por lo que AWS Config evaluará solo las instancias de EC2 según la regla. Como esta regla es una regla administrada por el cliente, el `Owner` atributo se establece en y el `SourceIdentifier` atributo se establece en el ARN de la función Lambda AWS . `CUSTOM_LAMBDA` El objeto `SourceDetails` es obligatorio. Los parámetros que se especifican para el `InputParameters` atributo se pasan a la función AWS Lambda cuando AWS Config la invoca para evaluar los recursos en función de la regla.

Si el comando se ejecuta correctamente, AWS Config no devuelve ningún resultado. Para verificar la configuración de la regla, ejecute el describe-config-rules comando y especifique el nombre de la regla.

- Para obtener más información sobre la API, consulte PutConfigRulela Referencia de AWS CLI comandos.

Python

SDK para Python (Boto3)

> **Note**

Actualización de AWS Config reglas

Puede utilizar la AWS Config consola o la AWS SDKs para actualizar las reglas.

Temas

- Actualización de reglas (consola)
- Actualización de reglas (AWS SDKs)

Actualización de reglas (consola)

La página Reglas muestra las reglas y los resultados de conformidad actuales en una tabla. El resultado de cada regla es Evaluar... hasta que AWS Config termine de evaluar sus recursos con respecto a la regla. Puede actualizar los resultados con el botón de actualizar. Cuando AWS Config finalicen las evaluaciones, podrá ver las reglas y los tipos de recursos que cumplen o no. Para obtener más información, consulte Visualización de la información de cumplimiento y los resultados de la evaluación de sus AWS recursos con AWS Config.

Actualización de reglas

Para actualizar una regla

1. Inicie sesión en la AWS Config consola de su https://console.aws.amazon.com/config/casa Consola de administración de AWS y ábrala.
2. En el Consola de administración de AWS menú, compruebe que el selector de región esté configurado en una región que admita AWS Config reglas. Para ver una lista de las regiones admitidas, consulte Regiones y puntos de enlace de AWS Config en la Referencia general de Amazon Web Services.
3. En el panel de navegación izquierdo, seleccione Rules (Reglas).

4. Elija una regla y Editar la regla para la regla que desee actualizar.
5. Modifique la configuración de la página Editar la regla para cambiar la regla según sea necesario.
6. Seleccione Save.

Actualización de reglas (AWS SDKs)

Actualización de reglas

Si va a actualizar una regla que ha añadido anteriormente, puede especificar la regla por `ConfigRuleName`, `ConfigRuleId` o `ConfigRuleArn` en el tipo de datos `ConfigRule` que utiliza en esta solicitud. Se utiliza el mismo comando (`PutConfigRule`) que se utiliza al añadir una regla.

Los siguientes ejemplos de código muestran cómo utilizar `PutConfigRule`.

CLI

AWS CLI

Para añadir una regla de Config AWS gestionada

El siguiente comando proporciona código JSON para añadir una regla de Config AWS gestionada:

```
aws configservice put-config-rule --config-rule file://
RequiredTagsForEC2Instances.json
```

`RequiredTagsForEC2Instances.json` es un archivo JSON que contiene la configuración de la regla:

```
{
  "ConfigRuleName": "RequiredTagsForEC2Instances",
  "Description": "Checks whether the CostCenter and Owner tags are applied to EC2
 instances.",
  "Scope": {
    "ComplianceResourceTypes": [
      "AWS::EC2::Instance"
    ]
  },
  "Source": {
    "Owner": "AWS",
```

```
    "SourceIdentifier": "REQUIRED_TAGS"
  },
  "InputParameters": "{\"tag1Key\":\"CostCenter\",\"tag2Key\":\"Owner\"}"
}
```

Para el `ComplianceResourceTypes` atributo, este código JSON limita el alcance a los recursos de este `AWS::EC2::Instance` tipo, por lo que AWS Config evaluará solo las instancias de EC2 según la regla. Puesto que la regla es una regla administrada, el atributo `Owner` se establece en `AWS` y el atributo `SourceIdentifier` en el identificador de la regla, `REQUIRED_TAGS`. Para el atributo `InputParameters`, se especifican las claves de etiqueta que requiere la regla, `CostCenter` y `Owner`.

Si el comando se ejecuta correctamente, AWS Config no devuelve ningún resultado. Para verificar la configuración de la regla, ejecute el describe-config-rules comando y especifique el nombre de la regla.

Adición de una regla de configuración administrada por el cliente

En el siguiente comando se proporciona un código JSON para añadir una regla de configuración administrada por el cliente:

```
aws configservice put-config-rule --config-rule file://
InstanceTypesAreT2micro.json
```

`InstanceTypesAreT2micro.json` es un archivo JSON que contiene la configuración de la regla:

```
{
  "ConfigRuleName": "InstanceTypesAreT2micro",
  "Description": "Evaluates whether EC2 instances are the t2.micro type.",
  "Scope": {
    "ComplianceResourceTypes": [
      "AWS::EC2::Instance"
    ]
  },
  "Source": {
    "Owner": "CUSTOM_LAMBDA",
    "SourceIdentifier": "arn:aws:lambda:us-
east-1:123456789012:function:InstanceTypeCheck",
    "SourceDetails": [
      {
        "EventSource": "aws.config",
```

```
        "MessageType": "ConfigurationItemChangeNotification"
      }
    ]
  },
  "InputParameters": "{\"desiredInstanceType\":\"t2.micro\"}"
}
```

Para el `ComplianceResourceTypes` atributo, este código JSON limita el alcance a los recursos de este `AWS::EC2::Instance` tipo, por lo que AWS Config evaluará solo las instancias de EC2 según la regla. Como esta regla es una regla administrada por el cliente, el `Owner` atributo se establece en y el `SourceIdentifier` atributo se establece en el ARN de la función Lambda AWS . `CUSTOM_LAMBDA` El objeto `SourceDetails` es obligatorio. Los parámetros que se especifican para el `InputParameters` atributo se pasan a la función AWS Lambda cuando AWS Config la invoca para evaluar los recursos en función de la regla.

Si el comando se ejecuta correctamente, AWS Config no devuelve ningún resultado. Para verificar la configuración de la regla, ejecute el describe-config-rules comando y especifique el nombre de la regla.

- Para obtener más información sobre la API, consulte PutConfigRulela Referencia de AWS CLI comandos.

Python

Eliminar AWS Config reglas

Puede usar la AWS Config consola o la AWS SDKs para eliminar sus reglas.

Temas

- Consideraciones
- Eliminación de reglas (consola)
- Eliminar reglas (AWS SDKs)

Consideraciones

Recomendación: considere excluir el tipo de recurso **`AWS::Config::ResourceCompliance`** del registro antes de eliminar reglas

Al eliminar las reglas, se crean elementos de configuración (CIs) `AWS::Config::ResourceCompliance` que pueden afectar a los costes del registrador de configuración. Si elimina reglas que evalúan un gran número de tipos de recursos, esto puede provocar un aumento en el número de CIs registros.

Para evitar los costos asociados, puede optar por deshabilitar el registro para el tipo de recurso `AWS::Config::ResourceCompliance` antes de eliminar reglas y volver a habilitarlo una vez eliminadas las reglas.

Sin embargo, dado que la eliminación de reglas es un proceso asincrónico, puede tardar una hora o más en completarse. Durante el tiempo en que el registro esté deshabilitado para `AWS::Config::ResourceCompliance`, las evaluaciones de reglas no se registrarán en el historial de recursos asociado.

Eliminación de reglas (consola)

La página Reglas muestra las reglas y los resultados de conformidad actuales en una tabla. El resultado de cada regla es Evaluar... hasta que AWS Config termine de evaluar sus recursos con respecto a la regla. Puede actualizar los resultados con el botón de actualizar. Cuando AWS Config finalicen las evaluaciones, podrá ver las reglas y los tipos de recursos que cumplen o no. Para obtener más información, consulte Visualización de la información de cumplimiento y los resultados de la evaluación de sus AWS recursos con AWS Config.

> **Note**
>
> AWS Config evalúa solo los tipos de recursos que está registrando. Por ejemplo, si agregas la regla habilitada para CloudTrail pero no registras el tipo de recurso de la CloudTrail ruta, no AWS Config podrás evaluar si las rutas de tu cuenta cumplen o no lo hacen. Para obtener más información, consulte Grabación de AWS recursos con AWS Config.

Eliminación de reglas

Para eliminar una regla

1. Inicia sesión en la consola de tu casa Consola de administración de AWS y ábrela AWS Config . https://console.aws.amazon.com/config/
2. En el Consola de administración de AWS menú, compruebe que el selector de región esté configurado en una región que admita AWS Config reglas. Para ver una lista de las regiones admitidas, consulte Regiones y puntos de enlace de AWS Config en la Referencia general de Amazon Web Services.
3. En el panel de navegación izquierdo, seleccione Rules (Reglas).
4. Elija la regla que desea eliminar de la tabla.
5. En el menú desplegable Acciones, elija Eliminar la regla.
6. Cuando se le pida, escriba Eliminar (distingue entre mayúsculas y minúsculas) y, a continuación, seleccione Eliminar.

Eliminar reglas (AWS SDKs)

Eliminación de reglas

Los siguientes ejemplos de código muestran cómo utilizar `DeleteConfigRule`.

CLI

AWS CLI

Para eliminar una regla de AWS Config

El siguiente comando elimina una regla de AWS Config denominada`MyConfigRule`:

```
aws configservice delete-config-rule --config-rule-name MyConfigRule
```

- Para obtener más información sobre la API, consulte DeleteConfigRulela Referencia de AWS CLI comandos.

Python

SDK para Python (Boto3)

> **Note**

Visualización de los detalles y la información de cumplimiento de sus AWS Config reglas

> **Important**
>
> Para obtener informes precisos sobre el estado de cumplimiento, debe registrar el tipo de recurso de `AWS::Config::ResourceCompliance`. Para obtener más información, consulte AWS Recursos de grabación.

Puedes usar la AWS Config consola o la AWS SDKs para ver tus reglas.

Temas

- Visualización de las reglas (consola)
- Reglas de visualización (AWS SDKs)

Visualización de las reglas (consola)

La página Reglas muestra las reglas y los resultados de conformidad actuales en una tabla. El resultado de cada regla es Evaluar... hasta que AWS Config termine de evaluar sus recursos con

respecto a la regla. Puede actualizar los resultados con el botón de actualizar. Cuando AWS Config finalicen las evaluaciones, podrá ver las reglas y los tipos de recursos que cumplen o no. Para obtener más información, consulte Visualización de la información de cumplimiento y los resultados de la evaluación de sus AWS recursos con AWS Config.

> **Note**
>
> AWS Config evalúa solo los tipos de recursos que está registrando. Por ejemplo, si agregas la regla habilitada para CloudTrail pero no registras el tipo de recurso de la CloudTrail ruta, no AWS Config podrás evaluar si las rutas de tu cuenta cumplen o no lo hacen. Para obtener más información, consulte Grabación de AWS recursos con AWS Config.

Visualización de reglas

Para ver las reglas

1. Inicia sesión en la consola de tu casa Consola de administración de AWS y ábrela AWS Config . https://console.aws.amazon.com/config/
2. En el Consola de administración de AWS menú, compruebe que el selector de región esté configurado en una región que admita AWS Config reglas. Para ver una lista de las regiones admitidas, consulte Regiones y puntos de enlace de AWS Config en la Referencia general de Amazon Web Services.
3. En el panel de navegación izquierdo, seleccione Rules (Reglas).
4. La página de reglas muestra todas las reglas que tiene actualmente en su cuenta Cuenta de AWS. En ella se muestra el nombre, la acción correctiva asociada y el estado de conformidad de cada regla.
   - Elija Add rule (Añadir regla) para comenzar la creación de una regla.
   - Elija una regla para ver su configuración o elija una regla y Ver detalles.
   - Consulte el estado de conformidad de la regla cuando se evalúan los recursos.
   - Elija una regla y Editar la regla para cambiar los ajustes de configuración de la regla y establecer una acción correctiva para una regla no conforme.

Reglas de visualización (AWS SDKs)

Visualización de los detalles de las reglas

Los siguientes ejemplos de código muestran cómo utilizar `DescribeConfigRules`.

CLI

AWS CLI

Para obtener detalles de una regla de AWS Config

El siguiente comando devuelve los detalles de una regla de AWS Config denominada`InstanceTypesAreT2micro`:

```
aws configservice describe-config-rules --config-rule-
names InstanceTypesAreT2micro
```

Salida:

```
{
    "ConfigRules": [
        {
            "ConfigRuleState": "ACTIVE",
            "Description": "Evaluates whether EC2 instances are the t2.micro
 type.",
            "ConfigRuleName": "InstanceTypesAreT2micro",
            "ConfigRuleArn": "arn:aws:config:us-east-1:123456789012:config-rule/
config-rule-abcdef",
            "Source": {
                "Owner": "CUSTOM_LAMBDA",
                "SourceIdentifier": "arn:aws:lambda:us-
east-1:123456789012:function:InstanceTypeCheck",
                "SourceDetails": [
                    {
                        "EventSource": "aws.config",
                        "MessageType": "ConfigurationItemChangeNotification"
                    }
                ]
            },
            "InputParameters": "{\"desiredInstanceType\":\"t2.micro\"}",
            "Scope": {
                "ComplianceResourceTypes": [
```

```
                    "AWS::EC2::Instance"
                ]
            },
            "ConfigRuleId": "config-rule-abcdef"
        }
    ]
}
```

- Para obtener más información sobre la API, consulte DescribeConfigRuleslla Referencia de AWS CLI comandos.

PowerShell

Herramientas para la PowerShell versión 4

Ejemplo 1: En este ejemplo, se enumeran las reglas de configuración de la cuenta, con las propiedades seleccionadas.

```
Get-CFGConfigRule | Select-Object ConfigRuleName, ConfigRuleId, ConfigRuleArn,
 ConfigRuleState
```

Salida:

```
ConfigRuleName                                     ConfigRuleId
 ConfigRuleArn
 ConfigRuleState
--------------                                     ------------
 -------------
 ---------------
ALB_REDIRECTION_CHECK                              config-rule-12iyn3
 arn:aws:config-service:eu-west-1:123456789012:config-rule/config-rule-12iyn3
 ACTIVE
access-keys-rotated                                config-rule-aospfr

 ACTIVE
```

- Para obtener más información sobre la API, consulte DescribeConfigRules Herramientas de AWS para PowerShellCmdlet Reference (V4).

Herramientas para la versión 5 PowerShell

Ejemplo 1: En este ejemplo, se enumeran las reglas de configuración de la cuenta, con las propiedades seleccionadas.

```
Get-CFGConfigRule | Select-Object ConfigRuleName, ConfigRuleId, ConfigRuleArn,
 ConfigRuleState
```

Salida:

```
ConfigRuleName                                   ConfigRuleId
 ConfigRuleArn
 ConfigRuleState
--------------                                   ------------
 -------------
 ---------------
ALB_REDIRECTION_CHECK                            config-rule-12iyn3
 arn:aws:config-service:eu-west-1:123456789012:config-rule/config-rule-12iyn3
 ACTIVE
access-keys-rotated                              config-rule-aospfr
 arn:aws:config-service:eu-west-1:123456789012:config-rule/config-rule-aospfr
 ACTIVE
autoscaling-group-elb-healthcheck-required       config-rule-cn1f2x
 arn:aws:config-service:eu-west-1:123456789012:config-rule/config-rule-cn1f2x
 ACTIVE
```

- Para obtener más información sobre la API, consulte DescribeConfigRuleslla referencia de Herramientas de AWS para PowerShell cmdlets (V5).

Python

SDK para Python (Boto3)

> **Note**
>
> Hay más información al respecto. GitHub Busque el ejemplo completo y aprenda a configurar y ejecutar en el Repositorio de ejemplos de código de AWS.

```
class ConfigWrapper:
```

```
    """
    Encapsulates AWS Config functions.
    """

    def __init__(self, config_client):
        """
        :param config_client: A Boto3 AWS Config client.
        """
        self.config_client = config_client

    def describe_config_rule(self, rule_name):
        """
        Gets data for the specified rule.

        :param rule_name: The name of the rule to retrieve.
        :return: The rule data.
        """
        try:
            response = self.config_client.describe_config_rules(
                ConfigRuleNames=[rule_name]
            )
            rule = response["ConfigRules"]
            logger.info("Got data for rule %s.", rule_name)
        except ClientError:
            logger.exception("Couldn't get data for rule %s.", rule_name)
            raise
        else:
            return rule
```

- Para obtener más información sobre la API, consulta DescribeConfigRuleslla AWS Referencia de API de SDK for Python (Boto3).

SAP ABAP

SDK para SAP ABAP

> **Note**
>
> Hay más información al respecto. GitHub Busque el ejemplo completo y aprenda a configurar y ejecutar en el Repositorio de ejemplos de código de AWS.

```
    DATA(lo_result) = lo_cfs->describeconfigrules(
      it_configrulenames = VALUE /aws1/
cl_cfsconfigrulenames_w=>tt_configrulenames(
        ( NEW /aws1/cl_cfsconfigrulenames_w( iv_rule_name ) )
      )
    ).
    ot_cfg_rules = lo_result->get_configrules( ).
    MESSAGE 'Retrieved AWS Config rule data.' TYPE 'I'.
```

- Para obtener más información sobre la API, consulte DescribeConfigRuleslа referencia sobre la API ABAP del AWS SDK para SAP.

Visualización de información de conformidad para las reglas

Los siguientes ejemplos de código muestran cómo utilizar `DescribeComplianceByConfigRule`.

CLI

AWS CLI

Para obtener información sobre el cumplimiento de tus reglas de AWS Config

El siguiente comando devuelve la información de conformidad de cada regla de AWS Config que uno o más AWS recursos infrinjan:

```
aws configservice describe-compliance-by-config-rule --compliance-
types NON_COMPLIANT
```

En el resultado, el valor de cada atributo de `CappedCount` indica cuántos recursos no cumplen con la regla relacionada. Por ejemplo, el siguiente resultado indica que tres recursos no cumplen con la regla denominada `InstanceTypesAreT2micro`.

Salida:

```
{
    "ComplianceByConfigRules": [
        {
            "Compliance": {
                "ComplianceContributorCount": {
                    "CappedCount": 3,
                    "CapExceeded": false
                },
                "ComplianceType": "NON_COMPLIANT"
            },
            "ConfigRuleName": "InstanceTypesAreT2micro"
        },
        {
            "Compliance": {
                "ComplianceContributorCount": {
                    "CappedCount": 10,
                    "CapExceeded": false
                },
                "ComplianceType": "NON_COMPLIANT"
            },
            "ConfigRuleName": "RequiredTagsForVolumes"
        }
    ]
}
```

- Para obtener más información sobre la API, consulte DescribeComplianceByConfigRulela Referencia de AWS CLI comandos.

PowerShell

Herramientas para la PowerShell versión 4

Ejemplo 1: Este ejemplo recupera los detalles de conformidad de la regla ebs-optimized-instance, para los que no hay resultados de evaluación actuales, por lo que devuelve INSUFFICIENT_DATA

```
(Get-CFGComplianceByConfigRule -ConfigRuleName ebs-optimized-instance).Compliance
```

Salida:

```
ComplianceContributorCount ComplianceType
------------------------- --------------
                           INSUFFICIENT_DATA
```

Ejemplo 2: Este ejemplo devuelve el número de recursos no conformes para la regla ALB_HTTP_TO_HTTPS_REDIRECTION_CHECK.

```
(Get-CFGComplianceByConfigRule -ConfigRuleName
 ALB_HTTP_TO_HTTPS_REDIRECTION_CHECK -ComplianceType
 NON_COMPLIANT).Compliance.ComplianceContributorCount
```

Salida:

```
CapExceeded CappedCount
----------- -----------
False       2
```

- Para obtener más información sobre la API, consulte Cmdlet Reference (V4 DescribeComplianceByConfigRule).Herramientas de AWS para PowerShell

Herramientas para la versión 5 PowerShell

Ejemplo 1: Este ejemplo recupera los detalles de conformidad de la regla ebs-optimized-instance, para los que no hay resultados de evaluación actuales, por lo que devuelve INSUFFICIENT_DATA

```
(Get-CFGComplianceByConfigRule -ConfigRuleName ebs-optimized-instance).Compliance
```

Salida:

```
ComplianceContributorCount ComplianceType
------------------------- --------------
                           INSUFFICIENT_DATA
```

Ejemplo 2: Este ejemplo devuelve el número de recursos no conformes para la regla ALB_HTTP_TO_HTTPS_REDIRECTION_CHECK.

```
(Get-CFGComplianceByConfigRule -ConfigRuleName
 ALB_HTTP_TO_HTTPS_REDIRECTION_CHECK -ComplianceType
 NON_COMPLIANT).Compliance.ComplianceContributorCount
```

Salida:

```
CapExceeded CappedCount
----------- -----------
False       2
```

- Para obtener más información sobre la API, consulte Cmdlet Reference (V5 DescribeComplianceByConfigRule).Herramientas de AWS para PowerShell

Visualización del resumen de conformidad de las reglas

Los siguientes ejemplos de código muestran cómo utilizar `GetComplianceSummaryByConfigRule`.

CLI

AWS CLI

Para obtener el resumen de conformidad de tus reglas de AWS Config

El comando siguiente devuelve el número de reglas conformes y el de las reglas no conformes:

```
aws configservice get-compliance-summary-by-config-rule
```

En el resultado, el valor de cada atributo `CappedCount` indica el número de reglas conformes o no conformes.

Salida:

```
{
    "ComplianceSummary": {
        "NonCompliantResourceCount": {
            "CappedCount": 3,
            "CapExceeded": false
        },
```

```
        "ComplianceSummaryTimestamp": 1452204131.493,
        "CompliantResourceCount": {
            "CappedCount": 2,
            "CapExceeded": false
        }
    }
}
```

- Para obtener más información sobre la API, consulta GetComplianceSummaryByConfigRulela Referencia de AWS CLI comandos.

PowerShell

Herramientas para la PowerShell versión 4

Ejemplo 1: Este ejemplo devuelve el número de reglas de Config que no son conformes.

```
Get-CFGComplianceSummaryByConfigRule -Select
 ComplianceSummary.NonCompliantResourceCount
```

Salida:

```
CapExceeded CappedCount
----------- -----------
False       9
```

- Para obtener más información sobre la API, consulte GetComplianceSummaryByConfigRule Herramientas de AWS para PowerShellCmdlet Reference (V4).

Herramientas para la versión 5 PowerShell

Ejemplo 1: Este ejemplo devuelve el número de reglas de Config que no son conformes.

```
Get-CFGComplianceSummaryByConfigRule -Select
 ComplianceSummary.NonCompliantResourceCount
```

Salida:

```
CapExceeded CappedCount
----------- -----------
False       9
```

- Para obtener más información sobre la API, consulte GetComplianceSummaryByConfigRulela referencia de Herramientas de AWS para PowerShell cmdlets (V5).

Visualización de los resultados de la evaluación de las reglas

Los siguientes ejemplos de código muestran cómo utilizar `GetComplianceDetailsByConfigRule`.

CLI

AWS CLI

Para obtener los resultados de la evaluación de una regla de AWS Config

El siguiente comando devuelve los resultados de la evaluación de todos los recursos que no cumplen con una regla de AWS Config denominada`InstanceTypesAreT2micro`:

```
aws configservice get-compliance-details-by-config-rule --config-rule-
name InstanceTypesAreT2micro --compliance-types NON_COMPLIANT
```

Salida:

```
{
    "EvaluationResults": [
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-1a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314645.261,
            "ConfigRuleInvokedTime": 1450314642.948,
            "ComplianceType": "NON_COMPLIANT"
        },
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
```

```
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-2a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314645.18,
            "ConfigRuleInvokedTime": 1450314642.902,
            "ComplianceType": "NON_COMPLIANT"
        },
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-3a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314643.346,
            "ConfigRuleInvokedTime": 1450314643.124,
            "ComplianceType": "NON_COMPLIANT"
        }
    ]
}
```

- Para obtener más información sobre la API, consulta GetComplianceDetailsByConfigRulela Referencia de AWS CLI comandos.

PowerShell

Herramientas para la PowerShell versión 4

Ejemplo 1: En este ejemplo se obtienen los resultados de la evaluación de la regla access-keys-rotated y se devuelve el resultado agrupado por tipo de conformidad

```
Get-CFGComplianceDetailsByConfigRule -ConfigRuleName access-keys-rotated | Group-
Object ComplianceType
```

Salida:

```
Count Name                      Group
----- ----                      -----
```

```
    2 COMPLIANT                 {Amazon.ConfigService.Model.EvaluationResult,
 Amazon.ConfigService.Model.EvaluationResult}
    5 NON_COMPLIANT             {Amazon.ConfigService.Model.EvaluationResult,
 Amazon.ConfigService.Model.EvaluationResult,
 Amazon.ConfigService.Model.EvaluationRes...
```

Ejemplo 2: En este ejemplo se consultan los detalles de conformidad de la regla access-keys-rotated para los recursos de COMPLIANT.

```
Get-CFGComplianceDetailsByConfigRule -ConfigRuleName access-
keys-rotated -ComplianceType COMPLIANT | ForEach-Object
 {$_.EvaluationResultIdentifier.EvaluationResultQualifier}
```

Salida:

```
ConfigRuleName      ResourceId            ResourceType
--------------      ----------            ------------
access-keys-rotated BCAB1CDJ2LITAPVEW3JAH AWS::IAM::User
access-keys-rotated BCAB1CDJ2LITL3EHREM4Q AWS::IAM::User
```

- Para obtener más información sobre la API, consulte GetComplianceDetailsByConfigRule Herramientas de AWS para PowerShellCmdlet Reference (V4).

Herramientas para la versión 5 PowerShell

Ejemplo 1: En este ejemplo se obtienen los resultados de la evaluación de la regla access-keys-rotated y se devuelve el resultado agrupado por tipo de conformidad

```
Get-CFGComplianceDetailsByConfigRule -ConfigRuleName access-keys-rotated | Group-
Object ComplianceType
```

Salida:

```
Count Name                      Group
----- ----                      -----
    2 COMPLIANT                 {Amazon.ConfigService.Model.EvaluationResult,
 Amazon.ConfigService.Model.EvaluationResult}
    5 NON_COMPLIANT             {Amazon.ConfigService.Model.EvaluationResult,
 Amazon.ConfigService.Model.EvaluationResult,
 Amazon.ConfigService.Model.EvaluationRes...
```

Ejemplo 2: En este ejemplo se consultan los detalles de conformidad de la regla access-keys-rotated para los recursos de COMPLIANT.

```
Get-CFGComplianceDetailsByConfigRule -ConfigRuleName access-
keys-rotated -ComplianceType COMPLIANT | ForEach-Object
 {$_.EvaluationResultIdentifier.EvaluationResultQualifier}
```

Salida:

```
ConfigRuleName      ResourceId            ResourceType
--------------      ----------            ------------
access-keys-rotated BCAB1CDJ2LITAPVEW3JAH AWS::IAM::User
access-keys-rotated BCAB1CDJ2LITL3EHREM4Q AWS::IAM::User
```

- Para obtener más información sobre la API, consulte GetComplianceDetailsByConfigRule Herramientas de AWS para PowerShellCmdlet Reference (V5).

Activar la evaluación proactiva de AWS Config las reglas

Puede utilizar la AWS Config consola o la AWS SDKs para activar las reglas de evaluación proactiva. Para obtener una lista de tipos de recursos y reglas administradas que admiten evaluación proactiva, consulte Componentes de una regla | Modos de evaluación.

Temas

- Activación de la evaluación proactiva (consola)
- Activar la evaluación proactiva ()AWS SDKs

Activación de la evaluación proactiva (consola)

La página Reglas muestra las reglas y los resultados de conformidad actuales en una tabla. El resultado de cada regla es Evaluar... hasta que AWS Config termine de evaluar sus recursos con respecto a la regla. Puede actualizar los resultados con el botón de actualizar.

Cuando AWS Config finalicen las evaluaciones, podrá ver las reglas y los tipos de recursos que cumplen o no. Para obtener más información, consulte Visualización de la información de cumplimiento y los resultados de la evaluación de sus AWS recursos con AWS Config.

> **Note**
>
> AWS Config evalúa solo los tipos de recursos que está registrando. Por ejemplo, si agregas la regla habilitada para CloudTrail pero no registras el tipo de recurso de la CloudTrail ruta, no AWS Config podrás evaluar si las rutas de tu cuenta cumplen o no lo hacen. Para obtener más información, consulte Grabación de AWS recursos con AWS Config.

Activación de la evaluación proactiva

Puede utilizar la evaluación proactiva para evaluar los recursos antes de que se implementen. Esto te permite evaluar si un conjunto de propiedades de un recurso, si se utiliza para definir un AWS recurso, cumple o no lo es, dado el conjunto de reglas proactivas que tienes en tu cuenta en tu región.

El Esquema de tipos de recurso indica las propiedades de un recurso. Puede encontrar el esquema del tipo de recurso en "extensiones AWS públicas" en el AWS CloudFormation registro o con el siguiente comando CLI:

```
aws cloudformation describe-type --type-name "AWS::S3::Bucket" --type RESOURCE
```

Para obtener más información, consulte Administración de extensiones mediante el CloudFormation registro y la referencia sobre los tipos de AWS recursos y propiedades en la Guía del AWS CloudFormation usuario.

> **Note**
>
> Las reglas proactivas no corrigen los recursos que están marcados como NON_COMPLIANT ni impiden su implementación.

Para activar una evaluación proactiva

1. Inicie sesión en la AWS Config consola de su https://console.aws.amazon.com/config/casa Consola de administración de AWS y ábrala.
2. En el Consola de administración de AWS menú, compruebe que el selector de regiones esté configurado en una región que admita AWS Config reglas. Para ver una lista de las regiones de AWS admitidas, consulte AWS Config Regions and Endpoints en la Referencia general de Amazon Web Services.

3. En el panel de navegación izquierdo, seleccione Rules (Reglas). Para obtener una lista de reglas administradas que admiten una evaluación proactiva, consulte la Lista de reglas AWS Config administradas por modo de evaluación.
4. Elija una regla y, a continuación, elija Editar la regla para la regla que desee actualizar.
5. En Modo de evaluación, seleccione Active la evaluación proactiva para ejecutar evaluaciones de los valores de configuración de sus recursos antes de que se implementen.
6. Seleccione Save.

Una vez que haya activado la evaluación proactiva, puede utilizar la StartResourceEvaluationAPI y la GetResourceEvaluationSummaryAPI para comprobar si los recursos que especifique en estos comandos se marcarán como NO CONFORMES según las reglas proactivas de su cuenta de su región.

Por ejemplo, comience con la API: StartResourceEvaluation

```
aws configservice start-resource-evaluation --evaluation-mode PROACTIVE
                --resource-details '{"ResourceId":"MY_RESOURCE_ID",
                                     "ResourceType":"AWS::RESOURCE::TYPE",

 "ResourceConfiguration":"RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA",

 "ResourceConfigurationSchemaType":"CFN_RESOURCE_SCHEMA"}'
```

Debería recibir el `ResourceEvaluationId` en el resultado:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID"
}
```

A continuación, `ResourceEvaluationId` utilícela con la GetResourceEvaluationSummary API para comprobar el resultado de la evaluación:

```
aws configservice get-resource-evaluation-summary
    --resource-evaluation-id MY_RESOURCE_EVALUATION_ID
```

Debería obtener un resultado similar al siguiente:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID",
    "EvaluationMode": "PROACTIVE",
    "EvaluationStatus": {
        "Status": "SUCCEEDED"
    },
    "EvaluationStartTimestamp": "2022-11-15T19:13:46.029000+00:00",
    "Compliance": "COMPLIANT",
    "ResourceDetails": {
        "ResourceId": "MY_RESOURCE_ID",
        "ResourceType": "AWS::RESOURCE::TYPE",
        "ResourceConfiguration":
 "RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA"
    }
}
```

Para ver información adicional sobre el resultado de la evaluación, por ejemplo, qué regla marcó un recurso como NO CUMPLIDO, usa la API. GetComplianceDetailsByResource

Activar la evaluación proactiva ()AWS SDKs

Activación de la evaluación proactiva (AWS CLI)

Puede utilizar la evaluación proactiva para evaluar los recursos antes de que se implementen. Esto le permite evaluar si un conjunto de propiedades de un recurso, si se utiliza para definir un AWS recurso, cumpliría o no lo sería, dado el conjunto de reglas proactivas que tiene en su cuenta en su región.

El Esquema de tipos de recurso indica las propiedades de un recurso. Puede encontrar el esquema del tipo de recurso en "extensiones AWS públicas" en el AWS CloudFormation registro o con el siguiente comando CLI:

```
aws cloudformation describe-type --type-name "AWS::S3::Bucket" --type RESOURCE
```

Para obtener más información, consulte Administración de extensiones mediante el CloudFormation registro y la referencia sobre los tipos de AWS recursos y propiedades en la Guía del AWS CloudFormation usuario.

> **Note**
>
> Las reglas proactivas no corrigen los recursos que están marcados como NON_COMPLIANT ni impiden su implementación.

Para activar la evaluación proactiva

Utilice el comando `put-config-rule` y active `PROACTIVE` para `EvaluationModes`.

Una vez que haya activado la evaluación proactiva, puede usar el comando start-resource-evaluationCLI y el comando get-resource-evaluation-summaryCLI para comprobar si los recursos que especifique en estos comandos se marcarán como NO CONFORMES según las reglas proactivas de su cuenta en su región.

Por ejemplo, empiece con el comando start-resource-evaluation:

```
aws configservice start-resource-evaluation --evaluation-mode PROACTIVE
                --resource-details '{"ResourceId":"MY_RESOURCE_ID",
                                     "ResourceType":"AWS::RESOURCE::TYPE",

 "ResourceConfiguration":"RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA",

 "ResourceConfigurationSchemaType":"CFN_RESOURCE_SCHEMA"}'
```

Debería recibir el `ResourceEvaluationId` en el resultado:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID"
}
```

A continuación, utilice el `ResourceEvaluationId` junto con el get-resource-evaluation-summary para comprobar el resultado de la evaluación:

```
aws configservice get-resource-evaluation-summary
    --resource-evaluation-id MY_RESOURCE_EVALUATION_ID
```

Debería obtener un resultado similar al siguiente:

```
{
```

```
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID",
    "EvaluationMode": "PROACTIVE",
    "EvaluationStatus": {
        "Status": "SUCCEEDED"
    },
    "EvaluationStartTimestamp": "2022-11-15T19:13:46.029000+00:00",
    "Compliance": "COMPLIANT",
    "ResourceDetails": {
        "ResourceId": "MY_RESOURCE_ID",
        "ResourceType": "AWS::RESOURCE::TYPE",
        "ResourceConfiguration":
 "RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA"
    }
}
```

Para ver información adicional sobre el resultado de la evaluación, por ejemplo, qué regla marcó un recurso como NON_COMPLIANT, utilice el comando CLI -resourceget-compliance-details-by.

> **Note**
>
> Para obtener una lista de reglas administradas que admiten una evaluación proactiva, consulte Lista de reglas AWS Config administradas por modo de evaluación.

Activación de la evaluación proactiva (API)

Puede utilizar la evaluación proactiva para evaluar los recursos antes de que se implementen. Esto le permite evaluar si un conjunto de propiedades de un recurso, si se utiliza para definir un AWS recurso, cumple o no cumple con las normas proactivas de las que dispone en su cuenta de su región.

El Esquema de tipos de recurso indica las propiedades de un recurso. Puede encontrar el esquema del tipo de recurso en "extensiones AWS públicas" en el AWS CloudFormation registro o con el siguiente comando CLI:

```
aws cloudformation describe-type --type-name "AWS::S3::Bucket" --type RESOURCE
```

Para obtener más información, consulte Administración de extensiones mediante el CloudFormation registro y la referencia sobre los tipos de AWS recursos y propiedades en la Guía del AWS CloudFormation usuario.

> **Note**
>
> Las reglas proactivas no corrigen los recursos que están marcados como NON_COMPLIANT ni impiden su implementación.

Para activar la evaluación proactiva para una regla

Utilice la PutConfigRuleacción y habilite `PROACTIVE` para`EvaluationModes`.

Una vez que hayas activado la evaluación proactiva, puedes usar la StartResourceEvaluationAPI y la GetResourceEvaluationSummaryAPI para comprobar si los recursos que especificas en estos comandos se marcarán como NO CONFORMES según las reglas proactivas de tu cuenta de tu región. Por ejemplo, comience con la API: StartResourceEvaluation

```
aws configservice start-resource-evaluation --evaluation-mode PROACTIVE
                --resource-details '{"ResourceId":"MY_RESOURCE_ID",
                                     "ResourceType":"AWS::RESOURCE::TYPE",

 "ResourceConfiguration":"RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA",

 "ResourceConfigurationSchemaType":"CFN_RESOURCE_SCHEMA"}'
```

Debería recibir el `ResourceEvaluationId` en el resultado:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID"
}
```

A continuación, `ResourceEvaluationId` utilícela con la GetResourceEvaluationSummary API para comprobar el resultado de la evaluación:

```
aws configservice get-resource-evaluation-summary
    --resource-evaluation-id MY_RESOURCE_EVALUATION_ID
```

Debería obtener un resultado similar al siguiente:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID",
```

```
    "EvaluationMode": "PROACTIVE",
    "EvaluationStatus": {
        "Status": "SUCCEEDED"
    },
    "EvaluationStartTimestamp": "2022-11-15T19:13:46.029000+00:00",
    "Compliance": "COMPLIANT",
    "ResourceDetails": {
        "ResourceId": "MY_RESOURCE_ID",
        "ResourceType": "AWS::RESOURCE::TYPE",
        "ResourceConfiguration":
 "RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA"
    }
}
```

Para ver información adicional sobre el resultado de la evaluación, por ejemplo, qué regla marcó un recurso como NO CUMPLIDO, usa la API. GetComplianceDetailsByResource

> **Note**
>
> Para obtener una lista de reglas administradas que admiten la evaluación proactiva, consulte la Lista de reglas AWS Config administradas por modo de evaluación.

Envío de evaluaciones de reglas a Security Hub (CSPM)

Después de añadir una AWS Config regla, también puede enviar las evaluaciones de la regla a. AWS Security Hub CSPM La integración entre Security Hub CSPM AWS Config y Security Hub le permite clasificar y corregir las evaluaciones de las reglas, junto con otros errores de configuración y problemas de seguridad.

Envíe las evaluaciones de las reglas a Security Hub (CSPM)

Para enviar evaluaciones de reglas a Security Hub CSPM, primero debe configurar AWS Security Hub CSPM y AWS Config, a continuación, agregar al menos una regla AWS Config administrada o personalizada. Después de esto, comienza AWS Config inmediatamente a enviar las evaluaciones de las reglas al Security Hub CSPM. Security Hub CSPM enriquece las evaluaciones de reglas y las transforma en hallazgos de Security Hub CSPM.

Para obtener más información sobre esta integración, consulte las integraciones de AWS servicios disponibles en la Guía del usuario. AWS Security Hub CSPM

Evaluación de sus recursos con AWS Config reglas

Cuando crea reglas personalizadas o utiliza reglas administradas, AWS Config evalúa sus recursos en función de esas reglas. Puede realizar evaluaciones bajo demanda de los recursos con respecto a sus reglas. Por ejemplo, esto resulta útil cuando se crea una regla personalizada y se desea comprobar si AWS Config se están evaluando correctamente los recursos o si hay algún problema con la lógica de evaluación de la AWS Lambda función.

Ejemplo

1. Puede crear una regla personalizada que evalúe si los usuarios de IAM tienen claves de acceso activas.
2. AWS Config evalúa los recursos en función de la regla personalizada.
3. Hay un usuario de IAM que no tiene una clave de acceso activa en su cuenta. La regla no marca correctamente este recurso como NON_COMPLIANT.
4. Puede corregir la regla y empezar de nuevo la evaluación.
5. Dado que ha corregido la regla, la regla evalúa correctamente los recursos y marca el recurso de usuario de IAM como NON_COMPLIANT.

Al agregar una regla a su cuenta, puede especificar en qué momento del proceso de creación y administración de recursos desea AWS Config evaluar sus recursos. El proceso de creación y administración de los recursos se denomina aprovisionamiento de recursos. Usted elige el modo de evaluación para especificar en qué momento de este proceso AWS Config desea evaluar sus recursos.

Según la regla, AWS Config puede evaluar las configuraciones de los recursos antes de que se haya desplegado un recurso, después de que se haya desplegado un recurso, o ambas cosas. Evaluar un recurso antes de implementarlo se denomina evaluación proactiva. Evaluar un recurso después de implementarlo se denomina evaluación de detectives.

Modo proactivo

Utilice una evaluación proactiva para evaluar los recursos antes de que se implementen. Esto le permite evaluar si un conjunto de propiedades de un recurso, si se utiliza para definir un AWS recurso, es conforme o no, dado el conjunto de reglas proactivas que tiene en su cuenta en su región.

El Esquema de tipos de recurso indica las propiedades de un recurso. Puede encontrar el esquema del tipo de recurso en "extensiones AWS públicas" en el AWS CloudFormation registro o con el siguiente comando CLI:

```
aws cloudformation describe-type --type-name "AWS::S3::Bucket" --type RESOURCE
```

Para obtener más información, consulte Administración de extensiones mediante el CloudFormation registro y la referencia sobre los tipos de AWS recursos y propiedades en la Guía del AWS CloudFormation usuario.

> **Note**
>
> Las reglas proactivas no corrigen los recursos que están marcados como NON_COMPLIANT ni impiden su implementación.

Evaluación de sus recursos

Para activar una evaluación proactiva

1. Inicie sesión en la AWS Config consola de su https://console.aws.amazon.com/config/casa Consola de administración de AWS y ábrala.
2. En el Consola de administración de AWS menú, compruebe que el selector de regiones esté configurado en una región que admita AWS Config reglas. Para ver una lista de las regiones de AWS admitidas, consulte AWS Config Regions and Endpoints en la Referencia general de Amazon Web Services.
3. En el panel de navegación izquierdo, seleccione Rules (Reglas). Para obtener una lista de reglas administradas que admiten una evaluación proactiva, consulte la Lista de reglas AWS Config administradas por modo de evaluación.
4. Elija una regla y, a continuación, elija Editar la regla para la regla que desee actualizar.
5. En Modo de evaluación, seleccione Active la evaluación proactiva para ejecutar evaluaciones de los valores de configuración de sus recursos antes de que se implementen.
6. Seleccione Save.

> **Note**
>
> También puede activar la evaluación proactiva mediante el `put-config-rule`comando y habilitar `PROACTIVE` `EvaluationModes` o usar la PutConfigRuleacción y habilitar `PROACTIVE` for`EvaluationModes`.

Una vez que hayas activado la evaluación proactiva, puedes usar la StartResourceEvaluationAPI y la GetResourceEvaluationSummaryAPI para comprobar si los recursos que especifiques en estos comandos se marcarán como NO CONFORMES según las reglas proactivas de tu cuenta de tu región.

Por ejemplo, comience con la API: StartResourceEvaluation

```
aws configservice start-resource-evaluation --evaluation-mode PROACTIVE
                --resource-details '{"ResourceId":"MY_RESOURCE_ID",
                                     "ResourceType":"AWS::RESOURCE::TYPE",

 "ResourceConfiguration":"RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA",

 "ResourceConfigurationSchemaType":"CFN_RESOURCE_SCHEMA"}'
```

Debería recibir el `ResourceEvaluationId` en el resultado:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID"
}
```

A continuación, `ResourceEvaluationId` utilícela con la GetResourceEvaluationSummary API para comprobar el resultado de la evaluación:

```
aws configservice get-resource-evaluation-summary
    --resource-evaluation-id MY_RESOURCE_EVALUATION_ID
```

Debería obtener un resultado similar al siguiente:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID",
```

```
    "EvaluationMode": "PROACTIVE",
    "EvaluationStatus": {
        "Status": "SUCCEEDED"
    },
    "EvaluationStartTimestamp": "2022-11-15T19:13:46.029000+00:00",
    "Compliance": "COMPLIANT",
    "ResourceDetails": {
        "ResourceId": "MY_RESOURCE_ID",
        "ResourceType": "AWS::RESOURCE::TYPE",
        "ResourceConfiguration":
 "RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA"
    }
}
```

Para ver información adicional sobre el resultado de la evaluación, por ejemplo, qué regla marcó un recurso como NO CUMPLIDO, usa la API. GetComplianceDetailsByResource

Modo de detectives

Utilice la evaluación de detectives para evaluar los recursos que ya se han implementado. Esto le permite evaluar los ajustes de configuración de los recursos existentes.

Evaluación de sus recursos (consola)

1. Inicia sesión en la AWS Config consola de tu Consola de administración de AWS casa y ábrela. https://console.aws.amazon.com/config/
2. En el Consola de administración de AWS menú, comprueba que el selector de regiones esté configurado en una región que admita AWS Config reglas. Para ver una lista de las regiones admitidas, consulte Regiones y puntos de enlace de AWS Config en la Referencia general de Amazon Web Services.
3. En el panel de navegación, seleccione Reglas. La página Reglas muestra el nombre, la acción correctiva asociada y el estado de conformidad de cada regla.
4. Seleccione una regla de la tabla.
5. En la lista desplegable Acciones, seleccione Volver a evaluar.
6. AWS Config comienza a evaluar los recursos en función de tu regla.

> **Note**
>
> Puede volver a evaluar una regla una vez por minuto. Debe esperar AWS Config a que se complete la evaluación de la regla antes de iniciar otra evaluación. No puede ejecutar una evaluación si la regla se está actualizando al mismo tiempo o si la regla se está eliminando.

Evaluación de sus recursos (CLI)

- Utilice el comando start-config-rules-evaluation:

```
$ aws configservice start-config-rules-evaluation --config-rule-
names ConfigRuleName
```

AWS Config comienza a evaluar las configuraciones de recursos registradas en función de su regla. También puede especificar varias reglas en su solicitud:

```
$ aws configservice start-config-rules-evaluation --config-rule-
names ConfigRuleName1 ConfigRuleName2 ConfigRuleName3
```

Evaluación de sus recursos (API)

Utilice la acción StartConfigRulesEvaluation.

Eliminar los resultados de la evaluación de AWS Config las reglas

Una vez AWS Config evaluada la regla, podrá ver los resultados de la evaluación en la página de reglas o en la página de detalles de la regla. Si los resultados de la evaluación son incorrectos o si desea realizar de nuevo la evaluación, puede eliminar los resultados de la evaluación actuales de la regla. Por ejemplo, si la regla estaba evaluando de forma incorrecta los recursos o recursos que se han eliminado recientemente de su cuenta, puede eliminar los resultados de la evaluación y, a continuación, ejecutar una nueva evaluación.

Deleting Evaluation Results (Console)

1. Inicie sesión en la AWS Config consola de su https://console.aws.amazon.com/config/casa Consola de administración de AWS y ábrala.

2. En el Consola de administración de AWS menú, compruebe que el selector de regiones esté configurado en una AWS región que admita AWS Config reglas. Para ver una lista de las regiones admitidas, consulte AWS Config Regions and Endpoints en la Referencia general de Amazon Web Services.
3. En el panel de navegación, seleccione Reglas. La página Reglas muestra el nombre, la acción correctiva asociada y el estado de conformidad de cada regla.
4. Seleccione una regla de la tabla.
5. En el menú desplegable Acciones, elija Eliminar los resultados.
6. Cuando se le pida, escriba Eliminar (distingue entre mayúsculas y minúsculas) y, a continuación, elija Eliminar. Después de eliminar una evaluación, no podrá recuperarla.
7. Después de que los resultados de la evaluación se eliminen, puede iniciar manualmente una nueva evaluación.

Deleting Evaluation Results (CLI)

- Utilice el comando delete-evaluation-results.

```
$ aws configservice delete-evaluation-results --config-rule-name ConfigRuleName
```

  AWS Config elimina los resultados de la evaluación de la regla.

Deleting Evaluation Results (API)

Utilice la acción DeleteEvaluationResults.

Solución de problemas relacionados con las reglas AWS Config

Compruebe los siguientes problemas para solucionarlos si no puede eliminar una AWS Config regla o recibe un error similar al siguiente: «Se ha producido un error con AWS Config».

La entidad AWS Identity and Access Management (IAM) tiene permisos para la API DeleteConfigRule

1. Abra la consola de IAM en https://console.aws.amazon.com/iam/.
2. En el panel de navegación, seleccione Usuarios o Roles.

3. Elija el usuario o el rol que utilizó para eliminar la AWS Config regla y amplíe las políticas de permisos.
4. En la pestaña Permisos, elija JSON.
5. En el panel de vista previa de JSON, confirme que la política de IAM permite permisos para la DeleteConfigRuleAPI.

El límite de permisos de la entidad de IAM permite la API DeleteConfigRule

Si la entidad de IAM tiene un límite de permisos, asegúrese de que permita los permisos para la DeleteConfigRule API.

1. Abra la consola de IAM en https://console.aws.amazon.com/iam/.
2. En el panel de navegación, seleccione Usuarios o Roles.
3. Elija el usuario o el rol que utilizó para eliminar la AWS Config regla, amplíe el límite de permisos y, a continuación, elija JSON.
4. En el panel de vista previa de JSON, confirme que la política de IAM permite permisos para la DeleteConfigRuleAPI.

> **Warning**
>
> Los usuarios de IAM tienen credenciales de larga duración, lo que supone un riesgo de seguridad. Para ayudar a mitigar este riesgo, le recomendamos que brinde a estos usuarios únicamente los permisos que necesitan para realizar la tarea y que los elimine cuando ya no los necesiten.

La política de control de servicios (SCP) permite la API DeleteConfigRule

1. Abra la AWS Organizations consola al https://console.aws.amazon.com/organizations/ usar la cuenta de administración de la organización.
2. En Nombre de cuenta, seleccione la Cuenta de AWS.
3. En Políticas, expanda Políticas de control de servicios (SCP) y anote las políticas SCP asociadas.
4. En la parte superior de la página, seleccione Políticas.
5. Seleccione la política y Ver detalles.
6. En el panel de vista previa de JSON, confirme que la política permita la DeleteConfigRuleAPI.

La regla no es una regla vinculada a un servicio

Cuando habilitas un estándar de seguridad, AWS Security Hub CSPM crea reglas vinculadas al servicio para ti. No puede eliminar estas reglas vinculadas a un servicio mediante AWS Config, y el botón de eliminación aparece atenuado. Para eliminar una regla vinculada a un servicio, consulte Desactivación de un estándar de seguridad en la Guía del usuario de CSPM de Security Hub.

No hay ninguna acción correctiva en curso

No puede eliminar AWS Config las reglas que tengan acciones correctivas en curso. Siga los pasos para eliminar la acción correctiva asociada a esa regla. A continuación, intente eliminar la regla de nuevo.

> **Important**
>
> Elimine únicamente las acciones correctivas que se encuentren en el estado Error o Correcto.

Paquetes de conformidad para AWS Config

Un paquete de conformidad es un conjunto de AWS Config reglas y medidas correctivas que se pueden implementar fácilmente como una sola entidad en una cuenta y una región o en toda la organización de. AWS Organizations

Los paquetes de conformidad se crean generando una plantilla YAML que contiene la lista de reglas administradas o personalizadas y las acciones de corrección de AWS Config . También puede usar AWS Systems Manager documentos (documentos SSM) para almacenar las plantillas de los paquetes de conformidad e implementar directamente los paquetes de conformidad utilizando los nombres de los documentos SSM. AWS Puede implementar la plantilla utilizando la consola de AWS Config o la AWS CLI.

Para empezar rápidamente y evaluar su AWS entorno, utilice una de las plantillas de paquetes de conformidad de ejemplo. También puede crear un archivo YAML del paquete de conformidad desde cero basándose en el paquete de conformidad personalizado.

Temas

- Visualización de los datos de conformidad en el panel de paquetes de conformidad para AWS Config
- Requisito previo para los paquetes de conformidad para AWS Config
- Compatibilidad de la región
- AWS Config Comprobaciones de procesos dentro de un paquete de conformidad para AWS Config
- Plantillas de ejemplo de paquete de conformidad para AWS Config
- Creación de plantillas para paquetes de conformidad personalizados para AWS Config
- Implementación de paquetes de conformidad para AWS Config
- Edición de paquetes de conformidad para AWS Config
- Eliminación de paquetes de conformidad para AWS Config
- Visualización de detalles e información de conformidad en los paquetes de conformidad para AWS Config
- Visualización del cronograma del historial de cumplimiento de los paquetes de conformidad para AWS Config
- Consulta del historial de conformidad de los paquetes de conformidad para AWS Config

- Gestión de paquetes de conformidad para AWS Config todas las cuentas de su organización
- Solución de problemas en paquetes de conformidad para AWS Config

Visualización de los datos de conformidad en el panel de paquetes de conformidad para AWS Config

La página principal de los paquetes de conformidad muestra todos los paquetes de conformidad que tiene actualmente en su Cuenta de AWS. La página también contiene el nombre, el estado de implementación y la puntuación de conformidad de cada paquete de conformidad. La puntuación de conformidad es el porcentaje del número de combinaciones de reglas y recursos conformes en un paquete de conformidad en comparación con el número total de combinaciones posibles de reglas y recursos en el paquete de conformidad.

Puede utilizar este panel para comprender el nivel de conformidad de sus paquetes de conformidad y utilizar la puntuación de conformidad para realizar un seguimiento del progreso de las correcciones, realizar comparaciones entre diferentes conjuntos de requisitos y ver el impacto que un cambio o implementación específicos tienen en un paquete de conformidad.

Navegación por la página principal de los paquetes de conformidad

1. Inicie sesión en la Consola de administración de AWS y abra la consola de AWS Config en https://console.aws.amazon.com/config/home.
2. Navegue a la página de Paquetes de conformidad. Revise los paquetes de conformidad y su puntuación. También puede hacer lo siguiente:
   - Para añadir y configurar un nuevo paquete de conformidad, elija Implementar paquete de conformidad.
   - Para eliminar un paquete de conformidad y sus datos, cambiar los ajustes de configuración o ver detalles adicionales, como la ubicación de entrega o los parámetros, elija un paquete de conformidad y Acciones.

> **Note**
>
> No se puede editar un paquete de conformidad implementado. Puede modificar las demás selecciones en cualquier momento; para ello, elija el nombre del paquete de conformidad y edite en el menú desplegable Acciones.

- Para ver el historial de cambios en el estado de conformidad, elija un paquete de conformidad y Línea de tiempo del paquete de conformidad Para obtener más información, consulte Visualización de la línea de tiempo del historial de conformidad de los paquetes de conformidad.
- Para ver el estado de la implementación, la puntuación de conformidad, la línea de tiempo de la puntuación de conformidad y las reglas de un paquete de conformidad en una vista detallada, elija el paquete de conformidad y Ver.

Requisito previo para los paquetes de conformidad para AWS Config

Antes de implementar el paquete de conformidad, active la grabación. AWS Config

Temas

- Paso 1: Iniciar la AWS Config grabación (obligatorio para todos los paquetes de conformidad)
- Paso 2: requisitos previos adicionales por tipo de paquete de conformidad

Paso 1: Iniciar la AWS Config grabación (obligatorio para todos los paquetes de conformidad)

1. Inicia sesión en la AWS Config consola Consola de administración de AWS y ábrela en https://console.aws.amazon.com/config/casa.
2. Seleccione Configuración en el panel de navegación.
3. Si desea comenzar la grabación, en Recording is off (La grabación está desactivada), elija Turn on (Activar). Cuando se le pregunte, elija Continuar.

Paso 2: requisitos previos adicionales por tipo de paquete de conformidad

A. Requisitos previos para utilizar un paquete de conformidad con corrección

Antes de implementar los paquetes de conformidad mediante plantillas de ejemplo con soluciones, debe crear los recursos adecuados, como la automatización, la asunción de funciones y otros AWS recursos, en función de su objetivo de corrección.

Si tiene un rol de automatización existente que está utilizando para la corrección con documentos SSM, puede proporcionar directamente el ARN de ese rol. Si tiene algún recurso, puede incluirlo en la plantilla.

> **Note**
>
> Al implementar un paquete de conformidad con medidas correctivas en una organización, es necesario especificar el ID de la cuenta de administración de la organización. De lo contrario, durante la implementación del paquete de conformidad organizativo, AWS Config reemplaza automáticamente el ID de la cuenta de administración por el ID de la cuenta del miembro.

AWS Config no admite funciones CloudFormation intrínsecas para la función de ejecución de la automatización o la. `ConfigRuleName` Debe proporcionar el ARN exacto del rol en forma de cadena y debe usar el nombre completo de la regla sin funciones intrínsecas.

Para obtener más información acerca de cómo pasar el ARN exacto, consulte Plantillas de ejemplo de paquete de conformidad para AWS Config. Si utiliza plantillas de muestra, actualice el ID de cuenta y el ID de cuenta de administración de la organización.

B. Requisitos previos para utilizar un paquete de conformidad con una o más reglas personalizadas AWS Config

Antes de implementar un paquete de conformidad con una o más AWS Config reglas personalizadas, cree los recursos adecuados, como la AWS Lambda función y el rol de ejecución correspondiente.

Si ya tiene una AWS Config regla personalizada, puede proporcionar directamente la AWS Lambda función `ARN` of para crear otra instancia de esa regla personalizada como parte del paquete.

Si no tiene una AWS Config regla personalizada existente, puede crear una AWS Lambda función y usar el ARN de la función Lambda. Para obtener más información, consulte AWS Config Reglas personalizadas.

Si su AWS Lambda función está presente en otra Cuenta de AWS, puede crear AWS Config reglas con la autorización de función multicuenta AWS Lambda adecuada. Para obtener más información, consulte la entrada de Cuentas de AWS blog Cómo gestionar de forma centralizada AWS Config las reglas en varias direcciones.

Same account bucket policy

AWS Config Para poder almacenar los artefactos del paquete de conformidad, tendrá que proporcionar un bucket de Amazon S3 y añadir los siguientes permisos. Para obtener más información acerca de los nombres de bucket, consulte Reglas de nomenclatura de buckets.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {

            "Effect": "Allow",
            "Principal": {
                "AWS": [
                    "arn:aws:iam::111122223333:role/aws-service-role/config-
conforms.amazonaws.com/AWSServiceRoleForConfigConforms"
                ]
            },
            "Action": "s3:GetObject",
            "Resource": "arn:aws:s3:::awsconfigconforms-suffix in bucket name/
[optional] prefix/AWSLogs/AccountID/Config/*"
        }
    ]
}
```

> **Note**
>
> Al implementar paquetes de conformidad entre cuentas, el nombre del bucket de Amazon S3 de entrega debe empezar por `awsconfigconforms`.

C. Requisitos previos de los paquetes de conformidad de la organización

Si la plantilla de entrada tiene una configuración de corrección automática, especifique el ARN del rol de ejecución de automatización de esa corrección en la plantilla. Compruebe que existe un rol con el nombre especificado en todas las cuentas (de administración y miembro) de una organización. Debe crear este rol en todas las cuentas antes de llamar a `PutOrganizationConformancePack`. Puede crear este rol manualmente o usar los AWS CloudFormation conjuntos de pilas para crear este rol en cada cuenta.

Si su plantilla utiliza una función AWS CloudFormation intrínseca `Fn::ImportValue` para importar una variable en particular, entonces esa variable debe definirse como una `Export Value` en todas las cuentas de los miembros de esa organización.

Para ver una AWS Config regla personalizada, consulta el blog Cómo gestionar de forma centralizada AWS Config las reglas en varios Cuentas de AWS blogs para configurar los permisos adecuados.

Política de buckets organizativos:

AWS Config Para poder almacenar los artefactos del paquete de conformidad, tendrá que proporcionar un bucket de Amazon S3 y añadir los siguientes permisos. Para obtener más información acerca de los nombres de bucket, consulte Reglas de nomenclatura de buckets.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "AllowGetObject",
            "Effect": "Allow",
            "Principal": "*",
            "Action": [
                 "s3:GetObject",
                 "s3:PutObject"
            ],
            "Resource": "arn:aws:s3:::awsconfigconforms-suffix in bucket name/*",
            "Condition": {
                "StringEquals": {
                    "aws:PrincipalOrgID": "customer_org_id"
                },
                "ArnLike": {
                    "aws:PrincipalArn": "arn:aws:iam::*:role/aws-service-role/
config-conforms.amazonaws.com/AWSServiceRoleForConfigConforms"
                }
            }
        },
        {
            "Sid": "AllowGetBucketAcl",
            "Effect": "Allow",
            "Principal": "*",
            "Action": "s3:GetBucketAcl",
            "Resource": "arn:aws:s3:::awsconfigconforms-suffix in bucket name",
            "Condition": {
                "StringEquals": {
```

```
                    "aws:PrincipalOrgID": "customer_org_id"
                },
                "ArnLike": {
                    "aws:PrincipalArn": "arn:aws:iam::*:role/aws-service-role/
config-conforms.amazonaws.com/AWSServiceRoleForConfigConforms"
                }
            }
        }
    ]
}
```

> **Note**
>
> Al implementar paquetes de conformidad en una organización, el nombre del bucket de Amazon S3 de entrega debe empezar por `awsconfigconforms`.

Compatibilidad de la región

Los paquetes de conformidad se admiten en las siguientes regiones:

Nombre de la región	Región	Punto de conexión	Protocolo
Este de EE. UU. (Ohio)	us-east-2	config.us-east-2.amazonaws.com	HTTPS

AWS Config Comprobaciones de procesos dentro de un paquete de conformidad para AWS Config

Las comprobaciones de procesos son un tipo de AWS Config regla que le permite realizar un seguimiento de las tareas externas e internas que requieren verificación como parte de los paquetes de conformidad. Estas comprobaciones se pueden agregar a un paquete de conformidad existente o a un paquete de conformidad nuevo. Puede realizar un seguimiento de todo el cumplimiento, incluidas las AWS Config duraciones y las comprobaciones manuales, en un solo lugar.

Las comprobaciones de procesos permiten enumerar la conformidad de los requisitos y las acciones en una única ubicación. Estas comprobaciones de procesos ayudan a aumentar la cobertura de los paquetes de conformidad basados en los regímenes de conformidad. Puede ampliar aún más el paquete de conformidad agregando nuevas comprobaciones de procesos que rastreen los procesos y las acciones que requieren verificación y seguimiento manuales. Esto permite que el paquete de conformidad se convierta en la plantilla que proporciona detalles sobre las AWS Config duraciones y los procesos manuales de un régimen de cumplimiento.

Puede realizar un seguimiento y gestionar el cumplimiento de los procesos no asociados a los cambios en la configuración de los recursos dentro de un paquete de conformidad como comprobaciones del proceso. Por ejemplo, puede agregar una verificación del proceso para realizar un seguimiento del requisito de conformidad con el PCI-DSS de almacenar las copias de seguridad

multimedia en una ubicación externa. Evaluará manualmente su conformidad de acuerdo con las directrices del PCI-DSS o según las directrices de su organización.

Disponibilidad regional: las comprobaciones de los procesos con los paquetes de conformidad están disponibles en todos los Regiones de AWS lugares donde estén disponibles los paquetes de AWS Config conformidad. Para obtener más información, consulte Compatibilidad de la región.

Temas

- Ejemplo de plantilla de paquete de conformidad para crear comprobaciones de procesos
- Inclusión de comprobaciones de procesos dentro de un paquete de conformidad
- Cambio del estado de conformidad de una verificación de proceso
- Ver y editar la verificación del proceso (consola)

Ejemplo de plantilla de paquete de conformidad para crear comprobaciones de procesos

```
################################################################################
#
#  Conformance Pack template for process check
#
################################################################################
Resources:
  AWSConfigProcessCheck:
    Properties:
      ConfigRuleName: RuleName
      Description: Description of Rule
      Source:
        Owner: AWS
        SourceIdentifier: AWS_CONFIG_PROCESS_CHECK
    Type: AWS::Config::ConfigRule
```

Consulte dos plantillas de ejemplo, la plantilla Mejores prácticas operativas para CIS AWS Foundations Benchmark v1.4 Level 1 y la plantilla Mejores prácticas operativas para CIS AWS Foundations Benchmark v1.4 Level 2.

Inclusión de comprobaciones de procesos dentro de un paquete de conformidad

1. Agregue una verificación del proceso en la plantilla del paquete de conformidad. Consulte Ejemplo de plantilla de paquete de conformidad para crear comprobaciones de procesos.

```
Resources:
  ConfigEnabledAllRegions:
    Properties:
      ConfigRuleName: Config-Enabled-All-Regions
      Description: Ensure AWS Config is enabled in all Regions.
      Source:
        Owner: AWS
        SourceIdentifier: AWS_CONFIG_PROCESS_CHECK
    Type: AWS::Config::ConfigRule
```

2. Introduzca el nombre de la verificación del proceso.
3. Introduzca la descripción de la verificación del proceso.
4. Implemente el paquete de conformidad. Para obtener más información, consulte Implementación de paquetes de conformidad para AWS Config.

Cambio del estado de conformidad de una verificación de proceso

Puede cambiar el estado de conformidad de una verificación de proceso mediante la AWS Config consola AWS CLI, el y. APIs

Change Compliance Status for Process Checks (Console)

1. Inicie sesión en la AWS Config consola Consola de administración de AWS y ábrala en https://console.aws.amazon.com/config/casa.
2. Ve a la página de AWS Config reglas.
3. Elija el nombre de la verificación del proceso que especificó en la plantilla junto con el identificador del paquete de conformidad.

> **Note**
>
> Todas las verificaciones del proceso del mismo paquete de conformidad tienen el mismo sufijo.

4. En la página de detalles de la regla, no puede editar la regla, pero puede editar su conformidad. En la sección Conformidad manual, seleccione Editar conformidad.
5. Elija la conformidad adecuada en la lista desplegable.
6. (Opcional) Escriba una descripción del estado de conformidad.
7. Seleccione Save.

Change the Compliance Status for Process Checks (AWS CLI)

Puede actualizar la conformidad de las comprobaciones del proceso dentro de un paquete de conformidad mediante AWS Command Line Interface (AWS CLI).

Para instalarlo AWS CLI en su máquina local, consulte Instalación del AWS CLI en la Guía del AWS CLI usuario.

Si es necesario, escriba `AWS Config ure` para configurar el AWS CLI uso de una AWS región en la que estén disponibles los paquetes de AWS Config conformidad.

1. Abra un símbolo del sistema o una ventana de terminal.
2. Introduzca el siguiente comando para actualizar la conformidad de una verificación de procesos (`ComplianceResourceId` es el `Account ID`) e incluya el nombre de la regla.

```
aws configservice put-external-evaluation --config-rule-
name process-check-rule-name  --external-evaluation
 ComplianceResourceType=AWS::::Account,ComplianceResourceId=Account
 ID,ComplianceType=NON_COMPLIANT,OrderingTimestamp=2020-12-17T00:10:00.000Z
```

3. Pulse Intro para ejecutar el comando.

Change the Compliance Status for Process Checks (API)

Una vez completada la implementación, utilice la API `PutExternalEvaluation` para actualizar las evaluaciones y la conformidad de las comprobaciones del proceso. Para obtener más información, consulte PutExternalEvaluation.

Ver y editar la verificación del proceso (consola)

Solo puede ver las verificaciones del proceso después de agregar un estado de conformidad a las verificaciones del proceso. Elija el paquete de conformidad específico para ver todas las comprobaciones de proceso incluidas en ese paquete de conformidad. Aquí puede ver una lista de las verificaciones de procesos que cumplen y no cumplen con las normas.

Como se trata de una regla vinculada a un servicio, no puede editar la verificación del proceso a través de la página de detalles de la regla.

> **Note**
>
> Sin embargo, puede actualizar la conformidad de la verificación del proceso seleccionando Editar conformidad y seleccionando el valor adecuado entre Conforme, No conforme o No aplicable.

Puede editar o eliminar una verificación de proceso del paquete de conformidad en el que haya agregado las verificaciones de proceso.

Plantillas de ejemplo de paquete de conformidad para AWS Config

Estas son algunas plantillas de YAML de los paquetes de conformidad que puede ver en la consola de AWS Config. En la plantilla de paquetes de conformidad, puede utilizar una o varias acciones de corrección y reglas de AWS Config. Las reglas de AWS Config enumeradas en el paquete de conformidad pueden ser reglas administradas de AWS Config o reglas personalizadas de AWS Config. Puedes descargar todas las plantillas del paquete de conformidad desde GitHub.

> **Important**
>
> Los paquetes de conformidad proporcionan un marco de conformidad de propósito general para ayudarle a crear comprobaciones de control de seguridad, operativas o de optimización de costos mediante reglas administradas o personalizadas de AWS Config y acciones de corrección de AWS Config. Las plantillas de ejemplo del paquete de conformidad de AWS tienen la intención de ayudarle a crear sus propios paquetes de conformidad con reglas, parámetros de entrada y acciones de corrección diferentes o adicionales que se adapten a su entorno. Las plantillas de ejemplo, incluidas las relacionadas con las normas de conformidad y los parámetros de referencia del sector, no están diseñadas para garantizar

la conformidad de una norma de gobierno específica. No pueden reemplazar los esfuerzos internos ni garantizar que superará una evaluación de conformidad.

> **Note**
>
> Se recomienda revisar las reglas disponibles en la región en la que implemente un paquete de conformidad (Lista de reglas de AWS Config administradas por disponibilidad regional) y que modifique la plantilla para incluir las reglas que aún no estén disponibles en esa región antes de implementarlas.

AWS Paquete de conformidad con las barandillas Control Tower Detective

Este paquete de conformidad contiene AWS Config reglas basadas en las barandillas de Detective AWS de la Torre de Control. Para obtener una lista de todas las reglas administradas compatibles AWS Config, consulte la Lista de AWS Config reglas administradas.

Consulte la sección `Parameters` de la siguiente plantilla para ver los nombres y las descripciones de los parámetros obligatorios.

La plantilla está disponible en GitHub: AWS Control Tower Detective Guardrails Conformance Pack.

Prácticas recomendadas de ciberresiliencia para Amazon S3, Amazon EBS y Amazon DynamoDB

Este paquete de conformidad contiene AWS Config reglas basadas en las prácticas recomendadas de ciberresiliencia para Amazon S3, Amazon EBS y Amazon DynamoDB. Para obtener una lista de todas las reglas administradas compatibles AWS Config, consulte la Lista de reglas administradas. AWS Config

Consulte la sección `Parameters` de la siguiente plantilla para ver los nombres y las descripciones de los parámetros obligatorios.

La plantilla está disponible en GitHub: Mejores prácticas de resiliencia cibernética para Amazon S3, Amazon EBS y Amazon DynamoDB.

Prácticas operativas recomendadas para cargas de trabajo de material de ABS CCIG 2.0

Los paquetes de conformidad proporcionan un marco de cumplimiento de uso general diseñado para permitirle crear controles de seguridad, operativos o de optimización de costes mediante reglas gestionadas o personalizadas y acciones correctivas. AWS Config AWS Config Los paquetes de conformidad, como plantillas de ejemplo, no están diseñados para garantizar plenamente el cumplimiento de una norma de gobernanza o de conformidad específicas. Usted debe evaluar si su uso de los servicios cumple con los requisitos legales y normativos aplicables.

A continuación, se proporciona un ejemplo de mapeo entre la Guía de implementación de computación en nube 2.0 de ABS (Material Workloads) y las reglas de configuración AWS gestionadas. Cada regla de Config se aplica a un AWS recurso específico y se refiere a uno o más controles de la Guía de implementación de computación en nube de ABS. Un control de la guía de implementación de computación en la nube de ABS puede estar relacionado con varias reglas de Config. Consulte la siguiente tabla para obtener más detalles y orientación relacionados con estas asignaciones.

ID de control	AWS Regla de configuración	Directrices
sección 4a-govern-the-cloud: 2: cargas de trabajo materiale s	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de cibersegu ridad mediante fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendiza je automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.
sección 4a-govern-the-cloud: 2: cargas de trabajo materiale s	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS
sección 4:2: cargas de trabajo estándar a-govern-the-cloud	account-part-of-organizations	La administración centraliz ada Cuentas de AWS dentro de AWS Organizations ayuda a garantizar que las cuentas cumplan con las normas. La falta de gobernanza centraliz

ID de control	AWS Regla de configuración	Directrices
		ada de las cuentas puede provocar incoherencias en las configuraciones de cuentas, lo que puede exponer los recursos y los datos confidenc iales.
sección 4a-govern-the-cloud: 2: cargas de trabajo estándar	cloudtrail-s3-dataevents-en abled	La recopilación de eventos de datos del Simple Storage Service (Amazon S3) ayuda a detectar cualquier actividad anómala. Los detalles incluyen la información de la cuenta de AWS a la que ha accedido un bucket de Amazon S3, la dirección IP y la hora del evento.
sección 4 -2: cargas a-govern-the-cloud de trabajo estándar	cloudtrail-security-trail-enabled	Esta regla ayuda a garantiza r el uso de las mejores prácticas de seguridad AWS recomendadas AWS CloudTrail, ya que comprueba la habilitación de varios ajustes. Estas incluyen el uso del cifrado de registros, la validación de registros y la habilitación AWS CloudTrail en varias regiones.

ID de control	AWS Regla de configuración	Directrices
sección 4a-govern-the-cloud: 2: cargas de trabajo estándar	cloudwatch-alarm-action-check	CloudWatch Las alarmas de Amazon alertan cuando una métrica supera el umbral durante un número específico o de períodos de evaluación. La alarma realiza una o varias acciones según el valor de la métrica o expresión con respecto a un umbral durante varios períodos de tiempo. Esta regla requiere un valor para alarmActionRequired (Config Default: True), insufficientDataAction Obligatorio (Config Default: True) o okActionRequired (Config Default: False). El valor real debe reflejar las acciones de alarma de su entorno.
sección 4a-govern-the-cloud: 2: cargas de trabajo estándar	cloud-trail-cloud-watch-habilitado para registros	Usa Amazon CloudWatch para recopilar y gestionar de forma centralizada la actividad de los eventos de registro. La inclusión de AWS CloudTrail datos proporciona detalles de la actividad de llamadas a la API en su interior Cuenta de AWS.

ID de control	AWS Regla de configuración	Directrices
sección 4a-govern-the-cloud: 2: cargas de trabajo estándar	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.
sección 4a-govern-the-cloud: 2: cargas de trabajo estándar	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

sección 4a-govern-the-cloud: 2: cargas de trabajo estándar	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS

ID de control	AWS Regla de configuración	Directrices
sección 4:3: cargas de trabajo materiales a-govern-the-cloud	dynamodb-throughput-limit-check	Active esta regla para asegurarse de que la capacidad de rendimiento aprovisionada se compruebe en las tablas de Amazon DynamoDB. Esta es la cantidad de actividad que puede soportar cada mesa. read/write DynamoDB utiliza esta información para reservar recursos del sistema suficientes para satisfacer sus necesidades de rendimiento. Esta regla genera una alerta cuando el rendimiento se acerca al límite máximo de la cuenta de un cliente. Esta regla le permite configurar opcionalmente los parámetros de RCUThreshold porcentaje de cuenta (Config Default: 80) y WCUThreshold Percentag e de cuenta (Config Default: 80). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4a-govern-the-cloud: 3: cargas de trabajo materiales	lambda-concurrency-check	Esta regla garantiza que se establezcan los límites máximos y mínimos de simultaneidad de una función Lambda. Esto puede ayudar a la hora de establecer el número de solicitudes de referencia que la función atiende en un momento dado.
sección 4 -3: cargas a-govern-the-cloud de trabajo estándar	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.

ID de control	AWS Regla de configuración	Directrices
sección 4a-govern-the-cloud: 3: cargas de trabajo estándar	ec2-stopped-instance	Habilite esta regla para facilitar la configuración de referencia de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) al comprobar si las instancia s de Amazon EC2 se han detenido durante más días de los permitidos, de acuerdo con los estándares de su organización.
sección 4 -3: cargas a-govern-the-cloud de trabajo estándar	ec2- volume-inuse-check	Esta regla garantiza que los volúmenes de Amazon Elastic Block Store que están adjuntos a instancias de Amazon Elastic Compute Cloud (Amazon EC2) estén marcados para su eliminaci ón al finalizar una instancia . Si un volumen de Amazon EBS no se elimina al finalizar la instancia a la que está asociado, podría infringir el concepto de funcionalidad mínima.

ID de control	AWS Regla de configuración	Directrices
sección 4 -3a-govern-the-cloud: cargas de trabajo estándar	eip-attached	Esta regla garantiza que las IP elásticas asignadas a una Amazon Virtual Private Cloud (Amazon VPC) estén conectadas a instancias de Amazon Elastic Compute Cloud (Amazon EC2) o a interfaces de red elástica en uso. Esta regla ayuda a monitorear las no utilizadas en su entorno. EIPs
sección 4a-govern-the-cloud: 3: cargas de trabajo estándar	vpc-network-acl-unused-comprobar	Esta regla garantiza que se utilicen las listas de control de acceso a la red de Amazon Virtual Private Cloud (VPC). El monitoreo de las listas de control de acceso a la red no utilizadas puede ayudar a realizar un inventario y una gestión precisos del entorno.
sección 4b-design-and-secure: cargas de trabajo estándar en la nube	autoscaling-launch-config-public-ip-deshabilitado	Si configura las interfaces de red con una dirección IP pública, se puede acceder a los recursos asociados a esas interfaces de red desde Internet. Los recursos de EC2 no deben ser de acceso público, ya que esto podría permitir el acceso no deseado a sus aplicaciones o servidores.

ID de control	AWS Regla de configuración	Directrices
sección 4: cargas de trabajo estándar en la nube 1 b-design-and-secure	dms-replication-not-public	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancia s de replicación del DMS. Las instancias de replicaci ón de DMS pueden contener información confidencial y dichas cuentas requieren control de acceso.
sección 4b-design-and-secu re: la nube: 1 carga de trabajo estándar	ebs-snapshot-public-restora ble-comprobar	Gestione el acceso a la AWS nube asegurándose de que las instantáneas de EBS no se puedan restaurar públicamente. Las instantán eas de volumen de EBS pueden contener información confidencial y dichas cuentas requieren control de acceso.
b-design-and-securesección 4: la nube, 1: cargas de trabajo estándar	ec2- instance-no-public-ip	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de Amazon Elastic Compute Cloud (Amazon EC2). Las instancias de Amazon EC2 pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	ec2- instance-profile-attached	Los perfiles de instancia s de EC2 pasan un rol de IAM a una instancia de EC2. Adjuntar un perfil de instancia a las instancias puede ayudar a gestionar los privilegios mínimos y los permisos.
sección 4b-design-and-secure: cargas de trabajo estándar en la nube 1	ecs-task-definition-user-for-host-mode-check	Si la definición de una tarea tiene privilegios elevados, se debe a que el cliente ha optado específicamente por esa configuración. Este control comprueba si hay una escalada inesperada de privilegios cuando una definición de tarea tiene habilitadas las redes de host, pero el cliente no ha elegido los privilegios elevados.

ID de control	AWS Regla de configuración	Directrices
sección 4: cargas de trabajo b-design-and-secure estándar de la nube 1	emr-kerberos-enabled	Los permisos y autorizac iones de acceso se pueden administrar e incorporar con los principios de privilegi o mínimo y separación de funciones al habilitar Kerberos para los clústeres de Amazon EMR. En Kerberos, los servicios y los usuarios que deben autenticarse se denominan entidades principal es. Las entidades principal es existen dentro de un ámbito de Kerberos. Dentro de ese ámbito, un servidor de Kerberos se conoce como el centro de distribuc ión de claves (KDC). Este proporciona un medio para que las entidades principal es se autentiquen. El KDC se autentica emitiendo tickets de autenticación. El KDC mantiene una base de datos de las entidades principal es dentro de su ámbito, sus contraseñas y otros datos administrativos sobre cada una de las entidades principal es.

ID de control	AWS Regla de configuración	Directrices
sección 4: cargas de trabajo b-design-and-secure estándar de la nube 1	emr-master-no-public-ip	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a los nodos maestros del clúster de Amazon EMR. Los nodos maestros del clúster de Amazon EMR pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	iam-customer-policy-blocked-kms-acciones	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, lo que impide que las políticas contengan acciones bloqueadas en todas AWS las claves del Servicio de Administración de Claves. Tener más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones . Esta regla le permite establecer el blockedAc tionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencrip tar, kms:ReEncryptFrom). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube 1 b-design-and-secure	iam-group-has-users-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios de privilegios mínimos y separación de funciones en los permisos y autorizaciones de acceso, garantizando que los grupos de IAM tengan al menos un usuario. Una forma de incorporar privilegios mínimos es colocar a los usuarios en grupos en función de los permisos o funciones laborales asociados.

ID de control	AWS Regla de configuración	Directrices
sección 4: cargas de trabajo estándar en la nube b-design-and-secure	iam-inline-policy-blocked-kms-acciones	Asegúrese de que un usuario, rol de IAM o grupo de IAM (AWS Identity and Access Management) no tenga una política integrada que permita bloquear acciones en todas las claves del Servicio de administración de claves. AWS AWS recomienda utilizar políticas gestionad as en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administr ación de permisos. Esta regla le permite establece r el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar, kms:ReEnc ryptFrom). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube 1 b-design-and-secure	iam-no-inline-policy-comprobar	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	iam-password-policy	Las identidades y las credenciales se emiten, administran y verifican en función de la política de contraseñas de IAM de la organización. Cumplen o superan los requisitos establecidos por el NIST SP 800-63 y el estándar fundamental de mejores prácticas de seguridad para la seguridad de las contraseñ as. AWS Esta regla le permite configurar opcionalmente RequireUppercaseCharacters (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireLo wercaseCharacters (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireSy mbols (valor de las mejores prácticas de seguridad AWS fundamentales: verdadero), RequireNumbers (valor de las mejores prácticas de seguridad AWS AWS fundamentales: verdadero), MinimumPasswordLen gth (valor de las mejores prácticas de seguridad AWS fundamentales: 14), PasswordReusePrevention

ID de control	AWS Regla de configuración	Directrices
		(valor de las mejores prácticas de seguridad AWS fundamentales: 24) y MaxPasswordAge (valor de las mejores prácticas de seguridad fundamentales: 90) para su IAM La política de contraseñas. Los valores reales deben reflejar las políticas de su organización.
sección 4b-design-and-secure: cargas de trabajo estándar en la nube 1	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube b-design-and-secure	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: cargas de trabajo b-design-and-secure estándar de la nube 1	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube 1 b-design-and-secure	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: cargas de trabajo estándar en la nube b-design-and-secure	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.

ID de control	AWS Regla de configuración	Directrices
sección 4: cargas de trabajo b-design-and-secure estándar de la nube 1	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.
sección 4b-design-and-secure: cargas de trabajo estándar en la nube	iam-user-unused-credentials-comprobar	AWS Identity and Access Management (IAM) puede ayudarlo con los permisos y autorizaciones de acceso comprobando las contraseñ as y claves de acceso de IAM que no se utilicen durante un período de tiempo específic o. Si se identifican estas credenciales no utilizadas, debe deshabilitar la opción de and/or eliminar las credencia les, ya que esto podría infringir el principio del privilegio mínimo. Esta regla requiere que establezcas un valor en la maxCredentialUsage Edad (Config Default: 90). El valor real debe reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	restricted-ssh	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a administrar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS AI no permitir el tráfico de entrada (o el tráfico remoto) desde 0.0.0.0/0 al puerto 22 en sus recursos, podrá restringir el acceso remoto.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: la nube, 1 carga de trabajo estándar	ec2- instances-in-vpc	Implemente instancias de Amazon Elastic Compute Cloud (Amazon EC2) dentro de una Amazon Virtual Private Cloud (Amazon VPC) para permitir una comunicación segura entre una instancia y otros servicios dentro de la Amazon VPC, sin necesidad de utilizar una puerta de enlace de internet, un dispositivo NAT ni una conexión de VPN. Todo el tráfico permanece seguro en la AWS nube. Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Asigne instancias de Amazon EC2 a una Amazon VPC para gestionar correctamente el acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 1: cargas de trabajo estándar	internet-gateway-authorized-vpc-solo	Gestione el acceso a los recursos de la AWS nube asegurándose de que las puertas de enlace de Internet solo estén conectadas a Amazon Virtual Private Cloud (Amazon VPC) autorizada. Las puertas de enlace de Internet permiten el acceso bidireccional a internet desde y hacia la Amazon VPC, lo que puede provocar un acceso no autorizado a los recursos de Amazon VPC.
sección 4: la nube, 1 carga de trabajo estándar b-design-and-secure	lambda-function-public-access-prohibido	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a las funciones de AWS Lambda. El acceso público puede degradar la disponibilidad de los recursos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	lambda-inside-vpc	Implemente funciones de AWS Lambda en una Amazon Virtual Private Cloud (Amazon VPC) para una comunicación segura entre una función y otros servicios de la Amazon VPC. Con esta configuración, no se requiere ninguna puerta de enlace de internet, dispositi vo NAT ni conexión de VPN. Todo el tráfico permanece de forma segura en la nube. AWS Debido a su aislamien to lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Para gestionar correctam ente el acceso, las funciones de AWS Lambda deben asignarse a una VPC.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube 1 b-design-and-secure	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protecció n a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidente s de cuentas compromet idas y evitar que usuarios no autorizados accedan a los datos confidenciales.
sección 4: la nube, 1 carga de trabajo estándar b-design-and-secure	no-unrestricted-route-to-igw	Asegúrese de que las tablas de enrutamiento de Amazon EC2 no tengan rutas ilimitada s a una puerta de enlace de internet. Eliminar o limitar el acceso a Internet para las cargas de trabajo en Amazon VPCs puede reducir el acceso no deseado dentro de su entorno.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube 1 b-design-and-secure	rds-instance-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.
sección 4: las cargas de trabajo estándar de la nube 1 b-design-and-secure	redshift-cluster-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que los clústeres de Amazon Redshift no sean públicos. Los clústeres de Amazon Redshift pueden contener informaci ón confidencial y principio s. Además dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: la nube: 1 carga de trabajo estándar	redshift-enhanced-vpc-routing-habilitado	El enrutamiento de VPC mejorado fuerza que todo el tráfico de COPY y UNLOAD entre los repositorios de datos y de clúster pase por su Amazon VPC. A continuac ión, puede utilizar las caracterí sticas de la VPC, como los grupos de seguridad y las listas de control de acceso a la red, para proteger el tráfico de la red. También puede usar los registros de flujo de la VPC para monitorear el tráfico de la red.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: cargas de trabajo estándar en la nube 1	restricted-common-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Esta regla le permite configurar de forma opcional los parámetros blockedPo rt1 a blockedPort5 (valores predeterminados de Config: 20,21,3389,3306,4333). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 1 carga de trabajo estándar	root-account-hardware-mfa-habilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	s3- -bloques-periódicos account-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configura r opcionalmente los restrictP ublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPubl icPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	s3- bucket-public-read-prohibit ed	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositi vos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	s3- bucket-public-write-prohibited	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositivos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	sagemaker-notebook-no-direct-acceso a internet	Gestione el acceso a los recursos en la AWS nube asegurándose de que las SageMaker libretas de Amazon no permitan el acceso directo a Internet. Al impedir el acceso directo a internet, puede evitar que usuarios no autorizados accedan a los datos confidenciales.
sección 4b-design-and-secure: la nube, 1: cargas de trabajo estándar	ssm-document-not-public	Asegúrese de que los documentos de AWS Systems Manager (SSM) no sean públicos, ya que esto podría permitir el acceso no deseado a los documentos de SSM. Un documento de SSM público puede exponer información sobre su cuenta, sus recursos y sus procesos internos.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: cargas de trabajo estándar en la nube	vpc-default-security-group-cerrado	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a gestionar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS Restringir todo el tráfico en el grupo de seguridad predeterminado ayuda a restringir el acceso remoto a los recursos. AWS
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	vpc-sg-open-only-to-authorized-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integridad y confidencialidad de los sistemas. Al restringir el acceso a los recursos dentro de un grupo de seguridad desde internet (0.0.0.0/0), se puede controlar el acceso remoto a los sistemas internos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: la nube, 1 carga de trabajo estándar	ecs-containers-nonprivileged	Para ayudar a implementar el principio de privilegio mínimo, las definiciones de tareas de Amazon Elastic Container Service (Amazon ECS) no deben tener habilitados los privilegios elevados. Cuando este parámetro es verdadero, al contenedor se le conceden privilegios elevados en la instancia de contenedor de host, similares a los de un usuario raíz.
sección 4: cargas de trabajo b-design-and-secure estándar de la nube 1	s3- -prohibido bucket-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público en el nivel del bucket.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	subnet-auto-assign-public-ip-deshabilitado	Gestione el acceso a la AWS nube asegurándose de que a las subredes de Amazon Virtual Private Cloud (VPC) no se les asigne automátic amente una dirección IP pública. Las instancias de Amazon Elastic Compute Cloud (EC2) que se lanzan en subredes que tienen este atributo habilitado tienen una dirección IP pública asignada a su interfaz de red principal.
sección 4: las cargas de trabajo estándar de la nube 2 b-design-and-secure	cloudtrail-security-trail-enabled	Esta regla ayuda a garantiza r el uso de las mejores prácticas de seguridad AWS recomendadas AWS CloudTrail, ya que comprueba la habilitación de varios ajustes. Estas incluyen el uso del cifrado de registros, la validación de registros y la habilitación AWS CloudTrail en varias regiones.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 2 cargas de trabajo estándar	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 2	ec2- -check managedinstance-association-compliance-status	Use AWS Systems Manager Associations para ayudar con el inventario de las plataformas y aplicaciones de software dentro de una organización. AWS Systems Manager asigna un estado de configuración a las instancias administradas y le permite establecer líneas de referencia de los niveles de parches del sistema operativo, las instalaciones de software, las configuraciones de las aplicaciones y otros detalles sobre su entorno.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 2	ec2- -check managedinstance-patch-compliance-status	Habilite esta regla para ayudar a identificar y documenta r las vulnerabilidades de Amazon Elastic Compute Cloud (Amazon EC2). La regla comprueba si los parches de instancias Amazon EC2 cumplen con los requisitos de las políticas y procedimientos de su organización en AWS Systems Manager.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 2	redshift-cluster-maintenancesettings-check	Esta regla garantiza que los clústeres de Amazon Redshift tengan la configuración preferida para su organización. En concreto, que tengan períodos de mantenimiento preferidos y períodos de retención automática de instantáneas para la base de datos. Esta regla requiere que configure el. allowVersionUpgrade El valor predeterminado es true. También te permite configurar de forma opcional el periodo preferred MaintenanceWindow (el predeterminado es sáb: 16:00 -sáb: 16:30) y el automated SnapshotRetention Periodo (el valor predeterminado es 1). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: la nube, 3 cargas de trabajo materiales	dynamodb-autoscaling-enabled	El escalado automático de Amazon DynamoDB AWS usa el servicio Application Auto Scaling para ajustar la capacidad de rendimiento aprovisionada para que responda automáticamente a los patrones de tráfico reales. Esto permite que una tabla o un índice secundario global aumente su read/write capacidad aprovisionada para gestionar los aumentos repentinos de tráfico, sin limitaciones.
b-design-and-securesección 4: la nube, las 3 cargas de trabajo materiales	elb-cross-zone-load-habilitado para el equilibrio	Habilite el equilibrio de carga entre zonas para sus Elastic Load Balancers (ELBs) para ayudar a mantener la capacidad y la disponibilidad adecuadas. El equilibrio de carga entre zonas reduce la necesidad de mantener automáticamente cantidades equivalentes de instancias en cada zona de disponibilidad habilitada. También mejora la capacidad de la aplicación para gestionar la pérdida de una o más instancias.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 3 cargas de trabajo materiales b-design-and-secure	elb-deletion-protection-enabled	Esta regla garantiza que Elastic Load Balancing tenga habilitada la protección contra borrado. Utilice esta característica para evitar que el equilibrador de carga se elimine de forma accidental o malintencionada, lo que puede provocar la pérdida de disponibilidad de sus aplicaciones.
sección 4: las cargas de trabajo materiales b-design-and-secure de la nube, 3	rds-instance-deletion-protection-habilitado	Asegúrese de que las instancias de Amazon Relational Database Service (Amazon RDS) tengan habilitada la protección contra borrado. Utilice la protección contra borrado para evitar que las instancias de Amazon RDS se eliminen de forma accidental o malintencionada, lo que puede provocar la pérdida de disponibilidad de sus aplicaciones.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: las cargas de trabajo de la nube, 3 materiales	rds-multi-az-support	La compatibilidad con las zonas de disponibilidad múltiples (Multi-AZ) de Amazon Relational Database Service (Amazon RDS) permite mejorar la disponibi lidad y durabilidad de las instancias de bases de datos. Cuando aprovisio na una instancia de base de datos Multi-AZ, Amazon RDS crea automáticamente una instancia de base de datos principal y replica sincrónicamente los datos en una instancia en espera en una zona de disponibi lidad diferente. Cada zona de disponibilidad se ejecuta en su propia infraestructura independiente y físicamente distinta, y está diseñada para ser altamente fiable. En caso de que se produzca un fallo en la infraestructura, Amazon RDS realiza una conmutaci ón por error automática a la estación en espera para que pueda reanudar las operaciones de la base de datos en cuanto se complete la conmutación por error.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo materiales b-design-and-secure de la nube, 3	rds-cluster-multi-az-habilitado	La compatibilidad con las zonas de disponibilidad múltiples (Multi-AZ) de Amazon Relational Database Service (Amazon RDS) permite mejorar la disponibilidad y durabilidad de las instancias de bases de datos. Cuando aprovisiona una instancia de base de datos Multi-AZ, Amazon RDS crea automáticamente una instancia de base de datos principal y replica sincrónicamente los datos en una instancia en espera en una zona de disponibilidad diferente. Cada zona de disponibilidad se ejecuta en su propia infraestructura independiente y físicamente distinta, y está diseñada para ser altamente fiable. En caso de que se produzca un fallo en la infraestructura, Amazon RDS realiza una conmutación por error automática a la estación en espera para que pueda reanudar las operaciones de la base de datos en cuanto se complete la conmutación por error.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: las cargas de trabajo de la nube, 3 materiales	s3- bucket-replication-enabled	Con la replicación entre regiones (CRR) de Amazon Simple Storage Service (Amazon S3) se puede mantener la capacidad y la disponibilidad adecuadas. La CRR permite copiar objetos entre buckets de Amazon S3 de forma automática y asincrónica para garantizar la disponibilidad de los datos.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 3	autoscaling-group-elb-healt hcheck-obligatorio	Las revisiones de estado de Elastic Load Balancer (ELB) para los grupos de escalado automático de Amazon Elastic Compute Cloud (Amazon EC2) permiten mantener la capacidad y disponibi lidad adecuadas. De forma periódica, el equilibrador de carga envía pings, intenta establecer conexiones o envía solicitudes para probar el estado de las instancias de Amazon EC2 en un grupo de escalado automático. Si una instancia no informa, el tráfico se envía a una nueva instancia de Amazon EC2.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 3	dynamodb-autoscaling-enabled	El escalado automático de Amazon DynamoDB AWS usa el servicio Application Auto Scaling para ajustar la capacidad de rendimiento aprovisionada para que responda automáticamente a los patrones de tráfico reales. Esto permite que una tabla o un índice secundario global aumente su read/write capacidad aprovisionada para gestionar los aumentos repentinos de tráfico, sin limitaciones.
b-design-and-securesección 4: las cargas de trabajo estándar de la nube, las 3	ec2- instance-detailed-monitoring-enabled	Habilite esta regla para ayudar a mejorar el monitoreo de instancias de Amazon Elastic Compute Cloud (Amazon EC2) en la consola de Amazon EC2, que muestra gráficos de monitoreo de la instancia en periodos de 1 minuto.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 3	elb-cross-zone-load-habilitado para el equilibrio	Habilite el equilibrio de carga entre zonas para sus Elastic Load Balancers (ELBs) para ayudar a mantener la capacidad y la disponibilidad adecuadas. El equilibrio de carga entre zonas reduce la necesidad de mantener automáticamente cantidades equivalentes de instancias en cada zona de disponibilidad habilitada. También mejora la capacidad de la aplicación para gestionar la pérdida de una o más instancias.
sección 4: las cargas de trabajo estándar de la nube (3) b-design-and-secure	elb-deletion-protection-enabled	Esta regla garantiza que Elastic Load Balancing tenga habilitada la protección contra borrado. Utilice esta característica para evitar que el equilibrador de carga se elimine de forma accidental o malintencionada, lo que puede provocar la pérdida de disponibilidad de sus aplicaciones.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube 3	rds-enhanced-monitoring-enabled	Habilite Amazon Relational Database Service (Amazon RDS) para monitorear la disponibilidad de Amazon RDS. Esto proporciona información detallada del estado de las instancias de bases de datos de Amazon RDS. Cuando el almacenamiento de Amazon RDS utiliza más de un dispositivo físico subyacente, el monitoreo mejorado recopila los datos de cada dispositivo. Además, cuando la instancia de base de datos de Amazon RDS se ejecuta en una implementación Multi-AZ, se recopilan los datos de cada dispositivo del host secundario y las métricas del host secundario.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube 3	rds-multi-az-support	La compatibilidad con las zonas de disponibilidad múltiples (Multi-AZ) de Amazon Relational Database Service (Amazon RDS) permite mejorar la disponibilidad y durabilidad de las instancias de bases de datos. Cuando aprovisiona una instancia de base de datos Multi-AZ, Amazon RDS crea automáticamente una instancia de base de datos principal y replica sincrónicamente los datos en una instancia en espera en una zona de disponibilidad diferente. Cada zona de disponibilidad se ejecuta en su propia infraestructura independiente y físicamente distinta, y está diseñada para ser altamente fiable. En caso de que se produzca un fallo en la infraestructura, Amazon RDS realiza una conmutación por error automática a la estación en espera para que pueda reanudar las operaciones de la base de datos en cuanto se complete la conmutación por error.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube 3	rds-cluster-multi-az-habilitado	La compatibilidad con las zonas de disponibilidad múltiples (Multi-AZ) de Amazon Relational Database Service (Amazon RDS) permite mejorar la disponibilidad y durabilidad de las instancias de bases de datos. Cuando aprovisiona una instancia de base de datos Multi-AZ, Amazon RDS crea automáticamente una instancia de base de datos principal y replica sincrónicamente los datos en una instancia en espera en una zona de disponibilidad diferente. Cada zona de disponibilidad se ejecuta en su propia infraestructura independiente y físicamente distinta, y está diseñada para ser altamente fiable. En caso de que se produzca un fallo en la infraestructura, Amazon RDS realiza una conmutación por error automática a la estación en espera para que pueda reanudar las operaciones de la base de datos en cuanto se complete la conmutación por error.

sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 3	beanstalk-enhanced-health-reporting-habilitado	AWS Los informes de estado mejorados de Elastic Beanstalk permiten una respuesta más rápida a los cambios en el estado de la infraestructura subyacente. Estos cambios podrían provocar una falta de disponibilidad de la aplicación. Los informes de estado mejorados de Elastic Beanstalk proporcionan un descriptor de estado para evaluar la gravedad de los problemas detectados e identificar las posibles causas que se deben investigar.
b-design-and-securesección 4: la nube, 4 cargas de trabajo materiales	alb-waf-enabled	Asegúrese de que el AWS WAF esté habilitado en los Elastic Load Balancers (ELB) para ayudar a proteger las aplicaciones web. Un WAF ayuda a proteger sus aplicaciones web o APIs contra los ataques web más comunes. Estas vulnerabilidades de la web pueden afectar a la disponibilidad, comprometer la seguridad o consumir recursos excesivos en su entorno.

ID de control	AWS Regla de configuración	Directrices
sección 4: La nube, 4 cargas de trabajo materiales b-design-and-secure	api-gw-associated-with-guerra	AWS El WAF le permite configurar un conjunto de reglas (denominadas listas de control de acceso web (ACL web)) que permiten, bloquean o cuentan las solicitudes web en función de las reglas y condiciones de seguridad web personalizables que usted defina. Asegúrese de que su etapa de Amazon API Gateway esté asociada a una ACL web de WAF para protegerla de ataques maliciosos.
sección 4b-design-and-secure: La nube, 4 cargas de trabajo materiales	autoscaling-launch-config-public-ip deshabilitado	Si configura las interfaces de red con una dirección IP pública, se puede acceder a los recursos asociados a esas interfaces de red desde Internet. Los recursos de EC2 no deben ser de acceso público, ya que esto podría permitir el acceso no deseado a sus aplicaciones o servidores.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo de la nube, 4 materiale s b-design-and-secure	dms-replication-not-public	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancia s de replicación del DMS. Las instancias de replicaci ón de DMS pueden contener información confidencial y dichas cuentas requieren control de acceso.
sección 4b-design-and-secure: La nube, 4 cargas de trabajo materiales	ec2- instance-no-public-ip	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de Amazon Elastic Compute Cloud (Amazon EC2). Las instancias de Amazon EC2 pueden contener información confidencial y dichas cuentas requieren control de acceso.
sección 4b-design-and-secure: La nube, 4 cargas de trabajo materiales	emr-master-no-public-ip	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicame nte a los nodos maestros del clúster de Amazon EMR. Los nodos maestros del clúster de Amazon EMR pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 4 cargas de trabajo materiales	restricted-ssh	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a administrar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS AI no permitir el tráfico de entrada (o el tráfico remoto) desde 0.0.0.0/0 al puerto 22 en sus recursos, podrá restringir el acceso remoto.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: la nube, 4 cargas de trabajo materiales	ec2- instances-in-vpc	Implemente instancias de Amazon Elastic Compute Cloud (Amazon EC2) dentro de una Amazon Virtual Private Cloud (Amazon VPC) para permitir una comunicación segura entre una instancia y otros servicios dentro de la Amazon VPC, sin necesidad de utilizar una puerta de enlace de internet, un dispositivo NAT ni una conexión de VPN. Todo el tráfico permanece seguro en la AWS nube. Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Asigne instancias de Amazon EC2 a una Amazon VPC para gestionar correctamente el acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 4 cargas de trabajo materiales	internet-gateway-authorized-vpc-solo	Gestione el acceso a los recursos de la AWS nube asegurándose de que las puertas de enlace de Internet solo estén conectadas a Amazon Virtual Private Cloud (Amazon VPC) autorizada. Las puertas de enlace de Internet permiten el acceso bidireccional a internet desde y hacia la Amazon VPC, lo que puede provocar un acceso no autorizado a los recursos de Amazon VPC.
sección 4: la nube, 4 cargas de trabajo materiales b-design-and-secure	lambda-function-public-access-prohibido	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a las funciones de AWS Lambda. El acceso público puede degradar la disponibilidad de los recursos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: La nube, 4 cargas de trabajo materiales	lambda-inside-vpc	Implemente funciones de AWS Lambda en una Amazon Virtual Private Cloud (Amazon VPC) para una comunicación segura entre una función y otros servicios de la Amazon VPC. Con esta configuración, no se requiere ninguna puerta de enlace de internet, dispositi vo NAT ni conexión de VPN. Todo el tráfico permanece de forma segura en la nube. AWS Debido a su aislamien to lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Para gestionar correctam ente el acceso, las funciones de AWS Lambda deben asignarse a una VPC.
sección 4: las cargas de trabajo de la nube, 4 materiale s b-design-and-secure	no-unrestricted-route-to-igw	Asegúrese de que las tablas de enrutamiento de Amazon EC2 no tengan rutas ilimitada s a una puerta de enlace de internet. Eliminar o limitar el acceso a Internet para las cargas de trabajo en Amazon VPCs puede reducir el acceso no deseado dentro de su entorno.

ID de control	AWS Regla de configuración	Directrices
sección 4: La nube, 4 cargas de trabajo materiales b-design-and-secure	opensearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch Service estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de Amazon OpenSearch Service dentro de una Amazon VPC permite una comunicación segura entre Amazon OpenSearch Service y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.
sección 4: la nube, 4 cargas de trabajo materiales b-design-and-secure	rds-instance-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4: La nube, 4 cargas de trabajo materiales b-design-and-secure	redshift-cluster-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que los clústeres de Amazon Redshift no sean públicos. Los clústeres de Amazon Redshift pueden contener informaci ón confidencial y principio s. Además dichas cuentas requieren control de acceso.
sección 4b-design-and-secure: la nube, 4 cargas de trabajo materiales	restricted-common-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Esta regla le permite configurar de forma opcional los parámetros blockedPo rt1 a blockedPort5 (valores predeterminados de Config: 20,21,3389,3306,4333). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 4 cargas de trabajo materiales	s3- -bloques-periódicos account-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configura r opcionalmente los restrictP ublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPubl icPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.
sección 4b-design-and-secu re: las cargas de trabajo de la nube, 4 materiales	sagemaker-notebook-no-direc t-acceso a internet	Gestione el acceso a los recursos en la AWS nube asegurándose de que las SageMaker libretas de Amazon no permitan el acceso directo a Internet. Al impedir el acceso directo a internet, puede evitar que usuarios no autorizados accedan a los datos confidenc iales.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 4 cargas de trabajo materiales	ssm-document-not-public	Asegúrese de que los documentos de AWS Systems Manager (SSM) no sean públicos, ya que esto podría permitir el acceso no deseado a los documentos de SSM. Un documento de SSM público puede exponer información sobre su cuenta, sus recursos y sus procesos internos.
b-design-and-securesección 4: La nube, 4 cargas de trabajo materiales	vpc-default-security-group-cerrada	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a gestionar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS Restringi r todo el tráfico en el grupo de seguridad predeterminado ayuda a restringir el acceso remoto a los recursos. AWS

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 4 cargas de trabajo materiales	vpc-sg-open-only-to-authorized-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Al restringir el acceso a los recursos dentro de un grupo de seguridad desde internet (0.0.0.0/0), se puede controlar el acceso remoto a los sistemas internos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 4 cargas de trabajo materiales	vpc-vpn-2-tunnels-up	Se pueden implementar túneles VPN redundantes Site-to-Site para cumplir con los requisitos de resilienc ia. Utiliza dos túneles para garantizar la conectividad en caso de que una de las conexiones Site-to-Site VPN no esté disponible. Para protegerse contra la pérdida de conectividad, en caso de que su pasarela de cliente deje de estar disponible, puede configurar una segunda conexión de Site-to-Site VPN a su Amazon Virtual Private Cloud (Amazon VPC) y a su puerta de enlace privada virtual mediante una segunda pasarela de cliente.
sección 4b-design-and-secure: La nube, 4 cargas de trabajo materiales	s3- -prohibido bucket-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público en el nivel del bucket.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: La nube, 4 cargas de trabajo materiales	subnet-auto-assign-public-ip deshabilitado	Gestione el acceso a la AWS nube asegurándose de que a las subredes de Amazon Virtual Private Cloud (VPC) no se les asigne automátic amente una dirección IP pública. Las instancias de Amazon Elastic Compute Cloud (EC2) que se lanzan en subredes que tienen este atributo habilitado tienen una dirección IP pública asignada a su interfaz de red principal.
sección 4: las cargas de trabajo estándar de la nube b-design-and-secure	alb-waf-enabled	Asegúrese de que el AWS WAF esté habilitado en los Elastic Load Balancers (ELB) para ayudar a proteger las aplicaciones web. Un WAF ayuda a proteger sus aplicacio nes web o APIs contra los ataques web más comunes. Estas vulnerabilidades de la web pueden afectar a la disponibilidad, comprometer la seguridad o consumir recursos excesivos en su entorno.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube, 4 b-design-and-secure	api-gw-associated-with-guerra	AWS El WAF le permite configurar un conjunto de reglas (denominadas listas de control de acceso web (ACL web)) que permiten, bloquean o cuentan las solicitudes web en función de las reglas y condiciones de seguridad web personalizables que usted defina. Asegúrese de que su etapa de Amazon API Gateway esté asociada a una ACL web de WAF para protegerla de ataques maliciosos.
sección 4b-design-and-secu re: Las cargas de trabajo estándar de la nube, 4	autoscaling-launch-config-p ublic-ip deshabilitado	Si configura las interfaces de red con una dirección IP pública, se puede acceder a los recursos asociados a esas interfaces de red desde Internet. Los recursos de EC2 no deben ser de acceso público, ya que esto podría permitir el acceso no deseado a sus aplicaciones o servidore s.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube 4 b-design-and-secure	ec2- instance-no-public-ip	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de Amazon Elastic Compute Cloud (Amazon EC2). Las instancias de Amazon EC2 pueden contener información confidencial y dichas cuentas requieren control de acceso.
sección 4b-design-and-secu re: Las cargas de trabajo estándar de la nube, 4	ec2- instance-profile-attached	Los perfiles de instancia s de EC2 pasan un rol de IAM a una instancia de EC2. Adjuntar un perfil de instancia a las instancias puede ayudar a gestionar los privilegios mínimos y los permisos.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 4	ecs-task-definition-user-for-host-mode-check	Si la definición de una tarea tiene privilegios elevados, se debe a que el cliente ha optado específicamente por esa configuración. Este control comprueba si hay una escalada inesperada de privilegios cuando una definición de tarea tiene habilitadas las redes de host, pero el cliente no ha elegido los privilegios elevados.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube, 4	emr-kerberos-enabled	Los permisos y autorizac iones de acceso se pueden administrar e incorporar con los principios de privilegi o mínimo y separación de funciones al habilitar Kerberos para los clústeres de Amazon EMR. En Kerberos, los servicios y los usuarios que deben autenticarse se denominan entidades principal es. Las entidades principal es existen dentro de un ámbito de Kerberos. Dentro de ese ámbito, un servidor de Kerberos se conoce como el centro de distribuc ión de claves (KDC). Este proporciona un medio para que las entidades principal es se autentiquen. El KDC se autentica emitiendo tickets de autenticación. El KDC mantiene una base de datos de las entidades principal es dentro de su ámbito, sus contraseñas y otros datos administrativos sobre cada una de las entidades principal es.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube, 4	emr-master-no-public-ip	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a los nodos maestros del clúster de Amazon EMR. Los nodos maestros del clúster de Amazon EMR pueden contener información confidencial y dichas cuentas requieren control de acceso.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 4	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube	iam-customer-policy-blocked-kms-acciones	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, lo que impide que las políticas contengan acciones bloqueadas en todas AWS las claves del Servicio de Administración de Claves. Tener más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones . Esta regla le permite establecer el blockedAc tionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencrip tar, kms:ReEncryptFrom). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube, 4 b-design-and-secure	iam-group-has-users-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios de privilegios mínimos y separación de funciones en los permisos y autorizaciones de acceso, garantizando que los grupos de IAM tengan al menos un usuario. Una forma de incorporar privilegios mínimos es colocar a los usuarios en grupos en función de los permisos o funciones laborales asociados.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube b-design-and-secure	iam-inline-policy-blocked-kms-acciones	Asegúrese de que un usuario, rol de IAM o grupo de IAM (AWS Identity and Access Management) no tenga una política integrada que permita bloquear acciones en todas las claves del Servicio de administración de claves. AWS AWS recomienda utilizar políticas gestionad as en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administr ación de permisos. Esta regla le permite establece r el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar, kms:ReEnc ryptFrom). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube, 4 b-design-and-secure	iam-password-policy	Las identidades y las credenciales se emiten, administran y verifican en función de la política de contraseñas de IAM de la organización. Cumplen o superan los requisitos establecidos por el NIST SP 800-63 y el estándar fundamental de mejores prácticas de seguridad para la seguridad de las contraseñ as. AWS Esta regla le permite configurar opcionalmente RequireUppercaseCharacters (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireLo wercaseCharacters (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireSy mbols (valor de las mejores prácticas de seguridad AWS fundamentales: verdadero), RequireNumbers (valor de las mejores prácticas de seguridad AWS AWS fundamentales: verdadero), MinimumPasswordLen gth (valor de las mejores prácticas de seguridad AWS fundamentales: 14), PasswordReusePrevention

ID de control	AWS Regla de configuración	Directrices
		(valor de las mejores prácticas de seguridad AWS fundamentales: 24) y MaxPasswordAge (valor de las mejores prácticas de seguridad fundamentales: 90) para su IAM La política de contraseñas. Los valores reales deben reflejar las políticas de su organización.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 4	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
sección 4: Las cargas de trabajo estándar de la nube, 4 b-design-and-secure	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube, 4	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube y las 4 b-design-and-secure	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: las cargas de trabajo estándar de la nube b-design-and-secure	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube, 4	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube	iam-user-unused-credentials-comprobar	AWS Identity and Access Management (IAM) puede ayudarlo con los permisos y autorizaciones de acceso comprobando las contraseñ as y claves de acceso de IAM que no se utilicen durante un período de tiempo específic o. Si se identifican estas credenciales no utilizadas, debe deshabilitar la opción de and/or eliminar las credencia les, ya que esto podría infringir el principio del privilegio mínimo. Esta regla requiere que establezcas un valor en la maxCredentialUsage Edad (Config Default: 90). El valor real debe reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, las 4	restricted-ssh	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a administrar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS AI no permitir el tráfico de entrada (o el tráfico remoto) desde 0.0.0.0/0 al puerto 22 en sus recursos, podrá restringir el acceso remoto.

sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 4	root-account-hardware-mfa-habilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 4	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 4	s3- -bloques-periódicos account-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configura r opcionalmente los restrictP ublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPubl icPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 4	sagemaker-notebook-no-direc t-acceso a internet	Gestione el acceso a los recursos en la AWS nube asegurándose de que las SageMaker libretas de Amazon no permitan el acceso directo a Internet. Al impedir el acceso directo a internet, puede evitar que usuarios no autorizados accedan a los datos confidenc iales.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 4	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS
sección 4: las cargas de trabajo estándar de la nube b-design-and-secure	vpc-default-security-group-cerrada	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a gestionar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS Restringi r todo el tráfico en el grupo de seguridad predeterminado ayuda a restringir el acceso remoto a los recursos. AWS

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 4	vpc-sg-open-only-to-authorized-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Al restringir el acceso a los recursos dentro de un grupo de seguridad desde internet (0.0.0.0/0), se puede controlar el acceso remoto a los sistemas internos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube	vpc-vpn-2-tunnels-up	Se pueden implementar túneles VPN redundantes Site-to-Site para cumplir con los requisitos de resilienc ia. Utiliza dos túneles para garantizar la conectividad en caso de que una de las conexiones Site-to-Site VPN no esté disponible. Para protegerse contra la pérdida de conectividad, en caso de que su pasarela de cliente deje de estar disponible, puede configurar una segunda conexión de Site-to-Site VPN a su Amazon Virtual Private Cloud (Amazon VPC) y a su puerta de enlace privada virtual mediante una segunda pasarela de cliente.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, las 4	s3- -prohibido bucket-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público en el nivel del bucket.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 4	subnet-auto-assign-public-ip deshabilitado	Gestione el acceso a la AWS nube asegurándose de que a las subredes de Amazon Virtual Private Cloud (VPC) no se les asigne automátic amente una dirección IP pública. Las instancias de Amazon Elastic Compute Cloud (EC2) que se lanzan en subredes que tienen este atributo habilitado tienen una dirección IP pública asignada a su interfaz de red principal.
sección 4: la nube, 5 cargas de trabajo materiales b-design-and-secure	cmk-backing-key-rotation-ha bilitado	Habilite la rotación de claves para garantizar que las claves se roten una vez que hayan alcanzado el final de su período criptográfico.
sección 4b-design-and-secu re: las cargas de trabajo de la nube, 5 materiales	iam-root-access-key-comprob ar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorpora r el principio de funcionalidad mínima.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 5 cargas de trabajo materiales b-design-and-secure	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.
sección 4: las cargas de trabajo de la b-design-and-secure nube, 5 materiales	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidentes de cuentas comprometidas y evitar que usuarios no autorizados accedan a los datos confidenciales.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 5 cargas de trabajo materiales b-design-and-secure	root-account-hardware-mfa-habilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegi os. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 5	acm-certificate-expiration-check	Asegúrese de que la integrida d de la red esté protegida asegurándose de que ACM emita los certificados X509. AWS Estos certificados deben ser válidos y estar vigentes. Esta regla requiere un valor para daysToExpiration (valor de prácticas recomendadas de seguridad AWS fundament ales: 90). El valor real debe reflejar las políticas de su organización.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 5	cmk-backing-key-rotation-habilitado	Habilite la rotación de claves para garantizar que las claves se roten una vez que hayan alcanzado el final de su período criptográfico.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, las 5	iam-customer-policy-blocked-kms-acciones	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, lo que impide que las políticas contengan acciones bloqueadas en todas AWS las claves del Servicio de Administración de Claves. Tener más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones . Esta regla le permite establecer el blockedAc tionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencrip tar, kms:ReEncryptFrom). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube, 5 b-design-and-secure	iam-inline-policy-blocked-kms-acciones	Asegúrese de que un usuario, rol de IAM o grupo de IAM (AWS Identity and Access Management) no tenga una política integrada que permita bloquear acciones en todas las claves del Servicio de administración de claves. AWS AWS recomienda utilizar políticas gestionad as en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administr ación de permisos. Esta regla le permite establece r el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar, kms:ReEnc ryptFrom). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube, 5 b-design-and-secure	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube 5	kms-cmk-not-scheduled-para su eliminación	Para ayudar a proteger los datos en reposo, asegúrese de que las claves maestras del cliente (CMKs) necesarias no estén programadas para su eliminación en el Servicio de administración de AWS claves (AWS KMS). Puesto que a veces es necesario eliminar las claves, esta regla ayuda a comprobar todas las claves cuyo borrado está programado para comprobar si alguna está ahí por error.
sección 4b-design-and-secure: la nube, seis cargas de trabajo materiales	cmk-backing-key-rotation-habilitado	Habilite la rotación de claves para garantizar que las claves se roten una vez que hayan alcanzado el final de su período criptográfico.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 6 cargas de trabajo materiales	iam-customer-policy-blocked-kms-acciones	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, lo que impide que las políticas contengan acciones bloqueadas en todas AWS las claves del Servicio de Administración de Claves. Tener más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones . Esta regla le permite establecer el blockedAc tionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencrip tar, kms:ReEncryptFrom). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
sección 4: La nube, seis cargas de trabajo materiales b-design-and-secure	iam-inline-policy-blocked-kms-acciones	Asegúrese de que un usuario, rol de IAM o grupo de IAM (AWS Identity and Access Management) no tenga una política integrada que permita bloquear acciones en todas las claves del Servicio de administración de claves. AWS AWS recomienda utilizar políticas gestionad as en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administr ación de permisos. Esta regla le permite establece r el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar, kms:ReEnc ryptFrom). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4: La nube, seis cargas de trabajo materiales b-design-and-secure	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: las cargas de trabajo de la nube, 6 materiales b-design-and-secure	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo de la b-design-and-secure nube con 6 materiales	kms-cmk-not-scheduled-para su eliminación	Para ayudar a proteger los datos en reposo, asegúrese de que las claves maestras del cliente (CMKs) necesarias no estén programadas para su eliminación en el Servicio de administración de AWS claves (AWS KMS). Puesto que a veces es necesario eliminar las claves, esta regla ayuda a comprobar todas las claves cuyo borrado está programado para comprobar si alguna está ahí por error.
sección 4b-design-and-secu re: las seis cargas de trabajo estándar de la nube	alb-http-drop-invalid-habilitado para encabezados	Asegúrese de que su Elastic Load Balancing (ELB) esté configurado para eliminar los encabezados http. Puesto que puede haber datos confidenc iales, habilite el cifrado en tránsito para proteger esos datos.
sección 4: las cargas de trabajo estándar de la nube b-design-and-secure	alb-http-to-https-verificación de redireccionamiento	Para ayudar a proteger los datos en tránsito, asegúrese de que el equilibrador de carga de aplicación redirija automáticamente las solicitud es HTTP no cifradas hacia HTTPS. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube b-design-and-secure	api-gw-cache-enabled-y encriptado	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté activado en la caché de la etapa de API Gateway. Puesto que pueden capturarse datos confidenc iales para el método de la API, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 6	cloudwatch-log-group-encryp ted	Para ayudar a proteger los datos confidenciales en reposo, asegúrate de que el cifrado esté activado en tus Amazon CloudWatch Log Groups.
sección 4b-design-and-secu re: la nube, las 6 cargas de trabajo estándar	cloud-trail-encryption-enabled	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en reposo, debe asegurarse de que el cifrado esté habilitado para sus registros de seguimiento de AWS CloudTrail.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube	dynamodb-table-encrypted-kms	Asegúrese de que el cifrado esté habilitado para las tablas de Amazon DynamoDB. Puesto que puede haber datos confidenciales en reposo en estas tablas, habilite el cifrado en reposo para ayudar a protegerlos. De forma predeterminada, las tablas de DynamoDB se AWS cifran con una clave maestra del cliente (CMK) propia.
b-design-and-securesección 4: la nube, las 6 cargas de trabajo estándar	ec2- ebs-encryption-by-default	Para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS). Puesto que puede haber datos confidenciales en reposo en estos volúmenes, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 6	efs-encrypted-check	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de Amazon Elastic File System (EFS).

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube	elasticsearch-encrypted-at-rest	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté habilitado para tus dominios de Amazon OpenSearch OpenSearch Service (Servicio).
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube	elasticsearch-node-to-node-verificación de cifrado	Asegúrese de que el node-to-node cifrado OpenSearc h de Amazon Service esté activado. Node-to-nodeel cifrado permite el cifrado TLS 1.2 para todas las comunicac iones dentro de Amazon Virtual Private Cloud (Amazon VPC). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
sección 4: la nube, las 6 cargas de trabajo estándar b-design-and-secure	elb v2- acm-certificate-re quired	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en tránsito, debe asegurarse de que el cifrado esté habilitado para su Elastic Load Balancing. Use AWS Certificate Manager para administrar, aprovisionar e implementar SSL/TLS certifica dos públicos y privados con AWS servicios y recursos internos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube	elb-acm-certificate-required	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en tránsito, debe asegurarse de que el cifrado esté habilitado para su Elastic Load Balancing. Use AWS Certificate Manager para administrar, aprovisionar e implementar SSL/TLS certifica dos públicos y privados con AWS servicios y recursos internos.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube	elb-tls-https-listeners-solo	Asegúrese de que sus Elastic Load Balancers (ELBs) estén configurados con agentes de escucha SSL o HTTPS. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
sección 4: la nube, las 6 cargas de trabajo estándar b-design-and-secure	encrypted-volumes	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS).

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube	opensearch-encrypted-at-rest	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté habilitado para tus dominios de Amazon OpenSearch Service.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube	rds-snapshot-encrypted	Asegúrese de que el cifrado esté habilitado para las instantáneas de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenc iales en reposo, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube	rds-storage-encrypted	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté habilitad o para sus instancias de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenciales en reposo en las instancias de Amazon RDS, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar informaci ón acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezc a un valor para clusterDb Encrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organizac ión.
b-design-and-securesección 4: las seis cargas de trabajo estándar de la nube	redshift-require-tls-ssl	Asegúrese de que sus clústeres de Amazon Redshift requieran cifrado TLS/SSL para conectarse a los clientes SQL. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube	habilitado para s3 bucket-server-side-encryption	Para ayudar a proteger los datos en reposo, asegúrese de habilitar el cifrado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de S3, habilite el cifrado para protegerlos.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube	s3- bucket-ssl-requests-only	Para ayudar a proteger los datos en tránsito, asegúrese de que los buckets de Amazon Simple Storage Service (Amazon S3) requieran solicitudes para usar la capa de sockets seguros (SSL). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 6	s3- default-encryption-kms	Asegúrese de tener el cifrado habilitado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de Amazon S3, habilite el cifrado en reposo para protegerlos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 6	sagemaker-endpoint-configuration-kms-configurado mediante clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado en su terminal. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker punto final, habilite el cifrado en reposo para ayudar a proteger esos datos.
sección 4b-design-and-secure: la nube, las 6 cargas de trabajo estándar	sagemaker-notebook-instance-kms-configurado mediante clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado en su portátil. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker portátil, habilite el cifrado en reposo para ayudar a proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, las 6 cargas de trabajo estándar	sns-encrypted-kms	Para ayudar a proteger los datos en reposo, asegúrese de que los temas del Amazon Simple Notification Service (Amazon SNS) requieran cifrado AWS mediante el Servicio AWS de administración de claves (KMS). Puesto que puede haber datos confidenciales en reposo en los mensajes publicados, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4b-design-and-secure: las seis cargas de trabajo estándar de la nube	api-gw-ssl-enabled	Asegúrese de que las etapas de la API de REST de Amazon API Gateway estén configuradas con certificados SSL para permitir que los sistemas de backend autentiquen que las solicitudes se originan en API Gateway.
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube	redshift-cluster-kms-enabled	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado para su clúster de Amazon Redshift. Puesto que puede haber datos confidenciales en reposo en los clústeres de Redshift, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo de la nube, 8 materiales	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.
sección 4: la nube, 8 cargas de trabajo materiales b-design-and-secure	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo de 8 b-design-and-secure materiales de la nube	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protecció n a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidente s de cuentas compromet idas y evitar que usuarios no autorizados accedan a los datos confidenciales.
sección 4: la nube, 8 cargas de trabajo materiales b-design-and-secure	root-account-hardware-mfa-h abilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegi os. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 8 cargas de trabajo materiales	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 8	access-keys-rotated	Se auditan las credenciales de los dispositivos, usuarios y procesos autorizados para garantizar que las claves de acceso de IAM se roten según la política de la organizac ión. Cambiar las claves de acceso de forma habitual es una práctica recomendada de seguridad. Al hacerlo, se reduce el período de tiempo en el que una clave de acceso está activa y el impacto sobre la empresa si las claves se ven comprometidas. Esta regla requiere un valor de rotación de clave de acceso (valor predeterminado de Config: 90). El valor real debe reflejar las políticas de su organización.
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube 8	account-part-of-organizations	La administración centraliz ada Cuentas de AWS dentro de AWS Organizations ayuda a garantizar que las cuentas cumplan con las normas. La falta de gobernanza centraliz ada de las cuentas puede provocar incoherencias en las configuraciones de cuentas, lo que puede exponer los recursos y los datos confidenc iales.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 8	cloudtrail-security-trail-enabled	Esta regla ayuda a garantizar el uso de las mejores prácticas de seguridad AWS recomendadas AWS CloudTrail, ya que comprueba la habilitación de varios ajustes. Estas incluyen el uso del cifrado de registros, la validación de registros y la habilitación AWS CloudTrail en varias regiones.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 8 cargas de trabajo estándar	emr-kerberos-enabled	Los permisos y autorizac iones de acceso se pueden administrar e incorporar con los principios de privilegi o mínimo y separación de funciones al habilitar Kerberos para los clústeres de Amazon EMR. En Kerberos, los servicios y los usuarios que deben autenticarse se denominan entidades principal es. Las entidades principal es existen dentro de un ámbito de Kerberos. Dentro de ese ámbito, un servidor de Kerberos se conoce como el centro de distribuc ión de claves (KDC). Este proporciona un medio para que las entidades principal es se autentiquen. El KDC se autentica emitiendo tickets de autenticación. El KDC mantiene una base de datos de las entidades principal es dentro de su ámbito, sus contraseñas y otros datos administrativos sobre cada una de las entidades principal es.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube 8	iam-customer-policy-blocked-kms-acciones	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, lo que impide que las políticas contengan acciones bloqueadas en todas AWS las claves del Servicio de Administración de Claves. Tener más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones . Esta regla le permite establecer el blockedAc tionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencrip tar, kms:ReEncryptFrom). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube, 8 b-design-and-secure	iam-group-has-users-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios de privilegios mínimos y separación de funciones en los permisos y autorizaciones de acceso, garantizando que los grupos de IAM tengan al menos un usuario. Una forma de incorporar privilegios mínimos es colocar a los usuarios en grupos en función de los permisos o funciones laborales asociados.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, las 8 cargas de trabajo estándar b-design-and-secure	iam-inline-policy-blocked-kms-acciones	Asegúrese de que un usuario, rol de IAM o grupo de IAM (AWS Identity and Access Management) no tenga una política integrada que permita bloquear acciones en todas las claves del Servicio de administración de claves. AWS AWS recomienda utilizar políticas gestionad as en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administr ación de permisos. Esta regla le permite establece r el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar, kms:ReEnc ryptFrom). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube, 8 b-design-and-secure	iam-no-inline-policy-comprobar	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integrada s. Las políticas administr adas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 8	iam-password-policy	Las identidades y las credenciales se emiten, administran y verifican en función de la política de contraseñas de IAM de la organización. Cumplen o superan los requisitos establecidos por el NIST SP 800-63 y el estándar fundamental de mejores prácticas de seguridad para la seguridad de las contraseñ as. AWS Esta regla le permite configurar opcionalmente RequireUppercaseCharacters (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireLo wercaseCharacters (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireSy mbols (valor de las mejores prácticas de seguridad AWS fundamentales: verdadero), RequireNumbers (valor de las mejores prácticas de seguridad AWS AWS fundamentales: verdadero), MinimumPasswordLen gth (valor de las mejores prácticas de seguridad AWS fundamentales: 14), PasswordReusePrevention

ID de control	AWS Regla de configuración	Directrices
		(valor de las mejores prácticas de seguridad AWS fundament ales: 24) y MaxPasswordAge (valor de las mejores prácticas de seguridad fundamentales: 90) para su IAM La política de contraseñas. Los valores reales deben reflejar las políticas de su organización.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 8	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegi o y la separación de funciones en los permisos y autorizac iones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesario s para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube, 8 b-design-and-secure	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube 8	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 8 cargas de trabajo estándar b-design-and-secure	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: las cargas de trabajo estándar de la nube, 8 b-design-and-secure	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube 8	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 8	iam-user-unused-credentials-comprobar	AWS Identity and Access Management (IAM) puede ayudarlo con los permisos y autorizaciones de acceso comprobando las contraseñ as y claves de acceso de IAM que no se utilicen durante un período de tiempo específic o. Si se identifican estas credenciales no utilizadas, debe deshabilitar la opción de and/or eliminar las credencia les, ya que esto podría infringir el principio del privilegio mínimo. Esta regla requiere que establezcas un valor en la maxCredentialUsage Edad (Config Default: 90). El valor real debe reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 8	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protecció n a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidente s de cuentas compromet idas y evitar que usuarios no autorizados accedan a los datos confidenciales.
sección 4: la nube, 8 cargas de trabajo estándar b-design-and-secure	root-account-hardware-mfa-h abilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegi os. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 8	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
sección 4b-design-and-secure: la nube, 9 cargas de trabajo materiales	cloudtrail-security-trail-enabled	Esta regla ayuda a garantiza r el uso de las mejores prácticas de seguridad AWS recomendadas AWS CloudTrail, ya que comprueba la habilitación de varios ajustes. Estas incluyen el uso del cifrado de registros, la validación de registros y la habilitación AWS CloudTrail en varias regiones.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 9 cargas de trabajo materiales	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.
sección 4b-design-and-secure: la nube, 9 cargas de trabajo materiales	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 9 cargas de trabajo materiales b-design-and-secure	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.
sección 4: la nube, 9 b-design-and-secure cargas de trabajo materiales	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidentes de cuentas comprometidas y evitar que usuarios no autorizados accedan a los datos confidenciales.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 9 cargas de trabajo materiales b-design-and-secure	root-account-hardware-mfa-habilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
sección 4b-design-and-secure: la nube, 9 cargas de trabajo materiales	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 9	cloudtrail-enabled	AWS CloudTrail puede ayudar a evitar el repudio al registrar las acciones de la consola de administración y las llamadas a la API. AWS Puede identificar a los usuarios y a quién llamó a un AWS servicio, la dirección IP de origen en la Cuentas de AWS que se generaron las llamadas y los horarios de las llamadas. Los detalles de los datos capturados se muestran en el contenido del AWS CloudTrail registro.
sección 4b-design-and-secure: Las cargas de trabajo estándar de la nube 9	iam-group-has-users-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios de privilegios mínimos y separación de funciones en los permisos y autorizaciones de acceso, garantizando que los grupos de IAM tengan al menos un usuario. Una forma de incorporar privilegios mínimos es colocar a los usuarios en grupos en función de los permisos o funciones laborales asociados.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube b-design-and-secure	iam-no-inline-policy-comprobar	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 9	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube 9 b-design-and-secure	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube 9	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). sección 4b-design-and-secure: las 10 cargas de trabajo materiales de la nube	iam-password-policy	Las identidades y las credenciales se emiten, administran y verifican en función de la política de contraseñas de IAM de la organización. Cumplen o superan los requisitos establecidos por el NIST SP 800-63 y el estándar fundamental de mejores prácticas de seguridad para la seguridad de las contraseñas. AWS Esta regla le permite configurar opcionalmente RequireUppercaseCharacters (valor de las mejores prácticas de seguridad AWS fundamentales: verdadero), RequireLowercaseCharacters (valor de las mejores prácticas de seguridad AWS fundamentales: verdadero), RequireSymbols (valor de las mejores prácticas de seguridad AWS fundamentales: verdadero), RequireNumbers (valor de las mejores prácticas de seguridad AWS AWS fundamentales: verdadero), MinimumPasswordLength (valor de las mejores prácticas de seguridad AWS fundamentales: 14), PasswordReusePrevention

ID de control	AWS Regla de configuración	Directrices
		(valor de las mejores prácticas de seguridad AWS fundamentales: 24) y MaxPasswordAge (valor de las mejores prácticas de seguridad fundamentales: 90) para su IAM La política de contraseñas. Los valores reales deben reflejar las políticas de su organización.
sección 4b-design-and-secure: las cargas de trabajo materiales de la nube	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.

ID de control	AWS Regla de configuración	Directrices
sección 4: las 10 cargas de trabajo materiales de la nube b-design-and-secure	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.
sección 4: las cargas de trabajo de los b-design-and-secure 10 materiales de la nube	restricted-ssh	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a administrar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS AI no permitir el tráfico de entrada (o el tráfico remoto) desde 0.0.0.0/0 al puerto 22 en sus recursos, podrá restringir el acceso remoto.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: las 10 cargas de trabajo materiales de la nube	internet-gateway-authorized-vpc-solo	Gestione el acceso a los recursos de la AWS nube asegurándose de que las puertas de enlace de Internet solo estén conectadas a Amazon Virtual Private Cloud (Amazon VPC) autorizada. Las puertas de enlace de Internet permiten el acceso bidireccional a internet desde y hacia la Amazon VPC, lo que puede provocar un acceso no autorizado a los recursos de Amazon VPC.
sección 4: las 10 cargas de trabajo materiales de la nube b-design-and-secure	lambda-function-public-access-prohibido	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a las funciones de AWS Lambda. El acceso público puede degradar la disponibilidad de los recursos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: las 10 cargas de trabajo materiales de la nube	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protecció n a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidente s de cuentas compromet idas y evitar que usuarios no autorizados accedan a los datos confidenciales.
sección 4: las 10 cargas de trabajo materiales de la nube b-design-and-secure	no-unrestricted-route-to-igw	Asegúrese de que las tablas de enrutamiento de Amazon EC2 no tengan rutas ilimitada s a una puerta de enlace de internet. Eliminar o limitar el acceso a Internet para las cargas de trabajo en Amazon VPCs puede reducir el acceso no deseado dentro de su entorno.

ID de control	AWS Regla de configuración	Directrices
sección 4: las 10 cargas de trabajo materiales de la nube b-design-and-secure	opensearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch Service estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de Amazon OpenSearch Service dentro de una Amazon VPC permite una comunicación segura entre Amazon OpenSearch Service y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.
sección 4: las 10 cargas de trabajo materiales de la nube b-design-and-secure	rds-instance-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4: las 10 cargas de trabajo materiales de la nube b-design-and-secure	redshift-cluster-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que los clústeres de Amazon Redshift no sean públicos. Los clústeres de Amazon Redshift pueden contener informaci ón confidencial y principio s. Además dichas cuentas requieren control de acceso.
sección 4b-design-and-secu re: las 10 cargas de trabajo materiales de la nube	redshift-enhanced-vpc-routing-habilitado	El enrutamiento de VPC mejorado fuerza que todo el tráfico de COPY y UNLOAD entre los repositorios de datos y de clúster pase por su Amazon VPC. A continuac ión, puede utilizar las caracterí sticas de la VPC, como los grupos de seguridad y las listas de control de acceso a la red, para proteger el tráfico de la red. También puede usar los registros de flujo de la VPC para monitorear el tráfico de la red.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: las 10 cargas de trabajo materiales de la nube	restricted-common-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Esta regla le permite configurar de forma opcional los parámetros blockedPo rt1 a blockedPort5 (valores predeterminados de Config: 20,21,3389,3306,4333). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 10 cargas de trabajo materiales	root-account-hardware-mfa-habilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
sección 4b-design-and-secure: la nube, 10 cargas de trabajo materiales	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 10 cargas de trabajo materiales	s3- -bloques-periódicos account-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configura r opcionalmente los restrictP ublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPubl icPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.
sección 4b-design-and-secure: las cargas de trabajo de los 10 materiales de la nube	sagemaker-notebook-no-direc t-acceso a internet	Gestione el acceso a los recursos en la AWS nube asegurándose de que las SageMaker libretas de Amazon no permitan el acceso directo a Internet. Al impedir el acceso directo a internet, puede evitar que usuarios no autorizados accedan a los datos confidenc iales.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: la nube, las 10 cargas de trabajo materiales	ssm-document-not-public	Asegúrese de que los documentos de AWS Systems Manager (SSM) no sean públicos, ya que esto podría permitir el acceso no deseado a los documentos de SSM. Un documento de SSM público puede exponer información sobre su cuenta, sus recursos y sus procesos internos.
b-design-and-securesección 4: las 10 cargas de trabajo materiales de la nube	vpc-default-security-group-cerrada	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a gestionar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS Restringi r todo el tráfico en el grupo de seguridad predeterminado ayuda a restringir el acceso remoto a los recursos. AWS

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las 10 cargas de trabajo materiales de la nube	vpc-sg-open-only-to-authorized-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Al restringir el acceso a los recursos dentro de un grupo de seguridad desde internet (0.0.0.0/0), se puede controlar el acceso remoto a los sistemas internos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 10 cargas de trabajo materiales	vpc-vpn-2-tunnels-up	Se pueden implementar túneles VPN redundantes Site-to-Site para cumplir con los requisitos de resilienc ia. Utiliza dos túneles para garantizar la conectividad en caso de que una de las conexiones Site-to-Site VPN no esté disponible. Para protegerse contra la pérdida de conectividad, en caso de que su pasarela de cliente deje de estar disponible, puede configurar una segunda conexión de Site-to-Site VPN a su Amazon Virtual Private Cloud (Amazon VPC) y a su puerta de enlace privada virtual mediante una segunda pasarela de cliente.
sección 4b-design-and-secu re: las 10 cargas de trabajo materiales de la nube	s3- -prohibido bucket-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público en el nivel del bucket.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: las 10 cargas de trabajo materiales de la nube	subnet-auto-assign-public-ip deshabilitado	Gestione el acceso a la AWS nube asegurándose de que a las subredes de Amazon Virtual Private Cloud (VPC) no se les asigne automátic amente una dirección IP pública. Las instancias de Amazon Elastic Compute Cloud (EC2) que se lanzan en subredes que tienen este atributo habilitado tienen una dirección IP pública asignada a su interfaz de red principal.

ID de control	AWS Regla de configuración	Directrices
sección 4: las 10 cargas de trabajo estándar de la nube b-design-and-secure	access-keys-rotated	Se auditan las credenciales de los dispositivos, usuarios y procesos autorizados para garantizar que las claves de acceso de IAM se roten según la política de la organizac ión. Cambiar las claves de acceso de forma habitual es una práctica recomendada de seguridad. Al hacerlo, se reduce el período de tiempo en el que una clave de acceso está activa y el impacto sobre la empresa si las claves se ven comprometidas. Esta regla requiere un valor de rotación de clave de acceso (valor predeterminado de Config: 90). El valor real debe reflejar las políticas de su organización.
sección 4: las 10 cargas de trabajo b-design-and-secure estándar de la nube	autoscaling-launch-config-p ublic-ip deshabilitado	Si configura las interfaces de red con una dirección IP pública, se puede acceder a los recursos asociados a esas interfaces de red desde Internet. Los recursos de EC2 no deben ser de acceso público, ya que esto podría permitir el acceso no deseado a sus aplicaciones o servidore s.

ID de control	AWS Regla de configuración	Directrices
sección 4: las 10 cargas de trabajo estándar de la nube b-design-and-secure	emr-master-no-public-ip	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a los nodos maestros del clúster de Amazon EMR. Los nodos maestros del clúster de Amazon EMR pueden contener información confidencial y dichas cuentas requieren control de acceso.
sección 4b-design-and-secure: las 10 cargas de trabajo estándar de la nube	iam-no-inline-policy-comprobar	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las 10 cargas de trabajo estándar de la nube	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: las 10 cargas de trabajo estándar de la nube b-design-and-secure	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.

ID de control	AWS Regla de configuración	Directrices
sección 4: las 10 cargas de trabajo estándar de la nube b-design-and-secure	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.
sección 4: las 10 cargas de trabajo b-design-and-secure estándar de la nube	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: las 10 cargas de trabajo estándar de la nube	iam-user-unused-credentials-comprobar	AWS Identity and Access Management (IAM) puede ayudarlo con los permisos y autorizaciones de acceso comprobando las contraseñ as y claves de acceso de IAM que no se utilicen durante un período de tiempo específic o. Si se identifican estas credenciales no utilizadas, debe deshabilitar la opción de and/or eliminar las credencia les, ya que esto podría infringir el principio del privilegio mínimo. Esta regla requiere que establezcas un valor en la maxCredentialUsage Edad (Config Default: 90). El valor real debe reflejar las políticas de su organización.
sección 4b-design-and-secu re: las 10 cargas de trabajo estándar de la nube	restricted-ssh	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a administrar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS Al no permitir el tráfico de entrada (o el tráfico remoto) desde 0.0.0.0/0 al puerto 22 en sus recursos, podrá restringir el acceso remoto.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: las 10 cargas de trabajo estándar de la nube	ec2- instances-in-vpc	Implemente instancias de Amazon Elastic Compute Cloud (Amazon EC2) dentro de una Amazon Virtual Private Cloud (Amazon VPC) para permitir una comunicación segura entre una instancia y otros servicios dentro de la Amazon VPC, sin necesidad de utilizar una puerta de enlace de internet, un dispositivo NAT ni una conexión de VPN. Todo el tráfico permanece seguro en la AWS nube. Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Asigne instancias de Amazon EC2 a una Amazon VPC para gestionar correctamente el acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: las 10 cargas de trabajo estándar de la nube	internet-gateway-authorized-vpc-solo	Gestione el acceso a los recursos de la AWS nube asegurándose de que las puertas de enlace de Internet solo estén conectadas a Amazon Virtual Private Cloud (Amazon VPC) autorizada. Las puertas de enlace de Internet permiten el acceso bidireccional a internet desde y hacia la Amazon VPC, lo que puede provocar un acceso no autorizado a los recursos de Amazon VPC.

ID de control	AWS Regla de configuración	Directrices
sección 4: las 10 cargas de trabajo estándar de la nube b-design-and-secure	lambda-inside-vpc	Implemente funciones de AWS Lambda en una Amazon Virtual Private Cloud (Amazon VPC) para una comunicación segura entre una función y otros servicios de la Amazon VPC. Con esta configuración, no se requiere ninguna puerta de enlace de internet, dispositi vo NAT ni conexión de VPN. Todo el tráfico permanece de forma segura en la nube. AWS Debido a su aislamien to lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Para gestionar correctam ente el acceso, las funciones de AWS Lambda deben asignarse a una VPC.

ID de control	AWS Regla de configuración	Directrices
sección 4: las 10 cargas de trabajo estándar de la nube b-design-and-secure	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protecció n a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidente s de cuentas compromet idas y evitar que usuarios no autorizados accedan a los datos confidenciales.
sección 4: las 10 cargas de trabajo estándar de la nube b-design-and-secure	no-unrestricted-route-to-igw	Asegúrese de que las tablas de enrutamiento de Amazon EC2 no tengan rutas ilimitada s a una puerta de enlace de internet. Eliminar o limitar el acceso a Internet para las cargas de trabajo en Amazon VPCs puede reducir el acceso no deseado dentro de su entorno.

ID de control	AWS Regla de configuración	Directrices
sección 4: las 10 cargas de trabajo estándar de la nube b-design-and-secure	opensearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch Service estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de Amazon OpenSearch Service dentro de una Amazon VPC permite una comunicación segura entre Amazon OpenSearch Service y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.
sección 4: las 10 cargas de trabajo estándar de la nube b-design-and-secure	rds-instance-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4: las 10 cargas de trabajo estándar de la nube b-design-and-secure	redshift-cluster-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que los clústeres de Amazon Redshift no sean públicos. Los clústeres de Amazon Redshift pueden contener informaci ón confidencial y principio s. Además dichas cuentas requieren control de acceso.
sección 4b-design-and-secu re: las 10 cargas de trabajo estándar de la nube	restricted-common-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Esta regla le permite configurar de forma opcional los parámetros blockedPo rt1 a blockedPort5 (valores predeterminados de Config: 20,21,3389,3306,4333). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las 10 cargas de trabajo estándar de la nube	root-account-hardware-mfa-habilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
sección 4b-design-and-secure: las 10 cargas de trabajo estándar de la nube	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: las 10 cargas de trabajo estándar de la nube	s3- -bloques-periódicos account-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configura r opcionalmente los restrictP ublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPubl icPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.
sección 4b-design-and-secu re: las 10 cargas de trabajo estándar de la nube	sagemaker-notebook-no-direc t-acceso a internet	Gestione el acceso a los recursos en la AWS nube asegurándose de que las SageMaker libretas de Amazon no permitan el acceso directo a Internet. Al impedir el acceso directo a internet, puede evitar que usuarios no autorizados accedan a los datos confidenc iales.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: las 10 cargas de trabajo estándar de la nube	ssm-document-not-public	Asegúrese de que los documentos de AWS Systems Manager (SSM) no sean públicos, ya que esto podría permitir el acceso no deseado a los documentos de SSM. Un documento de SSM público puede exponer información sobre su cuenta, sus recursos y sus procesos internos.
b-design-and-securesección 4: las 10 cargas de trabajo estándar de la nube	vpc-default-security-group-cerrado	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a gestionar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS Restringi r todo el tráfico en el grupo de seguridad predeterminado ayuda a restringir el acceso remoto a los recursos. AWS

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: las 10 cargas de trabajo estándar de la nube	vpc-sg-open-only-to-authori zed-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Al restringir el acceso a los recursos dentro de un grupo de seguridad desde internet (0.0.0.0/ 0), se puede controlar el acceso remoto a los sistemas internos.
sección 4b-design-and-secu re: las 10 cargas de trabajo estándar de la nube	s3- -prohibido bucket-level- public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público en el nivel del bucket.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las 10 cargas de trabajo estándar de la nube	subnet-auto-assign-public-ip deshabilitado	Gestione el acceso a la AWS nube asegurándose de que a las subredes de Amazon Virtual Private Cloud (VPC) no se les asigne automáticamente una dirección IP pública. Las instancias de Amazon Elastic Compute Cloud (EC2) que se lanzan en subredes que tienen este atributo habilitado tienen una dirección IP pública asignada a su interfaz de red principal.
sección 4: las 11 cargas de trabajo materiales de la nube b-design-and-secure	api-gw-execution-logging-habilitado	El registro de API Gateway muestra vistas detalladas de los usuarios que han accedido a la API y la forma en que han accedido a la API. Esta información permite ver las actividades de los usuarios.
sección 4b-design-and-secure: las 11 cargas de trabajo materiales de la nube	cloudtrail-s3-dataevents-enabled	La recopilación de eventos de datos del Simple Storage Service (Amazon S3) ayuda a detectar cualquier actividad anómala. Los detalles incluyen la información de la cuenta de AWS a la que ha accedido un bucket de Amazon S3, la dirección IP y la hora del evento.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure materiales de la nube	cloudtrail-security-trail-enabled	Esta regla ayuda a garantizar el uso de las mejores prácticas de seguridad AWS recomendadas AWS CloudTrail, ya que comprueba la habilitación de varios ajustes. Estas incluyen el uso del cifrado de registros, la validación de registros y la habilitación AWS CloudTrail en varias regiones.
sección 4b-design-and-secure: la nube, 11 cargas de trabajo materiales	cloudwatch-alarm-action-check	CloudWatch Las alarmas de Amazon alertan cuando una métrica supera el umbral durante un número específico de períodos de evaluación. La alarma realiza una o varias acciones según el valor de la métrica o expresión con respecto a un umbral durante varios períodos de tiempo. Esta regla requiere un valor para alarmActionRequired (Config Default: True), insufficientDataAction Obligatorio (Config Default: True) o okActionRequired (Config Default: False). El valor real debe reflejar las acciones de alarma de su entorno.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo materiales de la nube 11	cloud-trail-cloud-watch-habilitado para registros	Usa Amazon CloudWatch para recopilar y gestionar de forma centralizada la actividad de los eventos de registro. La inclusión de AWS CloudTrail datos proporciona detalles de la actividad de llamadas a la API en su interior Cuenta de AWS.
sección 4b-design-and-secure: las cargas de trabajo materiales de la nube 11	elasticsearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta . Los registros de errores de los dominios pueden ayudar en las auditorías de seguridad y acceso, además de para diagnosticar problemas de disponibilidad.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 11 cargas de trabajo materiales	elb-logging-enabled	La actividad de Elastic Load Balancing es un punto central de comunicación dentro de un entorno. Asegúrese de que el registro de ELB esté habilitado. Los datos recopilados proporcionan información detallada sobre las solicitudes enviadas al ELB. Cada registro contiene distintos datos, como el momento en que se recibió la solicitud, la dirección IP del cliente, las latencias, las rutas de solicitud y las respuestas del servidor.
sección 4: las cargas de trabajo b-design-and-secure materiales de la nube	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: las 11 cargas de trabajo materiales de la nube	iam-user-unused-credentials-comprobar	AWS Identity and Access Management (IAM) puede ayudarlo con los permisos y autorizaciones de acceso comprobando las contraseñ as y claves de acceso de IAM que no se utilicen durante un período de tiempo específic o. Si se identifican estas credenciales no utilizadas, debe deshabilitar la opción de and/or eliminar las credencia les, ya que esto podría infringir el principio del privilegio mínimo. Esta regla requiere que establezcas un valor en la maxCredentialUsage Edad (Config Default: 90). El valor real debe reflejar las políticas de su organización.
sección 4b-design-and-secure: la nube, 11 cargas de trabajo materiales	rds-logging-enabled	Para facilitar el registro y el monitoreo en su entorno, asegúrese de que el registro de Amazon Relational Database Service (Amazon RDS) esté habilitado. Con el registro de Amazon RDS, puede capturar eventos tales como conexiones, desconexi ones, consultas o tablas consultadas.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure materiales de la nube	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar informaci ón acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezc a un valor para clusterDb Encrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: las cargas de trabajo materiale s de la nube 11	s3- bucket-logging-enabled	El registro de acceso al servidor de Amazon Simple Storage Service (Amazon S3) proporciona un método para monitorear la red en busca de posibles eventos de ciberseguridad. Los eventos se monitorean mediante la captura detallada de las solicitudes realizadas a un bucket de Amazon S3. Cada registro de acceso proporcio na detalles sobre una única solicitud de acceso. Los detalles incluyen el solicitan te, el nombre del bucket, la hora de la solicitud, la acción solicitada, el estado de la respuesta y el código de error, si procede.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo materiale s de la nube 11	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS
sección 4: la nube, 11 cargas de trabajo materiales b-design-and-secure	vpc-flow-logs-enabled	Los registros del flujo de la VPC proporcionan registros detallados acerca del tráfico IP entrante y saliente de las interfaces de red en su Amazon Virtual Private Cloud (Amazon VPC). De forma predeterminada, el registro de flujo incluye valores para los distintos componentes del flujo de IP, incluido el origen, el destino y el protocolo.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure materiales de la nube	wafv2-logging-enabled	Para facilitar el registro y la supervisión de su entorno, habilite el registro con AWS WAF (V2) en la web regional y global. ACLs AWS El registro WAF proporciona informaci ón detallada sobre el tráfico que analiza su ACL web. Los registros registran la hora en que AWS WAF recibió la solicitud de su AWS recurso, la información sobre la solicitud y una acción para la regla según la cual cada solicitud coincidió.
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	api-gw-cache-enabled-y encriptado	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté activado en la caché de la etapa de API Gateway. Puesto que pueden capturarse datos confidenc iales para el método de la API, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	cloudwatch-log-group-encryp ted	Para ayudar a proteger los datos confidenciales en reposo, asegúrate de que el cifrado esté activado en tus Amazon CloudWatch Log Groups.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	cloud-trail-encryption-enabled	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en reposo, debe asegurarse de que el cifrado esté habilitado para sus registros de seguimiento de AWS CloudTrail.
sección 4: la nube, 12 b-design-and-secure cargas de trabajo estándar	codebuild-project-envvar-awscred-comprobar	Asegúrese de que las credenciales AWS_ACCESS_KEY_ID de autenticación AWS_SECRET_ACCESS_KEY no existan en los entornos de proyectos de AWS Codebuild. No almacene estas variables en texto sin cifrar. El almacenamiento de estas variables en texto sin cifrar provoca una exposición no intencionada de los datos y un acceso no autorizado.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	codebuild-project-source-repo-comprobar la URL	Asegúrese de que la URL del repositorio fuente GitHub o de Bitbucket no contenga tokens de acceso personale s ni credenciales de inicio de sesión en los entornos de proyectos de Codebuild . AWS OAuth Utilízalos en lugar de los tokens de acceso personales o las credencia les de inicio de sesión para conceder la autorización de acceso a los repositorios de Bitbucket GitHub .
b-design-and-securesección 4: la nube, 12 cargas de trabajo estándar	dynamodb-table-encrypted-km s	Asegúrese de que el cifrado esté habilitado para las tablas de Amazon DynamoDB. Puesto que puede haber datos confidenciales en reposo en estas tablas, habilite el cifrado en reposo para ayudar a protegerlos. De forma predeterminada, las tablas de DynamoDB se AWS cifran con una clave maestra del cliente (CMK) propia.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: la nube, 12 cargas de trabajo estándar	ec2- ebs-encryption-by-default	Para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS). Puesto que puede haber datos confidenc iales en reposo en estos volúmenes, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	efs-encrypted-check	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de Amazon Elastic File System (EFS).
sección 4: la nube, 12 b-design-and-secure cargas de trabajo estándar	elasticsearch-encrypted-at-rest	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté habilitado para tus dominios de Amazon OpenSearch OpenSearch Service (Servicio).
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	encrypted-volumes	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS).

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 12 b-design-and-secure cargas de trabajo estándar	iam-no-inline-policy-comprobar	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 12 cargas de trabajo estándar b-design-and-secure	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: la nube, 12 cargas de trabajo estándar b-design-and-secure	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	opensearch-encrypted-at-rest	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté habilitado para tus dominios de Amazon OpenSearch Service.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	rds-snapshot-encrypted	Asegúrese de que el cifrado esté habilitado para las instantáneas de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenc iales en reposo, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4: la nube, 12 b-design-and-secure cargas de trabajo estándar	rds-storage-encrypted	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté habilitad o para sus instancias de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenciales en reposo en las instancias de Amazon RDS, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 12 b-design-and-secure cargas de trabajo estándar	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar informaci ón acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezc a un valor para clusterDb Encrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organizac ión.
b-design-and-securesección 4: la nube, 12 cargas de trabajo estándar	habilitado para s3 bucket-se rver-side-encryption	Para ayudar a proteger los datos en reposo, asegúrese de habilitar el cifrado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de S3, habilite el cifrado para protegerlos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	sagemaker-endpoint-configuration-kms-configurado mediante clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado en su terminal. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker punto final, habilite el cifrado en reposo para ayudar a proteger esos datos.
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	sagemaker-notebook-instance-kms-configurado mediante clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado en su portátil. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker portátil, habilite el cifrado en reposo para ayudar a proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	sns-encrypted-kms	Para ayudar a proteger los datos en reposo, asegúrese de que los temas del Amazon Simple Notification Service (Amazon SNS) requieran cifrado AWS mediante el Servicio AWS de administr ación de claves (KMS). Puesto que puede haber datos confidenciales en reposo en los mensajes publicados, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo materiales	cloudtrail-s3-dataevents-en abled	La recopilación de eventos de datos del Simple Storage Service (Amazon S3) ayuda a detectar cualquier actividad anómala. Los detalles incluyen la información de la cuenta de AWS a la que ha accedido un bucket de Amazon S3, la dirección IP y la hora del evento.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 14 b-design-and-secure cargas de trabajo materiales	cloudtrail-security-trail-enabled	Esta regla ayuda a garantizar el uso de las mejores prácticas de seguridad AWS recomendadas, ya que comprueba la habilitación de varios ajustes AWS CloudTrail. Estas incluyen el uso del cifrado de registros, la validación de registros y la habilitación AWS CloudTrail en varias regiones.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo materiales	cloudwatch-alarm-action-check	CloudWatch Las alarmas de Amazon alertan cuando una métrica supera el umbral durante un número específico de períodos de evaluación. La alarma realiza una o varias acciones según el valor de la métrica o expresión con respecto a un umbral durante varios períodos de tiempo. Esta regla requiere un valor para alarmActionRequired (Config Default: True), insufficientDataAction Obligatorio (Config Default: True) o okActionRequired (Config Default: False). El valor real debe reflejar las acciones de alarma de su entorno.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 14 cargas de trabajo materiales	cloud-trail-cloud-watch-habilitado para registros	Usa Amazon CloudWatch para recopilar y gestionar de forma centralizada la actividad de los eventos de registro. La inclusión de AWS CloudTrail datos proporciona detalles de la actividad de llamadas a la API en su interior Cuenta de AWS.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo importantes	cw-loggroup-retention-period-comprobar	Asegúrese de que los datos del registro de eventos se conserven durante un tiempo mínimo para sus grupos de registros, a fin de facilitar la resolución de problemas y las investigaciones forenses. La falta de datos de registros de eventos anteriores disponibles dificulta la reconstrucción e identificación de eventos potencialmente maliciosos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 14 cargas de trabajo materiales	db-instance-backup-enabled	La característica de copia de seguridad de Amazon RDS crea copias de seguridad de sus bases de datos y registros de transacciones. Amazon RDS crea automátic amente una instantánea de volumen de almacenam iento de la instancia de base de datos y realiza una copia de seguridad de toda la instancia. El sistema le permite establecer períodos de retención específicos para cumplir con sus requisitos de resiliencia.
sección 4: la nube, 14 b-design-and-secure cargas de trabajo materiales	dynamodb-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que las tablas de Amazon DynamoDB formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administr ado con una solución de respaldo basada en políticas . Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 14 cargas de trabajo materiales b-design-and-secure	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.
sección 4b-design-and-secure: La nube, 14 cargas de trabajo importantes	rds-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que sus instancias de Amazon Relational Database Service (Amazon RDS) formen parte de un AWS plan de backup. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 14 cargas de trabajo materiales b-design-and-secure	redshift-backup-enabled	Para facilitar los procesos de copia de seguridad de datos, asegúrese de que sus clústeres de Amazon Redshift tengan instantáneas automatiz adas. Cuando las instantán eas automatizadas están habilitadas para un clúster, Redshift realiza instantáneas de ese clúster periódicamente. De manera predeterminada, Redshift realiza una instantán ea cada ocho horas o después de cada cambio de datos de 5 GB por nodo, lo que ocurra primero.
sección 4: la nube, 14 b-design-and-secure cargas de trabajo materiales	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 14 cargas de trabajo estándar b-design-and-secure	api-gw-execution-logging-habilitado	El registro de API Gateway muestra vistas detalladas de los usuarios que han accedido a la API y la forma en que han accedido a la API. Esta información permite ver las actividades de los usuarios.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	cloudtrail-s3-dataevents-enabled	La recopilación de eventos de datos del Simple Storage Service (Amazon S3) ayuda a detectar cualquier actividad anómala. Los detalles incluyen la información de la cuenta de AWS a la que ha accedido un bucket de Amazon S3, la dirección IP y la hora del evento.
sección 4: la nube, 14 b-design-and-secure cargas de trabajo estándar	cloudtrail-security-trail-enabled	Esta regla ayuda a garantizar el uso de las mejores prácticas de seguridad AWS recomendadas, ya que comprueba la habilitación de varios ajustes AWS CloudTrail. Estas incluyen el uso del cifrado de registros, la validación de registros y la habilitación AWS CloudTrail en varias regiones.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	cloudwatch-log-group-encrypted	Para ayudar a proteger los datos confidenciales en reposo, asegúrate de que el cifrado esté activado en tus Amazon CloudWatch Log Groups.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	cloud-trail-cloud-watch-habilitada para registros	Usa Amazon CloudWatch para recopilar y gestionar de forma centralizada la actividad de los eventos de registro. La inclusión de AWS CloudTrail datos proporciona detalles de la actividad de llamadas a la API en su interior Cuenta de AWS.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	cloud-trail-encryption-enabled	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en reposo, debe asegurarse de que el cifrado esté habilitado para sus registros de seguimiento de AWS CloudTrail.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 14 b-design-and-secure cargas de trabajo estándar	cloud-trail-log-file-habilitada para la validación	Utilice la validación de los archivos de AWS CloudTrai l registro para comprobar la integridad de los registros. CloudTrail La validación del archivo de registro ayuda a determinar si un archivo de registro se modificó, se eliminó o no se modificó después de CloudTrail entregarlo. Esta caracterí stica se compila mediante los algoritmos estándar de la industria: SHA-256 para el hash y SHA-256 con RSA para la firma digital. Esto hace que sea computacionalmente inviable modificar, eliminar o falsificar los archivos de CloudTrail registro sin ser detectados.
b-design-and-securesección 4: la nube, 14 cargas de trabajo estándar	cw-loggroup-retention-period-comprobar	Asegúrese de que los datos del registro de eventos se conserven durante un tiempo mínimo para sus grupos de registros, a fin de facilitar la resolución de problemas y las investigaciones forenses. La falta de datos de registros de eventos anteriores disponibl es dificulta la reconstrucción e identificación de eventos potencialmente maliciosos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	elasticsearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta . Los registros de errores de los dominios pueden ayudar en las auditorías de seguridad y acceso, además de para diagnosticar problemas de disponibilidad.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	elb-logging-enabled	La actividad de Elastic Load Balancing es un punto central de comunicación dentro de un entorno. Asegúrese de que el registro de ELB esté habilitado. Los datos recopilados proporcionan información detallada sobre las solicitudes enviadas al ELB. Cada registro contiene distintos datos, como el momento en que se recibió la solicitud, la dirección IP del cliente, las latencias, las rutas de solicitud y las respuestas del servidor.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 14 b-design-and-secure cargas de trabajo estándar	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	iam-no-inline-policy-comprobar	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: la nube, 14 cargas de trabajo estándar b-design-and-secure	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	multi-region-cloudtrail-enabled	AWS CloudTrail registra las acciones AWS de la consola de administración y las llamadas a la API. Puede identificar qué usuarios y cuentas llamaron AWS, la dirección IP de origen desde la que se realizaro n las llamadas y cuándo se produjeron. CloudTrai l entregará los archivos de registro de todas AWS las regiones a su bucket de S3 si MULTI_REGION_CLOUD _TRAIL_ENABLED está activado. Además, al AWS lanzar una nueva región, CloudTrail creará la misma ruta en la nueva región. En consecuencia, recibirá archivos de registro con la actividad de la API en la nueva región sin necesidad de realizar ninguna acción.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	rds-logging-enabled	Para facilitar el registro y el monitoreo en su entorno, asegúrese de que el registro de Amazon Relational Database Service (Amazon RDS) esté habilitado. Con el registro de Amazon RDS, puede capturar eventos tales como conexiones, desconexi ones, consultas o tablas consultadas.
sección 4: la nube, 14 b-design-and-secure cargas de trabajo estándar	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar informaci ón acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezc a un valor para clusterDb Encrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: la nube, 14 cargas de trabajo estándar	s3- -bloques-periódicos account-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configura r opcionalmente los restrictP ublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPubl icPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	s3- bucket-default-lock-enabled	Asegúrese de que su bucket de Amazon Simple Storage Service (Amazon S3) tenga el bloqueo habilitado de forma predeterminada. Puesto que puede haber datos confidenc iales en reposo en los buckets de S3, habilite el bloqueo de objetos en reposo para protegerlos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	s3- bucket-logging-enabled	El registro de acceso al servidor de Amazon Simple Storage Service (Amazon S3) proporciona un método para monitorear la red en busca de posibles eventos de ciberseguridad. Los eventos se monitorean mediante la captura detallada de las solicitudes realizadas a un bucket de Amazon S3. Cada registro de acceso proporcio na detalles sobre una única solicitud de acceso. Los detalles incluyen el solicitan te, el nombre del bucket, la hora de la solicitud, la acción solicitada, el estado de la respuesta y el código de error, si procede.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	s3- bucket-policy-grantee-check	Administre el acceso a la AWS nube habilitando s3_ bucket_policy_grantee_check . Esta regla comprueba que el acceso otorgado por el bucket de Amazon S3 esté restringido por cualquiera de AWS los principales, usuarios federados, principales de servicio, direcciones IP o Amazon Virtual Private Cloud (Amazon VPC) que usted proporcione. IDs

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 14 cargas de trabajo estándar b-design-and-secure	habilitado para s3 bucket-server-side-encryption	Para ayudar a proteger los datos en reposo, asegúrese de habilitar el cifrado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de S3, habilite el cifrado para protegerlos.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	s3- bucket-versioning-enabled	El control de versiones de buckets de Amazon Simple Storage Service (Amazon S3) permite usar múltiples variantes de un objeto en el mismo bucket de Amazon S3. Use el control de versiones para conservar, recuperar y restaurar todas las versiones de los objetos almacenados en su bucket de Amazon S3. El control de versiones ayuda a recuperarse fácilmente de acciones no deseadas del usuario y de errores de la aplicación.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS
sección 4: la nube, 14 cargas de trabajo estándar b-design-and-secure	vpc-flow-logs-enabled	Los registros del flujo de la VPC proporcionan registros detallados acerca del tráfico IP entrante y saliente de las interfaces de red en su Amazon Virtual Private Cloud (Amazon VPC). De forma predeterminada, el registro de flujo incluye valores para los distintos componentes del flujo de IP, incluido el origen, el destino y el protocolo.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 14 b-design-and-secure cargas de trabajo estándar	wafv2-logging-enabled	Para facilitar el registro y la supervisión de su entorno, habilite el registro con AWS WAF (V2) en la web regional y global. ACLs AWS El registro WAF proporciona informaci ón detallada sobre el tráfico que analiza su ACL web. Los registros registran la hora en que AWS WAF recibió la solicitud de su AWS recurso, la información sobre la solicitud y una acción para la regla según la cual cada solicitud coincidió.
sección 4b-design-and-secure: la nube, 15 cargas de trabajo materiales	db-instance-backup-enabled	La característica de copia de seguridad de Amazon RDS crea copias de seguridad de sus bases de datos y registros de transacciones. Amazon RDS crea automátic amente una instantánea de volumen de almacenam iento de la instancia de base de datos y realiza una copia de seguridad de toda la instancia. El sistema le permite establecer períodos de retención específicos para cumplir con sus requisitos de resiliencia.

ID de control	AWS Regla de configuración	Directrices
sección 4: cargas de trabajo de 15 b-design-and-secure materiales en la nube	dynamodb-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que las tablas de Amazon DynamoDB formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administr ado con una solución de respaldo basada en políticas . Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 15 cargas de trabajo materiales b-design-and-secure	rds-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que sus instancias de Amazon Relational Database Service (Amazon RDS) formen parte de un AWS plan de backup. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 15 cargas de trabajo materiales b-design-and-secure	redshift-backup-enabled	Para facilitar los procesos de copia de seguridad de datos, asegúrese de que sus clústeres de Amazon Redshift tengan instantáneas automatizadas. Cuando las instantáneas automatizadas están habilitadas para un clúster, Redshift realiza instantáneas de ese clúster periódicamente. De manera predeterminada, Redshift realiza una instantánea cada ocho horas o después de cada cambio de datos de 5 GB por nodo, lo que ocurra primero.
sección 4: la nube, 15 b-design-and-secure cargas de trabajo estándar	cmk-backing-key-rotation-habilitado	Habilite la rotación de claves para garantizar que las claves se roten una vez que hayan alcanzado el final de su período criptográfico.
sección 4b-design-and-secure: la nube, 15 cargas de trabajo estándar	dms-replication-not-public	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de replicación del DMS. Las instancias de replicación de DMS pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube: 15 cargas de trabajo estándar	ebs-snapshot-public-restorable-comprobar	Gestione el acceso a la AWS nube asegurándose de que las instantáneas de EBS no se puedan restaurar públicamente. Las instantáneas de volumen de EBS pueden contener información confidencial y dichas cuentas requieren control de acceso.
b-design-and-securesección 4: la nube: 15 cargas de trabajo estándar	ec2- ebs-encryption-by-default	Para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS). Puesto que puede haber datos confidenciales en reposo en estos volúmenes, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4b-design-and-secure: la nube, 15 cargas de trabajo estándar	efs-encrypted-check	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de Amazon Elastic File System (EFS).
sección 4: la nube, 15 b-design-and-secure cargas de trabajo estándar	encrypted-volumes	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS).

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 15 b-design-and-secure cargas de trabajo estándar	kms-cmk-not-scheduled-para su eliminación	Para ayudar a proteger los datos en reposo, asegúrese de que las claves maestras del cliente (CMKs) necesarias no estén programadas para su eliminación en el Servicio de administración de AWS claves (AWS KMS). Puesto que a veces es necesario eliminar las claves, esta regla ayuda a comprobar todas las claves cuyo borrado está programado para comprobar si alguna está ahí por error.
sección 4b-design-and-secure: 15 cargas de trabajo estándar en la nube	opensearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch Service estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de Amazon OpenSearch Service dentro de una Amazon VPC permite una comunicación segura entre Amazon OpenSearch Service y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 15 cargas de trabajo estándar b-design-and-secure	rds-snapshots-public-prohibited	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.
sección 4: la nube, 15 cargas de trabajo estándar b-design-and-secure	rds-snapshot-encrypted	Asegúrese de que el cifrado esté habilitado para las instantáneas de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenciales en reposo, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 15 b-design-and-secure cargas de trabajo estándar	s3- -bloques-periódicos account-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configura r opcionalmente los restrictP ublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPubl icPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.
sección 4b-design-and-secure: la nube, 15 cargas de trabajo estándar	s3- bucket-default-lock-enabled	Asegúrese de que su bucket de Amazon Simple Storage Service (Amazon S3) tenga el bloqueo habilitado de forma predeterminada. Puesto que puede haber datos confidenc iales en reposo en los buckets de S3, habilite el bloqueo de objetos en reposo para protegerlos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 15 cargas de trabajo estándar	s3- bucket-policy-grantee-check	Administre el acceso a la AWS nube habilitando s3_ bucket_policy_grantee_check . Esta regla comprueba que el acceso otorgado por el bucket de Amazon S3 esté restringido por cualquiera de AWS los principales, usuarios federados, principales de servicio, direcciones IP o Amazon Virtual Private Cloud (Amazon VPC) que usted proporcione. IDs
sección 4:15 cargas de trabajo estándar en la nube b-design-and-secure	s3- bucket-public-read-prohibited	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositivos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.
sección 4b-design-and-secure: la nube, 15 cargas de trabajo estándar	s3- bucket-public-write-prohibited	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositivos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 15 cargas de trabajo estándar	habilitado para s3 bucket-server-side-encryption	Para ayudar a proteger los datos en reposo, asegúrese de habilitar el cifrado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de S3, habilite el cifrado para protegerlos.
sección 4b-design-and-secure: la nube, 15 cargas de trabajo estándar	s3- bucket-versioning-enabled	El control de versiones de buckets de Amazon Simple Storage Service (Amazon S3) permite usar múltiples variantes de un objeto en el mismo bucket de Amazon S3. Use el control de versiones para conservar, recuperar y restaurar todas las versiones de los objetos almacenados en su bucket de Amazon S3. El control de versiones ayuda a recuperarse fácilmente de acciones no deseadas del usuario y de errores de la aplicación.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 15 cargas de trabajo estándar	s3- default-encryption-kms	Asegúrese de tener el cifrado habilitado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de Amazon S3, habilite el cifrado en reposo para protegerlos.
sección 4 -1c-run-the-cloud: cargas de trabajo estándar	cloudtrail-enabled	AWS CloudTrail puede ayudar a evitar el repudio al registrar las acciones de la consola de administración y las llamadas a la API. AWS Puede identific ar a los usuarios y a quién llamó a un AWS servicio, la dirección IP de origen en la Cuentas de AWS que se generaron las llamadas y los horarios de las llamadas. Los detalles de los datos capturados se muestran en el contenido del AWS CloudTrail registro.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 2: cargas de trabajo materiales	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.
sección 4c-run-the-cloud: 2: cargas de trabajo materiales	ec2- -check managedinstance-association-compliance-status	Use AWS Systems Manager Associations para ayudar con el inventario de las plataformas y aplicaciones de software dentro de una organización. AWS Systems Manager asigna un estado de configuración a las instancias administradas y le permite establecer líneas de referencia de los niveles de parches del sistema operativo, las instalaciones de software, las configuraciones de las aplicaciones y otros detalles sobre su entorno.

ID de control	AWS Regla de configuración	Directrices
sección 4 -2c-run-the-cloud: cargas de trabajo estándar	cloudwatch-alarm-action-check	CloudWatch Las alarmas de Amazon alertan cuando una métrica supera el umbral durante un número específico o de períodos de evaluación. La alarma realiza una o varias acciones según el valor de la métrica o expresión con respecto a un umbral durante varios períodos de tiempo. Esta regla requiere un valor para alarmActionRequired (Config Default: True), insufficientDataAction Obligatorio (Config Default: True) o okActionRequired (Config Default: False). El valor real debe reflejar las acciones de alarma de su entorno.
sección 4c-run-the-cloud: 2: cargas de trabajo estándar	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 2: cargas de trabajo estándar	iam-group-has-users-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios de privilegios mínimos y separación de funciones en los permisos y autorizaciones de acceso, garantizando que los grupos de IAM tengan al menos un usuario. Una forma de incorporar privilegios mínimos es colocar a los usuarios en grupos en función de los permisos o funciones laborales asociados.
sección 4:2: cargas de trabajo estándar c-run-the-cloud	iam-no-inline-policy-comprobar	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integrada s. Las políticas administr adas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 2: cargas de trabajo estándar	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4:2: cargas de trabajo estándar c-run-the-cloud	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
sección 4 -2: cargas c-run-the-cloud de trabajo estándar	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.
sección 4:2: cargas de trabajo estándar c-run-the-cloud	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
sección 4:2: cargas de trabajo estándar c-run-the-cloud	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.
sección 4c-run-the-cloud: 2: cargas de trabajo estándar	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS

ID de control	AWS Regla de configuración	Directrices
sección 4:3: cargas de trabajo estándar c-run-the-cloud	api-gw-execution-logging-habilitado	El registro de API Gateway muestra vistas detalladas de los usuarios que han accedido a la API y la forma en que han accedido a la API. Esta información permite ver las actividades de los usuarios.
sección 4 -3c-run-the-cloud: cargas de trabajo estándar	cloudtrail-s3-dataevents-enabled	La recopilación de eventos de datos del Simple Storage Service (Amazon S3) ayuda a detectar cualquier actividad anómala. Los detalles incluyen la información de la cuenta de AWS a la que ha accedido un bucket de Amazon S3, la dirección IP y la hora del evento.
sección 4 -3: cargas c-run-the-cloud de trabajo estándar	cloudtrail-security-trail-enabled	Esta regla ayuda a garantizar el uso de las mejores prácticas de seguridad AWS recomendadas AWS CloudTrail, ya que comprueba la habilitación de varios ajustes. Estas incluyen el uso del cifrado de registros, la validación de registros y la habilitación AWS CloudTrail en varias regiones.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 3: cargas de trabajo estándar	cloudwatch-alarm-action-check	CloudWatch Las alarmas de Amazon alertan cuando una métrica supera el umbral durante un número específico de períodos de evaluación. La alarma realiza una o varias acciones según el valor de la métrica o expresión con respecto a un umbral durante varios períodos de tiempo. Esta regla requiere un valor para alarmActionRequired (Config Default: True), insufficientDataAction Obligatorio (Config Default: True) o okActionRequired (Config Default: False). El valor real debe reflejar las acciones de alarma de su entorno.
sección 4c-run-the-cloud: 3: cargas de trabajo estándar	cloud-trail-cloud-watch-habilitado para registros	Usa Amazon CloudWatch para recopilar y gestionar de forma centralizada la actividad de los eventos de registro. La inclusión de AWS CloudTrail datos proporciona detalles de la actividad de llamadas a la API en su interior Cuenta de AWS.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 3: cargas de trabajo estándar	cloudtrail-enabled	AWS CloudTrail puede ayudar a evitar el repudio al registrar las acciones de la consola de administración y las llamadas a la API. AWS Puede identificar a los usuarios y a quién llamó a un AWS servicio, la dirección IP de origen en la Cuentas de AWS que se generaron las llamadas y los horarios de las llamadas. Los detalles de los datos capturados se muestran en el contenido del AWS CloudTrail registro.
sección 4c-run-the-cloud: 3: cargas de trabajo estándar	cloud-trail-encryption-enabled	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en reposo, debe asegurarse de que el cifrado esté habilitado para sus registros de seguimiento de AWS CloudTrail.

ID de control	AWS Regla de configuración	Directrices
sección 4 -3: cargas c-run-the-cloud de trabajo estándar	cloud-trail-log-file-habilitada para la validación	Utilice la validación de los archivos de AWS CloudTrai l registro para comprobar la integridad de los registros. CloudTrail La validación del archivo de registro ayuda a determinar si un archivo de registro se modificó, se eliminó o no se modificó después de CloudTrail entregarlo. Esta caracterí stica se compila mediante los algoritmos estándar de la industria: SHA-256 para el hash y SHA-256 con RSA para la firma digital. Esto hace que sea computacionalmente inviable modificar, eliminar o falsificar los archivos de CloudTrail registro sin ser detectados.

ID de control	AWS Regla de configuración	Directrices
c-run-the-cloudsección 4:3: cargas de trabajo estándar	elasticsearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta . Los registros de errores de los dominios pueden ayudar en las auditorías de seguridad y acceso, además de para diagnosticar problemas de disponibilidad.
sección 4c-run-the-cloud: 3: cargas de trabajo estándar	elb-logging-enabled	La actividad de Elastic Load Balancing es un punto central de comunicación dentro de un entorno. Asegúrese de que el registro de ELB esté habilitado. Los datos recopilados proporcionan información detallada sobre las solicitudes enviadas al ELB. Cada registro contiene distintos datos, como el momento en que se recibió la solicitud, la dirección IP del cliente, las latencias, las rutas de solicitud y las respuestas del servidor.

ID de control	AWS Regla de configuración	Directrices
sección 4 -3: cargas c-run-the-cloud de trabajo estándar	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 3: cargas de trabajo estándar	multi-region-cloudtrail-enabled	AWS CloudTrail registra AWS las acciones de la consola de administración y las llamadas a la API. Puede identificar qué usuarios y cuentas llamaron AWS, la dirección IP de origen desde la que se realizaro n las llamadas y cuándo se produjeron. CloudTrai l entregará los archivos de registro de todas AWS las regiones a su bucket de S3 si MULTI_REGION_CLOUD _TRAIL_ENABLED está activado. Además, al AWS lanzar una nueva región, CloudTrail creará la misma ruta en la nueva región. En consecuencia, recibirá archivos de registro con la actividad de la API en la nueva región sin necesidad de realizar ninguna acción.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 3: cargas de trabajo estándar	rds-logging-enabled	Para facilitar el registro y el monitoreo en su entorno, asegúrese de que el registro de Amazon Relational Database Service (Amazon RDS) esté habilitado. Con el registro de Amazon RDS, puede capturar eventos tales como conexiones, desconexi ones, consultas o tablas consultadas.
sección 4 -3: cargas c-run-the-cloud de trabajo estándar	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar informaci ón acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezc a un valor para clusterDb Encrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
c-run-the-cloudsección 4:3: cargas de trabajo estándar	s3- bucket-logging-enabled	El registro de acceso al servidor de Amazon Simple Storage Service (Amazon S3) proporciona un método para monitorear la red en busca de posibles eventos de ciberseguridad. Los eventos se monitorean mediante la captura detallada de las solicitudes realizadas a un bucket de Amazon S3. Cada registro de acceso proporcio na detalles sobre una única solicitud de acceso. Los detalles incluyen el solicitan te, el nombre del bucket, la hora de la solicitud, la acción solicitada, el estado de la respuesta y el código de error, si procede.

ID de control	AWS Regla de configuración	Directrices
sección 4 -3c-run-the-cloud: cargas de trabajo estándar	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS
sección 4:3: cargas de trabajo estándar c-run-the-cloud	vpc-flow-logs-enabled	Los registros del flujo de la VPC proporcionan registros detallados acerca del tráfico IP entrante y saliente de las interfaces de red en su Amazon Virtual Private Cloud (Amazon VPC). De forma predeterminada, el registro de flujo incluye valores para los distintos componentes del flujo de IP, incluido el origen, el destino y el protocolo.

ID de control	AWS Regla de configuración	Directrices
sección 4 -3: cargas c-run-the-cloud de trabajo estándar	wafv2-logging-enabled	Para facilitar el registro y la supervisión en su entorno, habilite el registro con AWS WAF (V2) en la web regional y global. ACLs AWS El registro WAF proporciona informaci ón detallada sobre el tráfico que analiza su ACL web. Los registros registran la hora en que AWS WAF recibió la solicitud de su AWS recurso, la información sobre la solicitud y una acción para la regla según la cual cada solicitud coincidió.
sección 4c-run-the-cloud: 4 cargas de trabajo estándar	response-plan-exists-mainta ined (verificación del proceso)	Asegúrese de que los planes de respuesta ante incidente s se establezcan, actualice n y distribuyan al personal responsable.
sección 4c-run-the-cloud: 4: cargas de trabajo materiales	alb-waf-enabled	Asegúrese de que el AWS WAF esté habilitado en los Elastic Load Balancers (ELB) para ayudar a proteger las aplicaciones web. Un WAF ayuda a proteger sus aplicacio nes web o APIs contra los ataques web más comunes. Estas vulnerabilidades de la web pueden afectar a la disponibilidad, comprometer la seguridad o consumir recursos excesivos en su entorno.

ID de control	AWS Regla de configuración	Directrices
sección 4:4: cargas de trabajo materiales c-run-the-cloud	api-gw-associated-with-guerra	AWS El WAF le permite configurar un conjunto de reglas (denominadas listas de control de acceso web (ACL web)) que permiten, bloquean o cuentan las solicitudes web en función de las reglas y condiciones de seguridad web personalizables que usted defina. Asegúrese de que su etapa de Amazon API Gateway esté asociada a una ACL web de WAF para protegerla de ataques maliciosos.
sección 4c-run-the-cloud: 4: cargas de trabajo materiales	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 4: cargas de trabajo materiales	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS

ID de control	AWS Regla de configuración	Directrices
sección 4:5: cargas de trabajo estándar c-run-the-cloud	autoscaling-group-elb-healthcheck- obligatorio	Las revisiones de estado de Elastic Load Balancer (ELB) para los grupos de escalado automático de Amazon Elastic Compute Cloud (Amazon EC2) permiten mantener la capacidad y disponibilidad adecuadas. De forma periódica, el equilibrador de carga envía pings, intenta establecer conexiones o envía solicitudes para probar el estado de las instancias de Amazon EC2 en un grupo de escalado automático. Si una instancia no informa, el tráfico se envía a una nueva instancia de Amazon EC2.
sección 4 -5c-run-the-cloud: cargas de trabajo estándar	cloud-trail-cloud-watch-habilitado para registros	Usa Amazon CloudWatch para recopilar y gestionar de forma centralizada la actividad de los eventos de registro. La inclusión de AWS CloudTrail datos proporciona detalles de la actividad de llamadas a la API en su interior Cuenta de AWS.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 5: cargas de trabajo estándar	dynamodb-autoscaling-enabled	El escalado automático de Amazon DynamoDB AWS usa el servicio Application Auto Scaling para ajustar la capacidad de rendimiento aprovisionada para que responda automáticamente a los patrones de tráfico reales. Esto permite que una tabla o un índice secundario global aumente su read/write capacidad aprovisionada para gestionar los aumentos repentinos de tráfico, sin limitaciones.

ID de control	AWS Regla de configuración	Directrices
sección 4:5: cargas de trabajo estándar c-run-the-cloud	dynamodb-throughput-limit-check	Active esta regla para asegurarse de que la capacidad de rendimiento aprovisionada se compruebe en las tablas de Amazon DynamoDB. Esta es la cantidad de actividad que puede soportar cada mesa. read/write DynamoDB utiliza esta información para reservar recursos del sistema suficientes para satisfacer sus necesidades de rendimiento. Esta regla genera una alerta cuando el rendimiento se acerca al límite máximo de la cuenta de un cliente. Esta regla le permite configurar opcionalmente los parámetros de RCUThreshold porcentaje de cuenta (Config Default: 80) y WCUThreshold Percentag e de cuenta (Config Default: 80). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 5: cargas de trabajo estándar	ec2- instance-detailed-monitoring-enabled	Habilite esta regla para ayudar a mejorar el monitoreo de instancias de Amazon Elastic Compute Cloud (Amazon EC2) en la consola de Amazon EC2, que muestra gráficos de monitoreo de la instancia en periodos de 1 minuto.
sección 4 -5c-run-the-cloud: cargas de trabajo estándar	lambda-concurrency-check	Esta regla garantiza que se establezcan los límites máximos y mínimos de simultaneidad de una función Lambda. Esto puede ayudar a la hora de establecer el número de solicitudes de referencia que la función atiende en un momento dado.

ID de control	AWS Regla de configuración	Directrices
sección 4 -5: cargas c-run-the-cloud de trabajo estándar	rds-enhanced-monitoring-enabled	Habilite Amazon Relational Database Service (Amazon RDS) para monitorear la disponibilidad de Amazon RDS. Esto proporciona información detallada del estado de las instancias de bases de datos de Amazon RDS. Cuando el almacenamiento de Amazon RDS utiliza más de un dispositivo físico subyacente, el monitoreo mejorado recopila los datos de cada dispositivo. Además, cuando la instancia de base de datos de Amazon RDS se ejecuta en una implementación Multi-AZ, se recopilan los datos de cada dispositivo del host secundario y las métricas del host secundario.

ID de control	AWS Regla de configuración	Directrices
sección 4 -5: cargas c-run-the-cloud de trabajo estándar	beanstalk-enhanced-health-reporting-habilitado	AWS Los informes de estado mejorados de Elastic Beanstalk permiten una respuesta más rápida a los cambios en el estado de la infraestructura subyacente. Estos cambios podrían provocar una falta de disponibilidad de la aplicación. Los informes de estado mejorados de Elastic Beanstalk proporcionan un descriptor de estado para evaluar la gravedad de los problemas detectados e identificar las posibles causas que se deben investigar.

ID de control	AWS Regla de configuración	Directrices
c-run-the-cloudsección 4:6 cargas de trabajo materiales	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.
sección 4c-run-the-cloud: 6 cargas de trabajo materiales	ec2- -check managedinstance-association-compliance-status	Use AWS Systems Manager Associations para ayudar con el inventario de las plataformas y aplicaciones de software dentro de una organización. AWS Systems Manager asigna un estado de configuración a las instancias administradas y le permite establecer líneas de referencia de los niveles de parches del sistema operativo, las instalaciones de software, las configuraciones de las aplicaciones y otros detalles sobre su entorno.

ID de control	AWS Regla de configuración	Directrices
sección 4 -6-cargas de trabajo materiales c-run-the-cloud	ec2- -check managedinstance-patch-compliance-status	Habilite esta regla para ayudar a identificar y documenta r las vulnerabilidades de Amazon Elastic Compute Cloud (Amazon EC2). La regla comprueba si los parches de instancias Amazon EC2 cumplen con los requisitos de las políticas y procedimientos de su organización en AWS Systems Manager.
sección 4c-run-the-cloud: 6 cargas de trabajo materiales	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de cibersegu ridad mediante fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendiza je automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 6: cargas de trabajo materiales	guardduty-non-archived-findings	Amazon te GuardDuty ayuda a entender el impacto de un incidente mediante la clasificación de los hallazgos por gravedad: baja, media y alta. Puede utilizar estas clasificaciones para determinar las estrategias y prioridades de corrección. Esta regla le permite configurar de forma opcional los valores daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7) y daysHighSev (Config Default: 1) para los hallazgos no archivados, según lo exijan las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4:6 cargas de trabajo estándar c-run-the-cloud	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.
sección 4c-run-the-cloud: 6 cargas de trabajo estándar	ec2- -check managedinstance-patch-compliance-status	Habilite esta regla para ayudar a identificar y documentar las vulnerabilidades de Amazon Elastic Compute Cloud (Amazon EC2). La regla comprueba si los parches de instancias Amazon EC2 cumplen con los requisitos de las políticas y procedimientos de su organización en AWS Systems Manager.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 6 cargas de trabajo estándar	redshift-cluster-maintenancesettings-check	Esta regla garantiza que los clústeres de Amazon Redshift tengan la configuración preferida para su organización. En concreto, que tengan períodos de mantenimiento preferidos y períodos de retención automática de instantáneas para la base de datos. Esta regla requiere que configure. allowVersionUpgrade El valor predeterminado es true. También te permite configurar de forma opcional el periodo preferredMaintenanceWindow (el predeterminado es sáb: 16:00 -sáb: 16:30) y el automatedSnapshotRetentionPeriodo (el valor predeterminado es 1). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4:6 cargas de trabajo estándar c-run-the-cloud	elastic-beanstalk-managed-updates-habilitado	La activación de las actualizaciones de plataforma gestionadas para un entorno de Amazon Elastic Beanstalk garantiza que se instalen las últimas correcciones, actualizaciones y características de la plataforma disponibles para el entorno. Mantenerse actualizado mediante la instalación de parches es una práctica recomendada para proteger los sistemas.

Plantilla

La plantilla está disponible en GitHub: Mejores prácticas operativas para cargas de trabajo con materiales ABS CCIG 2.0.

Prácticas operativas recomendadas para cargas de trabajo estándar de ABS CCIG 2.0

Los paquetes de conformidad proporcionan un marco de cumplimiento de uso general diseñado para permitirle crear controles de seguridad, operativos o de optimización de costes mediante reglas gestionadas o personalizadas y acciones correctivas. AWS Config AWS Config Los paquetes de conformidad, como plantillas de ejemplo, no están diseñados para garantizar plenamente el cumplimiento de una norma de gobernanza o de conformidad específicas. Usted debe evaluar si su uso de los servicios cumple con los requisitos legales y normativos aplicables.

A continuación, se proporciona un ejemplo de mapeo entre la Guía de implementación de computación en nube 2.0 de ABS: cargas de trabajo estándar y las reglas de configuración AWS administradas. Cada regla de Config se aplica a un AWS recurso específico y se refiere a uno o más controles de la Guía de implementación de computación en nube de ABS. Un control de la guía de implementación de computación en la nube de ABS puede estar relacionado con varias reglas de

Config. Consulte la siguiente tabla para obtener más detalles y orientación relacionados con estas asignaciones.

ID de control	AWS Regla de configuración	Directrices
sección 4a-govern-the-cloud: 2: cargas de trabajo estándar	account-part-of-organizations	La administración centralizada Cuentas de AWS dentro de AWS Organizations ayuda a garantizar que las cuentas cumplan con las normas. La falta de gobernanza centralizada de las cuentas puede provocar incoherencias en las configuraciones de cuentas, lo que puede exponer los recursos y los datos confidenciales.
sección 4a-govern-the-cloud: 2: cargas de trabajo estándar	cloudtrail-s3-dataevents-enabled	La recopilación de eventos de datos del Simple Storage Service (Amazon S3) ayuda a detectar cualquier actividad anómala. Los detalles incluyen la información de la cuenta de AWS a la que ha accedido un bucket de Amazon S3, la dirección IP y la hora del evento.
sección 4 -2: cargas a-govern-the-cloud de trabajo estándar	cloudtrail-security-trail-enabled	Esta regla ayuda a garantizar el uso de las mejores prácticas de seguridad AWS recomendadas AWS CloudTrail, ya que comprueba la habilitación de varios ajustes. Estas incluyen el uso del cifrado de registros, la

ID de control	AWS Regla de configuración	Directrices
		validación de registros y la habilitación AWS CloudTrail en varias regiones.
sección 4a-govern-the-cloud: 2: cargas de trabajo estándar	cloudwatch-alarm-action-check	CloudWatch Las alarmas de Amazon alertan cuando una métrica supera el umbral durante un número específico de períodos de evaluación. La alarma realiza una o varias acciones según el valor de la métrica o expresión con respecto a un umbral durante varios períodos de tiempo. Esta regla requiere un valor para alarmActionRequired (Config Default: True), insufficientDataAction Obligatorio (Config Default: True) o okActionRequired (Config Default: False). El valor real debe reflejar las acciones de alarma de su entorno.
sección 4a-govern-the-cloud: 2: cargas de trabajo estándar	cloud-trail-cloud-watch-habilitado para registros	Usa Amazon CloudWatch para recopilar y gestionar de forma centralizada la actividad de los eventos de registro. La inclusión de AWS CloudTrail datos proporciona detalles de la actividad de llamadas a la API en su interior Cuenta de AWS.

ID de control	AWS Regla de configuración	Directrices
sección 4a-govern-the-cloud: 2: cargas de trabajo estándar	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.
sección 4a-govern-the-cloud: 2: cargas de trabajo estándar	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante el uso de fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	AWS Regla de configuración	Directrices
sección 4a-govern-the-cloud: 2: cargas de trabajo estándar	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS

ID de control	AWS Regla de configuración	Directrices
sección 4:3: cargas de trabajo estándar a-govern-the-cloud	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.
sección 4a-govern-the-cloud: 3: cargas de trabajo estándar	ec2-stopped-instance	Habilite esta regla para facilitar la configuración de referencia de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) al comprobar si las instancias de Amazon EC2 se han detenido durante más días de los permitidos, de acuerdo con los estándares de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4 -3: cargas a-govern-the-cloud de trabajo estándar	ec2- volume-inuse-check	Esta regla garantiza que los volúmenes de Amazon Elastic Block Store que están adjuntos a instancias de Amazon Elastic Compute Cloud (Amazon EC2) estén marcados para su eliminación al finalizar una instancia. Si un volumen de Amazon EBS no se elimina al finalizar la instancia a la que está asociado, podría infringir el concepto de funcionalidad mínima.
sección 4 -3a-govern-the-cloud: cargas de trabajo estándar	eip-attached	Esta regla garantiza que las IP elásticas asignadas a una Amazon Virtual Private Cloud (Amazon VPC) estén conectadas a instancias de Amazon Elastic Compute Cloud (Amazon EC2) o a interfaces de red elástica en uso. Esta regla ayuda a monitorear las no utilizadas en su entorno. EIPs

ID de control	AWS Regla de configuración	Directrices
sección 4a-govern-the-cloud: 3: cargas de trabajo estándar	vpc-network-acl-unused-comprobar	Esta regla garantiza que se utilicen las listas de control de acceso a la red de Amazon Virtual Private Cloud (VPC). El monitoreo de las listas de control de acceso a la red no utilizadas puede ayudar a realizar un inventario y una gestión precisos del entorno.
sección 4b-design-and-secure: cargas de trabajo estándar en la nube 1	autoscaling-launch-config-public-ip-deshabilitado	Si configura las interfaces de red con una dirección IP pública, se puede acceder a los recursos asociados a esas interfaces de red desde Internet. Los recursos de EC2 no deben ser de acceso público, ya que esto podría permitir el acceso no deseado a sus aplicaciones o servidores.
sección 4: cargas de trabajo estándar en la nube 1 b-design-and-secure	dms-replication-not-public	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de replicación del DMS. Las instancias de replicación de DMS pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube: 1 carga de trabajo estándar	ebs-snapshot-public-restorable-comprobar	Gestione el acceso a la AWS nube asegurándose de que las instantáneas de EBS no se puedan restaurar públicamente. Las instantáneas de volumen de EBS pueden contener información confidencial y dichas cuentas requieren control de acceso.
b-design-and-securesección 4: las cargas de trabajo estándar de la nube 1	ec2- instance-no-public-ip	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de Amazon Elastic Compute Cloud (Amazon EC2). Las instancias de Amazon EC2 pueden contener información confidencial y dichas cuentas requieren control de acceso.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	ec2- instance-profile-attached	Los perfiles de instancias de EC2 pasan un rol de IAM a una instancia de EC2. Adjuntar un perfil de instancia a las instancias puede ayudar a gestionar los privilegios mínimos y los permisos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: cargas de trabajo estándar en la nube 1	ecs-task-definition-user-for-host-mode-check	Si la definición de una tarea tiene privilegios elevados, se debe a que el cliente ha optado específicamente por esa configuración. Este control comprueba si hay una escalada inesperada de privilegios cuando una definición de tarea tiene habilitadas las redes de host, pero el cliente no ha elegido los privilegios elevados.

ID de control	AWS Regla de configuración	Directrices
sección 4: cargas de trabajo b-design-and-secure estándar de la nube 1	emr-kerberos-enabled	Los permisos y autorizac iones de acceso se pueden administrar e incorporar con los principios de privilegi o mínimo y separación de funciones al habilitar Kerberos para los clústeres de Amazon EMR. En Kerberos, los servicios y los usuarios que deben autenticarse se denominan entidades principal es. Las entidades principal es existen dentro de un ámbito de Kerberos. Dentro de ese ámbito, un servidor de Kerberos se conoce como el centro de distribuc ión de claves (KDC). Este proporciona un medio para que las entidades principal es se autentiquen. El KDC se autentica emitiendo tickets de autenticación. El KDC mantiene una base de datos de las entidades principal es dentro de su ámbito, sus contraseñas y otros datos administrativos sobre cada una de las entidades principal es.

ID de control	AWS Regla de configuración	Directrices
sección 4: cargas de trabajo b-design-and-secure estándar de la nube 1	emr-master-no-public-ip	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicame nte a los nodos maestros del clúster de Amazon EMR. Los nodos maestros del clúster de Amazon EMR pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	iam-customer-policy-blocked-kms-acciones	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, lo que impide que las políticas contengan acciones bloqueadas en todas AWS las claves del Servicio de Administración de Claves. Tener más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones . Esta regla le permite establecer el blockedAc tionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencrip tar, kms:ReEncryptFrom). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube 1 b-design-and-secure	iam-group-has-users-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios de privilegios mínimos y separación de funciones en los permisos y autorizaciones de acceso, garantizando que los grupos de IAM tengan al menos un usuario. Una forma de incorporar privilegios mínimos es colocar a los usuarios en grupos en función de los permisos o funciones laborales asociados.

ID de control	AWS Regla de configuración	Directrices
sección 4: cargas de trabajo estándar en la nube b-design-and-secure	iam-inline-policy-blocked-kms-acciones	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política en línea que permita bloquear acciones en todas las claves del Servicio de administración de claves. AWS AWS recomiend a utilizar políticas gestionad as en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administr ación de permisos. Esta regla le permite establece r el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar, kms:ReEnc ryptFrom). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube 1 b-design-and-secure	iam-no-inline-policy-comprobar	Asegúrese de que un usuario, rol de IAM o grupo de IAM (AWS Identity and Access Management) no tenga una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	iam-password-policy	Las identidades y las credenciales se emiten, administran y verifican en función de la política de contraseñas de IAM de la organización. Cumplen o superan los requisitos establecidos por el NIST SP 800-63 y el estándar fundamental de mejores prácticas de seguridad para la seguridad de las contraseñ as. AWS Esta regla le permite configurar opcionalmente RequireUppercaseCharacters (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireLo wercaseCharacters (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireSy mbols (valor de las mejores prácticas de seguridad AWS fundamentales: verdadero), RequireNumbers (valor de las mejores prácticas de seguridad AWS AWS fundamentales: verdadero), MinimumPasswordLen gth (valor de las mejores prácticas de seguridad AWS fundamentales: 14), PasswordReusePrevention

ID de control	AWS Regla de configuración	Directrices
		(valor de las mejores prácticas de seguridad AWS fundament ales: 24) y MaxPasswordAge (valor de las mejores prácticas de seguridad fundamentales: 90) para su IAM La política de contraseñas. Los valores reales deben reflejar las políticas de su organización.
sección 4b-design-and-secure: cargas de trabajo estándar en la nube 1	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegi o y la separación de funciones en los permisos y autorizac iones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesario s para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube 1 b-design-and-secure	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: cargas de trabajo b-design-and-secure estándar de la nube 1	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube 1 b-design-and-secure	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: cargas de trabajo estándar en la nube b-design-and-secure	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.

ID de control	AWS Regla de configuración	Directrices
sección 4: cargas de trabajo b-design-and-secure estándar de la nube 1	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.
sección 4b-design-and-secure: cargas de trabajo estándar en la nube	iam-user-unused-credentials-comprobar	AWS Identity and Access Management (IAM) puede ayudarlo con los permisos y autorizaciones de acceso comprobando las contraseñ as y claves de acceso de IAM que no se utilicen durante un período de tiempo específic o. Si se identifican estas credenciales no utilizadas, debe deshabilitar la opción de and/or eliminar las credencia les, ya que esto podría infringir el principio del privilegio mínimo. Esta regla requiere que establezcas un valor en la maxCredentialUsage Edad (Config Default: 90). El valor real debe reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	restricted-ssh	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a administrar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS AI no permitir el tráfico de entrada (o el tráfico remoto) desde 0.0.0.0/0 al puerto 22 en sus recursos, podrá restringir el acceso remoto.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: la nube, 1 carga de trabajo estándar	ec2- instances-in-vpc	Implemente instancias de Amazon Elastic Compute Cloud (Amazon EC2) dentro de una Amazon Virtual Private Cloud (Amazon VPC) para permitir una comunicación segura entre una instancia y otros servicios dentro de la Amazon VPC, sin necesidad de utilizar una puerta de enlace de internet, un dispositivo NAT ni una conexión de VPN. Todo el tráfico permanece seguro dentro de la AWS nube. Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Asigne instancias de Amazon EC2 a una Amazon VPC para gestionar correctamente el acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 1: cargas de trabajo estándar	internet-gateway-authorized-vpc-solo	Gestione el acceso a los recursos de la AWS nube asegurándose de que las puertas de enlace de Internet solo estén conectadas a Amazon Virtual Private Cloud (Amazon VPC) autorizada. Las puertas de enlace de Internet permiten el acceso bidireccional a internet desde y hacia la Amazon VPC, lo que puede provocar un acceso no autorizado a los recursos de Amazon VPC.
sección 4: la nube, 1 carga de trabajo estándar b-design-and-secure	lambda-function-public-access-prohibido	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a las funciones de AWS Lambda. El acceso público puede degradar la disponibilidad de los recursos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	lambda-inside-vpc	Implemente funciones de AWS Lambda en una Amazon Virtual Private Cloud (Amazon VPC) para una comunicación segura entre una función y otros servicios de la Amazon VPC. Con esta configuración, no se requiere ninguna puerta de enlace de internet, dispositi vo NAT ni conexión de VPN. Todo el tráfico permanece de forma segura en la nube. AWS Debido a su aislamien to lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Para gestionar correctam ente el acceso, las funciones de AWS Lambda deben asignarse a una VPC.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube 1 b-design-and-secure	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protecció n a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidente s de cuentas compromet idas y evitar que usuarios no autorizados accedan a los datos confidenciales.
sección 4: la nube, 1 carga de trabajo estándar b-design-and-secure	no-unrestricted-route-to-igw	Asegúrese de que las tablas de enrutamiento de Amazon EC2 no tengan rutas ilimitada s a una puerta de enlace de internet. Eliminar o limitar el acceso a Internet para las cargas de trabajo en Amazon VPCs puede reducir el acceso no deseado dentro de su entorno.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube 1 b-design-and-secure	rds-instance-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.
sección 4: las cargas de trabajo estándar de la nube 1 b-design-and-secure	redshift-cluster-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que los clústeres de Amazon Redshift no sean públicos. Los clústeres de Amazon Redshift pueden contener informaci ón confidencial y principio s. Además dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: la nube: 1 carga de trabajo estándar	redshift-enhanced-vpc-routing-habilitado	El enrutamiento de VPC mejorado fuerza que todo el tráfico de COPY y UNLOAD entre los repositorios de datos y de clúster pase por su Amazon VPC. A continuac ión, puede utilizar las caracterí sticas de la VPC, como los grupos de seguridad y las listas de control de acceso a la red, para proteger el tráfico de la red. También puede usar los registros de flujo de la VPC para monitorear el tráfico de la red.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: cargas de trabajo estándar en la nube 1	restricted-common-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Esta regla le permite configurar de forma opcional los parámetros blockedPo rt1 a blockedPort5 (valores predeterminados de Config: 20,21,3389,3306,4333). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 1 carga de trabajo estándar	root-account-hardware-mfa-habilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	s3- -bloques-periódicos account-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configura r opcionalmente los restrictP ublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPubl icPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	s3- bucket-public-read-prohibit ed	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositi vos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	s3- bucket-public-write-prohibited	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositivos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	sagemaker-notebook-no-direct-acceso a internet	Gestione el acceso a los recursos en la AWS nube asegurándose de que las SageMaker libretas de Amazon no permitan el acceso directo a Internet. Al impedir el acceso directo a internet, puede evitar que usuarios no autorizados accedan a los datos confidenciales.
sección 4b-design-and-secure: la nube 1: cargas de trabajo estándar	ssm-document-not-public	Asegúrese de que los documentos de AWS Systems Manager (SSM) no sean públicos, ya que esto podría permitir el acceso no deseado a los documentos de SSM. Un documento de SSM público puede exponer información sobre su cuenta, sus recursos y sus procesos internos.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: cargas de trabajo estándar en la nube	vpc-default-security-group-cerrado	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a gestionar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS Restringir todo el tráfico en el grupo de seguridad predeterminado ayuda a restringir el acceso remoto a los recursos. AWS
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	vpc-sg-open-only-to-authorized-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Al restringir el acceso a los recursos dentro de un grupo de seguridad desde internet (0.0.0.0/0), se puede controlar el acceso remoto a los sistemas internos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 1 carga de trabajo estándar	ecs-containers-nonprivileged	Para ayudar a implementar el principio de privilegio mínimo, las definiciones de tareas de Amazon Elastic Container Service (Amazon ECS) no deben tener habilitados los privilegios elevados. Cuando este parámetro es verdadero, al contenedor se le conceden privilegios elevados en la instancia de contenedor de host, similares a los de un usuario raíz.
sección 4: cargas de trabajo b-design-and-secure estándar de la nube 1	ecs-containers-readonly-access	Habilitar el acceso de solo lectura a los contenedores de Amazon Elastic Container Service (ECS) puede ayudar a cumplir con el principio de privilegio mínimo. Esta opción puede reducir los vectores de ataque, ya que el sistema de archivos de la instancia de contenedor no se puede modificar a menos que tenga permisos explícitos de lectura y escritura.

ID de control	AWS Regla de configuración	Directrices
sección 4: cargas de trabajo b-design-and-secure estándar de la nube 1	opensearch-access-control-enabled	Asegúrese de que el control de acceso detallado esté habilitado en sus dominios de Amazon OpenSearch Service. El control de acceso detallado proporciona mecanismos de autorización mejorados para lograr el acceso con menos privilegios a los dominios de Amazon Service. OpenSearch Permite un control de acceso al dominio basado en funciones, así como una seguridad a nivel de índices, documentos y campos, la compatibilidad con los paneles de servicio, la multitenencia y la autenticación básica HTTP para OpenSearch Service y Kibana. OpenSearch
b-design-and-securesección 4: las cargas de trabajo estándar de la nube 1	s3- -prohibido bucket-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público en el nivel del bucket.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 1	subnet-auto-assign-public-ip-deshabilitado	Gestione el acceso a la AWS nube asegurándose de que a las subredes de Amazon Virtual Private Cloud (VPC) no se les asigne automátic amente una dirección IP pública. Las instancias de Amazon Elastic Compute Cloud (EC2) que se lanzan en subredes que tienen este atributo habilitado tienen una dirección IP pública asignada a su interfaz de red principal.
sección 4: las cargas de trabajo estándar de la nube 2 b-design-and-secure	cloudtrail-security-trail-enabled	Esta regla ayuda a garantiza r el uso de las mejores prácticas de seguridad AWS recomendadas AWS CloudTrail, ya que comprueba la habilitación de varios ajustes. Estas incluyen el uso del cifrado de registros, la validación de registros y la habilitación AWS CloudTrail en varias regiones.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 2	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 2	ec2- -check managedinstance-association-compliance-status	Use AWS Systems Manager Associations para ayudar con el inventario de las plataformas y aplicaciones de software dentro de una organización. AWS Systems Manager asigna un estado de configuración a las instancias administradas y le permite establecer líneas de referencia de los niveles de parches del sistema operativo, las instalaciones de software, las configuraciones de las aplicaciones y otros detalles sobre su entorno.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 2	ec2- -check managedinstance-patch-compliance-status	Habilite esta regla para ayudar a identificar y documenta r las vulnerabilidades de Amazon Elastic Compute Cloud (Amazon EC2). La regla comprueba si los parches de instancias Amazon EC2 cumplen con los requisitos de las políticas y procedimientos de su organización en AWS Systems Manager.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 2	redshift-cluster-maintenancesettings-check	Esta regla garantiza que los clústeres de Amazon Redshift tengan la configuración preferida para su organización. En concreto, que tengan períodos de mantenimiento preferidos y períodos de retención automática de instantáneas para la base de datos. Esta regla requiere que configure el. allowVersionUpgrade El valor predeterminado es true. También te permite configurar de forma opcional el periodo preferred MaintenanceWindow (el predeterminado es sáb: 16:00 -sáb: 16:30) y el automated SnapshotRetention Periodo (el valor predeterminado es 1). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: las cargas de trabajo estándar de la nube 3	autoscaling-group-elb-healthcheck-obligatorio	Las revisiones de estado de Elastic Load Balancer (ELB) para los grupos de escalado automático de Amazon Elastic Compute Cloud (Amazon EC2) permiten mantener la capacidad y disponibilidad adecuadas. De forma periódica, el equilibrador de carga envía pings, intenta establecer conexiones o envía solicitudes para probar el estado de las instancias de Amazon EC2 en un grupo de escalado automático. Si una instancia no informa, el tráfico se envía a una nueva instancia de Amazon EC2.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 3	dynamodb-autoscaling-enabled	El escalado automático de Amazon DynamoDB AWS usa el servicio Application Auto Scaling para ajustar la capacidad de rendimiento aprovisionada para que responda automáticamente a los patrones de tráfico reales. Esto permite que una tabla o un índice secundario global aumente su read/write capacidad aprovisionada para gestionar los aumentos repentinos de tráfico, sin limitaciones.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: las cargas de trabajo estándar de la nube, las 3	ec2- instance-detailed-monitoring-enabled	Habilite esta regla para ayudar a mejorar el monitoreo de instancias de Amazon Elastic Compute Cloud (Amazon EC2) en la consola de Amazon EC2, que muestra gráficos de monitoreo de la instancia en periodos de 1 minuto.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 3	elb-cross-zone-load-habilitado para el equilibrio	Habilite el equilibrio de carga entre zonas para sus Elastic Load Balancers (ELBs) para ayudar a mantener la capacidad y la disponibilidad adecuadas. El equilibrio de carga entre zonas reduce la necesidad de mantener automáticamente cantidades equivalentes de instancias en cada zona de disponibilidad habilitada. También mejora la capacidad de la aplicación para gestionar la pérdida de una o más instancias.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube (3) b-design-and-secure	elb-deletion-protection-enabled	Esta regla garantiza que Elastic Load Balancing tenga habilitada la protección contra borrado. Utilice esta característica para evitar que el equilibrador de carga se elimine de forma accidental o malintencionada, lo que puede provocar la pérdida de disponibilidad de sus aplicaciones.
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube 3	rds-enhanced-monitoring-enabled	Habilite Amazon Relational Database Service (Amazon RDS) para monitorear la disponibilidad de Amazon RDS. Esto proporciona información detallada del estado de las instancias de bases de datos de Amazon RDS. Cuando el almacenamiento de Amazon RDS utiliza más de un dispositivo físico subyacente, el monitoreo mejorado recopila los datos de cada dispositivo. Además, cuando la instancia de base de datos de Amazon RDS se ejecuta en una implementación Multi-AZ, se recopilan los datos de cada dispositivo del host secundario y las métricas del host secundario.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube 3	rds-multi-az-support	La compatibilidad con las zonas de disponibilidad múltiples (Multi-AZ) de Amazon Relational Database Service (Amazon RDS) permite mejorar la disponibilidad y durabilidad de las instancias de bases de datos. Cuando aprovisiona una instancia de base de datos Multi-AZ, Amazon RDS crea automáticamente una instancia de base de datos principal y replica sincrónicamente los datos en una instancia en espera en una zona de disponibilidad diferente. Cada zona de disponibilidad se ejecuta en su propia infraestructura independiente y físicamente distinta, y está diseñada para ser altamente fiable. En caso de que se produzca un fallo en la infraestructura, Amazon RDS realiza una conmutación por error automática a la estación en espera para que pueda reanudar las operaciones de la base de datos en cuanto se complete la conmutación por error.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube 3	rds-cluster-multi-az-habilitado	La compatibilidad con las zonas de disponibilidad múltiples (Multi-AZ) de Amazon Relational Database Service (Amazon RDS) permite mejorar la disponibilidad y durabilidad de las instancias de bases de datos. Cuando aprovisiona una instancia de base de datos Multi-AZ, Amazon RDS crea automáticamente una instancia de base de datos principal y replica sincrónicamente los datos en una instancia en espera en una zona de disponibilidad diferente. Cada zona de disponibilidad se ejecuta en su propia infraestructura independiente y físicamente distinta, y está diseñada para ser altamente fiable. En caso de que se produzca un fallo en la infraestructura, Amazon RDS realiza una conmutación por error automática a la estación en espera para que pueda reanudar las operaciones de la base de datos en cuanto se complete la conmutación por error.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 3	beanstalk-enhanced-health-reporting-habilitado	AWS Los informes de estado mejorados de Elastic Beanstalk permiten una respuesta más rápida a los cambios en el estado de la infraestructura subyacente. Estos cambios podrían provocar una falta de disponibilidad de la aplicación. Los informes de estado mejorados de Elastic Beanstalk proporcionan un descriptor de estado para evaluar la gravedad de los problemas detectados e identificar las posibles causas que se deben investigar.
b-design-and-securesección 4: las cargas de trabajo estándar de la nube, 4	alb-waf-enabled	Asegúrese de que el AWS WAF esté habilitado en los Elastic Load Balancers (ELB) para ayudar a proteger las aplicaciones web. Un WAF ayuda a proteger sus aplicaciones web o APIs contra los ataques web más comunes. Estas vulnerabilidades de la web pueden afectar a la disponibilidad, comprometer la seguridad o consumir recursos excesivos en su entorno.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube, 4 b-design-and-secure	api-gw-associated-with-guerra	AWS El WAF le permite configurar un conjunto de reglas (denominadas listas de control de acceso web (ACL web)) que permiten, bloquean o cuentan las solicitudes web en función de las reglas y condiciones de seguridad web personalizables que usted defina. Asegúrese de que su etapa de Amazon API Gateway esté asociada a una ACL web de WAF para protegerla de ataques maliciosos.
sección 4b-design-and-secu re: Las cargas de trabajo estándar de la nube, 4	autoscaling-launch-config-p ublic-ip deshabilitado	Si configura las interfaces de red con una dirección IP pública, se puede acceder a los recursos asociados a esas interfaces de red desde Internet. Los recursos de EC2 no deben ser de acceso público, ya que esto podría permitir el acceso no deseado a sus aplicaciones o servidore s.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube 4 b-design-and-secure	ec2- instance-no-public-ip	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de Amazon Elastic Compute Cloud (Amazon EC2). Las instancias de Amazon EC2 pueden contener información confidencial y dichas cuentas requieren control de acceso.
sección 4b-design-and-secu re: Las cargas de trabajo estándar de la nube, 4	ec2- instance-profile-attached	Los perfiles de instancia s de EC2 pasan un rol de IAM a una instancia de EC2. Adjuntar un perfil de instancia a las instancias puede ayudar a gestionar los privilegios mínimos y los permisos.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 4	ecs-task-definition-user-for-host-mode-check	Si la definición de una tarea tiene privilegios elevados, se debe a que el cliente ha optado específicamente por esa configuración. Este control comprueba si hay una escalada inesperada de privilegios cuando una definición de tarea tiene habilitadas las redes de host, pero el cliente no ha elegido los privilegios elevados.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube, 4	elasticsearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch OpenSearc h Service (Service) estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de OpenSearc h servicio dentro de una Amazon VPC permite una comunicación segura entre el OpenSearch Servicio y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube, 4 b-design-and-secure	emr-kerberos-enabled	Los permisos y autorizac iones de acceso se pueden administrar e incorporar con los principios de privilegi o mínimo y separación de funciones al habilitar Kerberos para los clústeres de Amazon EMR. En Kerberos, los servicios y los usuarios que deben autenticarse se denominan entidades principal es. Las entidades principal es existen dentro de un ámbito de Kerberos. Dentro de ese ámbito, un servidor de Kerberos se conoce como el centro de distribuc ión de claves (KDC). Este proporciona un medio para que las entidades principal es se autentiquen. El KDC se autentica emitiendo tickets de autenticación. El KDC mantiene una base de datos de las entidades principal es dentro de su ámbito, sus contraseñas y otros datos administrativos sobre cada una de las entidades principal es.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube, 4	emr-master-no-public-ip	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicame nte a los nodos maestros del clúster de Amazon EMR. Los nodos maestros del clúster de Amazon EMR pueden contener información confidencial y dichas cuentas requieren control de acceso.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 4	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de cibersegu ridad mediante el uso de fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automátic o para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube	iam-customer-policy-blocked-kms-acciones	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, lo que impide que las políticas contengan acciones bloqueadas en todas AWS las claves del Servicio de Administración de Claves. Tener más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones . Esta regla le permite establecer el blockedAc tionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencrip tar, kms:ReEncryptFrom). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube, 4 b-design-and-secure	iam-group-has-users-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios de privilegios mínimos y separación de funciones en los permisos y autorizaciones de acceso, garantizando que los grupos de IAM tengan al menos un usuario. Una forma de incorporar privilegios mínimos es colocar a los usuarios en grupos en función de los permisos o funciones laborales asociados.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube b-design-and-secure	iam-inline-policy-blocked-kms-acciones	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política en línea que permita bloquear acciones en todas las claves del Servicio de administración de claves. AWS AWS recomiend a utilizar políticas gestionad as en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administr ación de permisos. Esta regla le permite establece r el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar, kms:ReEnc ryptFrom). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube, 4 b-design-and-secure	iam-password-policy	Las identidades y las credenciales se emiten, administran y verifican en función de la política de contraseñas de IAM de la organización. Cumplen o superan los requisitos establecidos por el NIST SP 800-63 y el estándar fundamental de mejores prácticas de seguridad para la seguridad de las contraseñ as. AWS Esta regla le permite configurar opcionalmente RequireUppercaseCharacters (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireLo wercaseCharacters (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireSy mbols (valor de las mejores prácticas de seguridad AWS fundamentales: verdadero), RequireNumbers (valor de las mejores prácticas de seguridad AWS AWS fundamentales: verdadero), MinimumPasswordLen gth (valor de las mejores prácticas de seguridad AWS fundamentales: 14), PasswordReusePrevention

ID de control	AWS Regla de configuración	Directrices
		(valor de las mejores prácticas de seguridad AWS fundament ales: 24) y MaxPasswordAge (valor de las mejores prácticas de seguridad fundamentales: 90) para su IAM La política de contraseñas. Los valores reales deben reflejar las políticas de su organización.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 4	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegi o y la separación de funciones en los permisos y autorizac iones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesario s para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube, 4 b-design-and-secure	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube, 4	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube y las 4 b-design-and-secure	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: las cargas de trabajo estándar de la nube b-design-and-secure	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube, 4	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube	iam-user-unused-credentials-comprobar	AWS Identity and Access Management (IAM) puede ayudarlo con los permisos y autorizaciones de acceso comprobando las contraseñ as y claves de acceso de IAM que no se utilicen durante un período de tiempo específic o. Si se identifican estas credenciales no utilizadas, debe deshabilitar la opción de and/or eliminar las credencia les, ya que esto podría infringir el principio del privilegio mínimo. Esta regla requiere que establezcas un valor en la maxCredentialUsage Edad (Config Default: 90). El valor real debe reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, las 4	restricted-ssh	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a administrar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS AI no permitir el tráfico de entrada (o el tráfico remoto) desde 0.0.0.0/0 al puerto 22 en sus recursos, podrá restringir el acceso remoto.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: las cargas de trabajo estándar de la nube, 4	ec2- instances-in-vpc	Implemente instancias de Amazon Elastic Compute Cloud (Amazon EC2) dentro de una Amazon Virtual Private Cloud (Amazon VPC) para permitir una comunicación segura entre una instancia y otros servicios dentro de la Amazon VPC, sin necesidad de utilizar una puerta de enlace de internet, un dispositivo NAT ni una conexión de VPN. Todo el tráfico permanece seguro dentro de la AWS nube. Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Asigne instancias de Amazon EC2 a una Amazon VPC para gestionar correctamente el acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube	internet-gateway-authorized-vpc-solo	Gestione el acceso a los recursos de la AWS nube asegurándose de que las puertas de enlace de Internet solo estén conectadas a Amazon Virtual Private Cloud (Amazon VPC) autorizada. Las puertas de enlace de Internet permiten el acceso bidireccional a internet desde y hacia la Amazon VPC, lo que puede provocar un acceso no autorizado a los recursos de Amazon VPC.
sección 4: las cargas de trabajo estándar de la nube, las 4 b-design-and-secure	lambda-function-public-access-prohibido	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a las funciones de AWS Lambda. El acceso público puede degradar la disponibilidad de los recursos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 4	lambda-inside-vpc	Implemente funciones de AWS Lambda en una Amazon Virtual Private Cloud (Amazon VPC) para una comunicación segura entre una función y otros servicios de la Amazon VPC. Con esta configuración, no se requiere ninguna puerta de enlace de internet, dispositi vo NAT ni conexión de VPN. Todo el tráfico permanece de forma segura en la nube. AWS Debido a su aislamien to lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Para gestionar correctam ente el acceso, las funciones de AWS Lambda deben asignarse a una VPC.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube, 4 b-design-and-secure	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protecció n a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidente s de cuentas compromet idas y evitar que usuarios no autorizados accedan a los datos confidenciales.
sección 4: las cargas de trabajo estándar de la nube, 4 b-design-and-secure	no-unrestricted-route-to-igw	Asegúrese de que las tablas de enrutamiento de Amazon EC2 no tengan rutas ilimitada s a una puerta de enlace de internet. Eliminar o limitar el acceso a Internet para las cargas de trabajo en Amazon VPCs puede reducir el acceso no deseado dentro de su entorno.

ID de control	AWS Regla de configuración	Directrices
sección 4: Las cargas de trabajo estándar de la nube, 4 b-design-and-secure	opensearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch Service estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de Amazon OpenSearch Service dentro de una Amazon VPC permite una comunicación segura entre Amazon OpenSearch Service y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.
sección 4: las cargas de trabajo estándar de la nube, 4 b-design-and-secure	rds-instance-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube b-design-and-secure	redshift-cluster-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que los clústeres de Amazon Redshift no sean públicos. Los clústeres de Amazon Redshift pueden contener informaci ón confidencial y principio s. Además dichas cuentas requieren control de acceso.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube y las 4	restricted-common-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Esta regla le permite configurar de forma opcional los parámetros blockedPo rt1 a blockedPort5 (valores predeterminados de Config: 20,21,3389,3306,4333). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 4	root-account-hardware-mfa-habilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 4	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 4	s3- -bloques-periódicos account-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configura r opcionalmente los restrictP ublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPubl icPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 4	sagemaker-notebook-no-direc t-acceso a internet	Gestione el acceso a los recursos en la AWS nube asegurándose de que las SageMaker libretas de Amazon no permitan el acceso directo a Internet. Al impedir el acceso directo a internet, puede evitar que usuarios no autorizados accedan a los datos confidenc iales.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 4	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS
sección 4: las cargas de trabajo estándar de la nube b-design-and-secure	vpc-default-security-group-cerrada	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a gestionar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS Restringi r todo el tráfico en el grupo de seguridad predeterminado ayuda a restringir el acceso remoto a los recursos. AWS

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 4	vpc-sg-open-only-to-authorized-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Al restringir el acceso a los recursos dentro de un grupo de seguridad desde internet (0.0.0.0/0), se puede controlar el acceso remoto a los sistemas internos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube	vpc-vpn-2-tunnels-up	Se pueden implementar túneles VPN redundantes Site-to-Site para cumplir con los requisitos de resilienc ia. Utiliza dos túneles para garantizar la conectividad en caso de que una de las conexiones Site-to-Site VPN no esté disponible. Para protegerse contra la pérdida de conectividad, en caso de que su pasarela de cliente deje de estar disponible, puede configurar una segunda conexión de Site-to-Site VPN a su Amazon Virtual Private Cloud (Amazon VPC) y a su puerta de enlace privada virtual mediante una segunda pasarela de cliente.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 4	s3- -prohibido bucket-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público en el nivel del bucket.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 4	subnet-auto-assign-public-ip deshabilitado	Gestione el acceso a la AWS nube asegurándose de que a las subredes de Amazon Virtual Private Cloud (VPC) no se les asigne automátic amente una dirección IP pública. Las instancias de Amazon Elastic Compute Cloud (EC2) que se lanzan en subredes que tienen este atributo habilitado tienen una dirección IP pública asignada a su interfaz de red principal.
sección 4: las cargas de trabajo estándar de la nube, las 5 b-design-and-secure	acm-certificate-expiration-check	Asegúrese de que la integrida d de la red esté protegida asegurándose de que ACM emita los certificados X509. AWS Estos certificados deben ser válidos y estar vigentes. Esta regla requiere un valor para daysToExpiration (valor de prácticas recomendadas de seguridad AWS fundament ales: 90). El valor real debe reflejar las políticas de su organización.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 5	cmk-backing-key-rotation-ha bilitado	Habilite la rotación de claves para garantizar que las claves se roten una vez que hayan alcanzado el final de su período criptográfico.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, las 5	iam-customer-policy-blocked-kms-acciones	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, lo que impide que las políticas contengan acciones bloqueadas en todas AWS las claves del Servicio de Administración de Claves. Tener más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones . Esta regla le permite establecer el blockedAc tionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencrip tar, kms:ReEncryptFrom). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube, 5 b-design-and-secure	iam-inline-policy-blocked-kms-acciones	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política en línea que permita bloquear acciones en todas las claves del Servicio de administración de claves. AWS AWS recomiend a utilizar políticas gestionad as en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administr ación de permisos. Esta regla le permite establece r el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar, kms:ReEnc ryptFrom). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube, 5 b-design-and-secure	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegi os de los necesarios para completar una tarea puede infringir el principio de privilegi o mínimo y la separación de funciones.
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube 5	kms-cmk-not-scheduled-para su eliminación	Para ayudar a proteger los datos en reposo, asegúrese de que las claves maestras del cliente (CMKs) necesarias no estén programadas para su eliminación en el Servicio de administración de AWS claves (AWS KMS). Puesto que a veces es necesario eliminar las claves, esta regla ayuda a comprobar todas las claves cuyo borrado está programado para comprobar si alguna está ahí por error.
sección 4b-design-and-secu re: las seis cargas de trabajo estándar de la nube	alb-http-drop-invalid-habilitado para encabezados	Asegúrese de que su Elastic Load Balancing (ELB) esté configurado para eliminar los encabezados http. Puesto que puede haber datos confidenc iales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
sección 4: las seis cargas de trabajo estándar de la nube b-design-and-secure	alb-http-to-https-verificación de redireccionamiento	Para ayudar a proteger los datos en tránsito, asegúrese de que el equilibrador de carga de aplicación redirija automáticamente las solicitud es HTTP no cifradas hacia HTTPS. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
sección 4: las cargas de trabajo estándar de la nube b-design-and-secure	api-gw-cache-enabled-y encriptado	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté activado en la caché de la etapa de API Gateway. Puesto que pueden capturarse datos confidenc iales para el método de la API, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 6	cloudwatch-log-group-encryp ted	Para ayudar a proteger los datos confidenciales en reposo, asegúrate de que el cifrado esté activado en tus Amazon CloudWatch Log Groups.
sección 4b-design-and-secu re: la nube, las 6 cargas de trabajo estándar	cloud-trail-encryption-enabled	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en reposo, debe asegurarse de que el cifrado esté habilitado para sus registros de seguimiento de AWS CloudTrail.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube	dynamodb-table-encrypted-kms	Asegúrese de que el cifrado esté habilitado para las tablas de Amazon DynamoDB. Puesto que puede haber datos confidenciales en reposo en estas tablas, habilite el cifrado en reposo para ayudar a protegerlos. De forma predeterminada, las tablas de DynamoDB se AWS cifran con una clave maestra del cliente (CMK) propia.
b-design-and-securesección 4: las seis cargas de trabajo estándar de la nube	ec2- ebs-encryption-by-default	Para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS). Puesto que puede haber datos confidenciales en reposo en estos volúmenes, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 6	efs-encrypted-check	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de Amazon Elastic File System (EFS).

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube	elasticsearch-encrypted-at-rest	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté habilitado para tus dominios de Amazon OpenSearch OpenSearch Service (Servicio).
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube	elasticsearch-node-to-node-verificación de cifrado	Asegúrese de que el node-to-node cifrado OpenSearch de Amazon Service esté activado. Node-to-nodeel cifrado permite el cifrado TLS 1.2 para todas las comunicaciones dentro de Amazon Virtual Private Cloud (Amazon VPC). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
sección 4: la nube, las 6 cargas de trabajo estándar b-design-and-secure	elasticsearch-node-to-node-verificación de cifrado	Asegúrese de que el node-to-node cifrado OpenSearch de Amazon Service esté activado. Node-to-nodeel cifrado permite el cifrado TLS 1.2 para todas las comunicaciones dentro de Amazon Virtual Private Cloud (Amazon VPC). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, las 6 cargas de trabajo estándar b-design-and-secure	elb v2- acm-certificate-required	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en tránsito, debe asegurarse de que el cifrado esté habilitado para su Elastic Load Balancing. Use AWS Certificate Manager para administrar, aprovisionar e implementar SSL/TLS certificados públicos y privados con AWS servicios y recursos internos.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube	elb-acm-certificate-required	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en tránsito, debe asegurarse de que el cifrado esté habilitado para su Elastic Load Balancing. Use AWS Certificate Manager para administrar, aprovisionar e implementar SSL/TLS certificados públicos y privados con AWS servicios y recursos internos.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube	elb-tls-https-listeners-solo	Asegúrese de que sus Elastic Load Balancers (ELBs) estén configurados con agentes de escucha SSL o HTTPS. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube 6 b-design-and-secure	encrypted-volumes	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS).
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube	kinesis-stream-encrypted	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado para Amazon Kinesis Streams.
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube	kinesis-stream-encrypted	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado para Amazon Kinesis Streams.
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube	opensearch-encrypted-at-rest	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté habilitado para tus dominios de Amazon OpenSearch Service.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube	opensearch-node-to-node-verificación de cifrado	Asegúrese de que el node-to-node cifrado OpenSearch de Amazon Service esté activado. Node-to-nodeel cifrado permite el cifrado TLS 1.2 para todas las comunicaciones dentro de Amazon Virtual Private Cloud (Amazon VPC). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
sección 4: la nube, las 6 cargas de trabajo estándar b-design-and-secure	rds-snapshot-encrypted	Asegúrese de que el cifrado esté habilitado para las instantáneas de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenciales en reposo, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube	rds-storage-encrypted	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté habilitado para sus instancias de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenciales en reposo en las instancias de Amazon RDS, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar informaci ón acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezc a un valor para clusterDb Encrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organizac ión.
b-design-and-securesección 4: las seis cargas de trabajo estándar de la nube	redshift-require-tls-ssl	Asegúrese de que sus clústeres de Amazon Redshift requieran cifrado TLS/SSL para conectarse a los clientes SQL. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube	habilitado para s3 bucket-server-side-encryption	Para ayudar a proteger los datos en reposo, asegúrese de habilitar el cifrado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de S3, habilite el cifrado para protegerlos.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube	s3- bucket-ssl-requests-only	Para ayudar a proteger los datos en tránsito, asegúrese de que los buckets de Amazon Simple Storage Service (Amazon S3) requieran solicitudes para usar la capa de sockets seguros (SSL). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 6	s3- default-encryption-kms	Asegúrese de tener el cifrado habilitado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de Amazon S3, habilite el cifrado en reposo para protegerlos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 6	sagemaker-endpoint-configuration-kms-configurado mediante clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado en su terminal. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker punto final, habilite el cifrado en reposo para ayudar a proteger esos datos.
sección 4b-design-and-secure: la nube, las 6 cargas de trabajo estándar	sagemaker-notebook-instance-kms-configurado mediante clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado en su portátil. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker portátil, habilite el cifrado en reposo para ayudar a proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, las 6 cargas de trabajo estándar	sns-encrypted-kms	Para ayudar a proteger los datos en reposo, asegúrese de que los temas del Amazon Simple Notification Service (Amazon SNS) requieran cifrado AWS mediante el Servicio AWS de administración de claves (KMS). Puesto que puede haber datos confidenciales en reposo en los mensajes publicados, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4b-design-and-secure: las seis cargas de trabajo estándar de la nube	api-gw-ssl-enabled	Asegúrese de que las etapas de la API de REST de Amazon API Gateway estén configuradas con certificados SSL para permitir que los sistemas de backend autentiquen que las solicitudes se originan en API Gateway.
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube	redshift-cluster-kms-enabled	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado para su clúster de Amazon Redshift. Puesto que puede haber datos confidenciales en reposo en los clústeres de Redshift, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 8	access-keys-rotated	Se auditan las credenciales de los dispositivos, usuarios y procesos autorizados para garantizar que las claves de acceso de IAM se roten según la política de la organizac ión. Cambiar las claves de acceso de forma habitual es una práctica recomendada de seguridad. Al hacerlo, se reduce el período de tiempo en el que una clave de acceso está activa y el impacto sobre la empresa si las claves se ven comprometidas. Esta regla requiere un valor de rotación de clave de acceso (valor predeterminado de Config: 90). El valor real debe reflejar las políticas de su organización.
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube 8	account-part-of-organizations	La administración centraliz ada Cuentas de AWS dentro de AWS Organizations ayuda a garantizar que las cuentas cumplan con las normas. La falta de gobernanza centraliz ada de las cuentas puede provocar incoherencias en las configuraciones de cuentas, lo que puede exponer los recursos y los datos confidenc iales.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 8	cloudtrail-security-trail-enabled	Esta regla ayuda a garantizar el uso de las mejores prácticas de seguridad AWS recomendadas AWS CloudTrail, ya que comprueba la habilitación de varios ajustes. Estas incluyen el uso del cifrado de registros, la validación de registros y la habilitación AWS CloudTrail en varias regiones.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 8	emr-kerberos-enabled	Los permisos y autorizac iones de acceso se pueden administrar e incorporar con los principios de privilegi o mínimo y separación de funciones al habilitar Kerberos para los clústeres de Amazon EMR. En Kerberos, los servicios y los usuarios que deben autenticarse se denominan entidades principal es. Las entidades principal es existen dentro de un ámbito de Kerberos. Dentro de ese ámbito, un servidor de Kerberos se conoce como el centro de distribuc ión de claves (KDC). Este proporciona un medio para que las entidades principal es se autentiquen. El KDC se autentica emitiendo tickets de autenticación. El KDC mantiene una base de datos de las entidades principal es dentro de su ámbito, sus contraseñas y otros datos administrativos sobre cada una de las entidades principal es.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube 8	iam-customer-policy-blocked-kms-acciones	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, lo que impide que las políticas contengan acciones bloqueadas en todas AWS las claves del Servicio de Administración de Claves. Tener más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones . Esta regla le permite establecer el blockedAc tionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencrip tar, kms:ReEncryptFrom). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube 8 b-design-and-secure	iam-group-has-users-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios de privilegios mínimos y separación de funciones en los permisos y autorizaciones de acceso, garantizando que los grupos de IAM tengan al menos un usuario. Una forma de incorporar privilegios mínimos es colocar a los usuarios en grupos en función de los permisos o funciones laborales asociados.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, las 8 cargas de trabajo estándar b-design-and-secure	iam-inline-policy-blocked-kms-acciones	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política en línea que permita bloquear acciones en todas las claves del Servicio de administración de claves. AWS AWS recomiend a utilizar políticas gestionad as en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administr ación de permisos. Esta regla le permite establece r el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar, kms:ReEnc ryptFrom). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube, 8 b-design-and-secure	iam-no-inline-policy-comprobar	Asegúrese de que un usuario, rol de IAM o grupo de IAM (AWS Identity and Access Management) no tenga una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 8	iam-password-policy	Las identidades y las credenciales se emiten, administran y verifican en función de la política de contraseñas de IAM de la organización. Cumplen o superan los requisitos establecidos por el NIST SP 800-63 y el estándar fundamental de mejores prácticas de seguridad para la seguridad de las contraseñ as. AWS Esta regla le permite configurar opcionalmente RequireUppercaseCharacters (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireLo wercaseCharacters (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireSy mbols (valor de las mejores prácticas de seguridad AWS fundamentales: verdadero), RequireNumbers (valor de las mejores prácticas de seguridad AWS AWS fundamentales: verdadero), MinimumPasswordLen gth (valor de las mejores prácticas de seguridad AWS fundamentales: 14), PasswordReusePrevention

ID de control	AWS Regla de configuración	Directrices
		(valor de las mejores prácticas de seguridad AWS fundament ales: 24) y MaxPasswordAge (valor de las mejores prácticas de seguridad fundamentales: 90) para su IAM La política de contraseñas. Los valores reales deben reflejar las políticas de su organización.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 8	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegi o y la separación de funciones en los permisos y autorizac iones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesario s para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube 8 b-design-and-secure	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube 8	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo estándar de la nube, 8 b-design-and-secure	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesario s para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: las cargas de trabajo estándar de la nube, 8 b-design-and-secure	iam-user-mfa-enabled	Active esta regla para restringi r el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autentica ción multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protecció n además de un nombre de usuario y una contraseñ a. Reduzca los incidente s de cuentas compromet idas exigiendo la MFA a los usuarios.

ID de control	AWS Regla de configuración	Directrices
sección 4: las cargas de trabajo b-design-and-secure estándar de la nube 8	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 8	iam-user-unused-credentials-comprobar	AWS Identity and Access Management (IAM) puede ayudarlo con los permisos y autorizaciones de acceso comprobando las contraseñ as y claves de acceso de IAM que no se utilicen durante un período de tiempo específic o. Si se identifican estas credenciales no utilizadas, debe deshabilitar la opción de and/or eliminar las credencia les, ya que esto podría infringir el principio del privilegio mínimo. Esta regla requiere que establezcas un valor en la maxCredentialUsage Edad (Config Default: 90). El valor real debe reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, las 8 cargas de trabajo estándar	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidentes de cuentas comprometidas y evitar que usuarios no autorizados accedan a los datos confidenciales.
sección 4: las cargas de trabajo estándar de la nube, 8 b-design-and-secure	root-account-hardware-mfa-habilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube, 8	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 9	cloudtrail-enabled	AWS CloudTrail puede ayudar a evitar el repudio al registrar las acciones de la consola de administración y las llamadas a la API. AWS Puede identific ar a los usuarios y a quién llamó a un AWS servicio, la dirección IP de origen en la Cuentas de AWS que se generaron las llamadas y los horarios de las llamadas. Los detalles de los datos capturados se muestran en el contenido del AWS CloudTrail registro.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las cargas de trabajo estándar de la nube 9	iam-group-has-users-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios de privilegios mínimos y separación de funciones en los permisos y autorizaciones de acceso, garantizando que los grupos de IAM tengan al menos un usuario. Una forma de incorporar privilegios mínimos es colocar a los usuarios en grupos en función de los permisos o funciones laborales asociados.
sección 4: las cargas de trabajo estándar de la nube b-design-and-secure	iam-no-inline-policy-comprobar	Asegúrese de que un usuario, rol de IAM o grupo de IAM (AWS Identity and Access Management) no tenga una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las 10 cargas de trabajo estándar de la nube	restricted-ssh	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a administrar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS AI no permitir el tráfico de entrada (o el tráfico remoto) desde 0.0.0.0/0 al puerto 22 en sus recursos, podrá restringir el acceso remoto.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: las 10 cargas de trabajo estándar de la nube	ec2- instances-in-vpc	Implemente instancias de Amazon Elastic Compute Cloud (Amazon EC2) dentro de una Amazon Virtual Private Cloud (Amazon VPC) para permitir una comunicación segura entre una instancia y otros servicios dentro de la Amazon VPC, sin necesidad de utilizar una puerta de enlace de internet, un dispositivo NAT ni una conexión de VPN. Todo el tráfico permanece seguro dentro de la AWS nube. Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Asigne instancias de Amazon EC2 a una Amazon VPC para gestionar correctamente el acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: las 10 cargas de trabajo estándar de la nube	internet-gateway-authorized-vpc-solo	Gestione el acceso a los recursos de la AWS nube asegurándose de que las puertas de enlace de Internet solo estén conectadas a Amazon Virtual Private Cloud (Amazon VPC) autorizada. Las puertas de enlace de Internet permiten el acceso bidireccional a internet desde y hacia la Amazon VPC, lo que puede provocar un acceso no autorizado a los recursos de Amazon VPC.

ID de control	AWS Regla de configuración	Directrices
sección 4: las 10 cargas de trabajo estándar de la nube b-design-and-secure	lambda-inside-vpc	Implemente funciones de AWS Lambda en una Amazon Virtual Private Cloud (Amazon VPC) para una comunicación segura entre una función y otros servicios de la Amazon VPC. Con esta configuración, no se requiere ninguna puerta de enlace de internet, dispositi vo NAT ni conexión de VPN. Todo el tráfico permanece de forma segura en la nube. AWS Debido a su aislamien to lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Para gestionar correctam ente el acceso, las funciones de AWS Lambda deben asignarse a una VPC.

ID de control	AWS Regla de configuración	Directrices
sección 4: las 10 cargas de trabajo estándar de la nube b-design-and-secure	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protecció n a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidente s de cuentas compromet idas y evitar que usuarios no autorizados accedan a los datos confidenciales.
sección 4: las 10 cargas de trabajo estándar de la nube b-design-and-secure	no-unrestricted-route-to-igw	Asegúrese de que las tablas de enrutamiento de Amazon EC2 no tengan rutas ilimitada s a una puerta de enlace de internet. Eliminar o limitar el acceso a Internet para las cargas de trabajo en Amazon VPCs puede reducir el acceso no deseado dentro de su entorno.

ID de control	AWS Regla de configuración	Directrices
sección 4: las 10 cargas de trabajo estándar de la nube b-design-and-secure	opensearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch Service estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de Amazon OpenSearch Service dentro de una Amazon VPC permite una comunicación segura entre Amazon OpenSearch Service y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.
sección 4: las 10 cargas de trabajo estándar de la nube b-design-and-secure	rds-instance-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4: las 10 cargas de trabajo estándar de la nube b-design-and-secure	redshift-cluster-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que los clústeres de Amazon Redshift no sean públicos. Los clústeres de Amazon Redshift pueden contener informaci ón confidencial y principio s. Además dichas cuentas requieren control de acceso.
sección 4b-design-and-secu re: las 10 cargas de trabajo estándar de la nube	restricted-common-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Esta regla le permite configurar de forma opcional los parámetros blockedPo rt1 a blockedPort5 (valores predeterminados de Config: 20,21,3389,3306,4333). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: las 10 cargas de trabajo estándar de la nube	root-account-hardware-mfa-habilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
sección 4b-design-and-secure: las 10 cargas de trabajo estándar de la nube	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

sección 4b-design-and-secu re: las 10 cargas de trabajo estándar de la nube	s3- -bloques-periódicos account-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configura r opcionalmente los restrictP ublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPubl icPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.
sección 4b-design-and-secu re: las 10 cargas de trabajo estándar de la nube	sagemaker-notebook-no-direc t-acceso a internet	Gestione el acceso a los recursos en la AWS nube asegurándose de que las SageMaker libretas de Amazon no permitan el acceso directo a Internet. Al impedir el acceso directo a internet, puede evitar que usuarios no autorizados accedan a los datos confidenc iales.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: las 10 cargas de trabajo estándar de la nube	ssm-document-not-public	Asegúrese de que los documentos de AWS Systems Manager (SSM) no sean públicos, ya que esto podría permitir el acceso no deseado a los documentos de SSM. Un documento de SSM público puede exponer información sobre su cuenta, sus recursos y sus procesos internos.
b-design-and-securesección 4: las 10 cargas de trabajo estándar de la nube	vpc-default-security-group-cerrado	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a gestionar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS Restringi r todo el tráfico en el grupo de seguridad predeterminado ayuda a restringir el acceso remoto a los recursos. AWS

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: las 10 cargas de trabajo estándar de la nube	vpc-sg-open-only-to-authori zed-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Al restringir el acceso a los recursos dentro de un grupo de seguridad desde internet (0.0.0.0/ 0), se puede controlar el acceso remoto a los sistemas internos.
sección 4b-design-and-secu re: las 10 cargas de trabajo estándar de la nube	s3- -prohibido bucket-level- public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público en el nivel del bucket.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secu re: las 10 cargas de trabajo estándar de la nube	subnet-auto-assign-public-ip deshabilitado	Gestione el acceso a la AWS nube asegurándose de que a las subredes de Amazon Virtual Private Cloud (VPC) no se les asigne automátic amente una dirección IP pública. Las instancias de Amazon Elastic Compute Cloud (EC2) que se lanzan en subredes que tienen este atributo habilitado tienen una dirección IP pública asignada a su interfaz de red principal.
sección 4: la nube, 12 cargas de trabajo estándar b-design-and-secure	api-gw-cache-enabled-y encriptado	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté activado en la caché de la etapa de API Gateway. Puesto que pueden capturarse datos confidenc iales para el método de la API, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	cloudwatch-log-group-encryp ted	Para ayudar a proteger los datos confidenciales en reposo, asegúrate de que el cifrado esté activado en tus Amazon CloudWatch Log Groups.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	cloud-trail-encryption-enabled	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en reposo, debe asegurarse de que el cifrado esté habilitado para sus registros de seguimiento de AWS CloudTrail.
sección 4: la nube, 12 b-design-and-secure cargas de trabajo estándar	codebuild-project-envvar-awscred-comprobar	Asegúrese de que las credenciales AWS_ACCESS_KEY_ID de autenticación AWS_SECRET_ACCESS_KEY no existan en los entornos de proyectos de AWS Codebuild. No almacene estas variables en texto sin cifrar. El almacenamiento de estas variables en texto sin cifrar provoca una exposición no intencionada de los datos y un acceso no autorizado.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	codebuild-project-source-repo-comprobar la URL	Asegúrese de que la URL del repositorio fuente GitHub o de Bitbucket no contenga tokens de acceso personale s ni credenciales de inicio de sesión en los entornos de proyectos de Codebuild. AWS Úsalos OAuth en lugar de los tokens de acceso personale s o las credenciales de inicio de sesión para conceder la autorización de acceso a los repositorios de Bitbucket GitHub .
b-design-and-securesección 4: la nube, 12 cargas de trabajo estándar	dynamodb-table-encrypted-km s	Asegúrese de que el cifrado esté habilitado para las tablas de Amazon DynamoDB. Puesto que puede haber datos confidenciales en reposo en estas tablas, habilite el cifrado en reposo para ayudar a protegerlos. De forma predeterminada, las tablas de DynamoDB se AWS cifran con una clave maestra del cliente (CMK) propia.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: la nube, 12 cargas de trabajo estándar	ec2- ebs-encryption-by-default	Para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS). Puesto que puede haber datos confidenc iales en reposo en estos volúmenes, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	efs-encrypted-check	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de Amazon Elastic File System (EFS).
sección 4: la nube, 12 b-design-and-secure cargas de trabajo estándar	elasticsearch-encrypted-at-rest	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté habilitado para tus dominios de Amazon OpenSearch OpenSearch Service (Servicio).
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	encrypted-volumes	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS).

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 12 b-design-and-secure cargas de trabajo estándar	iam-no-inline-policy-comprobar	Asegúrese de que un usuario, rol de IAM o grupo de IAM (AWS Identity and Access Management) no tenga una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 12 cargas de trabajo estándar b-design-and-secure	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4: la nube, 12 cargas de trabajo estándar b-design-and-secure	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	kinesis-stream-encrypted	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado para Amazon Kinesis Streams.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 12 b-design-and-secure cargas de trabajo estándar	opensearch-encrypted-at-rest	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté habilitado para tus dominios de Amazon OpenSearch Service.
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	rds-snapshot-encrypted	Asegúrese de que el cifrado esté habilitado para las instantáneas de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenc iales en reposo, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4: la nube, 12 b-design-and-secure cargas de trabajo estándar	rds-storage-encrypted	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté habilitad o para sus instancias de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenciales en reposo en las instancias de Amazon RDS, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 12 b-design-and-secure cargas de trabajo estándar	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar informaci ón acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezc a un valor para clusterDb Encrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organizac ión.
b-design-and-securesección 4: la nube, 12 cargas de trabajo estándar	habilitado para s3 bucket-se rver-side-encryption	Para ayudar a proteger los datos en reposo, asegúrese de habilitar el cifrado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de S3, habilite el cifrado para protegerlos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	sagemaker-endpoint-configuration-kms-configurado mediante clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado en su terminal. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker punto final, habilite el cifrado en reposo para ayudar a proteger esos datos.
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	sagemaker-notebook-instance-kms-configurado mediante clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado en su portátil. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker portátil, habilite el cifrado en reposo para ayudar a proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 12 cargas de trabajo estándar	sns-encrypted-kms	Para ayudar a proteger los datos en reposo, asegúrese de que los temas del Amazon Simple Notification Service (Amazon SNS) requieran cifrado AWS mediante el Servicio AWS de administr ación de claves (KMS). Puesto que puede haber datos confidenciales en reposo en los mensajes publicados, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	api-gw-execution-logging-ha bilitado	El registro de API Gateway muestra vistas detalladas de los usuarios que han accedido a la API y la forma en que han accedido a la API. Esta información permite ver las actividades de los usuarios.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	cloudtrail-s3-dataevents-en abled	La recopilación de eventos de datos del Simple Storage Service (Amazon S3) ayuda a detectar cualquier actividad anómala. Los detalles incluyen la información de la cuenta de AWS a la que ha accedido un bucket de Amazon S3, la dirección IP y la hora del evento.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 14 b-design-and-secure cargas de trabajo estándar	cloudtrail-security-trail-enabled	Esta regla ayuda a garantizar el uso de las mejores prácticas de seguridad AWS recomendadas, ya que comprueba la habilitación de varios ajustes AWS CloudTrail. Estas incluyen el uso del cifrado de registros, la validación de registros y la habilitación AWS CloudTrail en varias regiones.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	cloudwatch-log-group-encrypted	Para ayudar a proteger los datos confidenciales en reposo, asegúrate de que el cifrado esté activado en tus Amazon CloudWatch Log Groups.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	cloud-trail-cloud-watch-habilitado para registros	Usa Amazon CloudWatch para recopilar y gestionar de forma centralizada la actividad de los eventos de registro. La inclusión de AWS CloudTrail datos proporciona detalles de la actividad de llamadas a la API en su interior Cuenta de AWS.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	cloud-trail-encryption-enabled	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en reposo, debe asegurarse de que el cifrado esté habilitado para sus registros de seguimiento de AWS CloudTrail.
sección 4: la nube, 14 b-design-and-secure cargas de trabajo estándar	cloud-trail-log-file-habilitada para la validación	Utilice la validación de los archivos de AWS CloudTrai l registro para comprobar la integridad de los registros. CloudTrail La validación del archivo de registro ayuda a determinar si un archivo de registro se modificó, se eliminó o no se modificó después de CloudTrail entregarlo. Esta caracterí stica se compila mediante los algoritmos estándar de la industria: SHA-256 para el hash y SHA-256 con RSA para la firma digital. Esto hace que sea computacionalmente inviable modificar, eliminar o falsificar los archivos de CloudTrail registro sin ser detectados.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: la nube, 14 cargas de trabajo estándar	cw-loggroup-retention-period-comprobar	Asegúrese de que los datos del registro de eventos se conserven durante un tiempo mínimo para sus grupos de registros, a fin de facilitar la resolución de problemas y las investigaciones forenses. La falta de datos de registros de eventos anteriores disponibl es dificulta la reconstrucción e identificación de eventos potencialmente maliciosos.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	elasticsearch-logs-to-cloud watch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta . Los registros de errores de los dominios pueden ayudar en las auditorías de seguridad y acceso, además de para diagnosticar problemas de disponibilidad.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	elb-logging-enabled	La actividad de Elastic Load Balancing es un punto central de comunicación dentro de un entorno. Asegúrese de que el registro de ELB esté habilitado. Los datos recopilados proporcionan información detallada sobre las solicitudes enviadas al ELB. Cada registro contiene distintos datos, como el momento en que se recibió la solicitud, la dirección IP del cliente, las latencias, las rutas de solicitud y las respuestas del servidor.
sección 4: la nube, 14 b-design-and-secure cargas de trabajo estándar	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante el uso de fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	iam-no-inline-policy-comprobar	Asegúrese de que un usuario, rol de IAM o grupo de IAM (AWS Identity and Access Management) no tenga una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 14 cargas de trabajo estándar b-design-and-secure	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	multi-region-cloudtrail-enabled	AWS CloudTrail registra las acciones AWS de la consola de administración y las llamadas a la API. Puede identificar qué usuarios y cuentas llamaron AWS, la dirección IP de origen desde la que se realizaro n las llamadas y cuándo se produjeron. CloudTrai l entregará los archivos de registro de todas AWS las regiones a su bucket de S3 si MULTI_REGION_CLOUD _TRAIL_ENABLED está activado. Además, al AWS lanzar una nueva región, CloudTrail creará la misma ruta en la nueva región. En consecuencia, recibirá archivos de registro con la actividad de la API en la nueva región sin necesidad de realizar ninguna acción.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	opensearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta . OpenSearch Los registros de errores del servicio pueden ayudar con las auditorías de seguridad y acceso, y pueden ayudar a diagnosticar problemas de disponibilidad.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	rds-logging-enabled	Para facilitar el registro y el monitoreo en su entorno, asegúrese de que el registro de Amazon Relational Database Service (Amazon RDS) esté habilitado. Con el registro de Amazon RDS, puede capturar eventos tales como conexiones, desconexiones, consultas o tablas consultadas.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 14 b-design-and-secure cargas de trabajo estándar	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar informaci ón acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezc a un valor para clusterDb Encrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: la nube, 14 cargas de trabajo estándar	s3- -bloques-periódicos account-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configura r opcionalmente los restrictP ublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPubl icPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	s3- bucket-default-lock-enabled	Asegúrese de que su bucket de Amazon Simple Storage Service (Amazon S3) tenga el bloqueo habilitado de forma predeterminada. Puesto que puede haber datos confidenc iales en reposo en los buckets de S3, habilite el bloqueo de objetos en reposo para protegerlos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	s3- bucket-logging-enabled	El registro de acceso al servidor de Amazon Simple Storage Service (Amazon S3) proporciona un método para monitorear la red en busca de posibles eventos de ciberseguridad. Los eventos se monitorean mediante la captura detallada de las solicitudes realizadas a un bucket de Amazon S3. Cada registro de acceso proporcio na detalles sobre una única solicitud de acceso. Los detalles incluyen el solicitan te, el nombre del bucket, la hora de la solicitud, la acción solicitada, el estado de la respuesta y el código de error, si procede.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	s3- bucket-policy-grantee-check	Administre el acceso a la AWS nube habilitando s3_ bucket_policy_grantee_check . Esta regla comprueba que el acceso otorgado por el bucket de Amazon S3 esté restringido por cualquiera de AWS los principales, usuarios federados, principales de servicio, direcciones IP o Amazon Virtual Private Cloud (Amazon VPC) que usted proporcione. IDs

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 14 cargas de trabajo estándar b-design-and-secure	habilitado para s3 bucket-server-side-encryption	Para ayudar a proteger los datos en reposo, asegúrese de habilitar el cifrado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de S3, habilite el cifrado para protegerlos.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	s3- bucket-versioning-enabled	El control de versiones de buckets de Amazon Simple Storage Service (Amazon S3) permite usar múltiples variantes de un objeto en el mismo bucket de Amazon S3. Use el control de versiones para conservar, recuperar y restaurar todas las versiones de los objetos almacenados en su bucket de Amazon S3. El control de versiones ayuda a recuperarse fácilmente de acciones no deseadas del usuario y de errores de la aplicación.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS
sección 4: la nube, 14 cargas de trabajo estándar b-design-and-secure	vpc-flow-logs-enabled	Los registros del flujo de la VPC proporcionan registros detallados acerca del tráfico IP entrante y saliente de las interfaces de red en su Amazon Virtual Private Cloud (Amazon VPC). De forma predeterminada, el registro de flujo incluye valores para los distintos componentes del flujo de IP, incluido el origen, el destino y el protocolo.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 14 b-design-and-secure cargas de trabajo estándar	wafv2-logging-enabled	Para facilitar el registro y la supervisión de su entorno, habilite el registro con AWS WAF (V2) en la web regional y global. ACLs AWS El registro WAF proporciona informaci ón detallada sobre el tráfico que analiza su ACL web. Los registros registran la hora en que AWS WAF recibió la solicitud de su AWS recurso, la información sobre la solicitud y una acción para la regla según la cual cada solicitud coincidió.
sección 4b-design-and-secure: la nube, 14 cargas de trabajo estándar	opensearch-audit-logging-en abled	Asegúrese de que el registro de auditoría esté habilitado en sus dominios OpenSearc h de Amazon Service. El registro de auditoría le permite realizar un seguimiento de la actividad de los usuarios en sus OpenSearch dominios, incluidas las autenticaciones correctas y fallidas, las solicitudes OpenSearch, los cambios de indexación y las consultas de búsqueda entrantes.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 15 cargas de trabajo estándar	cmk-backing-key-rotation-habilitado	Habilite la rotación de claves para garantizar que las claves se roten una vez que hayan alcanzado el final de su período criptográfico.
sección 4b-design-and-secure: la nube, 15 cargas de trabajo estándar	dms-replication-not-public	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de replicación del DMS. Las instancias de replicación de DMS pueden contener información confidencial y dichas cuentas requieren control de acceso.
sección 4b-design-and-secure: la nube: 15 cargas de trabajo estándar	ebs-snapshot-public-restorable-comprobar	Gestione el acceso a la AWS nube asegurándose de que las instantáneas de EBS no se puedan restaurar públicamente. Las instantáneas de volumen de EBS pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
b-design-and-securesección 4: la nube: 15 cargas de trabajo estándar	ec2- ebs-encryption-by-default	Para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS). Puesto que puede haber datos confidenc iales en reposo en estos volúmenes, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4b-design-and-secure: la nube, 15 cargas de trabajo estándar	efs-encrypted-check	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de Amazon Elastic File System (EFS).
sección 4: la nube, 15 b-design-and-secure cargas de trabajo estándar	elasticsearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch OpenSearc h Service (Service) estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de OpenSearc h servicio dentro de una Amazon VPC permite una comunicación segura entre el OpenSearch Servicio y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 15 cargas de trabajo estándar b-design-and-secure	encrypted-volumes	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS).
sección 4: la nube, 15 b-design-and-secure cargas de trabajo estándar	kms-cmk-not-scheduled-para su eliminación	Para ayudar a proteger los datos en reposo, asegúrese de que las claves maestras del cliente (CMKs) necesarias no estén programadas para su eliminación en el Servicio de administración de AWS claves (AWS KMS). Puesto que a veces es necesario eliminar las claves, esta regla ayuda a comprobar todas las claves cuyo borrado está programado para comprobar si alguna está ahí por error.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: 15 cargas de trabajo estándar en la nube	opensearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch Service estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de Amazon OpenSearch Service dentro de una Amazon VPC permite una comunicación segura entre Amazon OpenSearch Service y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.
sección 4: la nube, 15 cargas de trabajo estándar b-design-and-secure	rds-snapshots-public-prohibited	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
sección 4: la nube, 15 cargas de trabajo estándar b-design-and-secure	rds-snapshot-encrypted	Asegúrese de que el cifrado esté habilitado para las instantáneas de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenc iales en reposo, habilite el cifrado en reposo para ayudar a protegerlos.
sección 4: la nube, 15 b-design-and-secure cargas de trabajo estándar	s3- -bloques-periódicos account-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configura r opcionalmente los restrictP ublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPubl icPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 15 cargas de trabajo estándar	s3- bucket-default-lock-enabled	Asegúrese de que su bucket de Amazon Simple Storage Service (Amazon S3) tenga el bloqueo habilitado de forma predeterminada. Puesto que puede haber datos confidenc iales en reposo en los buckets de S3, habilite el bloqueo de objetos en reposo para protegerlos.
sección 4b-design-and-secure: la nube, 15 cargas de trabajo estándar	s3- bucket-policy-grantee-check	Administre el acceso a la AWS nube habilitando s3_ bucket_policy_grantee_check . Esta regla comprueba que el acceso otorgado por el bucket de Amazon S3 esté restringido por cualquiera de AWS los principales, usuarios federados, principales de servicio, direcciones IP o Amazon Virtual Private Cloud (Amazon VPC) que usted proporcione. IDs
sección 4:15 cargas de trabajo estándar en la nube b-design-and-secure	s3- bucket-public-read-prohibit ed	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositi vos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 15 cargas de trabajo estándar	s3- bucket-public-write-prohibited	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositivos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.
sección 4b-design-and-secure: la nube, 15 cargas de trabajo estándar	habilitado para s3 bucket-server-side-encryption	Para ayudar a proteger los datos en reposo, asegúrese de habilitar el cifrado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de S3, habilite el cifrado para protegerlos.

ID de control	AWS Regla de configuración	Directrices
sección 4b-design-and-secure: la nube, 15 cargas de trabajo estándar	s3- bucket-versioning-enabled	El control de versiones de buckets de Amazon Simple Storage Service (Amazon S3) permite usar múltiples variantes de un objeto en el mismo bucket de Amazon S3. Use el control de versiones para conservar, recuperar y restaurar todas las versiones de los objetos almacenados en su bucket de Amazon S3. El control de versiones ayuda a recuperarse fácilmente de acciones no deseadas del usuario y de errores de la aplicación.
sección 4b-design-and-secure: la nube, 15 cargas de trabajo estándar	s3- default-encryption-kms	Asegúrese de tener el cifrado habilitado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de Amazon S3, habilite el cifrado en reposo para protegerlos.

ID de control	AWS Regla de configuración	Directrices
sección 4 -1c-run-the-cloud: cargas de trabajo estándar	cloudtrail-enabled	AWS CloudTrail puede ayudar a evitar el repudio al registrar las acciones de la consola de administración y las llamadas a la API. AWS Puede identificar a los usuarios y a quién llamó a un AWS servicio, la dirección IP de origen en la Cuentas de AWS que se generaron las llamadas y los horarios de las llamadas. Los detalles de los datos capturados se muestran en el contenido del AWS CloudTrail registro.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 2: cargas de trabajo estándar	cloudwatch-alarm-action-check	CloudWatch Las alarmas de Amazon alertan cuando una métrica supera el umbral durante un número específico de períodos de evaluación. La alarma realiza una o varias acciones según el valor de la métrica o expresión con respecto a un umbral durante varios períodos de tiempo. Esta regla requiere un valor para alarmActionRequired (Config Default: True), insufficientDataAction Obligatorio (Config Default: True) o okActionRequired (Config Default: False). El valor real debe reflejar las acciones de alarma de su entorno.
sección 4c-run-the-cloud: 2: cargas de trabajo estándar	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante el uso de fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 2: cargas de trabajo estándar	iam-group-has-users-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios de privilegios mínimos y separación de funciones en los permisos y autorizaciones de acceso, garantizando que los grupos de IAM tengan al menos un usuario. Una forma de incorporar privilegios mínimos es colocar a los usuarios en grupos en función de los permisos o funciones laborales asociados.
sección 4:2: cargas de trabajo estándar c-run-the-cloud	iam-no-inline-policy-comprobar	Asegúrese de que un usuario, rol de IAM o grupo de IAM (AWS Identity and Access Management) no tenga una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 2: cargas de trabajo estándar	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
sección 4:2: cargas de trabajo estándar c-run-the-cloud	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
sección 4 -2: cargas c-run-the-cloud de trabajo estándar	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.
sección 4:2: cargas de trabajo estándar c-run-the-cloud	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
sección 4:2: cargas de trabajo estándar c-run-the-cloud	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.
sección 4c-run-the-cloud: 2: cargas de trabajo estándar	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS

ID de control	AWS Regla de configuración	Directrices
sección 4:3: cargas de trabajo estándar c-run-the-cloud	api-gw-execution-logging-habilitado	El registro de API Gateway muestra vistas detalladas de los usuarios que han accedido a la API y la forma en que han accedido a la API. Esta información permite ver las actividades de los usuarios.
sección 4 -3c-run-the-cloud: cargas de trabajo estándar	cloudtrail-s3-dataevents-enabled	La recopilación de eventos de datos del Simple Storage Service (Amazon S3) ayuda a detectar cualquier actividad anómala. Los detalles incluyen la información de la cuenta de AWS a la que ha accedido un bucket de Amazon S3, la dirección IP y la hora del evento.
sección 4 -3: cargas c-run-the-cloud de trabajo estándar	cloudtrail-security-trail-enabled	Esta regla ayuda a garantizar el uso de las mejores prácticas de seguridad AWS recomendadas AWS CloudTrail, ya que comprueba la habilitación de varios ajustes. Estas incluyen el uso del cifrado de registros, la validación de registros y la habilitación AWS CloudTrail en varias regiones.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 3: cargas de trabajo estándar	cloudwatch-alarm-action-check	CloudWatch Las alarmas de Amazon alertan cuando una métrica supera el umbral durante un número específico de períodos de evaluación. La alarma realiza una o varias acciones según el valor de la métrica o expresión con respecto a un umbral durante varios períodos de tiempo. Esta regla requiere un valor para alarmActionRequired (Config Default: True), insufficientDataAction Obligatorio (Config Default: True) o okActionRequired (Config Default: False). El valor real debe reflejar las acciones de alarma de su entorno.
sección 4c-run-the-cloud: 3: cargas de trabajo estándar	cloud-trail-cloud-watch-habilitado para registros	Usa Amazon CloudWatch para recopilar y gestionar de forma centralizada la actividad de los eventos de registro. La inclusión de AWS CloudTrail datos proporciona detalles de la actividad de llamadas a la API en su interior Cuenta de AWS.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 3: cargas de trabajo estándar	cloudtrail-enabled	AWS CloudTrail puede ayudar a evitar el repudio al registrar las acciones de la consola de administración y las llamadas a la API. AWS Puede identificar a los usuarios y a quién llamó a un AWS servicio, la dirección IP de origen en la Cuentas de AWS que se generaron las llamadas y los horarios de las llamadas. Los detalles de los datos capturados se muestran en el contenido del AWS CloudTrail registro.
sección 4c-run-the-cloud: 3: cargas de trabajo estándar	cloud-trail-encryption-enabled	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en reposo, debe asegurarse de que el cifrado esté habilitado para sus registros de seguimiento de AWS CloudTrail.

ID de control	AWS Regla de configuración	Directrices
sección 4 -3: cargas c-run-the-cloud de trabajo estándar	cloud-trail-log-file-habilitada para la validación	Utilice la validación de los archivos de AWS CloudTrai l registro para comprobar la integridad de los registros. CloudTrail La validación del archivo de registro ayuda a determinar si un archivo de registro se modificó, se eliminó o no se modificó después de CloudTrail entregarlo. Esta caracterí stica se compila mediante los algoritmos estándar de la industria: SHA-256 para el hash y SHA-256 con RSA para la firma digital. Esto hace que sea computacionalmente inviable modificar, eliminar o falsificar los archivos de CloudTrail registro sin ser detectados.

ID de control	AWS Regla de configuración	Directrices
c-run-the-cloudsección 4:3: cargas de trabajo estándar	elasticsearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta . Los registros de errores de los dominios pueden ayudar en las auditorías de seguridad y acceso, además de para diagnosticar problemas de disponibilidad.
sección 4c-run-the-cloud: 3: cargas de trabajo estándar	elb-logging-enabled	La actividad de Elastic Load Balancing es un punto central de comunicación dentro de un entorno. Asegúrese de que el registro de ELB esté habilitado. Los datos recopilados proporcionan información detallada sobre las solicitudes enviadas al ELB. Cada registro contiene distintos datos, como el momento en que se recibió la solicitud, la dirección IP del cliente, las latencias, las rutas de solicitud y las respuestas del servidor.

ID de control	AWS Regla de configuración	Directrices
sección 4 -3: cargas c-run-the-cloud de trabajo estándar	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante el uso de fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático o para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 3: cargas de trabajo estándar	multi-region-cloudtrail-enabled	AWS CloudTrail registra AWS las acciones de la consola de administración y las llamadas a la API. Puede identificar qué usuarios y cuentas llamaron AWS, la dirección IP de origen desde la que se realizaro n las llamadas y cuándo se produjeron. CloudTrai l entregará los archivos de registro de todas AWS las regiones a su bucket de S3 si MULTI_REGION_CLOUD _TRAIL_ENABLED está activado. Además, al AWS lanzar una nueva región, CloudTrail creará la misma ruta en la nueva región. En consecuencia, recibirá archivos de registro con la actividad de la API en la nueva región sin necesidad de realizar ninguna acción.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 3: cargas de trabajo estándar	opensearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta . OpenSearch Los registros de errores del servicio pueden ayudar con las auditorías de seguridad y acceso, y pueden ayudar a diagnosticar problemas de disponibilidad.
sección 4c-run-the-cloud: 3: cargas de trabajo estándar	rds-logging-enabled	Para facilitar el registro y el monitoreo en su entorno, asegúrese de que el registro de Amazon Relational Database Service (Amazon RDS) esté habilitado. Con el registro de Amazon RDS, puede capturar eventos tales como conexiones, desconexiones, consultas o tablas consultadas.

ID de control	AWS Regla de configuración	Directrices
sección 4 -3: cargas c-run-the-cloud de trabajo estándar	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar informaci ón acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezc a un valor para clusterDb Encrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
c-run-the-cloudsección 4:3: cargas de trabajo estándar	s3- bucket-logging-enabled	El registro de acceso al servidor de Amazon Simple Storage Service (Amazon S3) proporciona un método para monitorear la red en busca de posibles eventos de ciberseguridad. Los eventos se monitorean mediante la captura detallada de las solicitudes realizadas a un bucket de Amazon S3. Cada registro de acceso proporcio na detalles sobre una única solicitud de acceso. Los detalles incluyen el solicitan te, el nombre del bucket, la hora de la solicitud, la acción solicitada, el estado de la respuesta y el código de error, si procede.

ID de control	AWS Regla de configuración	Directrices
sección 4 -3c-run-the-cloud: cargas de trabajo estándar	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS
sección 4:3: cargas de trabajo estándar c-run-the-cloud	vpc-flow-logs-enabled	Los registros del flujo de la VPC proporcionan registros detallados acerca del tráfico IP entrante y saliente de las interfaces de red en su Amazon Virtual Private Cloud (Amazon VPC). De forma predeterminada, el registro de flujo incluye valores para los distintos componentes del flujo de IP, incluido el origen, el destino y el protocolo.

ID de control	AWS Regla de configuración	Directrices
sección 4 -3: cargas c-run-the-cloud de trabajo estándar	wafv2-logging-enabled	Para facilitar el registro y la supervisión en su entorno, habilite el registro con AWS WAF (V2) en la web regional y global. ACLs AWS El registro WAF proporciona informaci ón detallada sobre el tráfico que analiza su ACL web. Los registros registran la hora en que AWS WAF recibió la solicitud de su AWS recurso, la información sobre la solicitud y una acción para la regla según la cual cada solicitud coincidió.
sección 4c-run-the-cloud: 3: cargas de trabajo estándar	opensearch-audit-logging-en abled	Asegúrese de que el registro de auditoría esté habilitado en sus dominios OpenSearc h de Amazon Service. El registro de auditoría le permite realizar un seguimiento de la actividad de los usuarios en sus OpenSearch dominios, incluidas las autenticaciones correctas y fallidas, las solicitudes OpenSearch, los cambios de indexación y las consultas de búsqueda entrantes.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 4: cargas de trabajo estándar	response-plan-exists-maintained (verificación del proceso)	Asegúrese de que los planes de respuesta ante incidentes se establezcan, actualicen y distribuyan al personal responsable.
sección 4 -5c-run-the-cloud: cargas de trabajo estándar	autoscaling-group-elb-healthcheck- obligatorio	Las revisiones de estado de Elastic Load Balancer (ELB) para los grupos de escalado automático de Amazon Elastic Compute Cloud (Amazon EC2) permiten mantener la capacidad y disponibilidad adecuadas. De forma periódica, el equilibrador de carga envía pings, intenta establecer conexiones o envía solicitudes para probar el estado de las instancias de Amazon EC2 en un grupo de escalado automático. Si una instancia no informa, el tráfico se envía a una nueva instancia de Amazon EC2.
sección 4 -5c-run-the-cloud: cargas de trabajo estándar	cloud-trail-cloud-watch-habilitado para registros	Usa Amazon CloudWatch para recopilar y gestionar de forma centralizada la actividad de los eventos de registro. La inclusión de AWS CloudTrail datos proporciona detalles de la actividad de llamadas a la API en su interior Cuenta de AWS.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 5: cargas de trabajo estándar	dynamodb-autoscaling-enabled	El escalado automático de Amazon DynamoDB AWS usa el servicio Application Auto Scaling para ajustar la capacidad de rendimiento aprovisionada para que responda automáticamente a los patrones de tráfico reales. Esto permite que una tabla o un índice secundario global aumente su read/write capacidad aprovisionada para gestionar los aumentos repentinos de tráfico, sin limitaciones.

ID de control	AWS Regla de configuración	Directrices
sección 4:5: cargas de trabajo estándar c-run-the-cloud	dynamodb-throughput-limit-check	Active esta regla para asegurarse de que la capacidad de rendimiento aprovisionada se compruebe en las tablas de Amazon DynamoDB. Esta es la cantidad de actividad que puede soportar cada mesa. read/write DynamoDB utiliza esta información para reservar recursos del sistema suficientes para satisfacer sus necesidades de rendimiento. Esta regla genera una alerta cuando el rendimiento se acerca al límite máximo de la cuenta de un cliente. Esta regla le permite configurar opcionalmente los parámetros de RCUThreshold porcentaje de cuenta (Config Default: 80) y WCUThreshold Percentag e de cuenta (Config Default: 80). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 5: cargas de trabajo estándar	ec2- instance-detailed-monitoring-enabled	Habilite esta regla para ayudar a mejorar el monitoreo de instancias de Amazon Elastic Compute Cloud (Amazon EC2) en la consola de Amazon EC2, que muestra gráficos de monitoreo de la instancia en periodos de 1 minuto.
sección 4 -5c-run-the-cloud: cargas de trabajo estándar	lambda-concurrency-check	Esta regla garantiza que se establezcan los límites máximos y mínimos de simultaneidad de una función Lambda. Esto puede ayudar a la hora de establecer el número de solicitudes de referencia que la función atiende en un momento dado.

ID de control	AWS Regla de configuración	Directrices
sección 4 -5: cargas c-run-the-cloud de trabajo estándar	rds-enhanced-monitoring-enabled	Habilite Amazon Relational Database Service (Amazon RDS) para monitorear la disponibilidad de Amazon RDS. Esto proporciona información detallada del estado de las instancias de bases de datos de Amazon RDS. Cuando el almacenamiento de Amazon RDS utiliza más de un dispositivo físico subyacente, el monitoreo mejorado recopila los datos de cada dispositivo. Además, cuando la instancia de base de datos de Amazon RDS se ejecuta en una implementación Multi-AZ, se recopilan los datos de cada dispositivo del host secundario y las métricas del host secundario.

ID de control	AWS Regla de configuración	Directrices
sección 4 -5: cargas c-run-the-cloud de trabajo estándar	beanstalk-enhanced-health-reporting-habilitado	AWS Los informes de estado mejorados de Elastic Beanstalk permiten una respuesta más rápida a los cambios en el estado de la infraestructura subyacente. Estos cambios podrían provocar una falta de disponibilidad de la aplicación. Los informes de estado mejorados de Elastic Beanstalk proporcionan un descriptor de estado para evaluar la gravedad de los problemas detectados e identificar las posibles causas que se deben investigar.

ID de control	AWS Regla de configuración	Directrices
c-run-the-cloudsección 4:6 cargas de trabajo estándar	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.
sección 4c-run-the-cloud: 6 cargas de trabajo estándar	ec2- -check managedinstance-patch-compliance-status	Habilite esta regla para ayudar a identificar y documentar las vulnerabilidades de Amazon Elastic Compute Cloud (Amazon EC2). La regla comprueba si los parches de instancias Amazon EC2 cumplen con los requisitos de las políticas y procedimientos de su organización en AWS Systems Manager.

ID de control	AWS Regla de configuración	Directrices
sección 4c-run-the-cloud: 6 cargas de trabajo estándar	redshift-cluster-maintenancesettings-check	Esta regla garantiza que los clústeres de Amazon Redshift tengan la configuración preferida para su organización. En concreto, que tengan períodos de mantenimiento preferidos y períodos de retención automática de instantáneas para la base de datos. Esta regla requiere que configure. allowVersionUpgrade El valor predeterminado es true. También te permite configurar de forma opcional el periodo preferredMaintenanceWindow (el predeterminado es sáb: 16:00 -sáb: 16:30) y el automatedSnapshotRetentionPeriodo (el valor predeterminado es 1). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
sección 4:6 cargas de trabajo estándar c-run-the-cloud	elastic-beanstalk-managed-updates-habilitado	La activación de las actualizaciones de plataforma gestionadas para un entorno de Amazon Elastic Beanstalk garantiza que se instalen las últimas correcciones, actualizaciones y características de la plataforma disponibles para el entorno. Mantenerse actualizado mediante la instalación de parches es una práctica recomendada para proteger los sistemas.

Plantilla

La plantilla está disponible en GitHub: Mejores prácticas operativas para cargas de trabajo estándar ABS CCIG 2.0.

Prácticas operativas recomendadas para ACSC Essential 8

Los paquetes de conformidad proporcionan un marco de cumplimiento de uso general diseñado para permitirle crear controles de seguridad, operativos o de optimización de costes mediante reglas gestionadas o personalizadas AWS Config y acciones correctivas. AWS Config Los paquetes de conformidad, como plantillas de ejemplo, no están diseñados para garantizar plenamente el cumplimiento de una norma de gobernanza o de conformidad específicas. Usted debe evaluar si su uso de los servicios cumple con los requisitos legales y normativos aplicables.

A continuación, se proporciona un ejemplo de mapeo entre el modelo Essential Eight Maturity del Centro de Ciberseguridad de Australia (ACSC) y las reglas de Config AWS gestionadas. Cada regla de Config se aplica a un AWS recurso específico y se refiere a uno o más controles ACSC Essential Eight. Un control ACSC Essential Eight puede estar relacionado con varias reglas de Config. Consulte la siguiente tabla para obtener más detalles y orientación relacionados con estas asignaciones. Algunas de las asignaciones a reglas de Config son para la sección de orden superior

(por ejemplo, estrategias de mitigación para limitar el alcance de los incidentes de ciberseguridad), a diferencia de las secciones más prescriptivas.

Este ejemplo de plantilla de paquete de conformidad contiene asignaciones a controles del ACSC Essential 8, creado por la Commonwealth de Australia y que está disponible en ACSC | Essential Eight. La licencia del marco en virtud de la Creative Commons Attribution 4.0 International Public License y la información sobre los derechos de autor del marco (incluida la exención de garantías) se pueden consultar en ACSC | Copyright.

ID de control	AWS Regla de configuración	Directrices
Application_control	alb-waf-enabled	Asegúrese de que AWS WAF esté habilitado en los Elastic Load Balancers (ELB) para ayudar a proteger las aplicacio nes web. Un WAF ayuda a proteger sus aplicaciones web o APIs contra los ataques web más comunes. Estas vulnerabi lidades de la web pueden afectar a la disponibilidad, comprometer la seguridad o consumir recursos excesivos en su entorno.
Application_control	api-gw-associated-with-guerra	AWS El WAF le permite configurar un conjunto de reglas (denominadas listas de control de acceso web (ACL web)) que permiten, bloquean o cuentan las solicitudes web en función de las reglas y condiciones de seguridad web personalizables que usted defina. Asegúrese de que su etapa de Amazon API Gateway esté asociada

ID de control	AWS Regla de configuración	Directrices
		a una ACL web de WAF para protegerla de ataques maliciosos.
Application_control	cloudwatch-log-group-encrypted	Comprueba si los grupos de CloudWatch registro de Amazon están cifrados con alguna clave de AWS KMS o con un identificador de clave de AWS KMS específico. La regla no cumple con los requisitos si un grupo de CloudWatch registros no se cifra con una clave de KMS o se cifra con una clave de KMS que no se proporciona en el parámetro de la regla.

ID de control	AWS Regla de configuración	Directrices
Application_control	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.
Application_control	waf-regional-rule-not-vacío	Asegúrese de que su AWS WAF tenga una regla que no esté vacía. Una regla sin condiciones podría desencadenar un comportamiento no deseado.
Application_control	waf-regional-rulegroup-not-vacío	Asegúrese de que su AWS WAF tenga un grupo de reglas que no esté vacío. Un grupo de reglas vacío podría desencadenar un comportamiento no deseado.

ID de control	AWS Regla de configuración	Directrices
Application_control	waf-regional-webacl-not-vacío	Una ACL web adjunta a un AWS WAF puede contener un conjunto de reglas y grupos de reglas para inspeccionar y controlar las solicitudes web. Si una ACL web está vacía, el tráfico web pasa sin que el WAF lo detecte ni actúe sobre él.
Application_control	ec2- -check managedinstance-association-compliance-status	Use AWS Systems Manager Associations para ayudar con el inventario de las plataform as y aplicaciones de software dentro de una organizac ión. AWS Systems Manager asigna un estado de configura ción a las instancias administr adas y le permite establece r líneas de referencia de los niveles de parches del sistema operativo, las instalaciones de software, las configuraciones de las aplicaciones y otros detalles sobre su entorno.

ID de control	AWS Regla de configuración	Directrices
Patch_applications	ec2-imdsv2-check	Asegúrese de que el método Servicio de metadatos de instancias versión 2 (IMDSv2) esté habilitado para ayudar a proteger el acceso y el control de los metadatos de instancia de Amazon Elastic Compute Cloud (Amazon EC2). El IMDSv2 método utiliza controles basados en sesiones. Con IMDSv2, se pueden implementar controles para restringir los cambios en los metadatos de la instancia.
Patch_applications	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.

ID de control	AWS Regla de configuración	Directrices
Patch_applications	ecs-fargate-latest-platform-versión	Las actualizaciones y los parches de seguridad se implementan automáticamente para sus tareas de AWS Fargate. Si se detecta un problema de seguridad que afecte a una versión de la plataforma AWS Fargate, aplique AWS parches a la versión de la plataforma. Para facilitar la administración de parches de las tareas de Amazon Elastic Container Service (ECS) que ejecutan AWS Fargate, actualice las tareas independientes de sus servicios para usar la versión de plataforma más reciente.
Patch_applications	ec2- -ami instance-launched-with-allowed	Comprueba si las instancias EC2 en ejecución o detenidas se lanzaron con Amazon Machine Images (AMIs) que cumplen AMIs los criterios permitidos. La regla no es compatible si una AMI no cumple con los AMIs criterios permitidos y la AMIs configuración permitida no está deshabilitada.

ID de control	AWS Regla de configuración	Directrices
Patch_applications	elastic-beanstalk-managed-updates-activado	La activación de las actualizaciones de plataforma gestionadas para un entorno de Amazon Elastic Beanstalk garantiza que se instalen las últimas correcciones, actualizaciones y características de la plataforma disponibles para el entorno. Mantenerse actualizado mediante la instalación de parches es una práctica recomendada para proteger los sistemas.
Patch_applications	rds-automatic-minor-version-habilitado para la actualización	Habilite las actualizaciones automáticas de las versiones secundarias en sus instancias de Amazon Relational Database Service (RDS) para garantizar que estén instaladas las últimas actualizaciones de las versiones secundarias del sistema de administración de bases de datos relacionales (RDBMS, por sus siglas en inglés), que pueden incluir parches de seguridad y correcciones de errores.

ID de control	AWS Regla de configuración	Directrices
Patch_applications	ec2- -check managedinstance-association-compliance-status	Use AWS Systems Manager Associations para ayudar con el inventario de las plataform as y aplicaciones de software dentro de una organizac ión. AWS Systems Manager asigna un estado de configura ción a las instancias administr adas y le permite establece r líneas de referencia de los niveles de parches del sistema operativo, las instalaciones de software, las configuraciones de las aplicaciones y otros detalles sobre su entorno.

ID de control	AWS Regla de configuración	Directrices
Patch_applications	redshift-cluster-maintenancesettings-check	Esta regla garantiza que los clústeres de Amazon Redshift tengan la configuración preferida para su organización. En concreto, que tengan períodos de mantenimiento preferidos y períodos de retención automática de instantáneas para la base de datos. Esta regla requiere que configure el allowVersionUpgrade. El valor predeterminado es true. También te permite configurar de forma opcional el periodo preferredMaintenanceWindow (el predeterminado es sáb: 16:00 -sáb: 16:30) y el automatedSnapshotRetentionPeriodo (el valor predeterminado es 1). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
Restrict_administrative_privileges	iam-no-inline-policy-marcar	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.
Restrict_administrative_privileges	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
Restrict_administrative_privileges	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.
Restrict_administrative_privileges	codebuild-project-environment-privileged-comprobar	Para ayudarte a implementar el principio de privilegios mínimos, asegúrate de que el entorno de tu CodeBuild proyecto de Amazon no tenga activado el modo privilegiado. Esta configuración debe estar deshabilitada para evitar el acceso no deseado a Docker APIs y al hardware subyacente del contenedor.

ID de control	AWS Regla de configuración	Directrices
Restrict_administrative_privileges	ecs-containers-nonprivileged	Para ayudar a implementar el principio de privilegio mínimo, las definiciones de tareas de Amazon Elastic Container Service (Amazon ECS) no deben tener habilitados los privilegios elevados. Cuando este parámetro es verdadero, al contenedor se le conceden privilegios elevados en la instancia de contenedor de host, similares a los de un usuario raíz.
Restrict_administrative_privileges	ecs-containers-readonly-access	Habilitar el acceso de solo lectura a los contenedores de Amazon Elastic Container Service (ECS) puede ayudar a cumplir con el principio de privilegio mínimo. Esta opción puede reducir los vectores de ataque, ya que el sistema de archivos de la instancia de contenedor no se puede modificar a menos que tenga permisos explícitos de lectura y escritura.

ID de control	AWS Regla de configuración	Directrices
Restrict_administrative_privileges	ecs-task-definition-nonroot-usuario	Para ayudar a implementar el principio de privilegio mínimo, asegúrese de designar a un usuario que no sea raíz para acceder a las definiciones de tareas de Amazon Elastic Container Service (Amazon ECS).
Restrict_administrative_privileges	efs-access-point-enforce-identidad de usuario	Para ayudar a implementar el principio del privilegio mínimo, asegúrese de que la aplicación por parte de los usuarios esté habilitada en su Amazon Elastic File System (Amazon EFS). Cuando está habilitado, Amazon EFS reemplaza el usuario y el grupo IDs del cliente de NFS por la identidad configurada en el punto de acceso para todas las operaciones del sistema de archivos y solo permite el acceso a esta identidad de usuario forzada.

ID de control	AWS Regla de configuración	Directrices
Restrict_administrative_privileges	iam-user-group-membership-compruebe	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
Restrict_administrative_privileges	iam-user-unused-credentials-comprobar	AWS Identity and Access Management (IAM) puede ayudarlo con los permisos y autorizaciones de acceso comprobando las contraseñas y claves de acceso de IAM que no se utilicen durante un período de tiempo específico. Si se identifican estas credenciales no utilizadas, debe deshabilitar la opción de and/or eliminar las credenciales, ya que esto podría infringir el principio del privilegio mínimo. Esta regla requiere que establezcas un valor en la maxCredentialUsage Edad (Config Default: 90). El valor real debe reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
Restrict_administrative_privileges	rds-instance-iam-authentication-activado	Asegúrese de que la autenticación AWS Identity and Access Management (IAM) esté habilitada en las instancias del Amazon Relational Database Service (Amazon RDS) para controlar el acceso a los sistemas y activos. De esta manera se fuerza el cifrado del tráfico de red hacia y desde la base de datos mediante la capa de sockets seguros (SSL). No es necesario almacenar credenciales de usuario en la base de datos, ya que la autenticación se administra de forma externa.
Restrict_administrative_privileges	ec2- instance-profile-attached	Los perfiles de instancias de EC2 pasan un rol de IAM a una instancia de EC2. Adjuntar un perfil de instancia a las instancias puede ayudar a gestionar los privilegios mínimos y los permisos.

ID de control	AWS Regla de configuración	Directrices
Restrict_administrative_privileges	ecs-task-definition-user-for-host-mode-check	Si la definición de una tarea tiene privilegios elevados, se debe a que el cliente ha optado específicamente por esa configuración. Este control comprueba si hay una escalada inesperada de privilegios cuando una definición de tarea tiene habilitadas las redes de host, pero el cliente no ha elegido los privilegios elevados.

ID de control	AWS Regla de configuración	Directrices
Restrict_administrative_privileges	iam-customer-policy-blocked-kms-acciones	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, lo que impide que las políticas contengan acciones bloqueadas en todas AWS las claves del Servicio de Administración de Claves. Tener más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones . Esta regla le permite establecer el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar, kms:ReEncryptFrom). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
Restrict_administrative_privileges	iam-inline-policy-blocked-kms-acciones	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política en línea que permita bloquear acciones en todas las claves del Servicio de administración de claves. AWS AWS recomiend a utilizar políticas gestionad as en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administr ación de permisos. Esta regla le permite establece r el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar, kms:ReEnc ryptFrom). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
Restrict_administrative_privileges	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
Patch_operating_systems	ec2- -check managedinstance-patch-compliance-status	Habilite esta regla para ayudar a identificar y documentar las vulnerabilidades de Amazon Elastic Compute Cloud (Amazon EC2). La regla comprueba si los parches de instancias Amazon EC2 cumplen con los requisitos de las políticas y procedimientos de su organización en AWS Systems Manager.

ID de control	AWS Regla de configuración	Directrices
Multi-factor_authentication	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.
Multi-factor_authentication	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.

ID de control	AWS Regla de configuración	Directrices
Multi-factor_authentication	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protecció n a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidente s de cuentas compromet idas y evitar que usuarios no autorizados accedan a los datos confidenciales.
Multi-factor_authentication	root-account-hardware-mfa-h abilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegi os. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
Multi-factor_authentication	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
Regular_backups	db-instance-backup-enabled	La característica de copia de seguridad de Amazon RDS crea copias de seguridad de sus bases de datos y registros de transacciones. Amazon RDS crea automátic amente una instantánea de volumen de almacenam iento de la instancia de base de datos y realiza una copia de seguridad de toda la instancia. El sistema le permite establecer períodos de retención específicos para cumplir con sus requisitos de resiliencia.

ID de control	AWS Regla de configuración	Directrices
Regular_backups	dynamodb-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que las tablas de Amazon DynamoDB formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administr ado con una solución de respaldo basada en políticas . Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.
Regular_backups	ebs-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que sus volúmenes de Amazon Elastic Block Store (Amazon EBS) formen parte de un plan de backup. AWS AWS Backup es un servicio de respaldo totalmente administr ado con una solución de respaldo basada en políticas . Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
Regular_backups	efs-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que sus sistemas de archivos Amazon Elastic File System (Amazon EFS) formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
Regular_backups	elasticache-redis-cluster-automatic-verificación de copias de seguridad	Cuando las copias de seguridad automáticas están habilitadas, Amazon ElastiCache crea una copia de seguridad del clúster a diario. La copia de seguridad se puede conservar durante el número de días que especifique su organización. Las copias de seguridad automáticas pueden ayudarle a protegerse frente a la pérdida de datos. En caso de error, puede crear un nuevo clúster y restaurar los datos de la copia de seguridad más reciente.

ID de control	AWS Regla de configuración	Directrices
Regular_backups	rds-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que sus instancias de Amazon Relational Database Service (Amazon RDS) formen parte de un AWS plan de backup. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.
Regular_backups	s3- bucket-default-lock-enabled	Comprueba si el bucket de S3 tiene habilitado el bloqueo de forma predeterminada. La regla es NON_COMPLIANT si el bloqueo no está habilitado.

ID de control	AWS Regla de configuración	Directrices
Regular_backups	s3- bucket-replication-enabled	Con la replicación entre regiones (CRR) de Amazon Simple Storage Service (Amazon S3) se puede mantener la capacidad y la disponibilidad adecuadas. La CRR permite copiar objetos entre buckets de Amazon S3 de forma automática y asincrónica para garantizar la disponibilidad de los datos.
Regular_backups	s3- bucket-versioning-enabled	El control de versiones de buckets de Amazon Simple Storage Service (Amazon S3) permite usar múltiples variantes de un objeto en el mismo bucket de Amazon S3. Use el control de versiones para conservar, recuperar y restaurar todas las versiones de los objetos almacenados en su bucket de Amazon S3. El control de versiones ayuda a recuperarse fácilmente de acciones no deseadas del usuario y de errores de la aplicación.

ID de control	AWS Regla de configuración	Directrices
Regular_backups	aurora-resources-protected-by-plan de respaldo	Para facilitar los procesos de backup de datos, asegúrese de que sus recursos de Amazon Aurora formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
Regular_backups	backup-plan-min-frequency-and-min-retention-check	Para ayudar con los procesos de respaldo de datos, asegúrese de que su plan de AWS respaldo esté configurado para una frecuencia y retención mínimas. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad. Esta regla le permite configurar los parámetros requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) y requiredFrequencyUnit (Config default: days). El valor real debe reflejar los requisitos de su organización.

ID de control	AWS Regla de configuración	Directrices
Regular_backups	backup-recovery-point-manual-eliminación-deshabilitada	Asegúrese de que sus puntos AWS de recuperación de Backup tengan adjunta una política basada en los recursos que impida la eliminación de los puntos de recuperación. El uso de una política basada en los recursos para evitar eliminar puntos de recuperación ayuda a evitar que se eliminen de forma accidental o intencionada.
Regular_backups	ec2- -plan resources-protected-by-backup	Para facilitar los procesos de respaldo de datos, asegúrese de que sus recursos de Amazon Elastic Compute Cloud (Amazon EC2) Compute Cloud (Amazon EC2) formen parte de un plan de respaldo. AWS AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
Regular_backups	redshift-backup-enabled	Para facilitar los procesos de copia de seguridad de datos, asegúrese de que sus clústeres de Amazon Redshift tengan instantáneas automatizadas. Cuando las instantáneas automatizadas están habilitadas para un clúster, Redshift realiza instantáneas de ese clúster periódicamente. De manera predeterminada, Redshift realiza una instantánea cada ocho horas o después de cada cambio de datos de 5 GB por nodo, lo que ocurra primero.

Plantilla

La plantilla está disponible en GitHub: Mejores prácticas operativas para el ACSC Essential 8.

Prácticas operativas recomendadas para ACSC ISM: parte 1

Los paquetes de conformidad proporcionan un marco de cumplimiento de uso general diseñado para permitirle crear controles de seguridad, operativos o de optimización de costes mediante reglas gestionadas o personalizadas AWS Config y acciones correctivas. AWS Config Los paquetes de conformidad, como plantillas de ejemplo, no están diseñados para garantizar plenamente el cumplimiento de una norma de gobernanza o de conformidad específicas. Usted debe evaluar si su uso de los servicios cumple con los requisitos legales y normativos aplicables.

A continuación, se proporciona un ejemplo de mapeo entre el Manual de seguridad de la información (ISM) 2020-06 del Centro de Ciberseguridad de Australia (ACSC) y las reglas de AWS Config administradas. Cada regla de Config se aplica a un AWS recurso específico y se refiere a uno o más controles de ISM. Un control del ISM puede estar relacionado con varias reglas de Config. Consulte la siguiente tabla para obtener más detalles y orientación relacionados con estas asignaciones.

Este ejemplo de plantilla de paquete de conformidad contiene asignaciones a controles dentro del marco del ISM, creado por la Commonwealth de Australia y que está disponible en el Australian Government Information Security Manual. La licencia del marco en virtud de la Creative Commons Attribution 4.0 International Public License y la información sobre los derechos de autor del marco (incluida la exención de garantías) se pueden consultar en ACSC | Copyright.

ID de control	AWS Regla de configuración	Directrices
43	response-plan-exists-maintained (verificación del proceso)	Asegúrese de que los planes de respuesta ante incidentes se establezcan, actualicen y distribuyan al personal responsable.
252	security-awareness-program-exists (verificación del proceso)	Establezca y mantenga un programa de concienciación sobre la seguridad para su organización. Los programas de concienciación sobre la seguridad enseñan al personal a proteger la organización frente a diversas infracciones o incidentes de seguridad.
261	api-gw-execution-logging-habilitado	El registro de API Gateway muestra vistas detalladas de los usuarios que han accedido a la API y la forma en que han accedido a la API. Esta información permite ver las actividades de los usuarios.
261	elb-logging-enabled	La actividad de Elastic Load Balancing (ELB) es un punto central de comunicación dentro de un entorno. Asegúrese de que el registro de ELB esté habilitado. Los

ID de control	AWS Regla de configuración	Directrices
		datos recopilados proporcio nan información detallada sobre las solicitudes enviadas al ELB. Cada registro contiene distintos datos, como el momento en que se recibió la solicitud, la dirección IP del cliente, las latencias, las rutas de solicitud y las respuestas del servidor.
261	wafv2-logging-enabled	Para facilitar el registro y la supervisión en su entorno, habilite el registro AWS WAF (V2) en la web ACLs regional y global. AWS WAF El registro proporciona información detallada sobre el tráfico que analiza su ACL web. Los registros registran la hora en que se AWS WAF recibió la solicitud de su AWS recurso, la información sobre la solicitud y una acción para la regla según la cual cada solicitud coincidió.

ID de control	AWS Regla de configuración	Directrices
298	ec2- -check managedinstance-patch-compliance-status	Habilite esta regla para ayudar a identificar y documenta r las vulnerabilidades de Amazon Elastic Compute Cloud (Amazon EC2). La regla comprueba si los parches de instancias de Amazon EC2 cumplen con AWS Systems Manager lo exigido por las políticas y los procedimientos de su organización.

ID de control	AWS Regla de configuración	Directrices
298	redshift-cluster-maintenancesettings-check	Esta regla garantiza que los clústeres de Amazon Redshift tengan la configuración preferida para su organización. En concreto, que tengan períodos de mantenimiento preferidos y períodos de retención automática de instantáneas para la base de datos. Esta regla requiere que configure el allowVersionUpgrade. El valor predeterminado es true. También te permite configurar de forma opcional el periodo preferredMaintenanceWindow (el predeterminado es sáb: 16:00 -sáb: 16:30) y el automatedSnapshotRetentionPeriodo (el valor predeterminado es 1). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
298	elastic-beanstalk-managed-updates-habilitado	La activación de las actualizaciones de plataforma gestionadas para un entorno de Amazon Elastic Beanstalk garantiza que se instalen las últimas correcciones, actualizaciones y características de la plataforma disponibles para el entorno. Mantenerse actualizado mediante la instalación de parches es una práctica recomendada para proteger los sistemas.
298	rds-automatic-minor-version-habilitado para la actualización	Habilite las actualizaciones automáticas de las versiones secundarias en sus instancias de Amazon Relational Database Service (Amazon RDS) para garantizar que estén instaladas las últimas actualizaciones de las versiones secundarias del sistema de administración de bases de datos relacionales (RDBMS, por sus siglas en inglés), que pueden incluir parches de seguridad y correcciones de errores.

ID de control	AWS Regla de configuración	Directrices
380	iam-group-has-users-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, garantizando que los grupos de IAM tengan al menos un usuario. Una forma de incorporar privilegios mínimos es colocar a los usuarios en grupos en función de los permisos o funciones laborales asociados.
459	api-gw-cache-enabled-y encriptado	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté activado en la caché de la etapa de API Gateway. Puesto que pueden capturarse datos confidenciales para el método de la API, habilite el cifrado en reposo para ayudar a protegerlos.
459	cloud-trail-encryption-enabled	Como es posible que existan datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté activado en tus AWS CloudTrail registros.

ID de control	AWS Regla de configuración	Directrices
459	ec2- ebs-encryption-by-default	Para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS). Puesto que puede haber datos confidenc iales en reposo en estos volúmenes, habilite el cifrado en reposo para ayudar a protegerlos.
459	efs-encrypted-check	Puesto que puede haber información confidencial, para proteger los datos en reposo, asegúrese de habilitar el cifrado de Amazon Elastic File System (Amazon EFS).
459	encrypted-volumes	Puesto que puede haber información confidencial, para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS).
459	habilitado para bucket-server-side-encryption s3	Para ayudar a proteger los datos en reposo, asegúrese de habilitar el cifrado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de S3, habilite el cifrado para protegerlos.

ID de control	AWS Regla de configuración	Directrices
459	s3- default-encryption-kms	Asegúrese de tener el cifrado habilitado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de Amazon S3, habilite el cifrado en reposo para protegerlos.
459	redshift-cluster-kms-enabled	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con AWS Key Management Service(AWS KMS) esté habilitado para el clúster de Amazon Redshift. Puesto que puede haber datos confidenciales en reposo en los clústeres de Redshift, habilite el cifrado en reposo para ayudar a protegerlos.
459	elasticsearch-encrypted-at-rest	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté habilitado para tus dominios de Amazon OpenSearch OpenSearch Service (Servicio).

ID de control	AWS Regla de configuración	Directrices
459	opensearch-encrypted-at-rest	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté habilitado para tus dominios de Amazon OpenSearch Service.
459	sagemaker-endpoint-configuration-kms-configurado por clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con AWS Key Management Service (AWS KMS) esté activado en su terminal. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker punto final, habilite el cifrado en reposo para ayudar a proteger esos datos.
459	sagemaker-notebook-instance-kms-configurado por clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con AWS Key Management Service(AWS KMS) esté activado en su portátil. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker bloc de notas, habilite el cifrado en reposo para ayudar a proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
459	backup-recovery-point-encrypted	Asegúrese de que el cifrado esté activado en sus puntos AWS Backup de recuperación. Puesto que puede haber datos confidenciales en reposo, habilite el cifrado en reposo para ayudar a protegerlos.
459	codebuild-project-artifact-encryption	Para ayudar a proteger los datos confidenciales en reposo, asegúrate de que el cifrado de tus AWS CodeBuild artefactos esté activado.
459	codebuild-project-sCifrado con 3 registros	Para ayudar a proteger los datos confidenciales en reposo, asegúrese de que el cifrado esté habilitado para AWS CodeBuild los registros almacenados en Amazon S3.
459	dynamodb-table-encrypted-kms	Asegúrese de que el cifrado esté habilitado para las tablas de Amazon DynamoDB. Puesto que puede haber datos confidenciales en reposo en estas tablas, habilite el cifrado en reposo para ayudar a protegerlos. De forma predeterminada, las tablas de DynamoDB se AWS cifran con una clave maestra del cliente (CMK) propia.

ID de control	AWS Regla de configuración	Directrices
459	kinesis-stream-encrypted	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado para Amazon Kinesis Streams.
459	rds-snapshot-encrypted	Asegúrese de que el cifrado esté habilitado para las instantáneas de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenc iales en reposo, habilite el cifrado en reposo para ayudar a protegerlos.
459	rds-storage-encrypted	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté habilitad o para sus instancias de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenciales en reposo en las instancias de Amazon RDS, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	AWS Regla de configuración	Directrices
459	sns-encrypted-kms	Para ayudar a proteger los datos en reposo, asegúrese de que los temas del Amazon Simple Notification Service (Amazon SNS) requieran cifrado mediante AWS Key Management Service ().AWS KMS Puesto que puede haber datos confidenciales en reposo en los mensajes publicados, habilite el cifrado en reposo para ayudar a protegerlos.
580	audit-log-policy-exists (verificación del proceso)	Establezca y mantenga una política de administración de registros de auditoría que defina los requisitos de registro de su organización. Esto incluye, pero no se limita a, la revisión y la conservación de los registros de auditoría.
634	vpc-flow-logs-enabled	Los registros del flujo de la VPC proporcionan registros detallados acerca del tráfico IP entrante y saliente de las interfaces de red en su Amazon Virtual Private Cloud (Amazon VPC). De forma predeterminada, el registro de flujo incluye valores para los distintos componentes del flujo de IP, incluido el origen, el destino y el protocolo.

ID de control	AWS Regla de configuración	Directrices
859	cw-loggroup-retention-period-comprobar	Asegúrese de que los datos del registro de eventos se conserven durante un tiempo mínimo para sus grupos de registros, a fin de facilitar la resolución de problemas y las investigaciones forenses. La falta de datos de registros de eventos anteriores disponibl es dificulta la reconstrucción e identificación de eventos potencialmente maliciosos.
974	iam-user-mfa-enabled	Habilite esta regla para restringir el acceso a los recursos en la Nube de AWS. Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.

ID de control	AWS Regla de configuración	Directrices
974	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos de la Nube de AWS asegurándose de que la MFA esté habilitada para todos los usuarios AWS Identity and Access Management(IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protecció n a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidente s de cuentas compromet idas y evitar que usuarios no autorizados accedan a los datos confidenciales.

ID de control	AWS Regla de configuración	Directrices
1139	elb-predefined-security-policy-ssl-check	Para ayudar a proteger los datos en tránsito, asegúrese de que sus oyentes de SSL de su Classic Elastic Load Balancing utilicen una política de seguridad predefinida. Elastic Load Balancing proporciona configuraciones predefinidas de negociación SSL que se utilizan para la negociación SSL cuando se establece una conexión entre un cliente y el equilibrador de carga. Las configuraciones de la negociación SSL proporcio nan compatibilidad con una amplia variedad de clientes y utilizan algoritmos criptográ ficos de alta seguridad. Esta regla requiere que establezc a una política de seguridad predefinida para sus oyentes de SSL. La política de seguridad predeterminada es: Policy-TLS-1-2-2017-0. ELBSecurity El valor real debe reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
1173	root-account-hardware-mfa-habilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
1173	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
1173	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.
1173	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.

ID de control	AWS Regla de configuración	Directrices
1173	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protecció n a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidente s de cuentas compromet idas y evitar que usuarios no autorizados accedan a los datos confidenciales.
1228	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de cibersegu ridad mediante el uso de fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automátic o para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	AWS Regla de configuración	Directrices
1240	alb-waf-enabled	Asegúrese de que AWS WAF esté habilitado en los Elastic Load Balancers (ELB) para ayudar a proteger las aplicacio nes web. Un WAF ayuda a proteger sus aplicaciones web o APIs contra los ataques web más comunes. Estas vulnerabi lidades de la web pueden afectar a la disponibilidad, comprometer la seguridad o consumir recursos excesivos en su entorno.
1240	api-gw-associated-with-guerra	AWS El WAF le permite configurar un conjunto de reglas (denominadas listas de control de acceso web (ACL web)) que permiten, bloquean o cuentan las solicitudes web en función de las reglas y condiciones de seguridad web personalizables que usted defina. Asegúrese de que su etapa de Amazon API Gateway esté asociada a una ACL web de WAF para protegerla de ataques maliciosos.

ID de control	AWS Regla de configuración	Directrices
1271	rds-instance-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.
1271	redshift-enhanced-vpc-routing-habilitado	El enrutamiento de VPC mejorado fuerza que todo el tráfico de COPY y UNLOAD entre los repositorios de datos y de clúster pase por su Amazon VPC. A continuac ión, puede utilizar las caracterí sticas de la VPC, como los grupos de seguridad y las listas de control de acceso a la red, para proteger el tráfico de la red. También puede usar los registros de flujo de la VPC para monitorear el tráfico de la red.

ID de control	AWS Regla de configuración	Directrices
1277	redshift-require-tls-ssl	Asegúrese de que sus clústeres de Amazon Redshift requieran cifrado TLS/SSL para conectarse a los clientes SQL. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
1277	rds-instance-iam-authentication-habilitado	Asegúrese de que la autenticación AWS Identity and Access Management (IAM) esté habilitada en las instancias del Amazon Relational Database Service (Amazon RDS) para controlar el acceso a los sistemas y activos. De esta manera se fuerza el cifrado del tráfico de red hacia y desde la base de datos mediante la capa de sockets seguros (SSL). No es necesario almacenar credenciales de usuario en la base de datos, ya que la autenticación se administra de forma externa.

ID de control	AWS Regla de configuración	Directrices
1277	api-gw-ssl-enabled	Asegúrese de que las etapas de la API de REST de Amazon API Gateway estén configuradas con certifica dos SSL para permitir que los sistemas de backend autentiquen que las solicitudes se originan en API Gateway.
1380	ec2-imdsv2-check	Asegúrese de que el método Servicio de metadatos de instancias versión 2 (IMDSv2) esté habilitado para ayudar a proteger el acceso y el control de los metadatos de instancia de Amazon Elastic Compute Cloud (Amazon EC2). El IMDSv2 método utiliza controles basados en la sesión. Con IMDSv2, se pueden implementar controles para restringir los cambios en los metadatos de la instancia.

ID de control	AWS Regla de configuración	Directrices
1380	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.

ID de control	AWS Regla de configuración	Directrices
1380	ecs-fargate-latest-platform-versión	Las actualizaciones y los parches de seguridad se implementan automáticamente para sus tareas de AWS Fargate. Si se detecta un problema de seguridad que afecte a una versión de la plataforma AWS Fargate, aplique AWS parches a la versión de la plataforma. Para facilitar la administración de parches de las tareas de Amazon Elastic Container Service (ECS) que ejecutan AWS Fargate, actualice las tareas independientes de sus servicios para usar la versión de plataforma más reciente.
1380	elastic-beanstalk-managed-updates-habilitado	La activación de las actualizaciones de plataforma gestionadas para un entorno de Amazon Elastic Beanstalk garantiza que se instalen las últimas correcciones, actualizaciones y características de la plataforma disponibles para el entorno. Mantenerse actualizado mediante la instalación de parches es una práctica recomendada para proteger los sistemas.

ID de control	AWS Regla de configuración	Directrices
1380	rds-automatic-minor-version-habilitada para la actualización	Habilite las actualizaciones automáticas de las versiones secundarias en sus instancia s de Amazon Relational Database Service (RDS) para garantizar que estén instalada s las últimas actualizaciones de las versiones secundari as del sistema de administr ación de bases de datos relacionales (RDBMS, por sus siglas en inglés), que pueden incluir parches de seguridad y correcciones de errores.
1380	ec2- -check managedinstance-association-compliance-status	Use AWS Systems Manager Associations para ayudar con el inventario de las plataform as y aplicaciones de software dentro de una organizac ión. AWS Systems Manager asigna un estado de configura ción a las instancias administr adas y le permite establece r líneas de referencia de los niveles de parches del sistema operativo, las instalaciones de software, las configuraciones de las aplicaciones y otros detalles sobre su entorno.

ID de control	AWS Regla de configuración	Directrices
1380	redshift-cluster-maintenancesettings-check	Esta regla garantiza que los clústeres de Amazon Redshift tengan la configuración preferida para su organización. En concreto, que tengan períodos de mantenimiento preferidos y períodos de retención automática de instantáneas para la base de datos. Esta regla requiere que configure el allowVersionUpgrade. El valor predeterminado es true. También te permite configurar de forma opcional el periodo preferredMaintenanceWindow (el predeterminado es sáb: 16:00 -sáb: 16:30) y el automatedSnapshotRetentionPeriodo (el valor predeterminado es 1). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
1380	iam-no-inline-policy-comprobar	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.
1380	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
1380	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.
1380	codebuild-project-environment-privileged-comprobar	Para ayudarte a implementar el principio de privilegios mínimos, asegúrate de que el entorno de tu CodeBuild proyecto de Amazon no tenga activado el modo privilegiado. Esta configuración debe estar deshabilitada para evitar el acceso no deseado a Docker APIs y al hardware subyacente del contenedor.

ID de control	AWS Regla de configuración	Directrices
1380	ecs-containers-nonprivileged	Para ayudar a implementar el principio de privilegio mínimo, las definiciones de tareas de Amazon Elastic Container Service (Amazon ECS) no deben tener habilitados los privilegios elevados. Cuando este parámetro es verdadero, al contenedor se le conceden privilegios elevados en la instancia de contenedor de host, similares a los de un usuario raíz.
1380	ecs-containers-readonly-access	Habilitar el acceso de solo lectura a los contenedores de Amazon Elastic Container Service (ECS) puede ayudar a cumplir con el principio de privilegio mínimo. Esta opción puede reducir los vectores de ataque, ya que el sistema de archivos de la instancia de contenedor no se puede modificar a menos que tenga permisos explícitos de lectura y escritura.

ID de control	AWS Regla de configuración	Directrices
1380	ecs-task-definition-nonroot-usuario	Para ayudar a implementar el principio de privilegio mínimo, asegúrese de designar a un usuario que no sea raíz para acceder a las definiciones de tareas de Amazon Elastic Container Service (Amazon ECS).
1380	efs-access-point-enforce-id entidad de usuario	Para ayudar a implementar el principio del privilegio mínimo, asegúrese de que la aplicació n por parte de los usuarios esté habilitada en su Amazon Elastic File System (Amazon EFS). Cuando está habilitad o, Amazon EFS reemplaza el usuario y el grupo IDs del cliente de NFS por la identidad configurada en el punto de acceso para todas las operaciones del sistema de archivos y solo permite el acceso a esta identidad de usuario forzada.

ID de control	AWS Regla de configuración	Directrices
1380	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
1380	rds-instance-iam-authentication-habilitado	Asegúrese de que la autenticación AWS Identity and Access Management (IAM) esté habilitada en las instancias del Amazon Relational Database Service (Amazon RDS) para controlar el acceso a los sistemas y activos. De esta manera se fuerza el cifrado del tráfico de red hacia y desde la base de datos mediante la capa de sockets seguros (SSL). No es necesario almacenar credenciales de usuario en la base de datos, ya que la autenticación se administra de forma externa.

ID de control	AWS Regla de configuración	Directrices
1380	ec2- instance-profile-attached	Los perfiles de instancia s de EC2 pasan un rol de IAM a una instancia de EC2. Adjuntar un perfil de instancia a las instancias puede ayudar a gestionar los privilegios mínimos y los permisos.
1380	ecs-task-definition-user-for-host-mode-check	Si la definición de una tarea tiene privilegios elevados, se debe a que el cliente ha optado específicamente por esa configuración. Este control comprueba si hay una escalada inesperada de privilegios cuando una definición de tarea tiene habilitadas las redes de host, pero el cliente no ha elegido los privilegios elevados.

ID de control	AWS Regla de configuración	Directrices
1380	iam-customer-policy-blocked-kms-acciones	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, lo que impide que las políticas contengan acciones bloqueadas en todas AWS las claves del Servicio de Administración de Claves. Tener más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones . Esta regla le permite establecer el blockedAc tionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencrip tar, kms:ReEncryptFrom). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
1380	iam-inline-policy-blocked-kms-acciones	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política en línea que permita bloquear acciones en todas las claves del Servicio de administración de claves. AWS AWS recomiend a utilizar políticas gestionad as en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administr ación de permisos. Esta regla le permite establece r el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar, kms:ReEnc ryptFrom). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
1380	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
1388	restricted-common-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integridad y confidencialidad de los sistemas. Esta regla le permite configurar de forma opcional los parámetros blockedPort1 a blockedPort5 (valores predeterminados de Config: 20,21,3389,3306,4333). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
1388	vpc-sg-open-only-to-authorized-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Al restringir el acceso a los recursos dentro de un grupo de seguridad desde internet (0.0.0.0/0), se puede controlar el acceso remoto a los sistemas internos.
1401	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.

ID de control	AWS Regla de configuración	Directrices
1401	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.
1401	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidentes de cuentas comprometidas y evitar que usuarios no autorizados accedan a los datos confidenciales.

ID de control	AWS Regla de configuración	Directrices
1401	root-account-hardware-mfa-habilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
1401	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
1402	iam-password-policy	Las identidades y las credenciales se emiten, administran y verifican en función de la política de contraseñas de IAM de la organización. Cumplen o superan los requisitos establecidos por la norma NIST SP 800-63 y el estándar AWS fundamental de mejores prácticas de seguridad para la seguridad de las contraseñas. Esta regla le permite configura r opcionalmente RequireUp percaseCharacters (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireLo wercaseCharacters (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireSy mbols (valor de las mejores prácticas de seguridad AWS fundamentales: verdadero), RequireNumbers (valor de las mejores prácticas de seguridad AWS AWS fundamentales: verdadero), MinimumPasswordLen gth (valor de las mejores prácticas de seguridad AWS fundamentales: 14), PasswordReusePrevention

ID de control	AWS Regla de configuración	Directrices
		(valor de las mejores prácticas de seguridad AWS fundament ales: 24) y MaxPasswordAge (valor de las mejores prácticas de seguridad fundamentales: 90) para su IAM La política de contraseñas. Los valores reales deben reflejar las políticas de su organización.
1404	iam-user-unused-credentials-comprobar	AWS Identity and Access Management (IAM) puede ayudarlo con los permisos y autorizaciones de acceso comprobando las contraseñ as y claves de acceso de IAM que no se utilicen durante un período de tiempo específic o. Si se identifican estas credenciales no utilizadas, debe deshabilitar la opción de and/or eliminar las credencia les, ya que esto podría infringir el principio del privilegio mínimo. Esta regla requiere que establezcas un valor en la maxCredentialUsage Edad (Config Default: 90). El valor real debe reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
1405	cloud-trail-cloud-watch-habilitado para registros	Usa Amazon CloudWatch para recopilar y gestionar de forma centralizada la actividad de los eventos de registro. La inclusión de AWS CloudTrail datos proporciona detalles de la actividad de llamadas a la API en su interior Cuenta de AWS.
1405	cloudtrail-enabled	AWS CloudTrail puede ayudar a evitar el repudio al registrar las acciones de la consola de AWS administración y las llamadas a la API. Puede identificar a los usuarios y a quién llamó a un AWS servicio, la dirección IP de origen en la Cuentas de AWS que se generaron las llamadas y los horarios de las llamadas. Los detalles de los datos capturados se muestran en el contenido del AWS CloudTrail registro.
1405	multi-region-cloudtrail-enabled	MULTI_REGION_CLOUD_TRAIL_ENABLED

ID de control	AWS Regla de configuración	Directrices
1405	cloudtrail-security-trail-enabled	Esta regla ayuda a garantizar el uso de las mejores prácticas de seguridad AWS recomendadas AWS CloudTrail, ya que comprueba la habilitación de varias configuraciones. Estas incluyen el uso del cifrado de registros, la validación de registros y la habilitación AWS CloudTrail en varias regiones.
1405	elasticsearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta. Los registros de errores de los dominios pueden ayudar en las auditorías de seguridad y acceso, además de para diagnosticar problemas de disponibilidad.
1405	api-gw-execution-logging-habilitado	El registro de API Gateway muestra vistas detalladas de los usuarios que han accedido a la API y la forma en que han accedido a la API. Esta información permite ver las actividades de los usuarios.

ID de control	AWS Regla de configuración	Directrices
1405	cloudtrail-s3-dataevents-enabled	La recopilación de eventos de datos del Simple Storage Service (Amazon S3) ayuda a detectar cualquier actividad anómala. Los detalles incluyen la información de la cuenta de AWS a la que ha accedido un bucket de Amazon S3, la dirección IP y la hora del evento.
1405	rds-logging-enabled	Para facilitar el registro y el monitoreo en su entorno, asegúrese de que el registro de Amazon Relational Database Service (Amazon RDS) esté habilitado. Con el registro de Amazon RDS, puede capturar eventos tales como conexiones, desconexiones, consultas o tablas consultadas.

ID de control	AWS Regla de configuración	Directrices
1405	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar informaci ón acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezc a un valor para clusterDb Encrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
1405	s3- bucket-logging-enabled	El registro de acceso al servidor de Amazon Simple Storage Service (Amazon S3) proporciona un método para monitorear la red en busca de posibles eventos de ciberseguridad. Los eventos se monitorean mediante la captura detallada de las solicitudes realizadas a un bucket de Amazon S3. Cada registro de acceso proporcio na detalles sobre una única solicitud de acceso. Los detalles incluyen el solicitan te, el nombre del bucket, la hora de la solicitud, la acción solicitada, el estado de la respuesta y el código de error, si procede.
1405	vpc-flow-logs-enabled	Los registros del flujo de la VPC proporcionan registros detallados acerca del tráfico IP entrante y saliente de las interfaces de red en su Amazon Virtual Private Cloud (Amazon VPC). De forma predeterminada, el registro de flujo incluye valores para los distintos componentes del flujo de IP, incluido el origen, el destino y el protocolo.

ID de control	AWS Regla de configuración	Directrices
1405	wafv2-logging-enabled	Para facilitar el registro y la supervisión en su entorno, habilite el registro AWS WAF (V2) en la web regional y global. ACLs AWS El registro WAF proporciona informaci ón detallada sobre el tráfico que analiza su ACL web. Los registros registran la hora en que AWS WAF recibió la solicitud de su AWS recurso, la información sobre la solicitud y una acción para la regla según la cual cada solicitud coincidió.
1405	elb-logging-enabled	La actividad de Elastic Load Balancing es un punto central de comunicación dentro de un entorno. Asegúrese de que el registro de ELB esté habilitado. Los datos recopilad os proporcionan información detallada sobre las solicitud es enviadas al ELB. Cada registro contiene distintos datos, como el momento en que se recibió la solicitud, la dirección IP del cliente, las latencias, las rutas de solicitud y las respuestas del servidor.

ID de control	AWS Regla de configuración	Directrices
1405	codebuild-project-logging-enabled	Asegúrese de que el registro de AWS CodeBuild proyectos esté habilitado para que los registros de salida de la compilación se envíen a Amazon CloudWatch o a Amazon Simple Storage Service (Amazon S3). Los registros de salida de la compilación proporcionan información detallada sobre el proyecto de compilación.
1405	redshift-audit-logging-enabled	Para recopilar información sobre las conexiones y las actividades de los usuarios en su clúster de Amazon Redshift, asegúrese de que el registro de auditoría esté habilitado.
1405	opensearch-audit-logging-enabled	Asegúrese de que el registro de auditoría esté habilitado en sus dominios OpenSearch de Amazon Service. El registro de auditoría le permite realizar un seguimiento de la actividad de los usuarios en sus OpenSearch dominios, incluidas las autenticaciones correctas y fallidas, las solicitudes OpenSearch, los cambios de indexación y las consultas de búsqueda entrantes.

ID de control	AWS Regla de configuración	Directrices
1405	opensearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta . OpenSearch Los registros de errores del servicio pueden ayudar con las auditorías de seguridad y acceso, y pueden ayudar a diagnosticar problemas de disponibilidad.
1490	alb-waf-enabled	Asegúrese de que AWS WAF esté habilitado en los Elastic Load Balancers (ELB) para ayudar a proteger las aplicaciones web. Un WAF ayuda a proteger sus aplicaciones web o APIs contra los ataques web más comunes. Estas vulnerabilidades de la web pueden afectar a la disponibilidad, comprometer la seguridad o consumir recursos excesivos en su entorno.

ID de control	AWS Regla de configuración	Directrices
1490	api-gw-associated-with-guerra	AWS El WAF le permite configurar un conjunto de reglas (denominadas listas de control de acceso web (ACL web)) que permiten, bloquean o cuentan las solicitudes web en función de las reglas y condiciones de seguridad web personalizables que usted defina. Asegúrese de que su etapa de Amazon API Gateway esté asociada a una ACL web de WAF para protegerla de ataques maliciosos.
1490	waf-regional-rule-not-vacío	Asegúrese de que su AWS WAF tenga una regla que no esté vacía. Una regla sin condiciones podría desencade nar un comportamiento no deseado.
1490	waf-regional-rulegroup-not-vacío	Asegúrese de que su AWS WAF tenga un grupo de reglas que no esté vacío. Un grupo de reglas vacío podría desencadenar un comportam iento no deseado.

ID de control	AWS Regla de configuración	Directrices
1490	waf-regional-webacl-not-vacío	Una ACL web adjunta a un AWS WAF puede contener un conjunto de reglas y grupos de reglas para inspeccionar y controlar las solicitudes web. Si una ACL web está vacía, el tráfico web pasa sin que el WAF lo detecte ni actúe sobre él.
1490	ec2- -check managedinstance-association-compliance-status	Use AWS Systems Manager Associations para ayudar con el inventario de las plataform as y aplicaciones de software dentro de una organizac ión. AWS Systems Manager asigna un estado de configura ción a las instancias administr adas y le permite establece r líneas de referencia de los niveles de parches del sistema operativo, las instalaciones de software, las configuraciones de las aplicaciones y otros detalles sobre su entorno.

ID de control	AWS Regla de configuración	Directrices
1501	ec2- -check managedinstance-patch-compliance-status	Habilite esta regla para ayudar a identificar y documenta r las vulnerabilidades de Amazon Elastic Compute Cloud (Amazon EC2). La regla comprueba si los parches de instancias Amazon EC2 cumplen con los requisitos de las políticas y procedimientos de su organización en AWS Systems Manager.
1504	iam-root-access-key-comprob ar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorpora r el principio de funcionalidad mínima.

ID de control	AWS Regla de configuración	Directrices
1504	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.
1504	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidentes de cuentas comprometidas y evitar que usuarios no autorizados accedan a los datos confidenciales.

ID de control	AWS Regla de configuración	Directrices
1504	root-account-hardware-mfa-habilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

OpenSearch Los registros de errores del servicio pueden ayudar con las auditorías de seguridad y acceso, y pueden ayudar a diagnosticar problemas de disponibilidad.
1511	db-instance-backup-enabled	La característica de copia de seguridad de Amazon RDS crea copias de seguridad de sus bases de datos y registros de transacciones. Amazon RDS crea automátic amente una instantánea de volumen de almacenam iento de la instancia de base de datos y realiza una copia de seguridad de toda la instancia. El sistema le permite establecer períodos de retención específicos para cumplir con sus requisitos de resiliencia.

ID de control	AWS Regla de configuración	Directrices
1511	dynamodb-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que las tablas de Amazon DynamoDB formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administr ado con una solución de respaldo basada en políticas . Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.
1511	dynamodb-pitr-enabled	Active esta regla para comprobar que se haya realizado una copia de seguridad de la información. También mantiene las copias de seguridad al garantizar que la point-in-time recuperación esté habilitada en Amazon DynamoDB. La recuperación mantiene copias de seguridad continuas de la tabla durante los últimos 35 días.

ID de control	AWS Regla de configuración	Directrices
1511	ebs-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que sus volúmenes de Amazon Elastic Block Store (Amazon EBS) formen parte de un plan de backup. AWS AWS Backup es un servicio de respaldo totalmente administr ado con una solución de respaldo basada en políticas . Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
1511	efs-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que sus sistemas de archivos Amazon Elastic File System (Amazon EFS) formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
1511	elasticache-redis-cluster-automatic-verificación de respaldo	Cuando las copias de seguridad automáticas están habilitadas, Amazon ElastiCache crea una copia de seguridad del clúster a diario. La copia de seguridad se puede conservar durante el número de días que especifique su organizac ión. Las copias de seguridad automáticas pueden ayudarle a protegerse frente a la pérdida de datos. En caso de error, puede crear un nuevo clúster y restaurar los datos de la copia de seguridad más reciente.

ID de control	AWS Regla de configuración	Directrices
1511	rds-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que sus instancias de Amazon Relational Database Service (Amazon RDS) formen parte de un AWS plan de backup. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
1511	s3- bucket-versioning-enabled	El control de versiones de buckets de Amazon Simple Storage Service (Amazon S3) permite usar múltiples variantes de un objeto en el mismo bucket de Amazon S3. Use el control de versiones para conservar, recuperar y restaurar todas las versiones de los objetos almacenados en su bucket de Amazon S3. El control de versiones ayuda a recuperarse fácilmente de acciones no deseadas del usuario y de errores de la aplicación.
1511	redshift-backup-enabled	Para facilitar los procesos de copia de seguridad de datos, asegúrese de que sus clústeres de Amazon Redshift tengan instantáneas automatiz adas. Cuando las instantán eas automatizadas están habilitadas para un clúster, Redshift realiza instantáneas de ese clúster periódicamente. De manera predeterminada, Redshift realiza una instantán ea cada ocho horas o después de cada cambio de datos de 5 GB por nodo, lo que ocurra primero.

ID de control	AWS Regla de configuración	Directrices
1511	aurora-resources-protected-by-plan de respaldo	Para facilitar los procesos de backup de datos, asegúrese de que sus recursos de Amazon Aurora formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
1511	backup-plan-min-frequency-and-min-retention-check	Para ayudar con los procesos de respaldo de datos, asegúrese de que su plan de AWS respaldo esté configurado para una frecuencia y retención mínimas. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad. Esta regla le permite configurar los parámetros requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) y requiredFrequencyUnit (Config default: days). El valor real debe reflejar los requisitos de su organización.

ID de control	AWS Regla de configuración	Directrices
1511	backup-recovery-point-minimum-control de retención	Para facilitar los procesos de backup de datos, asegúrese de que sus puntos AWS de recuperación de Backup tengan establecido un período de retención mínimo. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad. Esta regla le permite establecer el parámetro requiredRetentionDays (configuración predeterminada: 35). El valor real debe reflejar los requisitos de su organización.

ID de control	AWS Regla de configuración	Directrices
1511	ec2- -plan resources-protected-by-backup	Para facilitar los procesos de respaldo de datos, asegúrese de que sus recursos de Amazon Elastic Compute Cloud (Amazon EC2) Compute Cloud (Amazon EC2) formen parte de un plan de respaldo. AWS AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas . Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
1511	fsx-resources-protected-by-plan de respaldo	Para facilitar los procesos de backup de datos, asegúrate de que tus sistemas de FSx archivos de Amazon formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalment e administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.
1511	s3- bucket-replication-enabled	Con la replicación entre regiones (CRR) de Amazon Simple Storage Service (Amazon S3) se puede mantener la capacidad y la disponibilidad adecuadas. La CRR permite copiar objetos entre buckets de Amazon S3 de forma automática y asincrónica para garantizar la disponibilidad de los datos.

ID de control	AWS Regla de configuración	Directrices
1511	backup-plan-min-frequency-and-min-retention-check	Para ayudar con los procesos de respaldo de datos, asegúrese de que su plan de AWS respaldo esté configurado para una frecuencia y retención mínimas. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad. Esta regla le permite configurar los parámetros requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) y requiredFrequencyUnit (Config default: days). El valor real debe reflejar los requisitos de su organización.

ID de control	AWS Regla de configuración	Directrices
1511	backup-recovery-point-manual-eliminación-deshabilitada	Asegúrese de que sus puntos AWS de recuperación de Backup tengan adjunta una política basada en los recursos que impida la eliminación de los puntos de recuperación. El uso de una política basada en los recursos para evitar eliminar puntos de recuperación ayuda a evitar que se eliminen de forma accidental o intencionada.
1515	db-instance-backup-enabled	La característica de copia de seguridad de Amazon RDS crea copias de seguridad de sus bases de datos y registros de transacciones. Amazon RDS crea automáticamente una instantánea de volumen de almacenamiento de la instancia de base de datos y realiza una copia de seguridad de toda la instancia. El sistema le permite establecer períodos de retención específicos para cumplir con sus requisitos de resiliencia.

1515	dynamodb-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que las tablas de Amazon DynamoDB formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administr ado con una solución de respaldo basada en políticas . Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.
1515	ebs-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que sus volúmenes de Amazon Elastic Block Store (Amazon EBS) formen parte de un plan de backup. AWS AWS Backup es un servicio de respaldo totalmente administr ado con una solución de respaldo basada en políticas . Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
1515	efs-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que sus sistemas de archivos Amazon Elastic File System (Amazon EFS) formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
1515	elasticache-redis-cluster-automatic-verificación de copias de seguridad	Cuando las copias de seguridad automáticas están habilitadas, Amazon ElastiCache crea una copia de seguridad del clúster a diario. La copia de seguridad se puede conservar durante el número de días que especifique su organización. Las copias de seguridad automáticas pueden ayudarle a protegerse frente a la pérdida de datos. En caso de error, puede crear un nuevo clúster y restaurar los datos de la copia de seguridad más reciente.

ID de control	AWS Regla de configuración	Directrices
1515	rds-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que sus instancias de Amazon Relational Database Service (Amazon RDS) formen parte de un AWS plan de backup. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.
1515	s3- bucket-replication-enabled	Con la replicación entre regiones (CRR) de Amazon Simple Storage Service (Amazon S3) se puede mantener la capacidad y la disponibilidad adecuadas. La CRR permite copiar objetos entre buckets de Amazon S3 de forma automática y asincrónica para garantizar la disponibilidad de los datos.

ID de control	AWS Regla de configuración	Directrices
1515	s3- bucket-versioning-enabled	El control de versiones de buckets de Amazon Simple Storage Service (Amazon S3) permite usar múltiples variantes de un objeto en el mismo bucket de Amazon S3. Use el control de versiones para conservar, recuperar y restaurar todas las versiones de los objetos almacenados en su bucket de Amazon S3. El control de versiones ayuda a recuperarse fácilmente de acciones no deseadas del usuario y de errores de la aplicación.
1515	aurora-resources-protected-by-plan de respaldo	Para facilitar los procesos de backup de datos, asegúrese de que sus recursos de Amazon Aurora formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administr ado con una solución de respaldo basada en políticas . Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
1515	backup-plan-min-frequency-and-min-retention-check	Para ayudar con los procesos de respaldo de datos, asegúrese de que su plan de AWS respaldo esté configurado para una frecuencia y retención mínimas. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad. Esta regla le permite configurar los parámetros requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) y requiredFrequencyUnit (Config default: days). El valor real debe reflejar los requisitos de su organización.

ID de control	AWS Regla de configuración	Directrices
1515	backup-recovery-point-manual-eliminación-deshabilitada	Asegúrese de que sus puntos AWS de recuperación de Backup tengan adjunta una política basada en los recursos que impida la eliminación de los puntos de recuperación. El uso de una política basada en los recursos para evitar eliminar puntos de recuperación ayuda a evitar que se eliminen de forma accidental o intencionada.
1515	ec2- -plan resources-protected-by-backup	Para facilitar los procesos de respaldo de datos, asegúrese de que sus recursos de Amazon Elastic Compute Cloud (Amazon EC2) Compute Cloud (Amazon EC2) formen parte de un plan de respaldo. AWS AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
1515	redshift-backup-enabled	Para facilitar los procesos de copia de seguridad de datos, asegúrese de que sus clústeres de Amazon Redshift tengan instantáneas automatizadas. Cuando las instantáneas automatizadas están habilitadas para un clúster, Redshift realiza instantáneas de ese clúster periódicamente. De manera predeterminada, Redshift realiza una instantánea cada ocho horas o después de cada cambio de datos de 5 GB por nodo, lo que ocurra primero.
1536	cloudtrail-s3-dataevents-enabled	La recopilación de eventos de datos del Simple Storage Service (Amazon S3) ayuda a detectar cualquier actividad anómala. Los detalles incluyen la información de la cuenta de AWS a la que ha accedido un bucket de Amazon S3, la dirección IP y la hora del evento.

ID de control	AWS Regla de configuración	Directrices
1537	rds-logging-enabled	Para facilitar el registro y el monitoreo en su entorno, asegúrese de que el registro de Amazon Relational Database Service (Amazon RDS) esté habilitado. Con el registro de Amazon RDS, puede capturar eventos tales como conexiones, desconexi ones, consultas o tablas consultadas.
1537	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar informaci ón acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezc a un valor para clusterDb Encrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
1552	acm-certificate-expiration-check	Asegúrese de que la integrida d de la red esté protegida asegurándose de que ACM emita los certificados X509. AWS Estos certificados deben ser válidos y estar vigentes. Esta regla requiere un valor para daysToExpiration (valor de prácticas recomendadas de seguridad AWS fundament ales: 90). El valor real debe reflejar las políticas de su organización.
1552	alb-http-to-https-verificación de redireccionamiento	Para ayudar a proteger los datos en tránsito, asegúrese de que el equilibrador de carga de aplicación redirija automáticamente las solicitud es HTTP no cifradas hacia HTTPS. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
1552	elb-acm-certificate-required	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en tránsito, debe asegurarse de que el cifrado esté habilitado para su Elastic Load Balancing. Use AWS Certificate Manager para administrar, aprovisionar e implementar SSL/TLS certifica dos públicos y privados con AWS servicios y recursos internos.
1552	elb-tls-https-listeners-solo	Asegúrese de que sus Elastic Load Balancers (ELBs) estén configurados con agentes de escucha SSL o HTTPS. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
1552	elb 2- acm-certificate-required	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en tránsito, debe asegurarse de que el cifrado esté habilitado para su Elastic Load Balancing. Use AWS Certificate Manager para administrar, aprovisionar e implementar SSL/TLS certifica dos públicos y privados con AWS servicios y recursos internos.

ID de control	AWS Regla de configuración	Directrices
1579	dynamodb-autoscaling-enabled	El escalado automático de Amazon DynamoDB AWS usa el servicio Application Auto Scaling para ajustar la capacidad de rendimiento aprovisionada para que responda automáticamente a los patrones de tráfico reales. Esto permite que una tabla o un índice secundario global aumente su read/write capacidad aprovisionada para gestionar los aumentos repentinos de tráfico, sin limitaciones.
1580	elb-cross-zone-load-habilitado para el equilibrio	Habilite el equilibrio de carga entre zonas para sus Elastic Load Balancers (ELBs) para ayudar a mantener la capacidad y la disponibilidad adecuadas. El equilibrio de carga entre zonas reduce la necesidad de mantener automáticamente cantidades equivalentes de instancias en cada zona de disponibilidad habilitada. También mejora la capacidad de la aplicación para gestionar la pérdida de una o más instancias.

ID de control	AWS Regla de configuración	Directrices
1580	rds-multi-az-support	La compatibilidad con las zonas de disponibilidad múltiples (Multi-AZ) de Amazon Relational Database Service (Amazon RDS) permite mejorar la disponibilidad y durabilidad de las instancias de bases de datos. Cuando aprovisiona una instancia de base de datos Multi-AZ, Amazon RDS crea automáticamente una instancia de base de datos principal y replica sincrónicamente los datos en una instancia en espera en una zona de disponibilidad diferente. Cada zona de disponibilidad se ejecuta en su propia infraestructura independiente y físicamente distinta, y está diseñada para ser altamente fiable. En caso de que se produzca un fallo en la infraestructura, Amazon RDS realiza una conmutación por error automática a la estación en espera para que pueda reanudar las operaciones de la base de datos en cuanto se complete la conmutación por error.

ID de control	AWS Regla de configuración	Directrices
1580	rds-cluster-multi-az-habilitado	Los clústeres de Amazon Relational Database Service (Amazon RDS) deben tener habilitada la replicación Multi-AZ para facilitar la disponibilidad de los datos almacenados. Cada zona de disponibilidad se ejecuta en su propia infraestructura independiente y físicamente distinta, y está diseñada para ser altamente fiable. En caso de que se produzca un fallo en la infraestructura, Amazon RDS realiza una conmutación por error automática a la estación en espera para que pueda reanudar las operaciones de la base de datos en cuanto se complete la conmutación por error.
1650	cloud-trail-cloud-watch-habilitado para registros	Usa Amazon CloudWatch para recopilar y gestionar de forma centralizada la actividad de los eventos de registro. La inclusión de AWS CloudTrail datos proporciona detalles de la actividad de llamadas a la API en su interior Cuenta de AWS.

ID de control	AWS Regla de configuración	Directrices
1650	cloudtrail-enabled	AWS CloudTrail puede ayudar a evitar el repudio al registrar las acciones de la consola de AWS administración y las llamadas a la API. Puede identificar a los usuarios y a quién llamó a un AWS servicio, la dirección IP de origen en la Cuentas de AWS que se generaron las llamadas y los horarios de las llamadas. Los detalles de los datos capturados se muestran en el contenido del AWS CloudTrail registro.

ID de control	AWS Regla de configuración	Directrices
1650	multi-region-cloudtrail-enabled	AWS CloudTrail registra las acciones AWS de la consola de administración y las llamadas a la API. Puede identificar qué usuarios y cuentas llamaron AWS, la dirección IP de origen desde la que se realizaro n las llamadas y cuándo se produjeron. CloudTrai l entregará los archivos de registro de todas AWS las regiones a su bucket de S3 si MULTI_REGION_CLOUD _TRAIL_ENABLED está activado. Además, al AWS lanzar una nueva región, CloudTrail creará la misma ruta en la nueva región. En consecuencia, recibirá archivos de registro con la actividad de la API en la nueva región sin necesidad de realizar ninguna acción.

ID de control	AWS Regla de configuración	Directrices
1650	cloudtrail-security-trail-enabled	Esta regla ayuda a garantizar el uso de las mejores prácticas de seguridad AWS recomendadas AWS CloudTrail, ya que comprueba la habilitación de varias configuraciones. Estas incluyen el uso del cifrado de registros, la validación de registros y la habilitación AWS CloudTrail en varias regiones.
1650	elasticsearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta. Los registros de errores de los dominios pueden ayudar en las auditorías de seguridad y acceso, además de para diagnosticar problemas de disponibilidad.
1650	api-gw-execution-logging-habilitado	El registro de API Gateway muestra vistas detalladas de los usuarios que han accedido a la API y la forma en que han accedido a la API. Esta información permite ver las actividades de los usuarios.

ID de control	AWS Regla de configuración	Directrices
1650	cloudtrail-s3-dataevents-enabled	La recopilación de eventos de datos del Simple Storage Service (Amazon S3) ayuda a detectar cualquier actividad anómala. Los detalles incluyen la información de la cuenta de AWS a la que ha accedido un bucket de Amazon S3, la dirección IP y la hora del evento.
1650	rds-logging-enabled	Para facilitar el registro y el monitoreo en su entorno, asegúrese de que el registro de Amazon Relational Database Service (Amazon RDS) esté habilitado. Con el registro de Amazon RDS, puede capturar eventos tales como conexiones, desconexiones, consultas o tablas consultadas.

ID de control	AWS Regla de configuración	Directrices
1650	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar informaci ón acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezc a un valor para clusterDb Encrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
1650	s3- bucket-logging-enabled	El registro de acceso al servidor de Amazon Simple Storage Service (Amazon S3) proporciona un método para monitorear la red en busca de posibles eventos de ciberseguridad. Los eventos se monitorean mediante la captura detallada de las solicitudes realizadas a un bucket de Amazon S3. Cada registro de acceso proporcio na detalles sobre una única solicitud de acceso. Los detalles incluyen el solicitan te, el nombre del bucket, la hora de la solicitud, la acción solicitada, el estado de la respuesta y el código de error, si procede.
1650	vpc-flow-logs-enabled	Los registros del flujo de la VPC proporcionan registros detallados acerca del tráfico IP entrante y saliente de las interfaces de red en su Amazon Virtual Private Cloud (Amazon VPC). De forma predeterminada, el registro de flujo incluye valores para los distintos componentes del flujo de IP, incluido el origen, el destino y el protocolo.

ID de control	AWS Regla de configuración	Directrices
1650	wafv2-logging-enabled	Para facilitar el registro y la supervisión en su entorno, habilite el registro AWS WAF (V2) en la web regional y global. ACLs AWS El registro WAF proporciona informaci ón detallada sobre el tráfico que analiza su ACL web. Los registros registran la hora en que AWS WAF recibió la solicitud de su AWS recurso, la información sobre la solicitud y una acción para la regla según la cual cada solicitud coincidió.
1650	elb-logging-enabled	La actividad de Elastic Load Balancing es un punto central de comunicación dentro de un entorno. Asegúrese de que el registro de ELB esté habilitado. Los datos recopilad os proporcionan información detallada sobre las solicitud es enviadas al ELB. Cada registro contiene distintos datos, como el momento en que se recibió la solicitud, la dirección IP del cliente, las latencias, las rutas de solicitud y las respuestas del servidor.

ID de control	AWS Regla de configuración	Directrices
1650	codebuild-project-logging-enabled	Asegúrese de que el registro de AWS CodeBuild proyectos esté habilitado para que los registros de salida de la compilación se envíen a Amazon CloudWatch o a Amazon Simple Storage Service (Amazon S3). Los registros de salida de la compilación proporcionan información detallada sobre el proyecto de compilación.
1650	redshift-audit-logging-enabled	Para recopilar información sobre las conexiones y las actividades de los usuarios en su clúster de Amazon Redshift, asegúrese de que el registro de auditoría esté habilitado.
1650	opensearch-audit-logging-enabled	Asegúrese de que el registro de auditoría esté habilitado en sus dominios OpenSearch de Amazon Service. El registro de auditoría le permite realizar un seguimiento de la actividad de los usuarios en sus OpenSearch dominios, incluidas las autenticaciones correctas y fallidas, las solicitudes OpenSearch, los cambios de indexación y las consultas de búsqueda entrantes.

ID de control	AWS Regla de configuración	Directrices
1650	opensearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta . OpenSearch Los registros de errores del servicio pueden ayudar con las auditorías de seguridad y acceso, y pueden ayudar a diagnosticar problemas de disponibilidad.
1657	alb-waf-enabled	Asegúrese de que AWS WAF esté habilitado en los Elastic Load Balancers (ELB) para ayudar a proteger las aplicaciones web. Un WAF ayuda a proteger sus aplicaciones web o APIs contra los ataques web más comunes. Estas vulnerabilidades de la web pueden afectar a la disponibilidad, comprometer la seguridad o consumir recursos excesivos en su entorno.

ID de control	AWS Regla de configuración	Directrices
1657	api-gw-associated-with-guerra	AWS El WAF le permite configurar un conjunto de reglas (denominadas listas de control de acceso web (ACL web)) que permiten, bloquean o cuentan las solicitudes web en función de las reglas y condiciones de seguridad web personalizables que usted defina. Asegúrese de que su etapa de Amazon API Gateway esté asociada a una ACL web de WAF para protegerla de ataques maliciosos.
1657	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.

ID de control	AWS Regla de configuración	Directrices
1657	waf-regional-rule-not-vacío	Asegúrese de que su AWS WAF tenga una regla que no esté vacía. Una regla sin condiciones podría desencadenar un comportamiento no deseado.
1657	waf-regional-rulegroup-not-vacío	Asegúrese de que su AWS WAF tenga un grupo de reglas que no esté vacío. Un grupo de reglas vacío podría desencadenar un comportamiento no deseado.
1657	waf-regional-webacl-not-vacío	Una ACL web adjunta a un AWS WAF puede contener un conjunto de reglas y grupos de reglas para inspeccionar y controlar las solicitudes web. Si una ACL web está vacía, el tráfico web pasa sin que el WAF lo detecte ni actúe sobre él.

ID de control	AWS Regla de configuración	Directrices
1657	ec2- -check managedinstance-association-compliance-status	Use AWS Systems Manager Associations para ayudar con el inventario de las plataform as y aplicaciones de software dentro de una organizac ión. AWS Systems Manager asigna un estado de configura ción a las instancias administr adas y le permite establece r líneas de referencia de los niveles de parches del sistema operativo, las instalaciones de software, las configuraciones de las aplicaciones y otros detalles sobre su entorno.
1661	cloud-trail-cloud-watch-hab ilitado para registros	Usa Amazon CloudWatch para recopilar y gestionar de forma centralizada la actividad de los eventos de registro. La inclusión de AWS CloudTrail datos proporciona detalles de la actividad de llamadas a la API en su interior Cuenta de AWS.

ID de control	AWS Regla de configuración	Directrices
1661	cloudtrail-enabled	AWS CloudTrail puede ayudar a evitar el repudio al registrar las acciones de la consola de AWS administración y las llamadas a la API. Puede identificar a los usuarios y a quién llamó a un AWS servicio, la dirección IP de origen en la Cuentas de AWS que se generaron las llamadas y los horarios de las llamadas. Los detalles de los datos capturados se muestran en el contenido del AWS CloudTrail registro.

ID de control	AWS Regla de configuración	Directrices
1661	multi-region-cloudtrail-enabled	AWS CloudTrail registra las acciones AWS de la consola de administración y las llamadas a la API. Puede identificar qué usuarios y cuentas llamaron AWS, la dirección IP de origen desde la que se realizaro n las llamadas y cuándo se produjeron. CloudTrai l entregará los archivos de registro de todas AWS las regiones a su bucket de S3 si MULTI_REGION_CLOUD _TRAIL_ENABLED está activado. 1683	s3- bucket-logging-enabled	El registro de acceso al servidor de Amazon Simple Storage Service (Amazon S3) proporciona un método para monitorear la red en busca de posibles eventos de ciberseguridad. Los eventos se monitorean mediante la captura detallada de las solicitudes realizadas a un bucket de Amazon S3. Cada registro de acceso proporcio na detalles sobre una única solicitud de acceso. Los detalles incluyen el solicitan te, el nombre del bucket, la hora de la solicitud, la acción solicitada, el estado de la respuesta y el código de error, si procede.

ID de control	AWS Regla de configuración	Directrices
1690	ec2-imdsv2-check	Asegúrese de que el método Servicio de metadatos de instancias versión 2 (IMDSv2) esté habilitado para ayudar a proteger el acceso y el control de los metadatos de instancia de Amazon Elastic Compute Cloud (Amazon EC2). El IMDSv2 método utiliza controles basados en sesiones. Con IMDSv2, se pueden implementar controles para restringir los cambios en los metadatos de la instancia.
1690	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.

ID de control	AWS Regla de configuración	Directrices
1690	ecs-fargate-latest-platform-versión	Las actualizaciones y los parches de seguridad se implementan automáticamente para sus tareas de AWS Fargate. Si se detecta un problema de seguridad que afecte a una versión de la plataforma AWS Fargate, aplique AWS parches a la versión de la plataforma. Para facilitar la administración de parches de las tareas de Amazon Elastic Container Service (ECS) que ejecutan AWS Fargate, actualice las tareas independientes de sus servicios para usar la versión de plataforma más reciente.
1690	elastic-beanstalk-managed-updates-habilitado	La activación de las actualizaciones de plataforma gestionadas para un entorno de Amazon Elastic Beanstalk garantiza que se instalen las últimas correcciones, actualizaciones y características de la plataforma disponibles para el entorno. Mantenerse actualizado mediante la instalación de parches es una práctica recomendada para proteger los sistemas.

ID de control	AWS Regla de configuración	Directrices
1690	rds-automatic-minor-version-habilitada para la actualización	Habilite las actualizaciones automáticas de las versiones secundarias en sus instancia s de Amazon Relational Database Service (RDS) para garantizar que estén instalada s las últimas actualizaciones de las versiones secundari as del sistema de administr ación de bases de datos relacionales (RDBMS, por sus siglas en inglés), que pueden incluir parches de seguridad y correcciones de errores.
1690	ec2- -check managedinstance-association-compliance-status	Use AWS Systems Manager Associations para ayudar con el inventario de las plataform as y aplicaciones de software dentro de una organizac ión. AWS Systems Manager asigna un estado de configura ción a las instancias administr adas y le permite establece r líneas de referencia de los niveles de parches del sistema operativo, las instalaciones de software, las configuraciones de las aplicaciones y otros detalles sobre su entorno.

ID de control	AWS Regla de configuración	Directrices
1690	redshift-cluster-maintenancesettings-check	Esta regla garantiza que los clústeres de Amazon Redshift tengan la configuración preferida para su organización. En concreto, que tengan períodos de mantenimiento preferidos y períodos de retención automática de instantáneas para la base de datos. Esta regla requiere que configure el allowVersionUpgrade. El valor predeterminado es true. También te permite configurar de forma opcional el periodo preferredMaintenanceWindow (el predeterminado es sáb: 16:00 -sáb: 16:30) y el automatedSnapshotRetentionPeriodo (el valor predeterminado es 1). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
1691	ec2-imdsv2-check	Asegúrese de que el método Servicio de metadatos de instancias versión 2 (IMDSv2) esté habilitado para ayudar a proteger el acceso y el control de los metadatos de instancia de Amazon Elastic Compute Cloud (Amazon EC2). El IMDSv2 método utiliza controles basados en sesiones. Con IMDSv2, se pueden implementar controles para restringir los cambios en los metadatos de la instancia.
1691	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.

1694	ec2- -check managedinstance-patch-compliance-status	Habilite esta regla para ayudar a identificar y documenta r las vulnerabilidades de Amazon Elastic Compute Cloud (Amazon EC2). La regla comprueba si los parches de instancias Amazon EC2 cumplen con los requisitos de las políticas y procedimientos de su organización en AWS Systems Manager.
1695	ec2- -check managedinstance-patch-compliance-status	Habilite esta regla para ayudar a identificar y documenta r las vulnerabilidades de Amazon Elastic Compute Cloud (Amazon EC2). La regla comprueba si los parches de instancias Amazon EC2 cumplen con los requisitos de las políticas y procedimientos de su organización en AWS Systems Manager.

ID de control	AWS Regla de configuración	Directrices
1707	backup-recovery-point-manual-eliminación-deshabilitada	Asegúrese de que sus puntos AWS de recuperación de Backup tengan adjunta una política basada en los recursos que impida la eliminación de los puntos de recuperación. El uso de una política basada en los recursos para evitar eliminar puntos de recuperación ayuda a evitar que se eliminen de forma accidental o intencionada.
P1	rds-cluster-deletion-protection-habilitado	Asegúrese de que las instancias de Amazon Relational Database Service (Amazon RDS) tengan habilitada la protección contra borrado. Utilice la protección contra borrado para evitar que las instancias de Amazon RDS se eliminen de forma accidental o malintencionada, lo que puede provocar la pérdida de disponibilidad de sus aplicaciones.

ID de control	AWS Regla de configuración	Directrices
P1	rds-instance-deletion-protection-habilitado	Asegúrese de que las instancias de Amazon Relational Database Service (Amazon RDS) tengan habilitada la protección contra borrado. Utilice la protección contra borrado para evitar que las instancias de Amazon RDS se eliminen de forma accidental o malintencionada, lo que puede provocar la pérdida de disponibilidad de sus aplicaciones.
P3	ec2-imdsv2-check	Asegúrese de que el método Servicio de metadatos de instancias versión 2 (IMDSv2) esté habilitado para ayudar a proteger el acceso y el control de los metadatos de instancia de Amazon Elastic Compute Cloud (Amazon EC2). El IMDSv2 método utiliza controles basados en la sesión. Con IMDSv2, se pueden implementar controles para restringir los cambios en los metadatos de la instancia.

ID de control	AWS Regla de configuración	Directrices
P5	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS
P7	elasticsearch-node-to-node-verificación de cifrado	Asegúrese de que el node-to-node cifrado OpenSearc h de Amazon Service esté activado. Node-to-nodeel cifrado permite el cifrado TLS 1.2 para todas las comunicac iones dentro de Amazon Virtual Private Cloud (Amazon VPC). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
P7	s3- bucket-ssl-requests-only	Para ayudar a proteger los datos en tránsito, asegúrese de que los buckets de Amazon Simple Storage Service (Amazon S3) requieran solicitudes para usar la capa de sockets seguros (SSL). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
P7	opensearch-node-to-node-verificación de cifrado	Asegúrese de que el node-to-node cifrado OpenSearch de Amazon Service esté activado. Node-to-nodeel cifrado permite el cifrado TLS 1.2 para todas las comunicaciones dentro de Amazon Virtual Private Cloud (Amazon VPC). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
P7	opensearch-https-required	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en tránsito, asegúrate de que HTTPS esté habilitado para las conexiones a tus dominios de Amazon OpenSearch Service.

Los eventos se monitorean mediante la captura detallada de las solicitudes realizadas a un bucket de Amazon S3. Cada registro de acceso proporcio na detalles sobre una única solicitud de acceso. Los detalles incluyen el solicitan te, el nombre del bucket, la hora de la solicitud, la acción solicitada, el estado de la respuesta y el código de error, si procede.

ID de control	AWS Regla de configuración	Directrices
P9	aurora-resources-protected-by-plan de respaldo	Para facilitar los procesos de backup de datos, asegúrese de que sus recursos de Amazon Aurora formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
P9	backup-plan-min-frequency-and-min-retention-check	Para ayudar con los procesos de respaldo de datos, asegúrese de que su plan de AWS respaldo esté configurado para una frecuencia y retención mínimas. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad. Esta regla le permite configurar los parámetros requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) y requiredFrequencyUnit (Config default: days). El valor real debe reflejar los requisitos de su organización.

ID de control	AWS Regla de configuración	Directrices
P9	backup-recovery-point-encrypted	Asegúrese de que el cifrado esté activado en sus puntos AWS de recuperación de Backup. Puesto que puede haber datos confidenciales en reposo, habilite el cifrado en reposo para ayudar a protegerlos.
P9	backup-recovery-point-manual-eliminación-deshabilitada	Asegúrese de que sus puntos AWS de recuperación de Backup tengan adjunta una política basada en los recursos que impida la eliminación de los puntos de recuperación. El uso de una política basada en los recursos para evitar eliminar puntos de recuperación ayuda a evitar que se eliminen de forma accidental o intencionada.

ID de control	AWS Regla de configuración	Directrices
P9	backup-recovery-point-minimum-control de retención	Para facilitar los procesos de backup de datos, asegúrese de que sus puntos AWS de recuperación de Backup tengan establecido un período de retención mínimo. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad. Esta regla le permite establecer el parámetro requiredRetentionDays (configuración predeterminada: 35). El valor real debe reflejar los requisitos de su organización.

ID de control	AWS Regla de configuración	Directrices
P9	db-instance-backup-enabled	La característica de copia de seguridad de Amazon RDS crea copias de seguridad de sus bases de datos y registros de transacciones. Amazon RDS crea automátic amente una instantánea de volumen de almacenam iento de la instancia de base de datos y realiza una copia de seguridad de toda la instancia. El sistema le permite establecer períodos de retención específicos para cumplir con sus requisitos de resiliencia.
P9	dynamodb-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que las tablas de Amazon DynamoDB formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administr ado con una solución de respaldo basada en políticas . Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
P9	ebs-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que sus volúmenes de Amazon Elastic Block Store (Amazon EBS) formen parte de un plan de backup. AWS AWS Backup es un servicio de respaldo totalmente administr ado con una solución de respaldo basada en políticas . Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
P9	ec2- -plan resources-protected-by-backup	Para facilitar los procesos de respaldo de datos, asegúrese de que sus recursos de Amazon Elastic Compute Cloud (Amazon EC2) Compute Cloud (Amazon EC2) formen parte de un plan de respaldo. AWS AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas . Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
P9	efs-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que sus sistemas de archivos Amazon Elastic File System (Amazon EFS) formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
P9	elasticache-redis-cluster-automatic-verificación de copias de seguridad	Cuando las copias de seguridad automáticas están habilitadas, Amazon ElastiCache crea una copia de seguridad del clúster a diario. La copia de seguridad se puede conservar durante el número de días que especifique su organización. Las copias de seguridad automáticas pueden ayudarle a protegerse frente a la pérdida de datos. En caso de error, puede crear un nuevo clúster y restaurar los datos de la copia de seguridad más reciente.

ID de control	AWS Regla de configuración	Directrices
P9	fsx-resources-protected-by-plan de respaldo	Para facilitar los procesos de backup de datos, asegúrate de que tus sistemas de FSx archivos de Amazon formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalment e administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
P9	rds-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que sus instancias de Amazon Relational Database Service (Amazon RDS) formen parte de un AWS plan de backup. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
P9	redshift-backup-enabled	Para facilitar los procesos de copia de seguridad de datos, asegúrese de que sus clústeres de Amazon Redshift tengan instantáneas automatizadas. Cuando las instantáneas automatizadas están habilitadas para un clúster, Redshift realiza instantáneas de ese clúster periódicamente. De manera predeterminada, Redshift realiza una instantánea cada ocho horas o después de cada cambio de datos de 5 GB por nodo, lo que ocurra primero.
P10	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
P10	iam-no-inline-policy-comprobar	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.

ID de control	AWS Regla de configuración	Directrices
P10	iam-customer-policy-blocked-kms-acciones	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, lo que impide que las políticas contengan acciones bloqueadas en todas AWS las claves del Servicio de Administración de Claves. Tener más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones . Esta regla le permite establecer el blockedAc tionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencrip tar, kms:ReEncryptFrom). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
P10	iam-inline-policy-blocked-kms-acciones	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política en línea que permita bloquear acciones en todas las claves del Servicio de administración de claves. AWS AWS recomiend a utilizar políticas gestionad as en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administr ación de permisos. Esta regla le permite establece r el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar, kms:ReEnc ryptFrom). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
P10	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
P11	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

- Prácticas operativas recomendadas para ACSC ISM: parte 2

Prácticas operativas recomendadas para ACSC ISM: parte 2

Los paquetes de conformidad proporcionan un marco de cumplimiento de uso general diseñado para permitirle crear controles de seguridad, operativos o de optimización de costes mediante reglas gestionadas o personalizadas AWS Config y acciones correctivas. AWS Config Los paquetes de conformidad, como plantillas de ejemplo, no están diseñados para garantizar plenamente el cumplimiento de una norma de gobernanza o de conformidad específicas. Usted debe evaluar si su uso de los servicios cumple con los requisitos legales y normativos aplicables.

A continuación, se proporcionan ejemplos adicionales de mapeo entre el Manual de seguridad de la información (ISM) 2020-06 del Centro de Ciberseguridad de Australia (ACSC) y las reglas de AWS Config administradas. Cada regla de Config se aplica a un AWS recurso específico y se refiere a uno o más controles de ISM. Un control del ISM puede estar relacionado con varias reglas de Config. Consulte la siguiente tabla para obtener más detalles y orientación relacionados con estas asignaciones.

Este ejemplo de plantilla de paquete de conformidad contiene asignaciones a controles dentro del marco del ISM, creado por la Commonwealth de Australia y que está disponible en el Australian Government Information Security Manual. La licencia del marco en virtud de la Creative Commons Attribution 4.0 International Public License y la información sobre los derechos de autor del marco (incluida la exención de garantías) se pueden consultar en ACSC | Copyright.

ID de control	AWS Regla de configuración	Directrices
1984	appmesh-virtual-gateway-backend-defaults-tls	Comprueba si los valores predeterminados del backend para las puertas de enlace virtuales requieren que las puertas de enlace AWS App Mesh virtuales se comunique n con todos los puertos mediante TLS. La regla no cumple con los requisito s de Configuration.spec. BackendDefaults. ClientPol icy.Tls.Enforce es falso.

ID de control	AWS Regla de configuración	Directrices
1984	appmesh-virtual-node-backend-defaults-tls-on	Comprueba si los valores predeterminados del backend para los nodos AWS App Mesh virtuales requieren que los nodos virtuales se comuniquen con todos los puertos mediante TLS. La regla no cumple con los requisitos de Configuration.spec. BackendDefaults. ClientPolicy.Tls.Enforce es falso.
1984	msk-in-cluster-node-require-tls	Comprueba si un clúster de Amazon MSK está cifrado en tránsito con HTTPS (TLS) con los nodos de agente del clúster. La regla es NON_COMPLIANT si la comunicación de texto sin formato está habilitada para conexiones de nodo de agente dentro del clúster.

ID de control	AWS Regla de configuración	Directrices
1984	rds-mysql-instance-encrypted-en tránsito	Comprueba si las conexiones a las instancias de bases de datos de Amazon RDS para MySQL están configuradas para utilizar el cifrado en tránsito. La regla es NON_COMPLIANT si el grupo de parámetros de base de datos asociado no está sincronizado o si el parámetro require_secure_transport no está establecido en 1.
1984	rds-postgres-instance-encrypted-en tránsito	Comprueba si las conexiones a instancias de bases de datos de Amazon RDS para PostgreSQL están configuradas para utilizar cifrado en tránsito. La regla es NON_COMPLIANT si el grupo de parámetros de base de datos asociado no está sincronizado o si el parámetro rds.force_ssl no está establecido en 1.

ID de control	AWS Regla de configuración	Directrices
1985	ebs-snapshot-public-restorable-comprobar	Comprueba si las instantáneas de Amazon Elastic Block Store (Amazon EBS) no se pueden restaurar públicamente. La regla es NON_COMPLIANT si una o más instantáneas con el RestorableByUserIds campo están configuradas como todas, es decir, las instantáneas de Amazon EBS son públicas.
1985	s3- bucket-mfa-delete-enabled	Comprueba si las instantáneas de Amazon Elastic Block Store (Amazon EBS) no se pueden restaurar públicamente. La regla es NON_COMPLIANT si una o más instantáneas con el RestorableByUserIds campo están configuradas como todas, es decir, las instantáneas de Amazon EBS son públicas.

ID de control	AWS Regla de configuración	Directrices
1985	s3- bucket-public-read-prohibited	Comprueba si sus buckets de Amazon S3 no permiten acceso de lectura público. La regla comprueba la configuración de Block Public Access, la política del bucket y la lista de control de acceso (ACL) del bucket. La regla se cumple cuando se dan las dos condiciones siguientes: • La configuración de Block Public Access restringe las políticas públicas o la política del bucket no permite el acceso de lectura público. • La configuración Bloquear el acceso público restringe el acceso público ACLs o la ACL del bucket no permite el acceso de lectura público. La regla no se cumple en los siguientes casos: • Si la configuración Bloquear el acceso público no restringe las políticas públicas, AWS Config evalúa si la política permite el acceso de lectura público. Si la política permite acceso

ID de control	AWS Regla de configuración	Directrices
		de lectura público, la regla no se cumple. • Si la configuración Bloquear el acceso público no restringe el depósito público ACLs, AWS Config evalúa si la ACL del depósito permite el acceso de lectura público. Si la ACL del bucket permite acceso de lectura público, la regla no se cumple.

ID de control	AWS Regla de configuración	Directrices
1985	s3- bucket-public-write-prohibited	Comprueba si sus buckets de Amazon S3 no permiten acceso de escritura público. La regla comprueba la configuración de Block Public Access, la política del bucket y la lista de control de acceso (ACL) del bucket. La regla se cumple cuando se dan las dos condiciones siguientes: • La configuración de Block Public Access restringe las políticas públicas o la política del bucket no permite el acceso de escritura público. • La configuración Bloquear el acceso público restringe el acceso público ACLs o la ACL del bucket no permite el acceso de escritura público. La regla no se cumple en los siguientes casos: • Si la configuración Bloquear el acceso público no restringe las políticas públicas, AWS Config evalúa si la política permite el acceso de escritura

ID de control	AWS Regla de configuración	Directrices
		público. Si la política permite el acceso de escritura público, la regla no se cumple. • Si la configuración Bloquear el acceso público no restringe el segmento público ACLs, AWS Config evalúa si la ACL del segmento permite el acceso de escritura público. Si la ACL del bucket permite el acceso de escritura público, la regla no se cumple.
1985	aurora-resources-in-logically-air-gapped-vault	Comprueba si los clústeres de bases de datos de Amazon Aurora están en un almacén aislado lógicamente. La regla es NON_COMPLIANT si hay un clúster de base de datos de Amazon Aurora que no está en un almacén aislado lógicamente dentro del período de tiempo especific ado.

ID de control	AWS Regla de configuración	Directrices
1985	ebs-resources-in-logically-air-gapped-vault	Comprueba si los volúmenes de Amazon Elastic Block Store (Amazon EBS) están dentro de un almacén aislado lógicamente. La regla es NON_COMPLIANT si hay un volumen de Amazon EBS que no está en un almacén aislado lógicamente dentro del período de tiempo especific ado.
1985	ec2- -gapped-vault resources-in-logically-air	Comprueba si las instancia s de Amazon Elastic Block Store (Amazon EBS) están dentro de un almacén aislado lógicamente. La regla es NON_COMPLIANT si hay una instancia de Amazon EBS que no está en un almacén aislado lógicamente dentro del período de tiempo especific ado.
1985	efs-resources-in-logically-air-gapped-vault	Comprueba si los sistemas de archivos de Amazon Elastic File System (Amazon EFS) están dentro de un almacén aislado lógicamente. La regla es NON_COMPLIANT si hay una sistema de archivos de Amazon EFS que no está en un almacén aislado lógicamen te dentro del período de tiempo especificado.

ID de control	AWS Regla de configuración	Directrices
1985	s3- resources-in-logically-air - bóveda con huecos	Comprueba si los buckets de Amazon Simple Storage Service (Amazon S3) están dentro de un almacén aislado lógicamente. La regla es NON_COMPLIANT si hay un bucket de Amazon S3 que no está en un almacén aislado lógicamente dentro del período de tiempo especific ado.

Plantilla

Esta plantilla está disponible en GitHub: Mejores prácticas operativas para el ACSC ISM, parte 2.

Prácticas operativas recomendadas para IA y ML

Este paquete de conformidad contiene AWS Config reglas basadas en IA y ML. Para ver una lista de todas las reglas administradas compatibles AWS Config, consulta la Lista de reglas AWS Config administradas.

Consulte la sección `Parameters` de la siguiente plantilla para ver los nombres y las descripciones de los parámetros obligatorios.

La plantilla está disponible en GitHub: Mejores prácticas operativas para IA y aprendizaje automático.

Prácticas operativas recomendadas para Amazon API Gateway

Este paquete de conformidad contiene AWS Config reglas basadas en el uso de Amazon API Gateway en su interior AWS. Para ver una lista de todas las reglas administradas compatibles AWS Config, consulte la Lista de reglas AWS Config administradas.

Consulte la sección `Parameters` de la siguiente plantilla para ver los nombres y las descripciones de los parámetros obligatorios.

La plantilla está disponible en GitHub: Operational Best Practices for Amazon API Gateway.

Mejores prácticas operativas para Amazon CloudWatch

Este paquete de conformidad contiene AWS Config reglas basadas en el uso de Amazon CloudWatch en AWSél. Para ver una lista de todas las reglas gestionadas compatibles AWS Config, consulta la Lista de reglas AWS Config gestionadas.

Consulte la sección `Parameters` de la siguiente plantilla para ver los nombres y las descripciones de los parámetros obligatorios.

La plantilla está disponible en GitHub: Operational Best Practices for Amazon CloudWatch.

Prácticas operativas recomendadas para Amazon DynamoDB

La plantilla está disponible en GitHub: Operational Best Practices for Amazon DynamoDB.

Prácticas operativas recomendadas para Amazon S3

La plantilla está disponible en GitHub: Operational Best Practices for Amazon S3.

Prácticas operativas recomendadas para APRA CPG 234

Los paquetes de conformidad proporcionan un marco de cumplimiento de uso general diseñado para permitirle crear controles de seguridad, operativos o de optimización de costes mediante reglas gestionadas o personalizadas y acciones correctivas. AWS Config AWS Config Los paquetes de conformidad, como plantillas de ejemplo, no están diseñados para garantizar plenamente el cumplimiento de una norma de gobernanza o de conformidad específicas. Usted debe evaluar si su uso de los servicios cumple con los requisitos legales y normativos aplicables.

A continuación, se proporciona un ejemplo de mapeo entre la CPG 234 de la Autoridad de Regulación Prudencial de Australia (APRA) y las reglas de AWS Config administradas. Cada regla de Config se aplica a un AWS recurso específico y se refiere a uno o más controles APRA CPG 234. Un control de APRA CPG 234 puede estar relacionado con varias reglas de Config. Consulte la siguiente tabla para obtener más detalles y orientación relacionados con estas asignaciones.

Este ejemplo de plantilla de paquete de conformidad contiene asignaciones a controles dentro del marco de APRA CPG 234 2019, creado por la Commonwealth de Australia y que está disponible en Prudential Practice Guide: CPG 234 Information Security. La licencia del marco en virtud de la Creative Commons Australia Attribution 3.0 Licence y la información sobre los derechos de autor del marco (incluida la exención de garantías) se pueden consultar en APRA | Copyright.

ID de control	AWS Regla de configuración	Directrices
36a	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.
36a	ec2- -check managedinstance-association-compliance-status	Use AWS Systems Manager Associations para ayudar con el inventario de las plataformas y aplicaciones de software dentro de una organización. AWS Systems Manager asigna un estado de configuración a las instancias administradas y le permite establecer líneas de referencia de los niveles de parches del sistema operativo, las instalaciones de software, las configuraciones de las aplicaciones y otros detalles sobre su entorno.

ID de control	AWS Regla de configuración	Directrices
36a	ec2- -comprobar managedinstance-patch-compliance-status	Habilite esta regla para ayudar a identificar y documentar las vulnerabilidades de Amazon Elastic Compute Cloud (Amazon EC2). La regla comprueba si los parches de instancias Amazon EC2 cumplen con los requisitos de las políticas y procedimientos de su organización en AWS Systems Manager.
36b	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.

ID de control	AWS Regla de configuración	Directrices
36b	ec2- -check managedinstance-association-compliance-status	Use AWS Systems Manager Associations para ayudar con el inventario de las plataform as y aplicaciones de software dentro de una organizac ión. AWS Systems Manager asigna un estado de configura ción a las instancias administr adas y le permite establece r líneas de referencia de los niveles de parches del sistema operativo, las instalaciones de software, las configuraciones de las aplicaciones y otros detalles sobre su entorno.
36b	ec2- -comprobar managedin stance-patch-compliance-sta tus	Habilite esta regla para ayudar a identificar y documenta r las vulnerabilidades de Amazon Elastic Compute Cloud (Amazon EC2). La regla comprueba si los parches de instancias Amazon EC2 cumplen con los requisitos de las políticas y procedimientos de su organización en AWS Systems Manager.

ID de control	AWS Regla de configuración	Directrices
36b	cloudtrail-security-trail-enabled	Esta regla ayuda a garantizar el uso de las mejores prácticas de seguridad AWS recomendadas AWS CloudTrail, ya que comprueba la habilitación de varias configuraciones. Estas incluyen el uso del cifrado de registros, la validación de registros y la habilitación AWS CloudTrail en varias regiones.

ID de control	AWS Regla de configuración	Directrices
36b	redshift-cluster-maintenancesettings-check	Esta regla garantiza que los clústeres de Amazon Redshift tengan la configuración preferida para su organización. En concreto, que tengan períodos de mantenimiento preferidos y períodos de retención automática de instantáneas para la base de datos. Esta regla requiere que configure el allowVersionUpgrade. El valor predeterminado es true. También te permite configurar de forma opcional el periodo preferredMaintenanceWindow (el predeterminado es sáb: 16:00 -sáb: 16:30) y el automatedSnapshotRetentionPeriodo (el valor predeterminado es 1). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
36b	elastic-beanstalk-managed-updates-activado	La activación de las actualizaciones de plataforma gestionadas para un entorno de Amazon Elastic Beanstalk garantiza que se instalen las últimas correcciones, actualizaciones y características de la plataforma disponibles para el entorno. Mantenerse actualizado mediante la instalación de parches es una práctica recomendada para proteger los sistemas.
36b	rds-automatic-minor-version-habilitado para la actualización	Habilite las actualizaciones automáticas de las versiones secundarias en sus instancias de Amazon Relational Database Service (RDS) para garantizar que estén instaladas las últimas actualizaciones de las versiones secundarias del sistema de administración de bases de datos relacionales (RDBMS, por sus siglas en inglés), que pueden incluir parches de seguridad y correcciones de errores.

ID de control	AWS Regla de configuración	Directrices
36c	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
36c	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
36c	iam-no-inline-policy-comprobar	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.

ID de control	AWS Regla de configuración	Directrices
36c	restricted-common-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Esta regla le permite configurar de forma opcional los parámetros blockedPo rt1 a blockedPort5 (valores predeterminados de Config: 20,21,3389,3306,4333). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
36c	vpc-sg-open-only-to-authorized-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Al restringir el acceso a los recursos dentro de un grupo de seguridad desde internet (0.0.0.0/0), se puede controlar el acceso remoto a los sistemas internos.
36c	restricted-ssh	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a administrar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS Al no permitir el tráfico de entrada (o el tráfico remoto) desde 0.0.0.0/0 al puerto 22 en sus recursos, podrá restringir el acceso remoto.

ID de control	AWS Regla de configuración	Directrices
36c	ec2- instance-profile-attached	Los perfiles de instancia s de EC2 pasan un rol de IAM a una instancia de EC2. Adjuntar un perfil de instancia a las instancias puede ayudar a gestionar los privilegios mínimos y los permisos.
36c	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegi os de los necesarios para completar una tarea puede infringir el principio de privilegi o mínimo y la separación de funciones.
36c	ecs-task-definition-user-for-host-mode-check	Si la definición de una tarea tiene privilegios elevados, se debe a que el cliente ha optado específicamente por esa configuración. Este control comprueba si hay una escalada inesperada de privilegios cuando una definición de tarea tiene habilitadas las redes de host, pero el cliente no ha elegido los privilegios elevados.

ID de control	AWS Regla de configuración	Directrices
36d	dms-replication-not-public	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancia s de replicación del DMS. Las instancias de replicaci ón de DMS pueden contener información confidencial y dichas cuentas requieren control de acceso.
36d	ebs-snapshot-public-restora ble-comprobar	Gestione el acceso a la AWS nube asegurándose de que las instantáneas de EBS no se puedan restaurar públicamente. Las instantán eas de volumen de EBS pueden contener información confidencial y dichas cuentas requieren control de acceso.
36d	ec2- instance-no-public-ip	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de Amazon Elastic Compute Cloud (Amazon EC2). Las instancias de Amazon EC2 pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
36d	elasticsearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch OpenSearch Service (Service) estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de OpenSearch servicio dentro de una Amazon VPC permite una comunicación segura entre el OpenSearch Servicio y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.
36d	emr-master-no-public-IP	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a los nodos maestros del clúster de Amazon EMR. Los nodos maestros del clúster de Amazon EMR pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
36d	ec2- instances-in-vpc	Implemente instancias de Amazon Elastic Compute Cloud (Amazon EC2) dentro de una Amazon Virtual Private Cloud (Amazon VPC) para permitir una comunicación segura entre una instancia y otros servicios dentro de la Amazon VPC, sin necesidad de utilizar una puerta de enlace de internet, un dispositivo NAT ni una conexión de VPN. Todo el tráfico permanece seguro dentro de la AWS nube. Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Asigne instancias de Amazon EC2 a una Amazon VPC para gestionar correctamente el acceso.

ID de control	AWS Regla de configuración	Directrices
36d	internet-gateway-authorized-vpc-solo	Gestione el acceso a los recursos de la AWS nube asegurándose de que las puertas de enlace de Internet solo estén conectadas a Amazon Virtual Private Cloud (Amazon VPC) autorizada. Las puertas de enlace de Internet permiten el acceso bidireccional a internet desde y hacia la Amazon VPC, lo que puede provocar un acceso no autorizado a los recursos de Amazon VPC.
36d	lambda-function-public-access-prohibido	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a las funciones de AWS Lambda. El acceso público puede degradar la disponibilidad de los recursos.

ID de control	AWS Regla de configuración	Directrices
36d	lambda-inside-vpc	Implemente funciones de AWS Lambda en una Amazon Virtual Private Cloud (Amazon VPC) para una comunicación segura entre una función y otros servicios de la Amazon VPC. Con esta configuración, no se requiere ninguna puerta de enlace de internet, dispositi vo NAT ni conexión de VPN. Todo el tráfico permanece de forma segura dentro de la nube. AWS Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Para gestionar correctam ente el acceso, las funciones de AWS Lambda deben asignarse a una VPC.

ID de control	AWS Regla de configuración	Directrices
36d	rds-instance-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.
36d	rds-snapshots-public-prohibited	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
36d	redshift-cluster-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que los clústeres de Amazon Redshift no sean públicos. Los clústeres de Amazon Redshift pueden contener informaci ón confidencial y principio s. Además dichas cuentas requieren control de acceso.
36d	s3- bucket-public-read-prohibit ed	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositi vos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.
36d	s3- bucket-public-write-prohibi ted	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositi vos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.

ID de control	AWS Regla de configuración	Directrices
36d	sagemaker-notebook-no-direct-acceso a internet	Gestione el acceso a los recursos en la AWS nube asegurándose de que las SageMaker libretas de Amazon no permitan el acceso directo a Internet. Al impedir el acceso directo a internet, puede evitar que usuarios no autorizados accedan a los datos confidenciales.
36d	access-keys-rotated	Se auditan las credenciales de los dispositivos, usuarios y procesos autorizados para garantizar que las claves de acceso de IAM se roten según la política de la organización. Cambiar las claves de acceso de forma habitual es una práctica recomendada de seguridad. Al hacerlo, se reduce el período de tiempo en el que una clave de acceso está activa y el impacto sobre la empresa si las claves se ven comprometidas. Esta regla requiere un valor de rotación de clave de acceso (valor predeterminado de Config: 90). El valor real debe reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
36d	emr-kerberos-enabled	Los permisos y autorizac iones de acceso se pueden administrar e incorporar con los principios de privilegi o mínimo y separación de funciones al habilitar Kerberos para los clústeres de Amazon EMR. En Kerberos, los servicios y los usuarios que deben autenticarse se denominan entidades principal es. Las entidades principal es existen dentro de un ámbito de Kerberos. Dentro de ese ámbito, un servidor de Kerberos se conoce como el centro de distribuc ión de claves (KDC). Este proporciona un medio para que las entidades principal es se autentiquen. El KDC se autentica emitiendo tickets de autenticación. El KDC mantiene una base de datos de las entidades principal es dentro de su ámbito, sus contraseñas y otros datos administrativos sobre cada una de las entidades principal es.

ID de control	AWS Regla de configuración	Directrices
36d	iam-password-policy	Las identidades y las credenciales se emiten, administran y verifican en función de la política de contraseñas de IAM de la organización. Cumplen o superan los requisitos establecidos por la norma NIST SP 800-63 y el estándar AWS fundamental de mejores prácticas de seguridad para la seguridad de las contraseñas. Esta regla le permite configura r opcionalmente RequireUp percaseCharacters (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireLo wercaseCharacters (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireSy mbols (valor de las mejores prácticas de seguridad AWS fundamentales: verdadero), RequireNumbers (valor de las mejores prácticas de seguridad AWS AWS fundamentales: verdadero), MinimumPasswordLen gth (valor de las mejores prácticas de seguridad AWS fundamentales: 14), PasswordReusePrevention

ID de control	AWS Regla de configuración	Directrices
		(valor de las mejores prácticas de seguridad AWS fundamentales: 24) y MaxPasswordAge (valor de las mejores prácticas de seguridad fundamentales: 90) para su IAM La política de contraseñas. Los valores reales deben reflejar las políticas de su organización.
36d	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
36d	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.
36d	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
36d	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.
36d	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.

ID de control	AWS Regla de configuración	Directrices
36d	iam-user-unused-credentials-comprobar	AWS Identity and Access Management (IAM) puede ayudarlo con los permisos y autorizaciones de acceso comprobando las contraseñ as y claves de acceso de IAM que no se utilicen durante un período de tiempo específic o. Si se identifican estas credenciales no utilizadas, debe deshabilitar la opción de and/or eliminar las credencia les, ya que esto podría infringir el principio del privilegio mínimo. Esta regla requiere que establezcas un valor en la maxCredentialUsage Edad (Config Default: 90). El valor real debe reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
36d	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protecció n a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidente s de cuentas compromet idas y evitar que usuarios no autorizados accedan a los datos confidenciales.
36d	root-account-hardware-mfa-h abilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegi os. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
36d	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
36d	ec2-imdsv2-check	Asegúrese de que el método Servicio de metadatos de instancias versión 2 (IMDSv2) esté habilitado para ayudar a proteger el acceso y el control de los metadatos de instancia de Amazon Elastic Compute Cloud (Amazon EC2). El IMDSv2 método utiliza controles basados en sesiones. Con IMDSv2, se pueden implementar controles para restringir los cambios en los metadatos de la instancia.

ID de control	AWS Regla de configuración	Directrices
36d	iam-no-inline-policy-comprobar	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.

ID de control	AWS Regla de configuración	Directrices
36d	iam-customer-policy-blocked-kms-acciones	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, lo que impide que las políticas contengan acciones bloqueadas en todas AWS las claves del Servicio de Administración de Claves. Tener más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones . Esta regla le permite establecer el blockedAc tionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencrip tar, kms:ReEncryptFrom). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
36d	iam-inline-policy-blocked-kms-acciones	Asegúrese de que un usuario, rol de IAM o grupo de IAM (AWS Identity and Access Management) no tenga una política integrada que permita bloquear acciones en todas las claves del Servicio de administración de claves. AWS AWS recomienda utilizar políticas gestionad as en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administr ación de permisos. Esta regla le permite establece r el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar, kms:ReEnc ryptFrom). Los valores reales deben reflejar las políticas de su organización.
36d	ec2- instance-profile-attached	Los perfiles de instancia s de EC2 pasan un rol de IAM a una instancia de EC2. Adjuntar un perfil de instancia a las instancias puede ayudar a gestionar los privilegios mínimos y los permisos.

ID de control	AWS Regla de configuración	Directrices
36d	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
36d	ecs-task-definition-user-for-host-mode-check	Si la definición de una tarea tiene privilegios elevados, se debe a que el cliente ha optado específicamente por esa configuración. Este control comprueba si hay una escalada inesperada de privilegios cuando una definición de tarea tiene habilitadas las redes de host, pero el cliente no ha elegido los privilegios elevados.
36d	no-unrestricted-route-to-igw	Asegúrese de que las tablas de enrutamiento de Amazon EC2 no tengan rutas ilimitadas a una puerta de enlace de internet. Eliminar o limitar el acceso a Internet para las cargas de trabajo en Amazon VPCs puede reducir el acceso no deseado dentro de su entorno.

ID de control	AWS Regla de configuración	Directrices
36d	s3-: prohibido bucket-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público en el nivel del bucket.
36d	subnet-auto-assign-public-ip deshabilitada	Gestione el acceso a la AWS nube asegurándose de que a las subredes de Amazon Virtual Private Cloud (VPC) no se les asigne automátic amente una dirección IP pública. Las instancias de Amazon Elastic Compute Cloud (EC2) que se lanzan en subredes que tienen este atributo habilitado tienen una dirección IP pública asignada a su interfaz de red principal.

ID de control	AWS Regla de configuración	Directrices
36d	autoscaling-launch-config-public-ip deshabilitada	Si configura las interfaces de red con una dirección IP pública, se puede acceder a los recursos asociados a esas interfaces de red desde Internet. Los recursos de EC2 no deben ser de acceso público, ya que esto podría permitir el acceso no deseado a sus aplicaciones o servidores.
36d	redshift-enhanced-vpc-routing-habilitado	El enrutamiento de VPC mejorado fuerza que todo el tráfico de COPY y UNLOAD entre los repositorios de datos y de clúster pase por su Amazon VPC. A continuación, puede utilizar las características de la VPC, como los grupos de seguridad y las listas de control de acceso a la red, para proteger el tráfico de la red. También puede usar los registros de flujo de la VPC para monitorear el tráfico de la red.

ID de control	AWS Regla de configuración	Directrices
36d	s3- -bloques-periódicos account-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configura r opcionalmente los restrictP ublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPubl icPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.
36d	ssm-document-not-public	Asegúrese de que los documentos de AWS Systems Manager (SSM) no sean públicos, ya que esto podría permitir el acceso no deseado a los documentos de SSM. Un documento de SSM público puede exponer información sobre su cuenta, sus recursos y sus procesos internos.

ID de control	AWS Regla de configuración	Directrices
36d	opensearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch Service estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de Amazon OpenSearch Service dentro de una Amazon VPC permite una comunicación segura entre Amazon OpenSearch Service y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.
36e	secretsmanager-rotation-enabled-check	Esta regla garantiza que AWS los secretos de Secrets Manager tengan habilitada la rotación. La rotación de los secretos de forma habitual puede acortar el período de vigencia de un secreto y, potencialmente, reducir el impacto sobre la empresa si el secreto se desvela.

ID de control	AWS Regla de configuración	Directrices
36e	secretsmanager-scheduled-rotation-success-comprobar	Esta regla garantiza que AWS los secretos de Secrets Manager se hayan distribuido correctamente de acuerdo con el programa de rotación. La rotación de los secretos de forma habitual puede acortar el período de vigencia de un secreto y, potencialmente, reducir el impacto sobre la empresa si se desvela.
36e	dms-replication-not-public	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de replicación del DMS. Las instancias de replicación de DMS pueden contener información confidencial y dichas cuentas requieren control de acceso.
36e	ebs-snapshot-public-restorable-comprobar	Gestione el acceso a la AWS nube asegurándose de que las instantáneas de EBS no se puedan restaurar públicamente. Las instantáneas de volumen de EBS pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
36e	ec2- instance-no-public-ip	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de Amazon Elastic Compute Cloud (Amazon EC2). Las instancias de Amazon EC2 pueden contener información confidencial y dichas cuentas requieren control de acceso.
36e	elasticsearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch OpenSearc h Service (Service) estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de OpenSearc h servicio dentro de una Amazon VPC permite una comunicación segura entre el OpenSearch Servicio y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.

ID de control	AWS Regla de configuración	Directrices
36e	emr-master-no-public-IP	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a los nodos maestros del clúster de Amazon EMR. Los nodos maestros del clúster de Amazon EMR pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
36e	ec2- instances-in-vpc	Implemente instancias de Amazon Elastic Compute Cloud (Amazon EC2) dentro de una Amazon Virtual Private Cloud (Amazon VPC) para permitir una comunicación segura entre una instancia y otros servicios dentro de la Amazon VPC, sin necesidad de utilizar una puerta de enlace de internet, un dispositivo NAT ni una conexión de VPN. Todo el tráfico permanece seguro dentro de la AWS nube. Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Asigne instancias de Amazon EC2 a una Amazon VPC para gestionar correctamente el acceso.

ID de control	AWS Regla de configuración	Directrices
36e	internet-gateway-authorized-vpc-solo	Gestione el acceso a los recursos de la AWS nube asegurándose de que las puertas de enlace de Internet solo estén conectadas a Amazon Virtual Private Cloud (Amazon VPC) autorizada. Las puertas de enlace de Internet permiten el acceso bidireccional a internet desde y hacia la Amazon VPC, lo que puede provocar un acceso no autorizado a los recursos de Amazon VPC.
36e	lambda-function-public-access-prohibido	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a las funciones de AWS Lambda. El acceso público puede degradar la disponibilidad de los recursos.

ID de control	AWS Regla de configuración	Directrices
36e	lambda-inside-vpc	Implemente funciones de AWS Lambda en una Amazon Virtual Private Cloud (Amazon VPC) para una comunicación segura entre una función y otros servicios de la Amazon VPC. Con esta configuración, no se requiere ninguna puerta de enlace de internet, dispositi vo NAT ni conexión de VPN. Todo el tráfico permanece de forma segura dentro de la nube. AWS Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Para gestionar correctam ente el acceso, las funciones de AWS Lambda deben asignarse a una VPC.

ID de control	AWS Regla de configuración	Directrices
36e	rds-instance-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.
36e	rds-snapshots-public-prohibited	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
36e	redshift-cluster-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que los clústeres de Amazon Redshift no sean públicos. Los clústeres de Amazon Redshift pueden contener informaci ón confidencial y principio s. Además dichas cuentas requieren control de acceso.
36e	s3- bucket-public-read-prohibit ed	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositi vos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.
36e	s3- bucket-public-write-prohibi ted	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositi vos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.

ID de control	AWS Regla de configuración	Directrices
36e	sagemaker-notebook-no-direct-acceso a internet	Gestione el acceso a los recursos en la AWS nube asegurándose de que las SageMaker libretas de Amazon no permitan el acceso directo a Internet. Al impedir el acceso directo a internet, puede evitar que usuarios no autorizados accedan a los datos confidenciales.
36e	ec2- instance-profile-attached	Los perfiles de instancias de EC2 pasan un rol de IAM a una instancia de EC2. Adjuntar un perfil de instancia a las instancias puede ayudar a gestionar los privilegios mínimos y los permisos.
36e	no-unrestricted-route-to-igw	Asegúrese de que las tablas de enrutamiento de Amazon EC2 no tengan rutas ilimitadas a una puerta de enlace de internet. Eliminar o limitar el acceso a Internet para las cargas de trabajo en Amazon VPCs puede reducir el acceso no deseado dentro de su entorno.

ID de control	AWS Regla de configuración	Directrices
36e	s3-: prohibido bucket-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público en el nivel del bucket.
36e	subnet-auto-assign-public-ip deshabilitada	Gestione el acceso a la AWS nube asegurándose de que a las subredes de Amazon Virtual Private Cloud (VPC) no se les asigne automátic amente una dirección IP pública. Las instancias de Amazon Elastic Compute Cloud (EC2) que se lanzan en subredes que tienen este atributo habilitado tienen una dirección IP pública asignada a su interfaz de red principal.

ID de control	AWS Regla de configuración	Directrices
36e	autoscaling-launch-config-public-ip deshabilitada	Si configura las interfaces de red con una dirección IP pública, se puede acceder a los recursos asociados a esas interfaces de red desde Internet. Los recursos de EC2 no deben ser de acceso público, ya que esto podría permitir el acceso no deseado a sus aplicaciones o servidores.
36e	redshift-enhanced-vpc-routing-habilitado	El enrutamiento de VPC mejorado fuerza que todo el tráfico de COPY y UNLOAD entre los repositorios de datos y de clúster pase por su Amazon VPC. A continuación, puede utilizar las características de la VPC, como los grupos de seguridad y las listas de control de acceso a la red, para proteger el tráfico de la red. También puede usar los registros de flujo de la VPC para monitorear el tráfico de la red.

ID de control	AWS Regla de configuración	Directrices
36e	api-gw-associated-with-guerra	AWS El WAF le permite configurar un conjunto de reglas (denominadas listas de control de acceso web (ACL web)) que permiten, bloquean o cuentan las solicitudes web en función de las reglas y condiciones de seguridad web personalizables que usted defina. Asegúrese de que su etapa de Amazon API Gateway esté asociada a una ACL web de WAF para protegerla de ataques maliciosos.

ID de control	AWS Regla de configuración	Directrices
36e	s3- -bloques periódicos account-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configura r opcionalmente los restrictP ublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPubl icPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.
36e	ssm-document-not-public	Asegúrese de que los documentos de AWS Systems Manager (SSM) no sean públicos, ya que esto podría permitir el acceso no deseado a los documentos de SSM. Un documento de SSM público puede exponer información sobre su cuenta, sus recursos y sus procesos internos.

ID de control	AWS Regla de configuración	Directrices
36e	opensearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch Service estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de Amazon OpenSearch Service dentro de una Amazon VPC permite una comunicación segura entre Amazon OpenSearch Service y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.
36f	dms-replication-not-public	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancia s de replicación del DMS. Las instancias de replicaci ón de DMS pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
36f	ebs-snapshot-public-restorable-comprobar	Gestione el acceso a la AWS nube asegurándose de que las instantáneas de EBS no se puedan restaurar públicamente. Las instantáneas de volumen de EBS pueden contener información confidencial y dichas cuentas requieren control de acceso.
36f	ec2- instance-no-public-ip	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de Amazon Elastic Compute Cloud (Amazon EC2). Las instancias de Amazon EC2 pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
36f	elasticsearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch OpenSearch Service (Service) estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de OpenSearch servicio dentro de una Amazon VPC permite una comunicación segura entre el OpenSearch Servicio y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.
36f	emr-master-no-public-IP	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a los nodos maestros del clúster de Amazon EMR. Los nodos maestros del clúster de Amazon EMR pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
36f	ec2- instances-in-vpc	Implemente instancias de Amazon Elastic Compute Cloud (Amazon EC2) dentro de una Amazon Virtual Private Cloud (Amazon VPC) para permitir una comunicación segura entre una instancia y otros servicios dentro de la Amazon VPC, sin necesidad de utilizar una puerta de enlace de internet, un dispositivo NAT ni una conexión de VPN. Todo el tráfico permanece seguro dentro de la AWS nube. Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Asigne instancias de Amazon EC2 a una Amazon VPC para gestionar correctamente el acceso.

ID de control	AWS Regla de configuración	Directrices
36f	internet-gateway-authorized-vpc-solo	Gestione el acceso a los recursos de la AWS nube asegurándose de que las puertas de enlace de Internet solo estén conectadas a Amazon Virtual Private Cloud (Amazon VPC) autorizada. Las puertas de enlace de Internet permiten el acceso bidireccional a internet desde y hacia la Amazon VPC, lo que puede provocar un acceso no autorizado a los recursos de Amazon VPC.
36f	lambda-function-public-access-prohibido	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a las funciones de AWS Lambda. El acceso público puede degradar la disponibilidad de los recursos.

ID de control	AWS Regla de configuración	Directrices
36f	lambda-inside-vpc	Implemente funciones de AWS Lambda en una Amazon Virtual Private Cloud (Amazon VPC) para una comunicación segura entre una función y otros servicios de la Amazon VPC. Con esta configuración, no se requiere ninguna puerta de enlace de internet, dispositi vo NAT ni conexión de VPN. Todo el tráfico permanece de forma segura dentro de la nube. AWS Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Para gestionar correctam ente el acceso, las funciones de AWS Lambda deben asignarse a una VPC.

ID de control	AWS Regla de configuración	Directrices
36f	rds-instance-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.
36f	rds-snapshots-public-prohibited	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
36f	redshift-cluster-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que los clústeres de Amazon Redshift no sean públicos. Los clústeres de Amazon Redshift pueden contener informaci ón confidencial y principio s. Además dichas cuentas requieren control de acceso.
36f	s3- bucket-public-read-prohibit ed	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositi vos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.
36f	s3- bucket-public-write-prohibi ted	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositi vos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.

ID de control	AWS Regla de configuración	Directrices
36f	sagemaker-notebook-no-direct-acceso a internet	Gestione el acceso a los recursos en la AWS nube asegurándose de que las SageMaker libretas de Amazon no permitan el acceso directo a Internet. Al impedir el acceso directo a internet, puede evitar que usuarios no autorizados accedan a los datos confidenciales.
36f	restricted-ssh	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a administrar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS Al no permitir el tráfico de entrada (o el tráfico remoto) desde 0.0.0.0/0 al puerto 22 en sus recursos, podrá restringir el acceso remoto.

ID de control	AWS Regla de configuración	Directrices
36f	restricted-common-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Esta regla le permite configurar de forma opcional los parámetros blockedPo rt1 a blockedPort5 (valores predeterminados de Config: 20,21,3389,3306,4333). Los valores reales deben reflejar las políticas de su organizac ión.
36f	vpc-default-security-group-cerrado	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a gestionar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS Restringi r todo el tráfico en el grupo de seguridad predeterminado ayuda a restringir el acceso remoto a los recursos. AWS

ID de control	AWS Regla de configuración	Directrices
36f	vpc-sg-open-only-to-authorized-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Al restringir el acceso a los recursos dentro de un grupo de seguridad desde internet (0.0.0.0/0), se puede controlar el acceso remoto a los sistemas internos.
36f	alb-waf-enabled	Asegúrese de que el AWS WAF esté habilitado en Elastic Load Balancers (ELB) para ayudar a proteger las aplicaciones web. Un WAF ayuda a proteger sus aplicaciones web o APIs contra los ataques web más comunes. Estas vulnerabilidades de la web pueden afectar a la disponibilidad, comprometer la seguridad o consumir recursos excesivos en su entorno.

ID de control	AWS Regla de configuración	Directrices
36f	no-unrestricted-route-to-igw	Asegúrese de que las tablas de enrutamiento de Amazon EC2 no tengan rutas ilimitada s a una puerta de enlace de internet. Eliminar o limitar el acceso a Internet para las cargas de trabajo en Amazon VPCs puede reducir el acceso no deseado dentro de su entorno.
36f	s3-: prohibido bucket-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público en el nivel del bucket.

ID de control	AWS Regla de configuración	Directrices
36f	subnet-auto-assign-public-ip deshabilitada	Gestione el acceso a la AWS nube asegurándose de que a las subredes de Amazon Virtual Private Cloud (VPC) no se les asigne automátic amente una dirección IP pública. Las instancias de Amazon Elastic Compute Cloud (EC2) que se lanzan en subredes que tienen este atributo habilitado tienen una dirección IP pública asignada a su interfaz de red principal.
36f	autoscaling-launch-config-p ublic-ip deshabilitada	Si configura las interfaces de red con una dirección IP pública, se puede acceder a los recursos asociados a esas interfaces de red desde Internet. Los recursos de EC2 no deben ser de acceso público, ya que esto podría permitir el acceso no deseado a sus aplicaciones o servidore s.

ID de control	AWS Regla de configuración	Directrices
36f	redshift-enhanced-vpc-routing-habilitado	El enrutamiento de VPC mejorado fuerza que todo el tráfico de COPY y UNLOAD entre los repositorios de datos y de clúster pase por su Amazon VPC. ID de control	AWS Regla de configuración	Directrices
36h	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.
36h	ec2- -check managedinstance-association-compliance-status	Use AWS Systems Manager Associations para ayudar con el inventario de las plataformas y aplicaciones de software dentro de una organización. AWS Systems Manager asigna un estado de configuración a las instancias administradas y le permite establecer líneas de referencia de los niveles de parches del sistema operativo, las instalaciones de software, las configuraciones de las aplicaciones y otros detalles sobre su entorno.

ID de control	AWS Regla de configuración	Directrices
36h	ec2- -comprobar managedinstance-patch-compliance-status	Habilite esta regla para ayudar a identificar y documentar las vulnerabilidades de Amazon Elastic Compute Cloud (Amazon EC2). La regla comprueba si los parches de instancias Amazon EC2 cumplen con los requisitos de las políticas y procedimientos de su organización en AWS Systems Manager.

ID de control	AWS Regla de configuración	Directrices
36h	redshift-cluster-maintenancesettings-check	Esta regla garantiza que los clústeres de Amazon Redshift tengan la configuración preferida para su organización. En concreto, que tengan períodos de mantenimiento preferidos y períodos de retención automática de instantáneas para la base de datos. Esta regla requiere que configure el allowVersionUpgrade. El valor predeterminado es true. También te permite configurar de forma opcional el periodo preferredMaintenanceWindow (el predeterminado es sáb: 16:00 -sáb: 16:30) y el automatedSnapshotRetentionPeriodo (el valor predeterminado es 1). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
36h	elastic-beanstalk-managed-updates-activado	La activación de las actualizaciones de plataforma gestionadas para un entorno de Amazon Elastic Beanstalk garantiza que se instalen las últimas correcciones, actualizaciones y características de la plataforma disponibles para el entorno. Mantenerse actualizado mediante la instalación de parches es una práctica recomendada para proteger los sistemas.
36i	autoscaling-group-elb-healthcheck-obligatorio	Las revisiones de estado de Elastic Load Balancer (ELB) para los grupos de escalado automático de Amazon Elastic Compute Cloud (Amazon EC2) permiten mantener la capacidad y disponibilidad adecuadas. De forma periódica, el equilibrador de carga envía pings, intenta establecer conexiones o envía solicitudes para probar el estado de las instancias de Amazon EC2 en un grupo de escalado automático. Si una instancia no informa, el tráfico se envía a una nueva instancia de Amazon EC2.

ID de control	AWS Regla de configuración	Directrices
36i	cloudwatch-alarm-action-check	CloudWatch Las alarmas de Amazon alertan cuando una métrica supera el umbral durante un número específico de períodos de evaluación. La alarma realiza una o varias acciones según el valor de la métrica o expresión con respecto a un umbral durante varios períodos de tiempo. Esta regla requiere un valor para alarmActionRequired (Config Default: True), insufficientDataAction Obligatorio (Config Default: True) o okActionRequired (Config Default: False). El valor real debe reflejar las acciones de alarma de su entorno.

ID de control	AWS Regla de configuración	Directrices
36i	dynamodb-throughput-limit-check	Active esta regla para asegurarse de que la capacidad de rendimiento aprovisionada se compruebe en las tablas de Amazon DynamoDB. Esta es la cantidad de read/write actividad que puede soportar cada tabla. DynamoDB utiliza esta información para reservar recursos del sistema suficientes para satisfacer sus necesidades de rendimiento. Esta regla genera una alerta cuando el rendimiento se acerca al límite máximo de la cuenta de un cliente. Esta regla le permite configurar opcionalmente los parámetros de RCUThreshold porcentaje de cuenta (Config Default: 80) y WCUThreshold Percentag e de cuenta (Config Default: 80). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
36i	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante el uso de fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.
36i	lambda-concurrency-check	Esta regla garantiza que se establezcan los límites máximos y mínimos de simultaneidad de una función Lambda. Esto puede ayudar a la hora de establecer el número de solicitudes de referencia que la función atiende en un momento dado.
36i	lambda-dlq-check	Active esta regla para ayudar a notificar al personal correspondiente mediante Amazon Simple Queue Service (Amazon SQS) o Amazon Simple Notification Service (Amazon SNS) cuando una función falle.

ID de control	AWS Regla de configuración	Directrices
36i	rds-enhanced-monitoring-enabled	Habilite Amazon Relational Database Service (Amazon RDS) para monitorear la disponibilidad de Amazon RDS. Esto proporciona información detallada del estado de las instancias de bases de datos de Amazon RDS. Cuando el almacenamiento de Amazon RDS utiliza más de un dispositivo físico subyacente, el monitoreo mejorado recopila los datos de cada dispositivo. Además, cuando la instancia de base de datos de Amazon RDS se ejecuta en una implementación Multi-AZ, se recopilan los datos de cada dispositivo del host secundario y las métricas del host secundario.

ID de control	AWS Regla de configuración	Directrices
36i	opensearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta . OpenSearch Los registros de errores del servicio pueden ayudar con las auditorías de seguridad y acceso, y pueden ayudar a diagnosticar problemas de disponibilidad.
36i	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. Esto proporciona información detallada del estado de las instancias de bases de datos de Amazon RDS. Cuando el almacenam iento de Amazon RDS utiliza más de un dispositivo físico subyacente, el monitoreo mejorado recopila los datos de cada dispositivo. Además, cuando la instancia de base de datos de Amazon RDS se ejecuta en una implement ación Multi-AZ, se recopilan los datos de cada dispositi vo del host secundario y las métricas del host secundario.

ID de control	AWS Regla de configuración	Directrices
36j	beanstalk-enhanced-health-reporting-activado	AWS Los informes de estado mejorados de Elastic Beanstalk permiten una respuesta más rápida a los cambios en el estado de la infraestructura subyacente. Estos cambios podrían provocar una falta de disponibilidad de la aplicación. Los informes de estado mejorados de Elastic Beanstalk proporcionan un descriptor de estado para evaluar la gravedad de los problemas detectados e identificar las posibles causas que se deben investigar.
36j	elasticsearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta. Los registros de errores de los dominios pueden ayudar en las auditorías de seguridad y acceso, además de para diagnosticar problemas de disponibilidad.

ID de control	AWS Regla de configuración	Directrices
36l	db-instance-backup-enabled	La característica de copia de seguridad de Amazon RDS crea copias de seguridad de sus bases de datos y registros de transacciones. Amazon RDS crea automátic amente una instantánea de volumen de almacenam iento de la instancia de base de datos y realiza una copia de seguridad de toda la instancia. El sistema le permite establecer períodos de retención específicos para cumplir con sus requisitos de resiliencia.
36l	dynamodb-autoscaling-enable d	El escalado automático de Amazon DynamoDB AWS usa el servicio Application Auto Scaling para ajustar la capacidad de rendimien to aprovisionada para que responda automáticamente a los patrones de tráfico reales. Esto permite que una tabla o un índice secundario global aumente su read/writ e capacidad aprovisionada para gestionar los aumentos repentinos de tráfico, sin limitaciones.

ID de control	AWS Regla de configuración	Directrices
36l	dynamodb-pitr-enabled	Active esta regla para comprobar que se haya realizado una copia de seguridad de la información. También mantiene las copias de seguridad al garantizar que la point-in-time recuperación esté habilitada en Amazon DynamoDB. La recuperación mantiene copias de seguridad continuas de la tabla durante los últimos 35 días.
36l	elasticache-redis-cluster-automatic-verificación de copias de seguridad	Cuando las copias de seguridad automáticas están habilitadas, Amazon ElastiCache crea una copia de seguridad del clúster a diario. La copia de seguridad se puede conservar durante el número de días que especifique su organización. Las copias de seguridad automáticas pueden ayudarle a protegerse frente a la pérdida de datos. En caso de error, puede crear un nuevo clúster y restaurar los datos de la copia de seguridad más reciente.

ID de control	AWS Regla de configuración	Directrices
36l	elb-deletion-protection-enabled	Esta regla garantiza que Elastic Load Balancing tenga habilitada la protección contra borrado. Utilice esta característica para evitar que el equilibrador de carga se elimine de forma accidental o malintencionada, lo que puede provocar la pérdida de disponibilidad de sus aplicaciones.

ID de control	AWS Regla de configuración	Directrices
36l	rds-multi-az-support	La compatibilidad con las zonas de disponibilidad múltiples (Multi-AZ) de Amazon Relational Database Service (Amazon RDS) permite mejorar la disponibilidad y durabilidad de las instancias de bases de datos. Cuando aprovisiona una instancia de base de datos Multi-AZ, Amazon RDS crea automáticamente una instancia de base de datos principal y replica sincrónicamente los datos en una instancia en espera en una zona de disponibilidad diferente. Cada zona de disponibilidad se ejecuta en su propia infraestructura independiente y físicamente distinta, y está diseñada para ser altamente fiable. En caso de que se produzca un fallo en la infraestructura, Amazon RDS realiza una conmutación por error automática a la estación en espera para que pueda reanudar las operaciones de la base de datos en cuanto se complete la conmutación por error.

ID de control	AWS Regla de configuración	Directrices
36l	rds-cluster-multi-az-habilitado	La compatibilidad con las zonas de disponibilidad múltiples (Multi-AZ) de Amazon Relational Database Service (Amazon RDS) permite mejorar la disponibilidad y durabilidad de las instancias de bases de datos. Cuando aprovisiona una instancia de base de datos Multi-AZ, Amazon RDS crea automáticamente una instancia de base de datos principal y replica sincrónicamente los datos en una instancia en espera en una zona de disponibilidad diferente. Cada zona de disponibilidad se ejecuta en su propia infraestructura independiente y físicamente distinta, y está diseñada para ser altamente fiable. En caso de que se produzca un fallo en la infraestructura, Amazon RDS realiza una conmutación por error automática a la estación en espera para que pueda reanudar las operaciones de la base de datos en cuanto se complete la conmutación por error.

ID de control	AWS Regla de configuración	Directrices
36l	s3- bucket-replication-enabled	Con la replicación entre regiones (CRR) de Amazon Simple Storage Service (Amazon S3) se puede mantener la capacidad y la disponibilidad adecuadas. La CRR permite copiar objetos entre buckets de Amazon S3 de forma automática y asincrónica para garantizar la disponibilidad de los datos.
36l	vpc-vpn-2-tunnels-up	Se pueden implementar túneles Site-to-Site VPN redundantes para cumplir con los requisitos de resilienc ia. Utiliza dos túneles para garantizar la conectividad en caso de que una de las conexiones Site-to-Site VPN no esté disponible. Para protegerse contra la pérdida de conectividad, en caso de que su pasarela de cliente deje de estar disponible, puede configurar una segunda conexión de Site-to-Site VPN a su Amazon Virtual Private Cloud (Amazon VPC) y a su puerta de enlace privada virtual mediante una segunda pasarela de cliente.

ID de control	AWS Regla de configuración	Directrices
36l	dynamodb-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que las tablas de Amazon DynamoDB formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administr ado con una solución de respaldo basada en políticas . Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.
36l	ebs-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que sus volúmenes de Amazon Elastic Block Store (Amazon EBS) formen parte de un plan de backup. AWS AWS Backup es un servicio de respaldo totalmente administr ado con una solución de respaldo basada en políticas . Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
36l	efs-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que sus sistemas de archivos Amazon Elastic File System (Amazon EFS) formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.
36l	elb-cross-zone-load-habilitado para el equilibrio	Habilite el equilibrio de carga entre zonas para sus Elastic Load Balancers (ELBs) para ayudar a mantener la capacidad y la disponibilidad adecuadas. El equilibrio de carga entre zonas reduce la necesidad de mantener automáticamente cantidades equivalentes de instancias en cada zona de disponibilidad habilitada. También mejora la capacidad de la aplicación para gestionar la pérdida de una o más instancias.

ID de control	AWS Regla de configuración	Directrices
36l	rds-instance-deletion-protection-habilitado	Asegúrese de que las instancias de Amazon Relational Database Service (Amazon RDS) tengan habilitada la protección contra borrado. Utilice la protección contra borrado para evitar que las instancias de Amazon RDS se eliminen de forma accidental o malintencionada, lo que puede provocar la pérdida de disponibilidad de sus aplicaciones.
36l	rds-in-backup-plan	Para facilitar los procesos de backup de datos, asegúrese de que sus instancias de Amazon Relational Database Service (Amazon RDS) formen parte de un AWS plan de backup. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	AWS Regla de configuración	Directrices
36l	redshift-backup-enabled	Para facilitar los procesos de copia de seguridad de datos, asegúrese de que sus clústeres de Amazon Redshift tengan instantáneas automatizadas. Cuando las instantáneas automatizadas están habilitadas para un clúster, Redshift realiza instantáneas de ese clúster periódicamente. De manera predeterminada, Redshift realiza una instantánea cada ocho horas o después de cada cambio de datos de 5 GB por nodo, lo que ocurra primero.
36l	beanstalk-enhanced-health-reporting-habilitado	AWS Los informes de estado mejorados de Elastic Beanstalk permiten una respuesta más rápida a los cambios en el estado de la infraestructura subyacente. Estos cambios podrían provocar una falta de disponibilidad de la aplicación. Los informes de estado mejorados de Elastic Beanstalk proporcionan un descriptor de estado para evaluar la gravedad de los problemas detectados e identificar las posibles causas que se deben investigar.

ID de control	AWS Regla de configuración	Directrices
39(a)(b)(d)	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante el uso de fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.
39(a)(b)(d)	guardduty-non-archived-findings	Amazon le GuardDuty ayuda a comprender el impacto de un incidente mediante la clasificación de los hallazgos por gravedad: baja, media y alta. Puede utilizar estas clasificaciones para determinar las estrategias y prioridades de corrección. Esta regla le permite configurar de forma opcional los valores daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7) y daysHighSev (Config Default: 1) para los hallazgos no archivados, según lo exijan las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
39(a)(b)(d)	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS
40	ec2- -check managedinstance-patch-compliance-status	Habilite esta regla para ayudar a identificar y documenta r las vulnerabilidades de Amazon Elastic Compute Cloud (Amazon EC2). La regla comprueba si los parches de instancias Amazon EC2 cumplen con los requisitos de las políticas y procedimientos de su organización en AWS Systems Manager.

ID de control	AWS Regla de configuración	Directrices
40	redshift-cluster-maintenancesettings-check	Esta regla garantiza que los clústeres de Amazon Redshift tengan la configuración preferida para su organización. En concreto, que tengan períodos de mantenimiento preferidos y períodos de retención automática de instantáneas para la base de datos. Esta regla requiere que configure el allowVersionUpgrade. El valor predeterminado es true. También te permite configurar de forma opcional el periodo preferredMaintenanceWindow (el predeterminado es sáb: 16:00 -sáb: 16:30) y el automatedSnapshotRetentionPeriodo (el valor predeterminado es 1). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
40	elastic-beanstalk-managed-updates-activado	La activación de las actualizaciones de plataforma gestionadas para un entorno de Amazon Elastic Beanstalk garantiza que se instalen las últimas correcciones, actualizaciones y características de la plataforma disponibles para el entorno. Mantenerse actualizado mediante la instalación de parches es una práctica recomendada para proteger los sistemas.
40	rds-automatic-minor-version-habilitado para la actualización	Habilite las actualizaciones automáticas de las versiones secundarias en sus instancias de Amazon Relational Database Service (RDS) para garantizar que estén instaladas las últimas actualizaciones de las versiones secundarias del sistema de administración de bases de datos relacionales (RDBMS, por sus siglas en inglés), que pueden incluir parches de seguridad y correcciones de errores.

ID de control	AWS Regla de configuración	Directrices
44a	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.
44a	root-account-hardware-mfa-habilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
44a	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
44b	rds-instance-deletion-protection-habilitado	Asegúrese de que las instancias de Amazon Relational Database Service (Amazon RDS) tengan habilitada la protección contra borrado. Utilice la protección contra borrado para evitar que las instancias de Amazon RDS se eliminen de forma accidental o malintencionada, lo que puede provocar la pérdida de disponibilidad de sus aplicaciones.

ID de control	AWS Regla de configuración	Directrices
44b	s3- bucket-versioning-enabled	El control de versiones de buckets de Amazon Simple Storage Service (Amazon S3) permite usar múltiples variantes de un objeto en el mismo bucket de Amazon S3. Use el control de versiones para conservar, recuperar y restaurar todas las versiones de los objetos almacenados en su bucket de Amazon S3. El control de versiones ayuda a recuperarse fácilmente de acciones no deseadas del usuario y de errores de la aplicación.
44b	elb-deletion-protection-enabled	Esta regla garantiza que Elastic Load Balancing tenga habilitada la protección contra borrado. Utilice esta característica para evitar que el equilibrador de carga se elimine de forma accidental o malintencionada, lo que puede provocar la pérdida de disponibilidad de sus aplicaciones.

ID de control	AWS Regla de configuración	Directrices
44c	kms-cmk-not-scheduled-para su eliminación	Para ayudar a proteger los datos en reposo, asegúrese de que las claves maestras del cliente (CMKs) necesarias no estén programadas para su eliminación en el Servicio de administración de AWS claves (AWS KMS). Puesto que a veces es necesario eliminar las claves, esta regla ayuda a comprobar todas las claves cuyo borrado está programado para comprobar si alguna está ahí por error.
44c	iam-root-access-key-comprob ar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorpora r el principio de funcionalidad mínima.

ID de control	AWS Regla de configuración	Directrices
44c	iam-customer-policy-blocked-kms-acciones	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios de privilegios mínimos y separación de funciones en los permisos y autorizaciones de acceso, lo que impide que las políticas contengan acciones bloqueadas en todas AWS las claves del Servicio de administración de claves. Tener más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones . Esta regla le permite establecer el blockedAc tionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencrip tar, kms:ReEncryptFrom). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
44c	iam-inline-policy-blocked-kms-acciones	Asegúrese de que un usuario, rol de IAM o grupo de IAM (AWS Identity and Access Management) no tenga una política integrada que permita bloquear acciones en todas las claves del Servicio de administración de claves. AWS AWS recomienda utilizar políticas gestionad as en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administr ación de permisos. Esta regla le permite establece r el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar, kms:ReEnc ryptFrom). Los valores reales deben reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
45	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
45	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.

ID de control	AWS Regla de configuración	Directrices
45	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
45	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.

ID de control	AWS Regla de configuración	Directrices
45	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.
45	iam-user-unused-credentials-comprobar	AWS Identity and Access Management (IAM) puede ayudarlo con los permisos y autorizaciones de acceso comprobando las contraseñas y claves de acceso de IAM que no se utilicen durante un período de tiempo específico. Si se identifican estas credenciales no utilizadas, debe deshabilitar la opción de and/or eliminar las credenciales, ya que esto podría infringir el principio del privilegio mínimo. Esta regla requiere que establezcas un valor en la maxCredentialUsage Edad (Config Default: 90). El valor real debe reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
45	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protecció n a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidente s de cuentas compromet idas y evitar que usuarios no autorizados accedan a los datos confidenciales.
45	root-account-hardware-mfa-h abilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegi os. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
45	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
45	emr-kerberos-enabled	Los permisos y autorizac iones de acceso se pueden administrar e incorporar con los principios de privilegi o mínimo y separación de funciones al habilitar Kerberos para los clústeres de Amazon EMR. En Kerberos, los servicios y los usuarios que deben autenticarse se denominan entidades principal es. Las entidades principal es existen dentro de un ámbito de Kerberos. Dentro de ese ámbito, un servidor de Kerberos se conoce como el centro de distribuc ión de claves (KDC). Este proporciona un medio para que las entidades principal es se autentiquen. El KDC se autentica emitiendo tickets de autenticación. El KDC mantiene una base de datos de las entidades principal es dentro de su ámbito, sus contraseñas y otros datos administrativos sobre cada una de las entidades principal es.

ID de control	AWS Regla de configuración	Directrices
45	iam-no-inline-policy-comprobar	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.
45	dms-replication-not-public	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de replicación del DMS. Las instancias de replicación de DMS pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
45	ebs-snapshot-public-restorable-comprobar	Gestione el acceso a la AWS nube asegurándose de que las instantáneas de EBS no se puedan restaurar públicamente. Las instantáneas de volumen de EBS pueden contener información confidencial y dichas cuentas requieren control de acceso.
45	ec2- instance-no-public-ip	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de Amazon Elastic Compute Cloud (Amazon EC2). Las instancias de Amazon EC2 pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
45	elasticsearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch OpenSearch Service (Service) estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de OpenSearch servicio dentro de una Amazon VPC permite una comunicación segura entre el OpenSearch Servicio y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.
45	emr-master-no-public-IP	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a los nodos maestros del clúster de Amazon EMR. Los nodos maestros del clúster de Amazon EMR pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
45	restricted-ssh	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a administrar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS AI no permitir el tráfico de entrada (o el tráfico remoto) desde 0.0.0.0/0 al puerto 22 en sus recursos, podrá restringir el acceso remoto.

ID de control	AWS Regla de configuración	Directrices
45	ec2- instances-in-vpc	Implemente instancias de Amazon Elastic Compute Cloud (Amazon EC2) dentro de una Amazon Virtual Private Cloud (Amazon VPC) para permitir una comunicación segura entre una instancia y otros servicios dentro de la Amazon VPC, sin necesidad de utilizar una puerta de enlace de internet, un dispositivo NAT ni una conexión de VPN. Todo el tráfico permanece seguro dentro de la AWS nube. Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Asigne instancias de Amazon EC2 a una Amazon VPC para gestionar correctamente el acceso.

ID de control	AWS Regla de configuración	Directrices
45	internet-gateway-authorized-vpc-solo	Gestione el acceso a los recursos de la AWS nube asegurándose de que las puertas de enlace de Internet solo estén conectadas a Amazon Virtual Private Cloud (Amazon VPC) autorizada. Las puertas de enlace de Internet permiten el acceso bidireccional a internet desde y hacia la Amazon VPC, lo que puede provocar un acceso no autorizado a los recursos de Amazon VPC.
45	lambda-function-public-access-prohibido	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a las funciones de AWS Lambda. El acceso público puede degradar la disponibilidad de los recursos.

ID de control	AWS Regla de configuración	Directrices
45	lambda-inside-vpc	Implemente funciones de AWS Lambda en una Amazon Virtual Private Cloud (Amazon VPC) para una comunicación segura entre una función y otros servicios de la Amazon VPC. Con esta configuración, no se requiere ninguna puerta de enlace de internet, dispositi vo NAT ni conexión de VPN. Todo el tráfico permanece de forma segura dentro de la nube. AWS Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Para gestionar correctam ente el acceso, las funciones de AWS Lambda deben asignarse a una VPC.

ID de control	AWS Regla de configuración	Directrices
45	rds-instance-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.
45	rds-snapshots-public-prohibited	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
45	redshift-cluster-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que los clústeres de Amazon Redshift no sean públicos. Los clústeres de Amazon Redshift pueden contener informaci ón confidencial y principio s. Además dichas cuentas requieren control de acceso.
45	restricted-common-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integrida d y confidencialidad de los sistemas. Esta regla le permite configurar de forma opcional los parámetros blockedPo rt1 a blockedPort5 (valores predeterminados de Config: 20,21,3389,3306,4333). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
45	s3- bucket-public-read-prohibited	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositivos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.
45	s3- bucket-public-write-prohibited	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositivos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.
45	sagemaker-notebook-no-direct-acceso a internet	Gestione el acceso a los recursos en la AWS nube asegurándose de que las SageMaker libretas de Amazon no permitan el acceso directo a Internet. Al impedir el acceso directo a internet, puede evitar que usuarios no autorizados accedan a los datos confidenciales.

ID de control	AWS Regla de configuración	Directrices
45	vpc-default-security-group-cerrado	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a gestionar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS Restringir todo el tráfico en el grupo de seguridad predeterminado ayuda a restringir el acceso remoto a los recursos. AWS
45	vpc-sg-open-only-to-authorized-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integridad y confidencialidad de los sistemas. Al restringir el acceso a los recursos dentro de un grupo de seguridad desde internet (0.0.0.0/0), se puede controlar el acceso remoto a los sistemas internos.

ID de control	AWS Regla de configuración	Directrices
45	account-part-of-organizations	La administración centralizada Cuentas de AWS dentro de AWS Organizations ayuda a garantizar que las cuentas cumplan con las normas. La falta de gobernanza centralizada de las cuentas puede provocar incoherencias en las configuraciones de cuentas, lo que puede exponer los recursos y los datos confidenciales.

ID de control	AWS Regla de configuración	Directrices
45	iam-customer-policy-blocked-kms-acciones	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios de privilegios mínimos y separación de funciones en los permisos y autorizaciones de acceso, lo que impide que las políticas contengan acciones bloqueadas en todas AWS las claves del Servicio de administración de claves. Tener más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones . Esta regla le permite establecer el blockedAc tionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencrip tar, kms:ReEncryptFrom). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
45	iam-inline-policy-blocked-kms-acciones	Asegúrese de que un usuario, rol de IAM o grupo de IAM (AWS Identity and Access Management) no tenga una política integrada que permita bloquear acciones en todas las claves del Servicio de administración de claves. AWS AWS recomienda utilizar políticas gestionad as en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administr ación de permisos. Esta regla le permite establece r el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar, kms:ReEnc ryptFrom). Los valores reales deben reflejar las políticas de su organización.
45	ec2- instance-profile-attached	Los perfiles de instancia s de EC2 pasan un rol de IAM a una instancia de EC2. Adjuntar un perfil de instancia a las instancias puede ayudar a gestionar los privilegios mínimos y los permisos.

ID de control	AWS Regla de configuración	Directrices
45	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegi os de los necesarios para completar una tarea puede infringir el principio de privilegi o mínimo y la separación de funciones.
45	no-unrestricted-route-to-igw	Asegúrese de que las tablas de enrutamiento de Amazon EC2 no tengan rutas ilimitada s a una puerta de enlace de internet. Eliminar o limitar el acceso a Internet para las cargas de trabajo en Amazon VPCs puede reducir el acceso no deseado dentro de su entorno.
45	s3-: prohibido bucket-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público en el nivel del bucket.

ID de control	AWS Regla de configuración	Directrices
45	subnet-auto-assign-public-ip deshabilitada	Gestione el acceso a la AWS nube asegurándose de que a las subredes de Amazon Virtual Private Cloud (VPC) no se les asigne automátic amente una dirección IP pública. Las instancias de Amazon Elastic Compute Cloud (EC2) que se lanzan en subredes que tienen este atributo habilitado tienen una dirección IP pública asignada a su interfaz de red principal.
45	autoscaling-launch-config-p ublic-ip deshabilitada	Si configura las interfaces de red con una dirección IP pública, se puede acceder a los recursos asociados a esas interfaces de red desde Internet. Los recursos de EC2 no deben ser de acceso público, ya que esto podría permitir el acceso no deseado a sus aplicaciones o servidore s.

ID de control	AWS Regla de configuración	Directrices
45	redshift-enhanced-vpc-routing-habilitado	El enrutamiento de VPC mejorado fuerza que todo el tráfico de COPY y UNLOAD entre los repositorios de datos y de clúster pase por su Amazon VPC. A continuación, puede utilizar las características de la VPC, como los grupos de seguridad y las listas de control de acceso a la red, para proteger el tráfico de la red. También puede usar los registros de flujo de la VPC para monitorear el tráfico de la red.
45	opensearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch Service estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de Amazon OpenSearch Service dentro de una Amazon VPC permite una comunicación segura entre Amazon OpenSearch Service y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.

ID de control	AWS Regla de configuración	Directrices
45	s3- -bloques-periódicos account-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configura r opcionalmente los restrictP ublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPubl icPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.
45	ssm-document-not-public	Asegúrese de que los documentos de AWS Systems Manager (SSM) no sean públicos, ya que esto podría permitir el acceso no deseado a los documentos de SSM. Un documento de SSM público puede exponer información sobre su cuenta, sus recursos y sus procesos internos.

ID de control	AWS Regla de configuración	Directrices
47c	emr-kerberos-enabled	Los permisos y autorizac iones de acceso se pueden administrar e incorporar con los principios de privilegi o mínimo y separación de funciones al habilitar Kerberos para los clústeres de Amazon EMR. En Kerberos, los servicios y los usuarios que deben autenticarse se denominan entidades principal es. Las entidades principal es existen dentro de un ámbito de Kerberos. Dentro de ese ámbito, un servidor de Kerberos se conoce como el centro de distribuc ión de claves (KDC). Este proporciona un medio para que las entidades principal es se autentiquen. El KDC se autentica emitiendo tickets de autenticación. El KDC mantiene una base de datos de las entidades principal es dentro de su ámbito, sus contraseñas y otros datos administrativos sobre cada una de las entidades principal es.

ID de control	AWS Regla de configuración	Directrices
47c	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
47c	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.

ID de control	AWS Regla de configuración	Directrices
47c	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
47c	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.

ID de control	AWS Regla de configuración	Directrices
47c	iam-no-inline-policy-comprobar	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.
47c	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	AWS Regla de configuración	Directrices
52c	api-gw-cache-enabled-y cifrada	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté activado en la caché de la etapa de API Gateway. Puesto que pueden capturarse datos confidenc iales para el método de la API, habilite el cifrado en reposo para ayudar a protegerlos.
52c	cloud-trail-encryption-enabled	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en reposo, debe asegurarse de que el cifrado esté habilitado para sus registros de seguimiento de AWS CloudTrail.
52c	cloudwatch-log-group-encryp ted	Para ayudar a proteger los datos confidenciales en reposo, asegúrate de que el cifrado esté activado en tus Amazon CloudWatch Log Groups.
52c	efs-encrypted-check	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de Amazon Elastic File System (EFS).

ID de control	AWS Regla de configuración	Directrices
52c	elasticsearch-encrypted-at-rest	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté habilitado para tus dominios de Amazon OpenSearch OpenSearch Service (Servicio).
52c	encrypted-volumes	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS).
52c	rds-storage-encrypted	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté habilitado para sus instancias de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenciales en reposo en las instancias de Amazon RDS, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	AWS Regla de configuración	Directrices
52c	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar informaci ón acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezc a un valor para clusterDb Encrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organizac ión.
52c	Habilitado para s3 bucket-se rver-side-encryption	Para ayudar a proteger los datos en reposo, asegúrese de habilitar el cifrado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de S3, habilite el cifrado para protegerlos.

ID de control	AWS Regla de configuración	Directrices
52c	sagemaker-endpoint-configuration-kms-configurado por clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado en su terminal. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker punto final, habilite el cifrado en reposo para ayudar a proteger esos datos.
52c	sagemaker-notebook-instance-kms-configurado por clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado en su portátil. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker portátil, habilite el cifrado en reposo para ayudar a proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
52c	sns-encrypted-kms	Para ayudar a proteger los datos en reposo, asegúrese de que los temas del Amazon Simple Notification Service (Amazon SNS) requieran cifrado AWS mediante el Servicio AWS de administr ación de claves (KMS). Puesto que puede haber datos confidenciales en reposo en los mensajes publicados, habilite el cifrado en reposo para ayudar a protegerlos.
52c	ec2- ebs-encryption-by-default	Para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS). Puesto que puede haber datos confidenc iales en reposo en estos volúmenes, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	AWS Regla de configuración	Directrices
52c	dynamodb-table-encrypted-kms	Asegúrese de que el cifrado esté habilitado para las tablas de Amazon DynamoDB. Puesto que puede haber datos confidenciales en reposo en estas tablas, habilite el cifrado en reposo para ayudar a protegerlos. De forma predeterminada, las tablas de DynamoDB se AWS cifran con una clave maestra del cliente (CMK) propia.
52c	rds-snapshot-encrypted	Asegúrese de que el cifrado esté habilitado para las instantáneas de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenciales en reposo, habilite el cifrado en reposo para ayudar a protegerlos.
52c	s3- default-encryption-kms	Asegúrese de tener el cifrado habilitado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de Amazon S3, habilite el cifrado en reposo para protegerlos.

ID de control	AWS Regla de configuración	Directrices
52c	redshift-cluster-kms-enabled	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado para su clúster de Amazon Redshift. Puesto que puede haber datos confidenciales en reposo en los clústeres de Redshift, habilite el cifrado en reposo para ayudar a protegerlos.
52c	opensearch-encrypted-at-rest	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté habilitado para tus dominios de Amazon OpenSearch Service.
52d	s3- bucket-public-read-prohibited	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositivos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.

ID de control	AWS Regla de configuración	Directrices
52d	s3- bucket-public-write-prohibited	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositivos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.
52d	sagemaker-notebook-no-direct-acceso a internet	Gestione el acceso a los recursos en la AWS nube asegurándose de que las SageMaker libretas de Amazon no permitan el acceso directo a Internet. Al impedir el acceso directo a internet, puede evitar que usuarios no autorizados accedan a los datos confidenciales.
52d	dms-replication-not-public	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de replicación del DMS. Las instancias de replicación de DMS pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
52d	ebs-snapshot-public-restorable-comprobar	Gestione el acceso a la AWS nube asegurándose de que las instantáneas de EBS no se puedan restaurar públicamente. Las instantáneas de volumen de EBS pueden contener información confidencial y dichas cuentas requieren control de acceso.
52d	ec2- instance-no-public-ip	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de Amazon Elastic Compute Cloud (Amazon EC2). Las instancias de Amazon EC2 pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
52d	elasticsearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch OpenSearch Service (Service) estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de OpenSearch servicio dentro de una Amazon VPC permite una comunicación segura entre el OpenSearch Servicio y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.
52d	emr-master-no-public-IP	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a los nodos maestros del clúster de Amazon EMR. Los nodos maestros del clúster de Amazon EMR pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
52d	ec2- instances-in-vpc	Implemente instancias de Amazon Elastic Compute Cloud (Amazon EC2) dentro de una Amazon Virtual Private Cloud (Amazon VPC) para permitir una comunicación segura entre una instancia y otros servicios dentro de la Amazon VPC, sin necesidad de utilizar una puerta de enlace de internet, un dispositivo NAT ni una conexión de VPN. Todo el tráfico permanece seguro dentro de la AWS nube. Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Asigne instancias de Amazon EC2 a una Amazon VPC para gestionar correctamente el acceso.

ID de control	AWS Regla de configuración	Directrices
52d	internet-gateway-authorized-vpc-solo	Gestione el acceso a los recursos de la AWS nube asegurándose de que las puertas de enlace de Internet solo estén conectadas a Amazon Virtual Private Cloud (Amazon VPC) autorizada. Las puertas de enlace de Internet permiten el acceso bidireccional a internet desde y hacia la Amazon VPC, lo que puede provocar un acceso no autorizado a los recursos de Amazon VPC.
52d	lambda-function-public-access-prohibido	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a las funciones de AWS Lambda. El acceso público puede degradar la disponibilidad de los recursos.

ID de control	AWS Regla de configuración	Directrices
52d	lambda-inside-vpc	Implemente funciones de AWS Lambda en una Amazon Virtual Private Cloud (Amazon VPC) para una comunicación segura entre una función y otros servicios de la Amazon VPC. Con esta configuración, no se requiere ninguna puerta de enlace de internet, dispositi vo NAT ni conexión de VPN. Todo el tráfico permanece de forma segura dentro de la nube. AWS Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Para gestionar correctam ente el acceso, las funciones de AWS Lambda deben asignarse a una VPC.

ID de control	AWS Regla de configuración	Directrices
52d	rds-instance-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.
52d	rds-snapshots-public-prohibited	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.

ID de control	AWS Regla de configuración	Directrices
52d	redshift-cluster-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que los clústeres de Amazon Redshift no sean públicos. Los clústeres de Amazon Redshift pueden contener informaci ón confidencial y principio s. Además dichas cuentas requieren control de acceso.
52d	no-unrestricted-route-to-igw	Asegúrese de que las tablas de enrutamiento de Amazon EC2 no tengan rutas ilimitada s a una puerta de enlace de internet. Eliminar o limitar el acceso a Internet para las cargas de trabajo en Amazon VPCs puede reducir el acceso no deseado dentro de su entorno.
52d	subnet-auto-assign-public-ip deshabilitada	Gestione el acceso a la AWS nube asegurándose de que a las subredes de Amazon Virtual Private Cloud (VPC) no se les asigne automátic amente una dirección IP pública. Las instancias de Amazon Elastic Compute Cloud (EC2) que se lanzan en subredes que tienen este atributo habilitado tienen una dirección IP pública asignada a su interfaz de red principal.

ID de control	AWS Regla de configuración	Directrices
52d	autoscaling-launch-config-public-ip deshabilitada	Si configura las interfaces de red con una dirección IP pública, se puede acceder a los recursos asociados a esas interfaces de red desde Internet. Los recursos de EC2 no deben ser de acceso público, ya que esto podría permitir el acceso no deseado a sus aplicaciones o servidores.
52d	redshift-enhanced-vpc-routing-habilitado	El enrutamiento de VPC mejorado fuerza que todo el tráfico de COPY y UNLOAD entre los repositorios de datos y de clúster pase por su Amazon VPC. A continuación, puede utilizar las características de la VPC, como los grupos de seguridad y las listas de control de acceso a la red, para proteger el tráfico de la red. También puede usar los registros de flujo de la VPC para monitorear el tráfico de la red.

54	elb-acm-certificate-required	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en tránsito, debe asegurarse de que el cifrado esté habilitado para su Elastic Load Balancing. Use AWS Certificate Manager para administrar, aprovisionar e implementar SSL/TLS certifica dos públicos y privados con AWS servicios y recursos internos.
54	encrypted-volumes	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS).

ID de control	AWS Regla de configuración	Directrices
54	rds-storage-encrypted	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté habilitado para sus instancias de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenciales en reposo en las instancias de Amazon RDS, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	AWS Regla de configuración	Directrices
54	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar informaci ón acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezc a un valor para clusterDb Encrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
54	opensearch-node-to-node-comprobación de cifrado	Asegúrese de que el node-to-node cifrado OpenSearch de Amazon Service esté activado. Node-to-nodeel cifrado permite el cifrado TLS 1.2 para todas las comunicaciones dentro de Amazon Virtual Private Cloud (Amazon VPC). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
54	redshift-require-tls-ssl	Asegúrese de que sus clústeres de Amazon Redshift requieran cifrado TLS/SSL para conectarse a los clientes SQL. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
54	habilitado para s3 bucket-server-side-encryption	Para ayudar a proteger los datos en reposo, asegúrese de habilitar el cifrado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de S3, habilite el cifrado para protegerlos.

ID de control	AWS Regla de configuración	Directrices
54	s3- bucket-ssl-requests-only	Para ayudar a proteger los datos en tránsito, asegúrese de que los buckets de Amazon Simple Storage Service (Amazon S3) requieran solicitudes para usar la capa de sockets seguros (SSL). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
54	sagemaker-endpoint-configuration-kms-configurado por clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado en su terminal. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker punto final, habilite el cifrado en reposo para ayudar a proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
54	sagemaker-notebook-instance-kms-configurado por clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado en su portátil. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker portátil, habilite el cifrado en reposo para ayudar a proteger esos datos.
54	sns-encrypted-kms	Para ayudar a proteger los datos en reposo, asegúrese de que los temas del Amazon Simple Notification Service (Amazon SNS) requieran cifrado AWS mediante el Servicio AWS de administr ación de claves (KMS). Puesto que puede haber datos confidenciales en reposo en los mensajes publicados, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	AWS Regla de configuración	Directrices
54	ec2- ebs-encryption-by-default	Para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS). Puesto que puede haber datos confidenc iales en reposo en estos volúmenes, habilite el cifrado en reposo para ayudar a protegerlos.
54	rds-snapshot-encrypted	Asegúrese de que el cifrado esté habilitado para las instantáneas de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenc iales en reposo, habilite el cifrado en reposo para ayudar a protegerlos.
54	elasticsearch-node-to-node-verificación de cifrado	Asegúrese de que el node-to-node cifrado OpenSearc h de Amazon Service esté activado. Node-to-nodeel cifrado permite el cifrado TLS 1.2 para todas las comunicac iones dentro de Amazon Virtual Private Cloud (Amazon VPC). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
54	elb-tls-https-listeners-solo	Asegúrese de que sus Elastic Load Balancers (ELBs) estén configurados con agentes de escucha SSL o HTTPS. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
54	redshift-cluster-kms-enabled	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado para su clúster de Amazon Redshift. Puesto que puede haber datos confidenciales en reposo en los clústeres de Redshift, habilite el cifrado en reposo para ayudar a protegerlos.
54	api-gw-ssl-enabled	Asegúrese de que las etapas de la API de REST de Amazon API Gateway estén configuradas con certifica dos SSL para permitir que los sistemas de backend autentiquen que las solicitudes se originan en API Gateway.

ID de control	AWS Regla de configuración	Directrices
54	elbv2- acm-certificate-required	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en tránsito, debe asegurarse de que el cifrado esté habilitado para su Elastic Load Balancing. Use AWS Certificate Manager para administrar, aprovisionar e implementar SSL/TLS certifica dos públicos y privados con AWS servicios y recursos internos.
55	elasticsearch-node-to-node-verificación de cifrado	Asegúrese de que el node-to-node cifrado OpenSearc h de Amazon Service esté activado. Node-to-nodeel cifrado permite el cifrado TLS 1.2 para todas las comunicac iones dentro de Amazon Virtual Private Cloud (Amazon VPC). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
55	opensearch-node-to-node-comprobación de cifrado	Asegúrese de que el node-to-node cifrado OpenSearch de Amazon Service esté activado. Node-to-nodeel cifrado permite el cifrado TLS 1.2 para todas las comunicaciones dentro de Amazon Virtual Private Cloud (Amazon VPC). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
67	api-gw-execution-logging-habilitado	El registro de API Gateway muestra vistas detalladas de los usuarios que han accedido a la API y la forma en que han accedido a la API. Esta información permite ver las actividades de los usuarios.
67	cloud-trail-cloud-watch-habilitado para registros	Usa Amazon CloudWatch para recopilar y gestionar de forma centralizada la actividad de los eventos de registro. La inclusión de AWS CloudTrail datos proporciona detalles de la actividad de llamadas a la API en su interior Cuenta de AWS.

ID de control	AWS Regla de configuración	Directrices
67	cloudtrail-enabled	AWS CloudTrail puede ayudar a evitar el repudio al registrar las acciones de la consola AWS de administración y las llamadas a la API. Puede identificar a los usuarios y a quién llamó a un AWS servicio, la dirección IP de origen en la Cuentas de AWS que se generaron las llamadas y los horarios de las llamadas. Los detalles de los datos capturados se muestran en el contenido del AWS CloudTrail registro.
67	cloudtrail-s3-dataevents-enabled	La recopilación de eventos de datos del Simple Storage Service (Amazon S3) ayuda a detectar cualquier actividad anómala. Los detalles incluyen la información de la cuenta de AWS a la que ha accedido un bucket de Amazon S3, la dirección IP y la hora del evento.

ID de control	AWS Regla de configuración	Directrices
67	elb-logging-enabled	La actividad de Elastic Load Balancing es un punto central de comunicación dentro de un entorno. Asegúrese de que el registro de ELB esté habilitado. Los datos recopilados proporcionan información detallada sobre las solicitudes enviadas al ELB. Cada registro contiene distintos datos, como el momento en que se recibió la solicitud, la dirección IP del cliente, las latencias, las rutas de solicitud y las respuestas del servidor.

ID de control	AWS Regla de configuración	Directrices
67	multi-region-cloudtrail-enabled	AWS CloudTrail registra las acciones AWS de la consola de administración y las llamadas a la API. Puede identificar qué usuarios y cuentas llamaron AWS, la dirección IP de origen desde la que se realizaro n las llamadas y cuándo se produjeron. CloudTrai l entregará los archivos de registro de todas AWS las regiones a su bucket de S3 si MULTI_REGION_CLOUD _TRAIL_ENABLED está activado. Además, al AWS lanzar una nueva región, CloudTrail creará la misma ruta en la nueva región. En consecuencia, recibirá archivos de registro con la actividad de la API en la nueva región sin necesidad de realizar ninguna acción.

ID de control	AWS Regla de configuración	Directrices
67	s3- bucket-logging-enabled	El registro de acceso al servidor de Amazon Simple Storage Service (Amazon S3) proporciona un método para monitorear la red en busca de posibles eventos de ciberseguridad. Los eventos se monitorean mediante la captura detallada de las solicitudes realizadas a un bucket de Amazon S3. Cada registro de acceso proporcio na detalles sobre una única solicitud de acceso. Los detalles incluyen el solicitan te, el nombre del bucket, la hora de la solicitud, la acción solicitada, el estado de la respuesta y el código de error, si procede.
67	vpc-flow-logs-enabled	Los registros del flujo de la VPC proporcionan registros detallados acerca del tráfico IP entrante y saliente de las interfaces de red en su Amazon Virtual Private Cloud (Amazon VPC). De forma predeterminada, el registro de flujo incluye valores para los distintos componentes del flujo de IP, incluido el origen, el destino y el protocolo.

ID de control	AWS Regla de configuración	Directrices
67	rds-logging-enabled	Para facilitar el registro y el monitoreo en su entorno, asegúrese de que el registro de Amazon Relational Database Service (Amazon RDS) esté habilitado. Con el registro de Amazon RDS, puede capturar eventos tales como conexiones, desconexi ones, consultas o tablas consultadas.
67	wafv2-logging-enabled	Para facilitar el registro y la supervisión en su entorno, habilite el registro AWS WAF (V2) en la web ACLs regional y global. AWS El registro WAF proporciona información detallada sobre el tráfico que analiza su ACL web. Los registros registran la hora en que AWS WAF recibió la solicitud de su AWS recurso, la información sobre la solicitud y una acción para la regla según la cual cada solicitud coincidió.

ID de control	AWS Regla de configuración	Directrices
67	cloudwatch-alarm-action-check	CloudWatch Las alarmas de Amazon alertan cuando una métrica supera el umbral durante un número específico de períodos de evaluación. La alarma realiza una o varias acciones según el valor de la métrica o expresión con respecto a un umbral durante varios períodos de tiempo. Esta regla requiere un valor para alarmActionRequired (Config Default: True), insufficientDataAction Obligatorio (Config Default: True) o okActionRequired (Config Default: False). El valor real debe reflejar las acciones de alarma de su entorno.
67	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante el uso de fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	AWS Regla de configuración	Directrices
67	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS
67	opensearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta . OpenSearch Los registros de errores del servicio pueden ayudar con las auditorías de seguridad y acceso, y pueden ayudar a diagnosticar problemas de disponibilidad.

ID de control	AWS Regla de configuración	Directrices
67	ec2- -check managedinstance-patch-compliance-status	Habilite esta regla para ayudar a identificar y documenta r las vulnerabilidades de Amazon Elastic Compute Cloud (Amazon EC2). La regla comprueba si los parches de instancias Amazon EC2 cumplen con los requisitos de las políticas y procedimientos de su organización en AWS Systems Manager.
67	ec2- -check managedinstance-association-compliance-status	Use AWS Systems Manager Associations para ayudar con el inventario de las plataform as y aplicaciones de software dentro de una organizac ión. AWS Systems Manager asigna un estado de configura ción a las instancias administr adas y le permite establece r líneas de referencia de los niveles de parches del sistema operativo, las instalaciones de software, las configuraciones de las aplicaciones y otros detalles sobre su entorno.

AttachmentC_4	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.
AttachmentC_4	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.

ID de control	AWS Regla de configuración	Directrices
AttachmentC_4	iam-user-unused-credentials-comprobar	AWS Identity and Access Management (IAM) puede ayudarlo con los permisos y autorizaciones de acceso comprobando las contraseñ as y claves de acceso de IAM que no se utilicen durante un período de tiempo específic o. Si se identifican estas credenciales no utilizadas, debe deshabilitar la opción de and/or eliminar las credencia les, ya que esto podría infringir el principio del privilegio mínimo. Esta regla requiere que establezcas un valor en la maxCredentialUsage Edad (Config Default: 90). El valor real debe reflejar las políticas de su organización.

ID de control	AWS Regla de configuración	Directrices
AttachmentC_4	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protecció n a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidente s de cuentas compromet idas y evitar que usuarios no autorizados accedan a los datos confidenciales.
AttachmentC_4	root-account-hardware-mfa-h abilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegi os. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

ID de control	AWS Regla de configuración	Directrices
AttachmentC_4	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
AttachmentC_4	secretsmanager-rotation-enabled-check	Esta regla garantiza que AWS los secretos de Secrets Manager tengan habilitada la rotación. La rotación de los secretos de forma habitual puede acortar el período de vigencia de un secreto y, potencialmente, reducir el impacto sobre la empresa si el secreto se desvela.

ID de control	AWS Regla de configuración	Directrices
AttachmentC_4	secretsmanager-scheduled-rotation-success-comprobar	Esta regla garantiza que AWS los secretos de Secrets Manager se hayan distribuido correctamente de acuerdo con el programa de rotación. La rotación de los secretos de forma habitual puede acortar el período de vigencia de un secreto y, potencialmente, reducir el impacto sobre la empresa si se desvela.
AttachmentC_4	iam-no-inline-policy-comprobar	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos.

ID de control	AWS Regla de configuración	Directrices
AttachmentC_4	iam-customer-policy-blocked-kms-acciones	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios de privilegios mínimos y separación de funciones en los permisos y autorizaciones de acceso, lo que impide que las políticas contengan acciones bloqueadas en todas AWS las claves del Servicio de administración de claves. Tener más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones . Esta regla le permite establecer el blockedAc tionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencrip tar, kms:ReEncryptFrom). Los valores reales deben reflejar las políticas de su organizac ión.

ID de control	AWS Regla de configuración	Directrices
AttachmentC_4	iam-inline-policy-blocked-kms-acciones	Asegúrese de que un usuario, rol de IAM o grupo de IAM (AWS Identity and Access Management) no tenga una política integrada que permita bloquear acciones en todas las claves del Servicio de administración de claves. AWS AWS recomienda utilizar políticas gestionad as en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administr ación de permisos. Esta regla le permite establece r el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar, kms:ReEnc ryptFrom). Los valores reales deben reflejar las políticas de su organización.
AttachmentC_4	ec2- instance-profile-attached	Los perfiles de instancia s de EC2 pasan un rol de IAM a una instancia de EC2. Adjuntar un perfil de instancia a las instancias puede ayudar a gestionar los privilegios mínimos y los permisos.

ID de control	AWS Regla de configuración	Directrices
AttachmentC_4	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
AttachmentC_5	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidentes de cuentas comprometidas y evitar que usuarios no autorizados accedan a los datos confidenciales.

ID de control	AWS Regla de configuración	Directrices
AttachmentC_5	root-account-hardware-mfa-habilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
AttachmentC_5	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS
AttachmentC_6	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.

ID de control	AWS Regla de configuración	Directrices
AttachmentC_7(c)	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.
AttachmentC_7(h)	api-gw-execution-logging-habilitado	El registro de API Gateway muestra vistas detalladas de los usuarios que han accedido a la API y la forma en que han accedido a la API. Esta información permite ver las actividades de los usuarios.
AttachmentC_7(h)	cloud-trail-cloud-watch-habilitado para registros	Usa Amazon CloudWatch para recopilar y gestionar de forma centralizada la actividad de los eventos de registro. La inclusión de AWS CloudTrail datos proporciona detalles de la actividad de llamadas a la API en su interior Cuenta de AWS.

ID de control	AWS Regla de configuración	Directrices
AttachmentC_7(h)	cloudtrail-enabled	AWS CloudTrail puede ayudar a evitar el repudio al registrar las acciones de la consola AWS de administración y las llamadas a la API. Puede identificar a los usuarios y a quién llamó a un AWS servicio, la dirección IP de origen en la Cuentas de AWS que se generaron las llamadas y los horarios de las llamadas. Los detalles de los datos capturados se muestran en el contenido del AWS CloudTrail registro.
AttachmentC_7(h)	cloudtrail-s3-dataevents-enabled	La recopilación de eventos de datos del Simple Storage Service (Amazon S3) ayuda a detectar cualquier actividad anómala. Los detalles incluyen la información de la cuenta de AWS a la que ha accedido un bucket de Amazon S3, la dirección IP y la hora del evento.

ID de control	AWS Regla de configuración	Directrices
AttachmentC_7(h)	cloudwatch-alarm-action-check	CloudWatch Las alarmas de Amazon alertan cuando una métrica supera el umbral durante un número específico de períodos de evaluación. La alarma realiza una o varias acciones según el valor de la métrica o expresión con respecto a un umbral durante varios períodos de tiempo. Esta regla requiere un valor para alarmActionRequired (Config Default: True), insufficientDataAction Obligatorio (Config Default: True) o okActionRequired (Config Default: False). El valor real debe reflejar las acciones de alarma de su entorno.

ID de control	AWS Regla de configuración	Directrices
AttachmentC_7(h)	elb-logging-enabled	La actividad de Elastic Load Balancing es un punto central de comunicación dentro de un entorno. Asegúrese de que el registro de ELB esté habilitado. Los datos recopilados proporcionan información detallada sobre las solicitudes enviadas al ELB. Cada registro contiene distintos datos, como el momento en que se recibió la solicitud, la dirección IP del cliente, las latencias, las rutas de solicitud y las respuestas del servidor.
AttachmentC_7(h)	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante el uso de fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	AWS Regla de configuración	Directrices
AttachmentC_7(h)	multi-region-cloudtrail-enabled	AWS CloudTrail registra las acciones AWS de la consola de administración y las llamadas a la API. Puede identificar qué usuarios y cuentas llamaron AWS, la dirección IP de origen desde la que se realizaro n las llamadas y cuándo se produjeron. CloudTrai l entregará los archivos de registro de todas AWS las regiones a su bucket de S3 si MULTI_REGION_CLOUD _TRAIL_ENABLED está activado. Además, al AWS lanzar una nueva región, CloudTrail creará la misma ruta en la nueva región. En consecuencia, recibirá archivos de registro con la actividad de la API en la nueva región sin necesidad de realizar ninguna acción.

ID de control	AWS Regla de configuración	Directrices
AttachmentC_7(h)	s3- bucket-logging-enabled	El registro de acceso al servidor de Amazon Simple Storage Service (Amazon S3) proporciona un método para monitorear la red en busca de posibles eventos de ciberseguridad. Los eventos se monitorean mediante la captura detallada de las solicitudes realizadas a un bucket de Amazon S3. Cada registro de acceso proporcio na detalles sobre una única solicitud de acceso. Los detalles incluyen el solicitan te, el nombre del bucket, la hora de la solicitud, la acción solicitada, el estado de la respuesta y el código de error, si procede.

ID de control	AWS Regla de configuración	Directrices
AttachmentC_7(h)	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos , de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS
AttachmentC_7(h)	vpc-flow-logs-enabled	Los registros del flujo de la VPC proporcionan registros detallados acerca del tráfico IP entrante y saliente de las interfaces de red en su Amazon Virtual Private Cloud (Amazon VPC). De forma predeterminada, el registro de flujo incluye valores para los distintos componentes del flujo de IP, incluido el origen, el destino y el protocolo.

ID de control	AWS Regla de configuración	Directrices
AttachmentC_7(h)	rds-logging-enabled	Para facilitar el registro y el monitoreo en su entorno, asegúrese de que el registro de Amazon Relational Database Service (Amazon RDS) esté habilitado. Con el registro de Amazon RDS, puede capturar eventos tales como conexiones, desconexiones, consultas o tablas consultadas.
AttachmentC_7(h)	opensearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta. OpenSearch Los registros de errores del servicio pueden ayudar con las auditorías de seguridad y acceso, y pueden ayudar a diagnosticar problemas de disponibilidad.

ID de control	AWS Regla de configuración	Directrices
AttachmentC_7(h)	wafv2-logging-enabled	Para facilitar el registro y la supervisión en su entorno, habilite el registro con AWS WAF (V2) en la web ACLs regional y global. AWS El registro WAF proporciona información detallada sobre el tráfico que analiza su ACL web. Los registros registran la hora en que AWS WAF recibió la solicitud de su AWS recurso, la información sobre la solicitud y una acción para la regla según la cual cada solicitud coincidió.
AttachmentC_7(h)	elasticsearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta . Los registros de errores de los dominios pueden ayudar en las auditorías de seguridad y acceso, además de para diagnosticar problemas de disponibilidad.

Los registros de errores de los dominios pueden ayudar en las auditorías de seguridad y acceso, además de para diagnosticar problemas de disponibilidad.
AttachmentD_1	codebuild-project-envvar-awscred-comprobar	Asegúrese de que las credenciales AWS_ACCESS_KEY_ID de autenticación AWS_SECRET_ACCESS_KEY no existan en los entornos de proyectos de AWS Codebuild. No almacene estas variables en texto sin cifrar. El almacenamiento de estas variables en texto sin cifrar provoca una exposición no intencionada de los datos y un acceso no autorizado.

ID de control	AWS Regla de configuración	Directrices
AttachmentD_1	codebuild-project-source-repo-comprobar la URL	Asegúrese de que la URL del repositorio fuente GitHub o de Bitbucket no contenga tokens de acceso personale s ni credenciales de inicio de sesión en los entornos de proyectos de Codebuild. AWS Úsalos OAuth en lugar de los tokens de acceso personale s o las credenciales de inicio de sesión para conceder la autorización de acceso a los repositorios de Bitbucket GitHub .
AttachmentE_4	kms-cmk-not-scheduled-para su eliminación	Para ayudar a proteger los datos en reposo, asegúrese de que las claves maestras del cliente (CMKs) necesarias no estén programadas para su eliminación en el Servicio de administración de AWS claves (AWS KMS). Puesto que a veces es necesario eliminar las claves, esta regla ayuda a comprobar todas las claves cuyo borrado está programado para comprobar si alguna está ahí por error.
AttachmentE_4	cmk-backing-key-rotation-habilitado	Habilite la rotación de claves para garantizar que las claves se roten una vez que hayan alcanzado el final de su período criptográfico.

ID de control	AWS Regla de configuración	Directrices
AttachmentE_5(d)	cmk-backing-key-rotation-habilitado	Habilite la rotación de claves para garantizar que las claves se roten una vez que hayan alcanzado el final de su período criptográfico.
AttachmentE_1(a)(b)(d)	opensearch-encrypted-at-rest	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté habilitado para tus dominios de Amazon OpenSearch Service.
AttachmentE_1(a)(b)(d)	opensearch-node-to-node-verificación de cifrado	Asegúrese de que el node-to-node cifrado OpenSearch de Amazon Service esté activado. Node-to-nodeel cifrado permite el cifrado TLS 1.2 para todas las comunicaciones dentro de Amazon Virtual Private Cloud (Amazon VPC). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
AttachmentE_1(a)(b)(d)	acm-certificate-expiration-check	Asegúrese de que la integrida d de la red esté protegida asegurándose de que ACM emita los certificados X509. AWS Estos certificados deben ser válidos y estar vigentes. Esta regla requiere un valor para daysToExpiration (valor de prácticas recomendadas de seguridad AWS fundament ales: 90). El valor real debe reflejar las políticas de su organización.
AttachmentE_1(a)(b)(d)	alb-http-to-https-verificación de redireccionamiento	Para ayudar a proteger los datos en tránsito, asegúrese de que el equilibrador de carga de aplicación redirija automáticamente las solicitud es HTTP no cifradas hacia HTTPS. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
AttachmentE_1(a)(b)(d)	api-gw-cache-enabled-y encriptado	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté activado en la caché de la etapa de API Gateway. Puesto que pueden capturarse datos confidenc iales para el método de la API, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	AWS Regla de configuración	Directrices
AttachmentE_1(a)(b)(d)	cloud-trail-encryption-enabled	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en reposo, debe asegurarse de que el cifrado esté habilitado para sus registros de seguimiento de AWS CloudTrail.
AttachmentE_1(a)(b)(d)	cloudwatch-log-group-encrypted	Para ayudar a proteger los datos confidenciales en reposo, asegúrate de que el cifrado esté activado en tus Amazon CloudWatch Log Groups.
AttachmentE_1(a)(b)(d)	efs-encrypted-check	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de Amazon Elastic File System (EFS).
AttachmentE_1(a)(b)(d)	elasticsearch-encrypted-at-rest	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté habilitado para tus dominios de Amazon OpenSearch OpenSearch Service (Servicio).

ID de control	AWS Regla de configuración	Directrices
AttachmentE_1(a)(b)(d)	elb-acm-certificate-required	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en tránsito, debe asegurarse de que el cifrado esté habilitado para su Elastic Load Balancing. Use AWS Certificate Manager para administrar, aprovisionar e implementar SSL/TLS certifica dos públicos y privados con AWS servicios y recursos internos.
AttachmentE_1(a)(b)(d)	encrypted-volumes	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS).
AttachmentE_1(a)(b)(d)	kms-cmk-not-scheduled-para su eliminación	Para ayudar a proteger los datos en reposo, asegúrese de que las claves maestras del cliente (CMKs) necesarias no estén programadas para su eliminación en el Servicio de administración de AWS claves (AWS KMS). Puesto que a veces es necesario eliminar las claves, esta regla ayuda a comprobar todas las claves cuyo borrado está programado para comprobar si alguna está ahí por error.

ID de control	AWS Regla de configuración	Directrices
AttachmentE_1(a)(b)(d)	rds-storage-encrypted	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté habilitado para sus instancias de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenciales en reposo en las instancias de Amazon RDS, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	AWS Regla de configuración	Directrices
AttachmentE_1(a)(b)(d)	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar informaci ón acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezc a un valor para clusterDb Encrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organizac ión.
AttachmentE_1(a)(b)(d)	redshift-require-tls-ssl	Asegúrese de que sus clústeres de Amazon Redshift requieran cifrado TLS/SSL para conectarse a los clientes SQL. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
AttachmentE_1(a)(b)(d)	Habilitado para s3 bucket-server-side-encryption	Para ayudar a proteger los datos en reposo, asegúrese de habilitar el cifrado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de S3, habilite el cifrado para protegerlos.
AttachmentE_1(a)(b)(d)	s3- bucket-ssl-requests-only	Para ayudar a proteger los datos en tránsito, asegúrese de que los buckets de Amazon Simple Storage Service (Amazon S3) requieran solicitudes para usar la capa de sockets seguros (SSL). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
AttachmentE_1(a)(b)(d)	sagemaker-endpoint-configuration-kms-configurado por clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado en su terminal. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker punto final, habilite el cifrado en reposo para ayudar a proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
AttachmentE_1(a)(b)(d)	sagemaker-notebook-instance-kms-configurado por clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado en su portátil. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker portátil, habilite el cifrado en reposo para ayudar a proteger esos datos.
AttachmentE_1(a)(b)(d)	sns-encrypted-kms	Para ayudar a proteger los datos en reposo, asegúrese de que los temas del Amazon Simple Notification Service (Amazon SNS) requieran cifrado AWS mediante el Servicio AWS de administr ación de claves (KMS). Puesto que puede haber datos confidenciales en reposo en los mensajes publicados, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	AWS Regla de configuración	Directrices
AttachmentE_1(a)(b)(d)	ec2- ebs-encryption-by-default	Para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS). Puesto que puede haber datos confidenc iales en reposo en estos volúmenes, habilite el cifrado en reposo para ayudar a protegerlos.
AttachmentE_1(a)(b)(d)	rds-snapshot-encrypted	Asegúrese de que el cifrado esté habilitado para las instantáneas de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenc iales en reposo, habilite el cifrado en reposo para ayudar a protegerlos.
AttachmentE_1(a)(b)(d)	elasticsearch-node-to-node-verificación de cifrado	Asegúrese de que el node-to-node cifrado OpenSearc h de Amazon Service esté activado. Node-to-nodeel cifrado permite el cifrado TLS 1.2 para todas las comunicac iones dentro de Amazon Virtual Private Cloud (Amazon VPC). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	AWS Regla de configuración	Directrices
AttachmentE_1(a)(b)(d)	elb-tls-https-listeners-solo	Asegúrese de que sus Elastic Load Balancers (ELBs) estén configurados con agentes de escucha SSL o HTTPS. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
AttachmentE_1(a)(b)(d)	redshift-cluster-kms-enabled	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado para su clúster de Amazon Redshift. Puesto que puede haber datos confidenciales en reposo en los clústeres de Redshift, habilite el cifrado en reposo para ayudar a protegerlos.
AttachmentE_1(a)(b)(d)	api-gw-ssl-enabled	Asegúrese de que las etapas de la API de REST de Amazon API Gateway estén configuradas con certifica dos SSL para permitir que los sistemas de backend autentiquen que las solicitudes se originan en API Gateway.

Plantilla

La plantilla está disponible en GitHub: Mejores prácticas operativas para el APRA CPG 234.

Prácticas operativas recomendadas para la gestión de activos

Este paquete de conformidad contiene AWS Config reglas basadas en la gestión de activos interna AWS. Para obtener una lista de todas las reglas administradas compatibles AWS Config, consulte la Lista de reglas AWS Config administradas.

Consulte la sección `Parameters` de la siguiente plantilla para ver los nombres y las descripciones de los parámetros obligatorios.

La plantilla está disponible en GitHub: Mejores prácticas operativas para la gestión de activos.

Mejores prácticas operativas para AWS Backup

Este paquete de conformidad contiene AWS Config reglas basadas AWS Backup en AWS ellas. Para obtener una lista de todas las reglas administradas compatibles AWS Config, consulte la Lista de reglas AWS Config administradas.

Consulte la sección `Parameters` de la siguiente plantilla para ver los nombres y las descripciones de los parámetros obligatorios.

La plantilla está disponible en GitHub: Mejores prácticas operativas para AWS Backup.

Prácticas operativas recomendadas para AWS Identity and Access Management

La plantilla está disponible en GitHub: Operational Best Practices for AWS Identity and Access Management.

Mejores prácticas operativas para el pilar de confiabilidad de AWS un marco de trabajo bien diseñado

Los paquetes de conformidad proporcionan un marco de cumplimiento de uso general diseñado para permitirle crear controles de seguridad, operativos o de optimización de costes mediante reglas gestionadas o personalizadas y acciones correctivas. AWS Config AWS Config Los paquetes de conformidad, como plantillas de ejemplo, no están diseñados para garantizar plenamente el cumplimiento de una norma de gobernanza o de conformidad específicas. Usted debe evaluar si su uso de los servicios cumple con los requisitos legales y normativos aplicables.

A continuación, se proporciona un ejemplo de mapeo entre el pilar de confiabilidad del marco de trabajo de Well-Architected de Amazon Web Services y AWS las reglas de Config administradas.

Cada regla de Config se aplica a un AWS recurso específico y se refiere a uno o más de los principios de diseño del pilar. Una categoría de Well-Architected Framework puede estar relacionada con varias reglas de Config. Consulte la siguiente tabla para obtener más detalles y orientación relacionados con estas asignaciones.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
REL-1	¿Cómo administra las cuotas de servicio y las restricciones? Para las arquitecturas de carga de trabajo basadas en la nube, existen cuotas de servicio (que también se denominan límites de servicio). Estas cuotas existen para evitar el aprovisio namiento accidental de más recursos de los que se necesitan y para limitar las tasas de solicitud es en las operacion es de la API a fin de proteger los servicios contra el abuso. También hay limitacio nes de recursos, por ejemplo, la velocidad a la que se pueden introducir bits por un cable de fibra óptica o la cantidad	dynamodb-throughpu t-limit-check	Active esta regla para asegurarse de que la capacidad de rendimiento aprovisionada se compruebe en las tablas de Amazon DynamoDB. Esta es la cantidad de read/ write actividad que puede soportar cada mesa. DynamoDB utiliza esta informaci ón para reservar recursos del sistema suficientes para satisfacer sus necesidades de rendimiento. Esta regla genera una alerta cuando el rendimiento se acerca al límite máximo de la cuenta de un cliente. Esta regla le permite configurar opcionalm ente los parámetro s de RCUThreshold porcentaje de cuenta

ID de control	Descripción del control	AWS Regla de configuración	Directrices
	de almacenamiento en un disco físico.		(Config Default: 80) y WCUThreshold Percentage de cuenta (Config Default: 80). Los valores reales deben reflejar las políticas de su organización.

REL-1	¿Cómo administra las cuotas de servicio y las restricciones? Para las arquitecturas de carga de trabajo basadas en la nube, existen cuotas de servicio (que también se denominan límites de servicio). Estas cuotas existen para evitar el aprovisio namiento accidental de más recursos de los que se necesitan y para limitar las tasas de solicitud es en las operacion es de la API a fin de proteger los servicios contra el abuso. También hay limitacio nes de recursos, por ejemplo, la velocidad a la que se pueden introducir bits por un cable de fibra óptica o la cantidad de almacenamiento en un disco físico.	lambda-concurrency-check	Esta regla garantiza que se establezcan los límites máximos y mínimos de simultane idad de una función Lambda. Esto puede ayudar a la hora de establecer el número de solicitudes de referencia que la función atiende en un momento dado.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
REL-1	¿Cómo administra las cuotas de servicio y las restricciones? Para las arquitecturas de carga de trabajo basadas en la nube, existen cuotas de servicio (que también se denominan límites de servicio). Estas cuotas existen para evitar el aprovisio namiento accidental de más recursos de los que se necesitan y para limitar las tasas de solicitud es en las operacion es de la API a fin de proteger los servicios contra el abuso. También hay limitacio nes de recursos, por ejemplo, la velocidad a la que se pueden introducir bits por un cable de fibra óptica o la cantidad de almacenamiento en un disco físico.	ecs-task-definition-memory-límite estricto	Limitar el máximo de memoria disponible para los contenedo res de Amazon Elastic Container Service (ECS) garantiza que no se haga un uso indebido de los recursos en caso de que se produzca un acceso malintencionado a los contenedores.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
REL-2	¿Cómo planifica la topología de la red? Las cargas de trabajo suelen existir en varios entornos. Estos incluyen varios entornos de nube (tanto de acceso público como privados) y, posiblemente, la infraestructura de su centro de datos existente. Los planes deben incluir consideraciones sobre la red, como la conectividad dentro y entre sistemas, la administración de direcciones IP públicas, la administración de direcciones IP privadas y la resolución de nombres de dominio.	vpc-vpn-2-tunnels-up	Se pueden implementar túneles Site-to-Site VPN redundantes para cumplir con los requisitos de resiliencia. Utiliza dos túneles para garantizar la conectividad en caso de que una de las conexiones Site-to-Site VPN no esté disponible. Para protegerse contra la pérdida de conectividad, en caso de que su pasarela de cliente deje de estar disponible, puede configurar una segunda conexión de Site-to-Site VPN a su Amazon Virtual Private Cloud (Amazon VPC) y a su puerta de enlace privada virtual mediante una segunda pasarela de cliente.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
REL-2	¿Cómo planifica la topología de la red? Las cargas de trabajo suelen existir en varios entornos. Estos incluyen varios entornos de nube (tanto de acceso público como privados) y, posiblemente, la infraestructura de su centro de datos existente. Los planes deben incluir consideraciones sobre la red, como la conectividad dentro y entre sistemas, la administración de direcciones IP públicas, la administración de direcciones IP privadas y la resolución de nombres de dominio.	redshift-enhanced-vpc-routing-habilitada	El enrutamiento de VPC mejorado fuerza que todo el tráfico de COPY y UNLOAD entre los repositorios de datos y de clúster pase por su Amazon VPC. A continuación, puede utilizar las características de la VPC, como los grupos de seguridad y las listas de control de acceso a la red, para proteger el tráfico de la red. También puede usar los registros de flujo de la VPC para monitorear el tráfico de la red.

REL-2	¿Cómo planifica la topología de la red? Las cargas de trabajo suelen existir en varios entornos. Estos incluyen varios entornos de nube (tanto de acceso público como privados) y, posiblemente, la infraestructura de su centro de datos existente. Los planes deben incluir consideraciones sobre la red, como la conectividad dentro y entre sistemas, la administración de direcciones IP públicas, la administración de direcciones IP privadas y la resolución de nombres de dominio.	ec2- instances-in-vpc	Implemente instancias de Amazon Elastic Compute Cloud (Amazon EC2) dentro de una Amazon Virtual Private Cloud (Amazon VPC) para permitir una comunicación segura entre una instancia y otros servicios dentro de la Amazon VPC, sin necesidad de utilizar una puerta de enlace de internet, un dispositivo NAT ni una conexión de VPN. Todo el tráfico permanece seguro dentro de la AWS nube. Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Asigne instancias de Amazon EC2 a una

ID de control	Descripción del control	AWS Regla de configuración	Directrices
			Amazon VPC para gestionar correctam ente el acceso.
REL-5	¿Cómo se diseñan las interacciones en un sistema distribuido para mitigar o resistir los errores? Los sistemas distribuidos se basan en las redes de comunicaciones para interconectar componentes, como servidores o servicios . Su carga de trabajo debe funcionar de manera fiable a pesar de la pérdida de datos o la latencia en estas redes. Los component es del sistema distribuido deben funcionar de manera que no afecten negativamente a otros component es o a la carga de trabajo. Estas prácticas recomenda das previenen los fallos y mejoran el tiempo medio entre errores (MTBD).	lambda-dlq-check	Active esta regla para ayudar a notificar al personal correspon diente mediante Amazon Simple Queue Service (Amazon SQS) o Amazon Simple Notification Service (Amazon SNS) cuando una función falle.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
REL-6	¿Cómo se supervisan los recursos de la carga de trabajo? Los registros y las métricas son herramientas poderosas para obtener información sobre el estado de su carga de trabajo. Puede configurar su carga de trabajo para supervisar los registros y las métricas y enviar notificaciones cuando se superen los umbrales o se produzcan eventos significativos. La supervisión le permite a su carga de trabajo reconocer cuándo se superan los umbrales de bajo rendimiento o si se producen errores, de modo que pueda recuperarse automáticamente en respuesta a ellos.	autoscaling-group-elb-healthcheck-obligatorio	Las revisiones de estado de Elastic Load Balancer (ELB) para los grupos de escalado automático de Amazon Elastic Compute Cloud (Amazon EC2) permiten mantener la capacidad y disponibilidad adecuadas. De forma periódica, el equilibrador de carga envía pings, intenta establecer conexiones o envía solicitudes para probar el estado de las instancias de Amazon EC2 en un grupo de escalado automático. Si una instancia no informa, el tráfico se envía a una nueva instancia de Amazon EC2.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
REL-6	¿Cómo se supervisan los recursos de la carga de trabajo? Los registros y las métricas son herramientas poderosas para obtener información sobre el estado de su carga de trabajo. Puede configurar su carga de trabajo para supervisar los registros y las métricas y enviar notificaciones cuando se superen los umbrales o se produzcan eventos significativos. La supervisión le permite a su carga de trabajo reconocer cuándo se superan los umbrales de bajo rendimiento o si se producen errores, de modo que pueda recuperarse automáticamente en respuesta a ellos.	api-gw-xray-enabled	AWS X-Ray recopila datos sobre las solicitudes que atiende su aplicación y proporciona herramientas que puede utilizar para ver, filtrar y obtener información sobre esos datos a fin de identificar problemas y oportunidades de optimización. Asegúrese de que X-Ray esté habilitado para que pueda ver información detallada no solo sobre la solicitud y la respuesta, sino también sobre las llamadas que su aplicación realiza a AWS los recursos descendentes, los microservicios, las bases de datos y la web HTTP. APIs

REL-6	¿Cómo se supervisan los recursos de la carga de trabajo? Los registros y las métricas son herramientas poderosas para obtener información sobre el estado de su carga de trabajo. Puede configurar su carga de trabajo para supervisar los registros y las métricas y enviar notificaciones cuando se superen los umbrales o se produzcan eventos significativos. La supervisión le permite a su carga de trabajo reconocer cuándo se superan los umbrales de bajo rendimiento o si se producen errores, de modo que pueda recuperarse automáticamente en respuesta a ellos.	cloudtrail-s3-dataevents-enabled	La recopilación de eventos de datos del Simple Storage Service (Amazon S3) ayuda a detectar cualquier actividad anómala. Los detalles incluyen Cuenta de AWS información sobre el acceso a un bucket de Amazon S3, la dirección IP y la hora del evento.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
REL-6	¿Cómo se supervisan los recursos de la carga de trabajo? Los registros y las métricas son herramientas poderosas para obtener información sobre el estado de su carga de trabajo. Puede configurar su carga de trabajo para supervisar los registros y las métricas y enviar notificaciones cuando se superen los umbrales o se produzcan eventos significativos. La supervisión le permite a su carga de trabajo reconocer cuándo se superan los umbrales de bajo rendimiento o si se producen errores, de modo que pueda recuperarse automáticamente en respuesta a ellos.	elasticsearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta. Los registros de errores de los dominios pueden ayudar en las auditorías de seguridad y acceso, además de para diagnosticar problemas de disponibilidad.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
REL-6	¿Cómo se supervisan los recursos de la carga de trabajo? Los registros y las métricas son herramientas poderosas para obtener información sobre el estado de su carga de trabajo. Puede configurar su carga de trabajo para supervisar los registros y las métricas y enviar notificaciones cuando se superen los umbrales o se produzcan eventos significativos. La supervisión le permite a su carga de trabajo reconocer cuándo se superan los umbrales de bajo rendimiento o si se producen errores, de modo que pueda recuperarse automáticamente en respuesta a ellos.	opensearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta. OpenSearch Los registros de errores del servicio pueden ayudar con las auditorías de seguridad y acceso, y pueden ayudar a diagnosticar problemas de disponibilidad.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
REL-6	¿Cómo se supervisan los recursos de la carga de trabajo? Los registros y las métricas son herramientas poderosas para obtener información sobre el estado de su carga de trabajo. Puede configurar su carga de trabajo para supervisar los registros y las métricas y enviar notificaciones cuando se superen los umbrales o se produzcan eventos significativos. La supervisión le permite a su carga de trabajo reconocer cuándo se superan los umbrales de bajo rendimiento o si se producen errores, de modo que pueda recuperarse automáticamente en respuesta a ellos.	ecs-container-insights-enabled	La supervisión es una parte importante del mantenimiento de la fiabilidad, la disponibilidad y el rendimiento de Amazon Elastic Container Service (ECS) y sus AWS soluciones. Información de contenedores también proporciona información de diagnóstico, como, por ejemplo, errores de reinicio de contenedores, para ayudarlo a aislar problemas y solucionarlos rápidamente.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
REL-6	¿Cómo se supervisan los recursos de la carga de trabajo? Los registros y las métricas son herramientas poderosas para obtener información sobre el estado de su carga de trabajo. Puede configurar su carga de trabajo para supervisar los registros y las métricas y enviar notificaciones cuando se superen los umbrales o se produzcan eventos significativos. La supervisión le permite a su carga de trabajo reconocer cuándo se superan los umbrales de bajo rendimiento o si se producen errores, de modo que pueda recuperarse automáticamente en respuesta a ellos.	elb-logging-enabled	La actividad de Elastic Load Balancing es un punto central de comunicación dentro de un entorno. Asegúrese de que el registro de ELB esté habilitado. Los datos recopilados proporcionan información detallada sobre las solicitudes enviadas al ELB. Cada registro contiene distintos datos, como el momento en que se recibió la solicitud, la dirección IP del cliente, las latencias, las rutas de solicitud y las respuestas del servidor.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
REL-6	¿Cómo se supervisan los recursos de la carga de trabajo? Los registros y las métricas son herramientas poderosas para obtener información sobre el estado de su carga de trabajo. Puede configurar su carga de trabajo para supervisar los registros y las métricas y enviar notificaciones cuando se superen los umbrales o se produzcan eventos significativos. La supervisión le permite a su carga de trabajo reconocer cuándo se superan los umbrales de bajo rendimiento o si se producen errores, de modo que pueda recuperarse automáticamente en respuesta a ellos.	multi-region-cloudtrail-enabled	AWS CloudTrail registra las acciones AWS de la consola de administración y las llamadas a la API. Puede identificar qué usuarios y cuentas llamaron AWS, la dirección IP de origen desde la que se realizaron las llamadas y cuándo se produjeron. CloudTrail entregará los archivos de registro de todas AWS las regiones a su bucket de S3 si MULTI_REGION_CLOUD_TRAIL_ENABLED está activado. Además, al AWS lanzar una nueva región, CloudTrail creará la misma ruta en la nueva región. En consecuencia, recibirá archivos de registro con la actividad de la API en la nueva región sin necesidad de realizar ninguna acción.

REL-7	¿Cómo diseña su carga de trabajo para adaptarla a los cambios de la demanda? Una carga de trabajo escalable proporciona elasticidad para agregar o eliminar recursos automáticamente, de modo que se ajusten perfectamente a la demanda actual en cualquier momento dado.	autoscaling-group-elb-healthcheck-obligatorio	Las revisiones de estado de Elastic Load Balancer (ELB) para los grupos de escalado automático de Amazon Elastic Compute Cloud (Amazon EC2) permiten mantener la capacidad y disponibilidad adecuadas. De forma periódica, el equilibrador de carga envía pings, intenta establecer conexiones o envía solicitudes para probar el estado de las instancias de Amazon EC2 en un grupo de escalado automático. Si una instancia no informa, el tráfico se envía a una nueva instancia de Amazon EC2.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
REL-7	¿Cómo diseña su carga de trabajo para adaptarla a los cambios de la demanda? Una carga de trabajo escalable proporciona elasticidad para agregar o eliminar recursos automáticamente, de modo que se ajusten perfectamente a la demanda actual en cualquier momento dado.	dynamodb-autoscaling-enabled	El escalado automático de Amazon DynamoDB AWS usa el servicio Application Auto Scaling para ajustar la capacidad de rendimiento aprovisionada para que responda automáticamente a los patrones de tráfico reales. Esto permite que una tabla o un índice secundario global aumente su read/write capacidad aprovisionada para gestionar los aumentos repentinos de tráfico, sin limitaciones.

Los componentes que se encuentran fuera del límite no se ven afectados por el error. Al usar múltiples límites aislados de errores, puede limitar el impacto en su carga de trabajo.	vpc-vpn-2-tunnels-up	Se pueden implementar túneles Site-to-Site VPN redundantes para cumplir con los requisitos de resiliencia. Utiliza dos túneles para garantizar la conectividad en caso de que una de las conexiones Site-to-Site VPN no esté disponible. Para protegerse contra la pérdida de conectividad, en caso de que su pasarela de cliente deje de estar disponible, puede configurar una segunda conexión de Site-to-Site VPN a su Amazon Virtual Private Cloud (Amazon VPC) y a su puerta de enlace privada virtual mediante una segunda pasarela de cliente.

Plantilla

La plantilla está disponible en GitHub: Operational Best Practices for AWS Well-Architected Reliability Pillar.

Mejores prácticas operativas para el pilar de seguridad de AWS Well-Architected Framework

Los paquetes de conformidad proporcionan un marco de cumplimiento de uso general diseñado para permitirle crear controles de seguridad, operativos o de optimización de costes mediante reglas gestionadas o personalizadas y acciones correctivas. AWS Config AWS Config Los paquetes de conformidad, como plantillas de ejemplo, no están diseñados para garantizar plenamente el cumplimiento de una norma de gobernanza o de conformidad específicas. Usted debe evaluar si su uso de los servicios cumple con los requisitos legales y normativos aplicables.

A continuación, se proporciona un ejemplo de mapeo entre el pilar de seguridad del marco de arquitectura Well-Architected de Amazon Web Services y AWS las reglas de Config gestionadas. Cada regla de Config se aplica a un AWS recurso específico y se refiere a uno o más de los principios de diseño del pilar. Una categoría de Well-Architected Framework puede estar relacionada con varias reglas de Config. Consulte la siguiente tabla para obtener más detalles y orientación relacionados con estas asignaciones.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-1	¿Cómo gestiona su carga de trabajo de forma segura? Para gestionar su carga de trabajo de forma segura, debe aplicar las prácticas recomendadas generales en todas las áreas de seguridad. Tome los requisitos y procesos	account-part-of-organizations	La administración centralizada Cuentas de AWS dentro de AWS Organizations ayuda a garantizar que las cuentas cumplan con las normas. ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-5	¿Cómo protege los recursos de su red? Cualquier carga de trabajo que tenga algún tipo de conectividad de red, ya sea a Internet o una red privada, requiere varios niveles de defensa para ayudar a protegerse de las amenazas externas e internas basadas en la red.	autoscaling-launch-config-public-ip deshabilitada	Si configura las interfaces de red con una dirección IP pública, se puede acceder a los recursos asociados a esas interfaces de red desde Internet. Los recursos de EC2 no deben ser de acceso público, ya que esto podría permitir el acceso no deseado a sus aplicaciones o servidores.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-5	¿Cómo protege los recursos de su red? Cualquier carga de trabajo que tenga algún tipo de conectividad de red, ya sea a Internet o una red privada, requiere varios niveles de defensa para ayudar a protegerse de las amenazas externas e internas basadas en la red.	restricted-common-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integridad y confidencialidad de los sistemas. Esta regla le permite configurar de forma opcional los parámetros blockedPort1 a blockedPort5 (valores predeterminados de Config: 20,21,3389,3306,4333). Los valores reales deben reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-5	¿Cómo protege los recursos de su red? Cualquier carga de trabajo que tenga algún tipo de conectividad de red, ya sea a Internet o una red privada, requiere varios niveles de defensa para ayudar a protegerse de las amenazas externas e internas basadas en la red.	vpc-sg-open-only-to-authorized-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integridad y confidencialidad de los sistemas. Al restringir el acceso a los recursos dentro de un grupo de seguridad desde internet (0.0.0.0/0), se puede controlar el acceso remoto a los sistemas internos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-5	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	waf-regional-rule-not-vacío	Asegúrese de que su AWS WAF tenga una regla que no esté vacía. Una regla sin condiciones podría desencadenar un comportamiento no deseado.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-5	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	waf-regional-rulegroup-not-vacío	Asegúrese de que su AWS WAF tenga un grupo de reglas que no esté vacío. Un grupo de reglas vacío podría desencadenar un comportamiento no deseado.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-5	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	waf-regional-webacl-not-vacío	Una ACL web adjunta a un AWS WAF puede contener un conjunto de reglas y grupos de reglas para inspeccionar y controlar las solicitudes web. Si una ACL web está vacía, el tráfico web pasa sin que el WAF lo detecte ni actúe sobre él.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-5	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	vpc-network-acl-unused-comprobar	Esta regla garantiza que se utilicen las listas de control de acceso a la red de Amazon Virtual Private Cloud (VPC). El monitoreo de las listas de control de acceso a la red no utilizadas puede ayudar a realizar un inventario y una gestión precisos del entorno.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-5	¿Cómo protege los recursos de su red? Cualquier carga de trabajo que tenga algún tipo de conectividad de red, ya sea a Internet o una red privada, requiere varios niveles de defensa para ayudar a protegerse de las amenazas externas e internas basadas en la red.	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a monitorear y detectar posibles eventos de ciberseguridad mediante fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-5	¿Cómo protege los recursos de su red? Cualquier carga de trabajo que tenga algún tipo de conectividad de red, ya sea a Internet o una red privada, requiere varios niveles de defensa para ayudar a protegerse de las amenazas externas e internas basadas en la red.	vpc-flow-logs-enabled	Los registros del flujo de la VPC proporcionan registros detallados acerca del tráfico IP entrante y saliente de las interfaces de red en su Amazon Virtual Private Cloud (Amazon VPC). De forma predeterminada, el registro de flujo incluye valores para los distintos componentes del flujo de IP, incluido el origen, el destino y el protocolo.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	rds-automatic-minor-version-habilitada para la actualización	Habilite las actualizaciones automáticas de las versiones secundarias en sus instancias de Amazon Relational Database Service (RDS) para garantizar que estén instaladas las últimas actualizaciones de las versiones secundarias del sistema de administración de bases de datos relacionales (RDBMS, por sus siglas en inglés), que pueden incluir parches de seguridad y correcciones de errores.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	cloud-trail-log-file-habilitada para la validación	Utilice la validación de los archivos de AWS CloudTrail registro para comprobar la integridad de los registros. CloudTrail La validación del archivo de registro ayuda a determinar si un archivo de registro se modificó, se eliminó o no se modificó después de CloudTrail entregarlo. Esta característica se compila mediante los algoritmos estándar de la industria: SHA-256 para el hash y SHA-256 con RSA para la firma digital. Esto hace que sea computacionalmente inviable modificar, eliminar o falsificar los archivos de CloudTrail registro sin ser detectados.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	cloudtrail-security-trail-enabled	Esta regla ayuda a garantizar el uso de las mejores prácticas de seguridad AWS recomendadas AWS CloudTrail, ya que comprueba la habilitación de varios ajustes. Estas incluyen el uso del cifrado de registros, la validación de registros y la habilitación AWS CloudTrail en varias regiones.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	elastic-beanstalk-managed-updates-habilitado	La activación de las actualizaciones de plataforma gestionadas para un entorno de Amazon Elastic Beanstalk garantiza que se instalen las últimas correcciones, actualizaciones y características de la plataforma disponibles para el entorno. Mantenerse actualizado mediante la instalación de parches es una práctica recomendada para proteger los sistemas.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	lambda-inside-vpc	Implemente funciones de AWS Lambda en una Amazon Virtual Private Cloud (Amazon VPC) para una comunicación segura entre una función y otros servicios de la Amazon VPC. Con esta configuración, no se requiere ninguna puerta de enlace de internet, dispositivo NAT ni conexión de VPN. Todo el tráfico permanece de forma segura en la nube. AWS Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Para gestionar correctamente el acceso, las funciones de AWS Lambda

ID de control	Descripción del control	AWS Regla de configuración	Directrices
			deben asignarse a una VPC.
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	ecr-private-image-scanning-habilitado	El análisis de imágenes de Amazon Elastic Container Repository (ECR) ayuda a identificar vulnerabilidades de software en las imágenes de contenedor. Al habilitar el análisis de imágenes en los repositorios de ECR, se añade un nivel de verificación de la integridad y seguridad de las imágenes que se almacenan.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	ecs-container-insights-enabled	La supervisión es una parte importante del mantenimiento de la fiabilidad, la disponibilidad y el rendimiento de Amazon Elastic Container Service (ECS) y sus AWS soluciones. Información de contenedores también proporciona información de diagnóstico, como, por ejemplo, errores de reinicio de contenedores, para ayudarlo a aislar problemas y solucionarlos rápidamente.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	ecs-fargate-latest-platform-versión	Las actualizaciones y los parches de seguridad se implementan automáticamente para sus tareas de AWS Fargate. Si se detecta un problema de seguridad que afecte a una versión de la plataforma AWS Fargate, aplique AWS parches a la versión de la plataforma. Para facilitar la administración de parches de las tareas de Amazon Elastic Container Service (ECS) que ejecutan AWS Fargate, actualice las tareas independientes de sus servicios para usar la versión de plataforma más reciente.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	redshift-cluster-maintenancesettings-check	Esta regla garantiza que los clústeres de Amazon Redshift tengan la configuración preferida para su organización. En concreto, que tengan períodos de mantenimiento preferidos y períodos de retención automática de instantáneas para la base de datos. Esta regla requiere que configure el. allowVersionUpgrade El valor predeterminado es true. También te permite configurar de forma opcional el periodo preferredMaintenanceWindow (el predeterminado es sáb: 16:00 -sáb: 16:30) y el automated SnapshotRetention Periodo (el valor predeterminado es 1). Los valores reales deben reflejar

ID de control	Descripción del control	AWS Regla de configuración	Directrices
			las políticas de su organización.
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	ec2-imdsv2-check	Asegúrese de que el método Servicio de metadatos de instancias versión 2 (IMDSv2) esté habilitado para ayudar a proteger el acceso y el control de los metadatos de instancia de Amazon Elastic Compute Cloud (Amazon EC2). El IMDSv2 método utiliza controles basados en sesiones. Con IMDSv2, se pueden implementar controles para restringir los cambios en los metadatos de la instancia.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	ec2- instance-multiple-eni-check	Esta regla comprueba si las instancias de Amazon Elastic Compute Cloud (Amazon EC2) tienen varias. ENIs Tener varias ENIs puede provocar instancias de doble host, es decir, instancias que tienen varias subredes. Esto puede añadir complejidad a la seguridad de la red e introducir rutas y accesos a la red no deseados.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	ec2- instance-no-public-ip	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de Amazon Elastic Compute Cloud (Amazon EC2). Las instancias de Amazon EC2 pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	ec2- instance-profile-attached	Los perfiles de instancias de EC2 pasan un rol de IAM a una instancia de EC2. Adjuntar un perfil de instancia a las instancias puede ayudar a gestionar los privilegios mínimos y los permisos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administración de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios, instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	ec2- -eni-periodic security-group-attached-to	Esta regla garantiza que los grupos de seguridad estén asociados a una instancia de Amazon Elastic Compute Cloud (Amazon EC2) o a una ENI. Esta regla ayuda a monitorear los grupos de seguridad no utilizados en el inventario y la administración de su entorno.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	ec2-stopped-instance	Habilite esta regla para facilitar la configuración de referencia de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) al comprobar si las instancias de Amazon EC2 se han detenido durante más días de los permitidos, de acuerdo con los estándares de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	ec2- volume-inuse-check	Esta regla garantiza que los volúmenes de Amazon Elastic Block Store que están adjuntos a instancias de Amazon Elastic Compute Cloud (Amazon EC2) estén marcados para su eliminación al finalizar una instancia. Si un volumen de Amazon EBS no se elimina al finalizar la instancia a la que está asociado, podría infringir el concepto de funcionalidad mínima.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	ec2- -check managedinstance-association-compliance-status	Use AWS Systems Manager Associations para ayudar con el inventario de las plataformas y aplicaciones de software dentro de una organización. AWS Systems Manager asigna un estado de configuración a las instancias administradas y le permite establecer líneas base de los niveles de parches del sistema operativo, las instalaciones de software, las configuraciones de las aplicaciones y otros detalles sobre su entorno.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-6	¿Cómo protege sus recursos de computación? Los recursos de computación de su carga de trabajo requieren varios niveles de defensa para protegerse de las amenazas externas e internas. Los recursos informáticos incluyen instancias EC2, contenedores, funciones AWS Lambda, servicios de bases de datos, dispositivos IoT y más.	ec2- -check managedinstance-patch-compliance-status	Habilite esta regla para ayudar a identificar y documentar las vulnerabilidades de Amazon Elastic Compute Cloud (Amazon EC2). La regla comprueba si los parches de instancias Amazon EC2 cumplen con los requisitos de las políticas y procedimientos de su organización en AWS Systems Manager.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	api-gw-cache-enabled-y cifrados	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté activado en la caché de la etapa de API Gateway. Puesto que pueden capturarse datos confidenciales para el método de la API, habilite el cifrado en reposo para ayudar a protegerlos.
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	backup-recovery-point-encrypted	Asegúrese de que el cifrado esté activado en sus puntos AWS de recuperación de Backup. Puesto que puede haber datos confidenciales en reposo, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	codebuild-project-artifact-encryption	Para ayudar a proteger los datos confidenciales en reposo, asegúrese de que el cifrado de sus AWS CodeBuild artefactos esté activado.
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	codebuild-project-s3 registros cifrados	Para ayudar a proteger los datos confidenciales en reposo, asegúrese de que el cifrado esté habilitado para AWS CodeBuild los registros almacenados en Amazon S3.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	kms-cmk-not-scheduled-para su eliminación	Para ayudar a proteger los datos en reposo, asegúrese de que las claves maestras del cliente (CMKs) necesarias no estén programadas para su eliminación en el Servicio de administración de AWS claves (AWS KMS). Puesto que a veces es necesario eliminar las claves, esta regla ayuda a comprobar todas las claves cuyo borrado está programado para comprobar si alguna está ahí por error.
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	cloud-trail-encryption-enabled	Como es posible que existan datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté activado en tus AWS CloudTrail registros.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	cloudwatch-log-group-encrypted	Para ayudar a proteger los datos confidenciales en reposo, asegúrate de que el cifrado esté activado en tus Amazon CloudWatch Log Groups.
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	dynamodb-table-encrypted-kms	Asegúrese de que el cifrado esté habilitado para las tablas de Amazon DynamoDB. Puesto que puede haber datos confidenciales en reposo en estas tablas, habilite el cifrado en reposo para ayudar a protegerlos. De forma predeterminada, las tablas de DynamoDB se AWS cifran con una clave maestra del cliente (CMK) propia.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	ec2- ebs-encryption-by-default	Para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS). Puesto que puede haber datos confidenciales en reposo en estos volúmenes, habilite el cifrado en reposo para ayudar a protegerlos.
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	efs-encrypted-check	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de Amazon Elastic File System (EFS).

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	elasticsearch-encrypted-at-rest	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté habilitado para tus dominios de Amazon OpenSearch OpenSearch Service (Servicio).
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	opensearch-encrypted-at-rest	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté habilitado para tus dominios de Amazon OpenSearch Service.
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	encrypted-volumes	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS).

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	rds-snapshot-encrypted	Asegúrese de que el cifrado esté habilitado para las instantáneas de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenciales en reposo, habilite el cifrado en reposo para ayudar a protegerlos.
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	rds-storage-encrypted	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté habilitado para sus instancias de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenciales en reposo en las instancias de Amazon RDS, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar información acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezca un valor para clusterDbEncrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	redshift-cluster-kms-enabled	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado para su clúster de Amazon Redshift. Puesto que puede haber datos confidenciales en reposo en los clústeres de Redshift, habilite el cifrado en reposo para ayudar a protegerlos.
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	habilitado para s3 bucket-server-side-encryption	Para ayudar a proteger los datos en reposo, asegúrese de habilitar el cifrado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de S3, habilite el cifrado para protegerlos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	s3- default-encryption -kms	Asegúrese de tener el cifrado habilitad o para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de Amazon S3, habilite el cifrado en reposo para protegerlos.
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	sagemaker-endpoint -configuration-kms- configurado por clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administr ación de AWS claves (AWS KMS) esté habilitado en su terminal. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker punto final, habilite el cifrado en reposo para ayudar a proteger esos datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	sagemaker-notebook-instance-kms-configurado por clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado en su portátil. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker portátil, habilite el cifrado en reposo para ayudar a proteger esos datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	secretsmanager-using-cmk	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con AWS Key Management Service (AWS KMS) esté habilitado para AWS los secretos de Secrets Manager. Puesto que puede haber datos confidenciales en reposo en secretos de Secrets Manager, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	sns-encrypted-kms	Para ayudar a proteger los datos en reposo, asegúrese de que los temas del Amazon Simple Notification Service (Amazon SNS) requieran cifrado AWS mediante el Servicio AWS de administración de claves (KMS). Puesto que puede haber datos confidenciales en reposo en los mensajes publicados, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	s3- bucket-versioning-enabled	El control de versiones de buckets de Amazon Simple Storage Service (Amazon S3) permite usar múltiples variantes de un objeto en el mismo bucket de Amazon S3. Use el control de versiones para conservar, recuperar y restaurar todas las versiones de los objetos almacenados en su bucket de Amazon S3. El control de versiones ayuda a recuperarse fácilmente de acciones no deseadas del usuario y de errores de la aplicación.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	account-part-of-organizations	La administración centralizada Cuentas de AWS dentro de AWS Organizations ayuda a garantizar que las cuentas cumplan con las normas. La falta de gobernanza centralizada de las cuentas puede provocar incoherencias en las configuraciones de cuentas, lo que puede exponer los recursos y los datos confidenciales.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	s3- account-level-public-access -bloques-periodicos	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configurar opcionalmente los restrictPublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	s3- bucket-level-public-access -prohibido	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público en el nivel del bucket.
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	s3- bucket-public-read -prohibited	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositivos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-8	¿Cómo protege sus datos en reposo? Proteja sus datos en reposo mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o mala gestión.	s3- bucket-public-write-prohibited	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositivos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-9	¿Cómo protege sus datos en tránsito? Proteja sus datos en tránsito mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o pérdida.	acm-certificate-expiration-check	Asegúrese de que la integridad de la red esté protegida asegurándose de que ACM emita los certificados X509. AWS Estos certificados deben ser válidos y estar vigentes. Esta regla requiere un valor para daysToExpiration (valor de prácticas recomendadas de seguridad AWS fundamentales: 90). El valor real debe reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-9	¿Cómo protege sus datos en tránsito? Proteja sus datos en tránsito mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o pérdida.	elbv2- acm-certificate-required	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en tránsito, debe asegurarse de que el cifrado esté habilitado para su Elastic Load Balancing. Use AWS Certificate Manager para administrar, aprovisionar e implementar SSL/TLS certificados públicos y privados con AWS servicios y recursos internos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-9	¿Cómo protege sus datos en tránsito? Proteja sus datos en tránsito mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o pérdida.	elb-acm-certificate-required	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en tránsito, debe asegurarse de que el cifrado esté habilitado para su Elastic Load Balancing. Use AWS Certificate Manager para administrar, aprovisionar e implementar SSL/TLS certificados públicos y privados con AWS servicios y recursos internos.
SEC-9	¿Cómo protege sus datos en tránsito? Proteja sus datos en tránsito mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o pérdida.	alb-http-drop-invalid-habilitado para el encabezado	Asegúrese de que su Elastic Load Balancing (ELB) esté configurado para eliminar los encabezados http. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-9	¿Cómo protege sus datos en tránsito? Proteja sus datos en tránsito mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o pérdida.	alb-http-to-https-verificación de redireccionamiento	Para ayudar a proteger los datos en tránsito, asegúrese de que el equilibrador de carga de aplicació n redirija automátic amente las solicitud es HTTP no cifradas hacia HTTPS. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
SEC-9	¿Cómo protege sus datos en tránsito? Proteja sus datos en tránsito mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o pérdida.	api-gw-ssl-enabled	Asegúrese de que las etapas de la API de REST de Amazon API Gateway estén configuradas con certificados SSL para permitir que los sistemas de backend autentiquen que las solicitudes se originan en API Gateway.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-9	¿Cómo protege sus datos en tránsito? Proteja sus datos en tránsito mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o pérdida.	elasticsearch-node-to-node-verificación de cifrado	Asegúrese de que el node-to-node cifrado OpenSearch de Amazon Service esté activado. Node-to-nodeel cifrado permite el cifrado TLS 1.2 para todas las comunicaciones dentro de Amazon Virtual Private Cloud (Amazon VPC). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-9	¿Cómo protege sus datos en tránsito? Proteja sus datos en tránsito mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o pérdida.	opensearch-node-to-node-comprobación de cifrado	Asegúrese de que el node-to-node cifrado OpenSearch de Amazon Service esté activado. Node-to-nodeel cifrado permite el cifrado TLS 1.2 para todas las comunicaciones dentro de Amazon Virtual Private Cloud (Amazon VPC). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
SEC-9	¿Cómo protege sus datos en tránsito? Proteja sus datos en tránsito mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o pérdida.	opensearch-https-required	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en tránsito, asegúrate de que HTTPS esté habilitado para las conexiones a tus dominios de Amazon OpenSearch Service.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-9	¿Cómo protege sus datos en tránsito? Proteja sus datos en tránsito mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o pérdida.	redshift-require-tls-ssl	Asegúrese de que sus clústeres de Amazon Redshift requieran TLS/SSL cifrado para conectarse a los clientes de SQL. Puesto que puede haber datos confidenc iales, habilite el cifrado en tránsito para proteger esos datos.
SEC-9	¿Cómo protege sus datos en tránsito? Proteja sus datos en tránsito mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o pérdida.	s3- bucket-ssl-request s-only	Para ayudar a proteger los datos en tránsito, asegúrese de que los buckets de Amazon Simple Storage Service (Amazon S3) requieran solicitud es para usar la capa de sockets seguros (SSL). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-9	¿Cómo protege sus datos en tránsito? Proteja sus datos en tránsito mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o pérdida.	elb-tls-https-listeners-solo	Asegúrese de que sus Elastic Load Balancers (ELBs) estén configura dos con agentes de escucha SSL o HTTPS. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
SEC-9	¿Cómo protege sus datos en tránsito? Proteja sus datos en tránsito mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o pérdida.	vpc-flow-logs-enabled	Los registros del flujo de la VPC proporcionan registros detallados acerca del tráfico IP entrante y saliente de las interfaces de red en su Amazon Virtual Private Cloud (Amazon VPC). De forma predeterm inada, el registro de flujo incluye valores para los distintos componentes del flujo de IP, incluido el origen, el destino y el protocolo.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
SEC-9	¿Cómo protege sus datos en tránsito? Proteja sus datos en tránsito mediante la implementación de varios controles para reducir el riesgo de acceso no autorizado o pérdida.	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a monitorear y detectar posibles eventos de ciberseguridad mediante fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendiza je automático para identificar actividad es inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

Plantilla

La plantilla está disponible en GitHub: Mejores prácticas operativas para el pilar de seguridad AWS Well-Architected.

Prácticas operativas recomendadas para BCP y DR

Este paquete de conformidad contiene AWS Config reglas basadas en el BCP y el DR interno. AWS Para obtener una lista de todas las reglas administradas compatibles AWS Config, consulte la Lista de reglas AWS Config administradas.

Consulte la sección `Parameters` de la siguiente plantilla para ver los nombres y las descripciones de los parámetros obligatorios.

La plantilla está disponible en GitHub: Mejores prácticas operativas para BCP y DR.

Mejores prácticas operativas para BNM T RMi

Los paquetes de conformidad proporcionan un marco de cumplimiento de uso general diseñado para permitirle crear controles de seguridad, operativos o de optimización de costes mediante reglas gestionadas o personalizadas AWS Config y acciones correctivas. AWS Config Los paquetes de conformidad, como plantillas de ejemplo, no están diseñados para garantizar plenamente el cumplimiento de una norma de gobernanza o de conformidad específicas. Usted debe evaluar si su uso de los servicios cumple con los requisitos legales y normativos aplicables.

A continuación, se proporciona un ejemplo de mapeo entre la gestión de riesgos en tecnología (RMiT) de Bank Negara Malaysia (BNM) y las reglas de AWS Config gestionadas. Cada regla de Config se aplica a un AWS recurso específico y se refiere a uno o más controles BNM RMi T. Un control BNM RMi T puede estar relacionado con varias reglas de Config. Consulte la siguiente tabla para obtener más detalles y orientación relacionados con estas asignaciones.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.18	Una institución financiera debe actuar con la debida diligencia y evaluar los controles criptográficos asociados a la tecnología utilizada para proteger la confidencialidad, la integridad, la autenticación, la autorización y el no rechazo de la información. Si una entidad financiera no genera sus propias claves de cifrado, debe adoptar las	alb-http-to-https-verificación de redireccionamiento	Para ayudar a proteger los datos en tránsito, asegúrese de que el equilibrador de carga de aplicación redirija automáticamente las solicitudes HTTP no cifradas hacia HTTPS. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
	medidas adecuadas para garantizar que existan controles y procesos sólidos para administrar las claves de cifrado. Cuando ello implique basarse en evaluaciones de terceros, la entidad financiera deberá considerar si dicha confianza es coherente con la propensión y la tolerancia a riesgos de la entidad financiera. La entidad financiera también debe prestar la debida atención a los recursos del sistema necesarios para respaldar los controles criptográficos y al riesgo de que se reduzca la visibilidad de los datos cifrados en el tráfico de red.

			), RequireSy mbols (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireNu mbers (valor de las mejores prácticas de seguridad AWS AWS fundament ales: verdadero), MinimumPa sswordLength (valor de las mejores prácticas de seguridad AWS fundamentales: 14), PasswordReusePreve ntion (valor de las mejores prácticas de seguridad AWS fundamentales: 24) y MaxPasswo rdAge (valor de las mejores prácticas de seguridad fundament ales: 90) para su IAM La política de contraseñas. Los valores reales deben reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financiera debe implementar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgación y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapartes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Managemen t (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	iam-user-group-mem bership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizac iones de acceso, ya que garantiza que los usuarios de IAM sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separació n de funciones.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la AWS nube. Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios de IAM. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseñ a. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios de IAM.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Managemen t (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunid ades de que una identidad reciba o conserve demasiados privilegios.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	iam-user-unused-cr edentials-comprobar	AWS Identity and Access Management (IAM) puede ayudarlo con los permisos y autorizaciones de acceso comproban do las contraseñas y claves de acceso de IAM que no se utilicen durante un período de tiempo específic o. Si se identifican estas credenciales no utilizadas, debe deshabilitar la opción de and/or eliminar las credenciales, ya que esto podría infringir el principio del privilegi o mínimo. Esta regla requiere que establezcas un valor en la maxCreden tialUsage Edad (Config Default: 90). El valor real debe reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	internet-gateway-a uthorized-vpc-solo	Gestione el acceso a los recursos de la AWS nube aseguránd ose de que las puertas de enlace de Internet solo estén conectadas a Amazon Virtual Private Cloud (Amazon VPC) autorizada. Las puertas de enlace de Internet permiten el acceso bidirecci onal a internet desde y hacia la Amazon VPC, lo que puede provocar un acceso no autorizado a los recursos de Amazon VPC.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	kms-cmk-not-schedu led-para su eliminaci ón	Para ayudar a proteger los datos en reposo, asegúrese de que las claves maestras del cliente (CMKs) necesarias no estén programad as para su eliminaci ón en el Servicio de administración de AWS claves (AWS KMS). Puesto que a veces es necesario eliminar las claves, esta regla ayuda a comprobar todas las claves cuyo borrado está programado para comprobar si alguna está ahí por error.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financiera debe implementar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgación y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapartes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	lambda-function-public-access-prohibido	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a las funciones de AWS Lambda. El acceso público puede degradar la disponibilidad de los recursos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	lambda-inside-vpc	Implemente funciones de AWS Lambda en una Amazon Virtual Private Cloud (Amazon VPC) para una comunicac ión segura entre una función y otros servicios de la Amazon VPC. Con esta configuración, no se requiere ninguna puerta de enlace de internet, dispositivo NAT ni conexión de VPN. Todo el tráfico permanece de forma segura dentro de la nube. AWS Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Para gestionar correctamente el acceso, las funciones de AWS Lambda

ID de control	Descripción del control	AWS Regla de configuración	Directrices
			deben asignarse a una VPC.
10.51	Al utilizar los servicios en la nube, una institución financiera debe implementar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgación y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapartes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	no-unrestricted-route-to-igw	Asegúrese de que las tablas de enrutamiento de Amazon EC2 no tengan rutas ilimitadas a una puerta de enlace de internet. Eliminar o limitar el acceso a Internet para las cargas de trabajo en Amazon VPCs puede reducir el acceso no deseado dentro de su entorno.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	opensearch-encrypt ed-at-rest	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté habilitado para tus dominios de Amazon OpenSearch Service.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	opensearch-https-r equired	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en tránsito, asegúrate de que HTTPS esté habilitado para las conexiones a tus dominios de Amazon OpenSearch Service.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	opensearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch Service estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de Amazon OpenSearch Service dentro de una Amazon VPC permite una comunicación segura entre Amazon OpenSearch Service y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	opensearch-node-to -node-verificación de cifrado	Asegúrese de que el node-to-node cifrado OpenSearch de Amazon Service esté activado. Node-to-nodeel cifrado permite el cifrado TLS 1.2 para todas las comunicaciones dentro de Amazon Virtual Private Cloud (Amazon VPC). Puesto que puede haber datos confidenc iales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	habilitado para s3 bucket-server-side-encryption	Para ayudar a proteger los datos en reposo, asegúrese de habilitar el cifrado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenc iales en reposo en los buckets de S3, habilite el cifrado para protegerlos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	s3- bucket-ssl-request s-only	Para ayudar a proteger los datos en tránsito, asegúrese de que los buckets de Amazon Simple Storage Service (Amazon S3) requieran solicitud es para usar la capa de sockets seguros (SSL). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	s3- default-encryption -kms	Asegúrese de tener el cifrado habilitad o para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenciales en reposo en los buckets de Amazon S3, habilite el cifrado en reposo para protegerlos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	sagemaker-endpoint -configuration-kms- configurado por clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administr ación de AWS claves (AWS KMS) esté habilitado en su terminal. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker punto final, habilite el cifrado en reposo para ayudar a proteger esos datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	sagemaker-notebook -instance-kms-conf igurado por clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administr ación de AWS claves (AWS KMS) esté habilitado en su portátil. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker portátil, habilite el cifrado en reposo para ayudar a proteger esos datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	sagemaker-notebook -no-direct-acceso a internet	Gestione el acceso a los recursos en la AWS nube asegurándose de que las SageMaker libretas de Amazon no permitan el acceso directo a Internet. Al impedir el acceso directo a internet, puede evitar que usuarios no autorizad os accedan a los datos confidenciales.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	sns-encrypted-kms	Para ayudar a proteger los datos en reposo, asegúrese de que los temas del Amazon Simple Notification Service (Amazon SNS) requieran cifrado AWS mediante el Servicio AWS de administración de claves (KMS). Puesto que puede haber datos confidenciales en reposo en los mensajes publicados, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	ssm-document-not-p ublic	Asegúrese de que los documentos de AWS Systems Manager (SSM) no sean públicos, ya que esto podría permitir el acceso no deseado a los documentos de SSM. Un documento de SSM público puede exponer informaci ón sobre su cuenta, sus recursos y sus procesos internos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.51	Al utilizar los servicios en la nube, una institución financier a debe implement ar las medidas de seguridad adecuadas en relación con la información de los clientes y las contrapartes y los datos protegidos contra toda divulgaci ón y acceso no autorizados. Esto incluye conservar la propiedad, el control y la administración de todos los datos relacionados con la información de clientes y contrapar tes, los datos de propiedad y los servicios alojados en la nube, incluida la administración de las claves criptográficas pertinentes.	subnet-auto-assign-public-ip-deshabilitado	Gestione el acceso a la AWS nube asegurándose de que a las subredes de Amazon Virtual Private Cloud (VPC) no se les asigne automáticamente una dirección IP pública. Las instancia s de Amazon Elastic Compute Cloud (EC2) que se lanzan en subredes que tienen este atributo habilitad o tienen una dirección IP pública asignada a su interfaz de red principal.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.52	Una institución financiera debe implementar una política de controles de acceso adecuada para la identific ación, autenticación y autorización de los usuarios (usuarios internos y externos, como los proveedores de servicios externos) . Esto debe abordar los controles de acceso a la tecnologí a tanto lógicos como físicos, que sean proporcionales al nivel de riesgo de acceso no autorizado a sus sistemas tecnológi cos.	access-keys-rotated	Se auditan las credenciales de los dispositivos, usuarios y procesos autorizad os para garantiza r que las claves de acceso de IAM se roten según la política de la organización. Cambiar las claves de acceso de forma habitual es una práctica recomenda da de seguridad. Al hacerlo, se reduce el período de tiempo en el que una clave de acceso está activa y el impacto sobre la empresa si las claves se ven compromet idas. Esta regla requiere un valor de rotación de clave de acceso (valor predeterminado de Config: 90). El valor real debe reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10,52	Una institución financiera debe implementar una política de controles de acceso adecuada para la identific ación, autenticación y autorización de los usuarios (usuarios internos y externos, como los proveedores de servicios externos) . Esto debe abordar los controles de acceso a la tecnologí a tanto lógicos como físicos, que sean proporcionales al nivel de riesgo de acceso no autorizado a sus sistemas tecnológi cos.	account-part-of-or ganizations	La administración centralizada Cuentas de AWS dentro de AWS Organizations ayuda a garantiza r que las cuentas cumplan con las normas. La falta de gobernanza centraliz ada de las cuentas puede provocar incoherencias en las configuraciones de cuentas, lo que puede exponer los recursos y los datos confidenc iales.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.52	Una institución financiera debe implementar una política de controles de acceso adecuada para la identific ación, autenticación y autorización de los usuarios (usuarios internos y externos, como los proveedores de servicios externos) . Esto debe abordar los controles de acceso a la tecnologí a tanto lógicos como físicos, que sean proporcionales al nivel de riesgo de acceso no autorizado a sus sistemas tecnológi cos.	ec2- instance-profile-a ttached	Los perfiles de instancias de EC2 pasan un rol de IAM a una instancia de EC2. Adjuntar un perfil de instancia a las instancias puede ayudar a gestionar los privilegios mínimos y los permisos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.52	Una institución financiera debe implementar una política de controles de acceso adecuada para la identific ación, autenticación y autorización de los usuarios (usuarios internos y externos, como los proveedores de servicios externos) . Esto debe abordar los controles de acceso a la tecnologí a tanto lógicos como físicos, que sean proporcionales al nivel de riesgo de acceso no autorizado a sus sistemas tecnológi cos.	emr-kerberos-enabled	Los permisos y autorizaciones de acceso se pueden administr ar e incorporar con los principios de privilegio mínimo y separación de funciones al habilitar Kerberos para los clústeres de Amazon EMR. En Kerberos, los servicios y los usuarios que deben autenticarse se denominan entidades principales. Las entidades principal es existen dentro de un ámbito de Kerberos. Dentro de ese ámbito, un servidor de Kerberos se conoce como el centro de distribuc ión de claves (KDC). Este proporciona un medio para que las entidades principal es se autentiquen. El KDC se autentica emitiendo tickets de autenticación. El

ID de control	Descripción del control	AWS Regla de configuración	Directrices
			KDC mantiene una base de datos de las entidades principales dentro de su ámbito, sus contraseñas y otros datos administrativos sobre cada una de las entidades principales.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10,52	Una institución financiera debe implementar una política de controles de acceso adecuada para la identific ación, autenticación y autorización de los usuarios (usuarios internos y externos, como los proveedores de servicios externos) . Esto debe abordar los controles de acceso a la tecnologí a tanto lógicos como físicos, que sean proporcionales al nivel de riesgo de acceso no autorizado a sus sistemas tecnológi cos.	iam-customer-policy-blocked-kms-acciones	AWS Identity and Access Managemen t (IAM) puede ayudarle a incorpora r los principios de privilegios mínimos y separación de funciones en los permisos y autorizac iones de acceso, lo que impide que las políticas contengan acciones bloqueada s en todas AWS las claves del Servicio de administración de claves. Tener más privilegios de los necesario s para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones. Esta regla le permite establece r el blockedAc tionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar,

Las políticas administr adas permiten la reutilización, el control de versiones , la reversión y la delegación de la administración de permisos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.53(b)	Al cumplir con el párrafo 10.52, una institución financiera debería tener en cuenta los siguientes principios en su política de control de acceso: (b) emplear derechos de acceso con el «mínimo privilegio» o utilizar una base de «need-to-have» en la que solo se concedan los permisos mínimos suficientes a los usuarios legítimos para que desempeñen sus funciones;	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.53(b)	Al observar el párrafo 10.52, una institución financiera debería tener en cuenta los siguientes principios en su política de control del acceso: b) emplear derechos de acceso con «privilegios mínimos» o utilizar una base de «need-to-have» en la que solo se concedan los permisos mínimos suficientes a los usuarios legítimos para que desempeñen sus funciones;	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso, ya que garantiza que los usuarios de IAM sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.53(b)	Al observar el párrafo 10.52, una institución financiera debería tener en cuenta los siguientes principios en su política de control de acceso: (b) emplear derechos de acceso con el «mínimo privilegio» o utilizar una base de «» need-to-have en la que solo se concedan los permisos mínimos suficientes a los usuarios legítimos para que desempeñen sus funciones;	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.53(c)(f)	Si observamos el párrafo 10.52, una institución financier a debe tener en cuenta los siguiente s principios en su política de control de acceso: c) emplear derechos de acceso de tiempo limitado que restrinjan el acceso a un período específico, incluidos los derechos de acceso concedidos a los proveedores de servicios; (f) adoptar una autenticación más rígida para las actividades esenciale s, incluido el acceso remoto.	iam-password-policy	Las identidades y las credenciales se emiten, administr an y verifican en función de la política de contraseñas de IAM de la organizac ión. Cumplen o superan los requisito s establecidos en la norma NIST SP 800-63 y en el estándar AWS fundamental de mejores prácticas de seguridad para la seguridad de las contraseñ as. Esta regla le permite configura r opcionalmente RequireUppercaseCh aracters (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireLowercaseCh aracters (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero

ID de control	Descripción del control	AWS Regla de configuración	Directrices
			), RequireSy mbols (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireNu mbers (valor de las mejores prácticas de seguridad AWS AWS fundament ales: verdadero), MinimumPa sswordLength (valor de las mejores prácticas de seguridad AWS fundamentales: 14), PasswordReusePreve ntion (valor de las mejores prácticas de seguridad AWS fundamentales: 24) y MaxPasswo rdAge (valor de las mejores prácticas de seguridad fundament ales: 90) para su IAM La política de contraseñas. Los valores reales deben reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.53(f)(h)	Si observamos el párrafo 10.52, una institución financier a debe tener en cuenta los siguiente s principios en su política de control de acceso: (f) adoptar una autenticación más rígida para las actividades esenciale s, incluido el acceso remoto; (h) limitar y controlar el intercamb io de ID de usuario y contraseñas entre varios usuarios.	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la AWS nube. Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios de IAM. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseñ a. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios de IAM.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.53(f)(h)	Si observamos el párrafo 10.54, una institución financiera debe tener en cuenta los siguientes principios en su política de control de acceso: (f) adoptar una autenticación más rígida para las actividades esenciales, incluido el acceso remoto; (h) limitar y controlar el intercambio de ID de usuario y contraseñas entre varios usuarios.	root-account-hardware-mfa-habilitado	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA de hardware esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

Los registros de actividad deben conservarse durante al menos tres años y revisarse periódicamente de manera oportuna.	opensearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta. OpenSearch Los registros de errores del servicio pueden ayudar con las auditorías de seguridad y acceso, y pueden ayudar a diagnosticar problemas de disponibilidad.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.59	Una institución financiera debe garantizar: a) que los controles de acceso a los sistemas de toda la empresa se administren y supervisen de forma eficaz; y b) que las actividades de los usuarios en los sistemas esenciales se registren para su auditoría e investigación. Los registros de actividad deben conservarse durante al menos tres años y revisarse periódicamente de manera oportuna.	rds-logging-enabled	Para facilitar el registro y el monitoreo en su entorno, asegúrese de que el registro de Amazon Relational Database Service (Amazon RDS) esté habilitado. Con el registro de Amazon RDS, puede capturar eventos tales como conexiones, desconexiones, consultas o tablas consultadas.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10,59	Una institución financiera debe garantizar: a) que los controles de acceso a los sistemas de toda la empresa se administren y supervisen de forma eficaz; y b) que las actividades de los usuarios en los sistemas esenciales se registren para su auditoría e investigación. Los registros de actividad deben conservarse durante al menos tres años y revisarse periódicamente de manera oportuna.	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar información acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezca un valor para clusterDb Encrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.59	Una institución financiera debe garantizar: a) que los controles de acceso a los sistemas de toda la empresa se administren y supervisen de forma eficaz; y b) que las actividades de los usuarios en los sistemas esenciales se registren para su auditoría e investiga ción. Los registros de actividad deben conservarse durante al menos tres años y revisarse periódica mente de manera oportuna.	s3- bucket-logging-enabled	El registro de acceso al servidor de Amazon Simple Storage Service (Amazon S3) proporciona un método para monitorear la red en busca de posibles eventos de cibersegu ridad. Los eventos se monitorean mediante la captura detallada de las solicitudes realizadas a un bucket de Amazon S3. Cada registro de acceso proporciona detalles sobre una única solicitud de acceso. Los detalles incluyen el solicitante, el nombre del bucket, la hora de la solicitud , la acción solicitad a, el estado de la respuesta y el código de error, si procede.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.59	Una institución financiera debe garantizar: a) que los controles de acceso a los sistemas de toda la empresa se administren y supervisen de forma eficaz; y b) que las actividades de los usuarios en los sistemas esenciales se registren para su auditoría e investigación. Los registros de actividad deben conservarse durante al menos tres años y revisarse periódicamente de manera oportuna.	wafv2-logging-enabled	Para facilitar el registro y la supervisión en su entorno, habilite el registro AWS WAF (V2) en la web regional y global. ACLs AWS El registro WAF proporciona información detallada sobre el tráfico que analiza su ACL web. Los registros registran la hora en que AWS WAF recibió la solicitud de su AWS recurso, la información sobre la solicitud y una acción para la regla según la cual cada solicitud coincidió.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.60	Para cumplir con el requisito establecido en el párrafo 10.59, las grandes instituci ones financieras deben: a) implement ar un sistema de administración de acceso por identidad para gestionar y supervisar eficazmen te el acceso de los usuarios a los sistemas de toda la empresa; y (b) implementar herramientas de auditoría automatiz adas para detectar cualquier anomalía.	cloud-trail-cloud-watch-habilitado para registros	Usa Amazon CloudWatch para recopilar y gestionar de forma centralizada la actividad de los eventos de registro. La inclusión de AWS CloudTrail datos proporciona detalles de la actividad de llamadas a la API en su interior Cuenta de AWS.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.60	Para cumplir con el requisito establecido en el párrafo 10.61, las grandes instituciones financieras deben: a) implementar un sistema de administración de acceso por identidad para gestionar y supervisar eficazmente el acceso de los usuarios a los sistemas de toda la empresa; y (b) implementar herramientas de auditoría automatizadas para detectar cualquier anomalía.	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.60	Para cumplir con el requisito establecido en el párrafo 10.61, las grandes instituciones financieras deben: a) implementar un sistema de administración de acceso por identidad para gestionar y supervisar eficazmente el acceso de los usuarios a los sistemas de toda la empresa; y (b) implementar herramientas de auditoría automatizadas para detectar cualquier anomalía.	securityhub-enabled	AWS Security Hub ayuda a monitorear el personal, las conexiones, los dispositivos y el software no autorizados. AWS Security Hub agrupa, organiza y prioriza las alertas de seguridad, o hallazgos, de varios servicios. AWS Algunos de estos servicios son Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer y AWS Firewall Manager y Partner Solutions. AWS

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.61	Una institución financiera debe garantizar que los sistemas críticos no se ejecuten en sistemas obsoletos con vulnerabi lidades de seguridad conocidas o en sistemas tecnológi cos end-of-life (EOL). En este sentido, una institución financier a debe asignar claramente las responsabilidades a las funciones identificadas: (a) para monitorea r e implementar continuamente las últimas versiones de parches de manera oportuna; y (b) identificar los sistemas tecnológi cos esenciales que se están aproximan do al EOL para seguir tomando medidas correctivas.	ec2- -manager instance-managed-by-systems	Es posible realizar un inventario de las plataformas y aplicaciones de software de la organización mediante la administr ación de las instancia s de Amazon Elastic Compute Cloud (Amazon EC2) con Systems AWS Manager. Use AWS Systems Manager para proporcionar configuraciones detalladas del sistema, niveles de parches del sistema operativo, nombre y tipo de servicios , instalaciones de software, nombre de la aplicación, editor y versión, y otros detalles sobre su entorno.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.6.1	Una institución financiera debe garantizar que los sistemas críticos no se ejecuten en sistemas obsoletos con vulnerabilidades de seguridad conocidas o en sistemas tecnológicos end-of-life (EOL). En este sentido, una institución financiera debe asignar claramente las responsabilidades a las funciones identificadas: (a) para monitorear e implementar continuamente las últimas versiones de parches de manera oportuna; y (b) identificar los sistemas tecnológicos esenciales que se están aproximando al EOL para seguir tomando medidas correctivas.	ec2- -check managedinstance-association-compliance-status	Use AWS Systems Manager Associations para ayudar con el inventario de las plataformas y aplicaciones de software dentro de una organización. AWS Systems Manager asigna un estado de configuración a las instancias administradas y le permite establecer líneas base de los niveles de parches del sistema operativo, las instalaciones de software, las configuraciones de las aplicaciones y otros detalles sobre su entorno.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.6.1	Una institución financiera debe garantizar que los sistemas críticos no se ejecuten en sistemas obsoletos con vulnerabilidades de seguridad conocidas o en sistemas tecnológicos end-of-life (EOL). En este sentido, una institución financiera debe asignar claramente las responsabilidades a las funciones identificadas: (a) para monitorear e implementar continuamente las últimas versiones de parches de manera oportuna; y (b) identificar los sistemas tecnológicos esenciales que se están aproximando al EOL para seguir tomando medidas correctivas.	ec2- -check managedinstance-patch-compliance-status	Habilite esta regla para ayudar a identificar y documentar las vulnerabilidades de Amazon Elastic Compute Cloud (Amazon EC2). La regla comprueba si los parches de instancias Amazon EC2 cumplen con los requisitos de las políticas y procedimientos de su organización en AWS Systems Manager.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.6.1	Una institución financiera debe garantizar que los sistemas críticos no se ejecuten en sistemas obsoletos con vulnerabilidades de seguridad conocidas o en sistemas tecnológicos end-of-life (EOL). En este sentido, una institución financiera debe asignar claramente las responsabilidades a las funciones identificadas: (a) para monitorear e implementar continuamente las últimas versiones de parches de manera oportuna; y (b) identificar los sistemas tecnológicos esenciales que se están aproximando al EOL para seguir tomando medidas correctivas.	elastic-beanstalk-managed-updates-habilitado	La activación de las actualizaciones de plataforma gestionadas para un entorno de Amazon Elastic Beanstalk garantiza que se instalen las últimas correcciones, actualizaciones y características de la plataforma disponibles para el entorno. Mantenerse actualizado mediante la instalación de parches es una práctica recomendada para proteger los sistemas.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.61	Una institución financiera debe garantizar que los sistemas críticos no se ejecuten en sistemas obsoletos con vulnerabilidades de seguridad conocidas o en sistemas tecnológicos end-of-life (EOL). En este sentido, una institución financiera debe asignar claramente las responsabilidades a las funciones identificadas: (a) para monitorear e implementar continuamente las últimas versiones de parches de manera oportuna; y (b) identificar los sistemas tecnológicos esenciales que se están aproximando al EOL para seguir tomando medidas correctivas.	redshift-cluster-maintenancesettings-check	Esta regla garantiza que los clústeres de Amazon Redshift tengan la configuración preferida para su organización. En concreto, que tengan períodos de mantenimiento preferidos y períodos de retención automática de instantáneas para la base de datos. Esta regla requiere que configure el allowVersionUpgrade. El valor predeterminado es true. También te permite configurar de forma opcional el periodo preferred MaintenanceWindow (el predeterminado es sáb: 16:00 -sáb: 16:30) y el automated SnapshotRetention Periodo (el valor predeterminado es 1). Los valores reales deben reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	alb-http-to-https-verificación de redireccionamiento	Para ayudar a proteger los datos en tránsito, asegúrese de que el equilibrador de carga de aplicació n redirija automátic amente las solicitud es HTTP no cifradas hacia HTTPS. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	api-gw-cache-enabl ed-y encriptado	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté activado en la caché de la etapa de API Gateway. Puesto que pueden capturarse datos confidenciales para el método de la API, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	api-gw-ssl-enabled	Asegúrese de que las etapas de la API de REST de Amazon API Gateway estén configuradas con certificados SSL para permitir que los sistemas de backend autentiquen que las solicitudes se originan en API Gateway.
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	backup-recovery-point-encrypted	Asegúrese de que el cifrado esté activado en sus puntos AWS de recuperación de Backup. Puesto que puede haber datos confidenciales en reposo, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	cloudtrail-security-trail-enabled	Esta regla ayuda a garantizar el uso de las mejores prácticas de seguridad AWS recomendadas AWS CloudTrail, ya que comprueba si están habilitadas varias configuraciones. Estas incluyen el uso del cifrado de registros, la validació n de registros y la habilitación AWS CloudTrail en varias regiones.
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	cloudwatch-log-group-encrypted	Para ayudar a proteger los datos confidenciales en reposo, asegúrate de que el cifrado esté activado en tus Amazon CloudWatch Log Groups.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	dynamodb-table-encrypted-kms	Asegúrese de que el cifrado esté habilitado para las tablas de Amazon DynamoDB. Puesto que puede haber datos confidenciales en reposo en estas tablas, habilite el cifrado en reposo para ayudar a protegerlos. De forma predeterminada, las tablas de DynamoDB se AWS cifran con una clave maestra del cliente (CMK) propia.
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	ec2- ebs-encryption-by-default	Para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS). Puesto que puede haber datos confidenciales en reposo en estos volúmenes, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	efs-encrypted-check	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de Amazon Elastic File System (EFS).
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	elbv2- acm-certificate-required	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en tránsito, debe asegurarse de que el cifrado esté habilitado para su Elastic Load Balancing. Use AWS Certificate Manager para administrar, aprovisionar e implementar SSL/TLS certificados públicos y privados con AWS servicios y recursos internos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	encrypted-volumes	Puesto que puede haber datos confidenciales, para proteger los datos en reposo, asegúrese de habilitar el cifrado de los volúmenes de Amazon Elastic Block Store (Amazon EBS).
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	opensearch-encrypted-at-rest	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en reposo, asegúrate de que el cifrado esté habilitado para tus dominios de Amazon OpenSearch Service.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	opensearch-https-required	Como pueden existir datos confidenciales y, para ayudar a proteger los datos en tránsito, asegúrate de que HTTPS esté habilitado para las conexiones a tus dominios de Amazon OpenSearch Service.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	opensearch-node-to-node-verificación de cifrado	Asegúrese de que el node-to-node cifrado OpenSearch de Amazon Service esté activado. Node-to-nodeel cifrado permite el cifrado TLS 1.2 para todas las comunicaciones dentro de Amazon Virtual Private Cloud (Amazon VPC). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	rds-snapshot-encrypted	Asegúrese de que el cifrado esté habilitado para las instantáneas de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenciales en reposo, habilite el cifrado en reposo para ayudar a protegerlos.
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	rds-storage-encrypted	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado esté habilitado para sus instancias de Amazon Relational Database Service (Amazon RDS). Puesto que puede haber datos confidenciales en reposo en las instancias de Amazon RDS, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar información acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezca un valor para clusterDb Encrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	redshift-cluster-kms-enabled	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado para su clúster de Amazon Redshift. Puesto que puede haber datos confidenciales en reposo en los clústeres de Redshift, habilite el cifrado en reposo para ayudar a protegerlos.
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	redshift-require-tls-ssl	Asegúrese de que sus clústeres de Amazon Redshift requieran TLS/SSL cifrado para conectarse a los clientes de SQL. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	habilitado para s3 bucket-server-side-encryption	Para ayudar a proteger los datos en reposo, asegúrese de habilitar el cifrado para los buckets de Amazon Simple Storage Service (Amazon S3). Puesto que puede haber datos confidenc iales en reposo en los buckets de S3, habilite el cifrado para protegerlos.
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	s3- bucket-ssl-request s-only	Para ayudar a proteger los datos en tránsito, asegúrese de que los buckets de Amazon Simple Storage Service (Amazon S3) requieran solicitud es para usar la capa de sockets seguros (SSL). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	sagemaker-endpoint-configuration-kms-configurado por clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado en su terminal. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker punto final, habilite el cifrado en reposo para ayudar a proteger esos datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	sagemaker-notebook-instance-kms-configurado por clave	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con el Servicio de administración de AWS claves (AWS KMS) esté habilitado en su portátil. SageMaker Como los datos confidenciales pueden estar en reposo en el SageMaker portátil, habilite el cifrado en reposo para ayudar a proteger esos datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	secretsmanager-using-cmk	Para ayudar a proteger los datos en reposo, asegúrese de que el cifrado con AWS Key Management Service (AWS KMS) esté habilitado para AWS los secretos de Secrets Manager. Puesto que puede haber datos confidenciales en reposo en secretos de Secrets Manager, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(a)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (a) la confidencialidad e integridad de la información y las transacciones de los clientes y las contrapartes.	sns-encrypted-kms	Para ayudar a proteger los datos en reposo, asegúrese de que los temas del Amazon Simple Notification Service (Amazon SNS) requieran cifrado AWS mediante el Servicio AWS de administración de claves (KMS). Puesto que puede haber datos confidenciales en reposo en los mensajes publicados, habilite el cifrado en reposo para ayudar a protegerlos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(b)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (b) la fiabilidad de los servicios prestados a través de canales y dispositivos con una interrupción mínima de los servicios.	dynamodb-autoscaling-enabled	El escalado automático de Amazon DynamoDB AWS usa el servicio Application Auto Scaling para ajustar la capacidad de rendimiento aprovisionada para que responda automáticamente a los patrones de tráfico reales. Esto permite que una tabla o un índice secundario global aumente su read/write capacidad aprovisionada para gestionar los aumentos repentinos de tráfico, sin limitaciones.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(b)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (b) la fiabilidad de los servicios prestados a través de canales y dispositivos con una interrupción mínima de los servicios.	ec2-stopped-instance	Habilite esta regla para facilitar la configuración de referencia de las instancias de Amazon Elastic Compute Cloud (Amazon EC2) al comprobar si las instancias de Amazon EC2 se han detenido durante más días de los permitidos, de acuerdo con los estándares de su organización.
10.64(b)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (b) la fiabilidad de los servicios prestados a través de canales y dispositivos con una interrupción mínima de los servicios.	elb-deletion-protection-enabled	Esta regla garantiza que Elastic Load Balancing tenga habilitada la protección contra borrado. Utilice esta característica para evitar que el equilibrador de carga se elimine de forma accidental o malintencionada, lo que puede provocar la pérdida de disponibilidad de sus aplicaciones.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(b)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (b) la fiabilidad de los servicios prestados a través de canales y dispositivos con una interrupción mínima de los servicios.	nlb-cross-zone-load-habilitado para el equilibrio	Habilite el equilibrio de carga entre zonas para sus NetworkLoad balanceadores (NLBs) para ayudar a mantener la capacidad y la disponibilidad adecuadas. El equilibrio de carga entre zonas reduce la necesidad de mantener automáticamente cantidades equivalentes de instancias en cada zona de disponibilidad habilitada. También mejora la capacidad de la aplicación para gestionar la pérdida de una o más instancias.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(b)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (b) la fiabilidad de los servicios prestados a través de canales y dispositivos con una interrupción mínima de los servicios.	rds-instance-deletion-protection-habilitado	Asegúrese de que las instancias de Amazon Relational Database Service (Amazon RDS) tengan habilitad a la protección contra borrado. Utilice la protección contra borrado para evitar que las instancias de Amazon RDS se eliminen de forma accidental o malintenc ionada, lo que puede provocar la pérdida de disponibilidad de sus aplicaciones.

10.64(b)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (b) la fiabilidad de los servicios prestados a través de canales y dispositivos con una interrupción mínima de los servicios.	vpc-vpn-2-tunnels-up	Se pueden implementar túneles Site-to-Site VPN redundantes para cumplir con los requisitos de resiliencia. Utiliza dos túneles para garantizar la conectividad en caso de que una de las conexiones Site-to-Site VPN no esté disponible. Para protegerse contra la pérdida de conectividad, en caso de que su pasarela de cliente deje de estar disponible, puede configurar una segunda conexión de Site-to-Site VPN a su Amazon Virtual Private Cloud (Amazon VPC) y a su puerta de enlace privada virtual mediante una segunda pasarela de cliente.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(d)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (d) un registro de auditoría suficiente y un monitoreo de las transacciones anómalas.	api-gw-execution-logging-habilitada	El registro de API Gateway muestra vistas detalladas de los usuarios que han accedido a la API y la forma en que han accedido a la API. Esta información permite ver las actividades de los usuarios.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(d)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (d) un registro de auditoría suficiente y un monitoreo de las transacciones anómalas.	autoscaling-group-elb-healthcheck-obligatorio	Las revisiones de estado de Elastic Load Balancer (ELB) para los grupos de escalado automático de Amazon Elastic Compute Cloud (Amazon EC2) permiten mantener la capacidad y disponibilidad adecuadas. De forma periódica, el equilibrador de carga envía pings, intenta establecer conexiones o envía solicitudes para probar el estado de las instancias de Amazon EC2 en un grupo de escalado automático. Si una instancia no informa, el tráfico se envía a una nueva instancia de Amazon EC2.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(d)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (d) un registro de auditoría suficiente y un monitoreo de las transacciones anómalas.	cloudtrail-s3-data events-enabled	La recopilación de eventos de datos del Simple Storage Service (Amazon S3) ayuda a detectar cualquier actividad anómala. Los detalles incluyen Cuenta de AWS información sobre el acceso a un bucket de Amazon S3, la dirección IP y la hora del evento.
10.64(d)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (d) un registro de auditoría suficiente y un monitoreo de las transacciones anómalas.	cloudtrail-security-trail-enabled	Esta regla ayuda a garantizar el uso de las mejores prácticas de seguridad AWS recomendadas AWS CloudTrail, ya que comprueba la habilitación de varias configuraciones. Estas incluyen el uso del cifrado de registros, la validació n de registros y la habilitación AWS CloudTrail en varias regiones.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(d)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (d) un registro de auditoría suficiente y un monitoreo de las transacciones anómalas.	cloudwatch-alarm-action-check	CloudWatch Las alarmas de Amazon alertan cuando una métrica supera el umbral durante un número específico de períodos de evaluación. La alarma realiza una o varias acciones según el valor de la métrica o expresión con respecto a un umbral durante varios períodos de tiempo. Esta regla requiere un valor para alarmActionRequired (Config Default: True), insufficientDataAction Obligatorio (Config Default: True) o okActionRequired (Config Default: False). El valor real debe reflejar las acciones de alarma de su entorno.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(d)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (d) un registro de auditoría suficiente y un monitoreo de las transacciones anómalas.	cloud-trail-cloud-watch-habilitado para registros	Usa Amazon CloudWatch para recopilar y gestionar de forma centralizada la actividad de los eventos de registro. La inclusión de AWS CloudTrail datos proporciona detalles de la actividad de llamadas a la API en su interior Cuenta de AWS.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(d)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (d) un registro de auditoría suficiente y un monitoreo de las transacciones anómalas.	dynamodb-throughput-limit-check	Active esta regla para asegurarse de que la capacidad de rendimiento aprovisionada se compruebe en las tablas de Amazon DynamoDB. Esta es la cantidad de read/write actividad que puede soportar cada tabla. DynamoDB utiliza esta información para reservar recursos del sistema suficientes para satisfacer sus necesidades de rendimiento. Esta regla genera una alerta cuando el rendimiento se acerca al límite máximo de la cuenta de un cliente. Esta regla le permite configurar opcionalmente los parámetros de RCUThreshold porcentaje de cuenta (Config Default: 80) y WCUThreshold Percentage de cuenta (Config Default:

ID de control	Descripción del control	AWS Regla de configuración	Directrices
			80). Los valores reales deben reflejar las políticas de su organización.
10.64(d)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (d) un registro de auditoría suficiente y un monitoreo de las transacciones anómalas.	ec2- instance-detailed-monitoring-enabled	Habilite esta regla para ayudar a mejorar el monitoreo de instancias de Amazon Elastic Compute Cloud (Amazon EC2) en la consola de Amazon EC2, que muestra gráficos de monitoreo de la instancia en periodos de 1 minuto.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(d)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (d) un registro de auditoría suficiente y un monitoreo de las transacciones anómalas.	elb-logging-enabled	La actividad de Elastic Load Balancing es un punto central de comunicación dentro de un entorno. Asegúrese de que el registro de ELB esté habilitado. Los datos recopilados proporcio nan información detallada sobre las solicitudes enviadas al ELB. Cada registro contiene distintos datos, como el momento en que se recibió la solicitud , la dirección IP del cliente, las latencias, las rutas de solicitud y las respuestas del servidor.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(d)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (d) un registro de auditoría suficiente y un monitoreo de las transacciones anómalas.	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendiza je automático para identificar actividad es inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(d)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (d) un registro de auditoría suficiente y un monitoreo de las transacciones anómalas.	opensearch-logs-to-cloudwatch	Asegúrese de que los dominios de Amazon OpenSearch Service tengan los registros de errores habilitados y transmitidos a Amazon CloudWatch Logs para su retención y respuesta. OpenSearch Los registros de errores del servicio pueden ayudar con las auditorías de seguridad y acceso, y pueden ayudar a diagnosticar problemas de disponibilidad.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(d)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (d) un registro de auditoría suficiente y un monitoreo de las transacciones anómalas.	rds-enhanced-monitoring-enabled	Habilite Amazon Relational Database Service (Amazon RDS) para monitorear la disponibilidad de Amazon RDS. Esto proporciona información detallada del estado de las instancias de bases de datos de Amazon RDS. Cuando el almacenamiento de Amazon RDS utiliza más de un dispositivo físico subyacente, el monitoreo mejorado recopila los datos de cada dispositivo. Además, cuando la instancia de base de datos de Amazon RDS se ejecuta en una implementación Multi-AZ, se recopilan los datos de cada dispositivo del host secundario y las métricas del host secundario.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(d)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (d) un registro de auditoría suficiente y un monitoreo de las transacciones anómalas.	rds-logging-enabled	Para facilitar el registro y el monitoreo en su entorno, asegúrese de que el registro de Amazon Relational Database Service (Amazon RDS) esté habilitado. Con el registro de Amazon RDS, puede capturar eventos tales como conexiones, desconexiones, consultas o tablas consultadas.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(d)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (d) un registro de auditoría suficiente y un monitoreo de las transacciones anómalas.	redshift-cluster-configuration-check	Para proteger los datos en reposo, asegúrese de que el cifrado esté activado en los clústeres de Amazon Redshift. También debe asegurarse de que las configuraciones necesarias se implementen en los clústeres de Amazon Redshift. El registro de auditoría debería habilitarse para proporcionar información acerca de las conexiones y las actividades de usuario en la base de datos. Esta regla requiere que se establezca un valor para clusterDbEncrypted (Config Default: TRUE) y LoggingEnabled (Config Default: TRUE). Los valores reales deben reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(d)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (d) un registro de auditoría suficiente y un monitoreo de las transacciones anómalas.	s3- bucket-logging-enabled	El registro de acceso al servidor de Amazon Simple Storage Service (Amazon S3) proporciona un método para monitorear la red en busca de posibles eventos de ciberseguridad. Los eventos se monitorean mediante la captura detallada de las solicitudes realizadas a un bucket de Amazon S3. Cada registro de acceso proporciona detalles sobre una única solicitud de acceso. Los detalles incluyen el solicitante, el nombre del bucket, la hora de la solicitud, la acción solicitada, el estado de la respuesta y el código de error, si procede.

10.64(d)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (d) un registro de auditoría suficiente y un monitoreo de las transacciones anómalas.	vpc-flow-logs-enabled	Los registros del flujo de la VPC proporcionan registros detallados acerca del tráfico IP entrante y saliente de las interfaces de red en su Amazon Virtual Private Cloud (Amazon VPC). De forma predeterm inada, el registro de flujo incluye valores para los distintos componentes del flujo de IP, incluido el origen, el destino y el protocolo.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(d)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al prestar servicios digitales que garanticen lo siguiente: (d) un registro de auditoría suficiente y un monitoreo de las transacciones anómalas.	wafv2-logging-enabled	Para facilitar el registro y la supervisión en su entorno, habilite el registro con AWS WAF (V2) en la web regional y global. ACLs AWS El registro WAF proporciona información detallada sobre el tráfico que analiza su ACL web. Los registros registran la hora en que AWS WAF recibió la solicitud de su AWS recurso, la información sobre la solicitud y una acción para la regla según la cual cada solicitud coincidió.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(e)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al proporcionar servicios digitales que garanticen lo siguiente: (e) la capacidad de identificar y volver al punto de recuperación antes de un incidente o interrupción del servicio.	aurora-resources-protected-by-plan de respaldo	Para facilitar los procesos de backup de datos, asegúrese de que sus recursos de Amazon Aurora formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(e)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al proporcionar servicios digitales que garanticen lo siguiente: (e) la capacidad de identificar y volver al punto de recuperación antes de un incidente o interrupción del servicio.	db-instance-backup-enabled	La característica de copia de seguridad de Amazon RDS crea copias de seguridad de sus bases de datos y registros de transacciones. Amazon RDS crea automáticamente una instantánea de volumen de almacenamiento de la instancia de base de datos y realiza una copia de seguridad de toda la instancia. El sistema le permite establecer períodos de retención específicos para cumplir con sus requisitos de resiliencia.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(e)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al proporcionar servicios digitales que garanticen lo siguiente: (e) la capacidad de identificar y volver al punto de recuperación antes de un incidente o interrupción del servicio.	dynamodb-pitr-enabled	Active esta regla para comprobar que se haya realizado una copia de seguridad de la información. También mantiene las copias de seguridad al garantizar que la point-in-time recuperación esté habilitada en Amazon DynamoDB. La recuperación mantiene copias de seguridad continuas de la tabla durante los últimos 35 días.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
10.64(e)	Una institución financiera debe implementar controles de seguridad tecnológicos rígidos al proporcionar servicios digitales que garanticen lo siguiente: (e) la capacidad de identificar y volver al punto de recuperación antes de un incidente o interrupción del servicio.	dynamodb-resources-protected-by-plan de copias de seguridad	Para facilitar los procesos de backup de datos, asegúrese de que sus recursos de Amazon DynamoDB formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

AWS Restringir todo el tráfico en el grupo de seguridad predeterminado ayuda a restringir el acceso remoto a los recursos. AWS

ID de control	Descripción del control	AWS Regla de configuración	Directrices
Appendix 10 Part B - 1 (b)	Se alienta a las instituciones financieras a adoptar los principios de confianza cero para ofrecer una arquitectura ciberresiliente, adoptando una mentalidad de «dar por sentado que se ha producido una infracción», combinando defense-in-depth la microsegmentación, los derechos de acceso con «menos privilegios» y realizando inspecciones exhaustivas y validándolas continuamente cuando proceda. deny-by-default	vpc-sg-open-only-to-authorized-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integridad y confidencialidad de los sistemas. Al restringir el acceso a los recursos dentro de un grupo de seguridad desde internet (0.0.0.0/0), se puede controlar el acceso remoto a los sistemas internos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
Appendix 10 Part B - 1 (c)	Una institución financiera debe utilizar el enfoque de arquitectura de red más reciente y el concepto y las soluciones de diseño de red adecuados para administrar y monitorear la seguridad granular de la red y el suministr o centralizado de la red al administrar la complejidad del entorno de red en la nube.	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendiza je automático para identificar actividad es inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
Appendix 10 Part B - 1 (c)	Una institución financiera debe utilizar el enfoque de arquitectura de red más reciente y el concepto y las soluciones de diseño de red adecuados para administrar y monitorear la seguridad granular de la red y el suministr o centralizado de la red al administrar la complejidad del entorno de red en la nube.	vpc-flow-logs-enabled	Los registros del flujo de la VPC proporcionan registros detallados acerca del tráfico IP entrante y saliente de las interfaces de red en su Amazon Virtual Private Cloud (Amazon VPC). De forma predeterm inada, el registro de flujo incluye valores para los distintos componentes del flujo de IP, incluido el origen, el destino y el protocolo.
Appendix 10 Part B - 1 (d)	Una institución financiera debe establecer y utilizar canales de comunicac ión seguros y cifrados para migrar servidore s físicos, aplicacio nes o datos a las plataformas en la nube.	dms-replication-not-public	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de replicaci ón del DMS. Las instancias de replicaci ón de DMS pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
Appendix 10 Part B - 1 (d)	Una institución financiera debe establecer y utilizar canales de comunicación seguros y cifrados para migrar servidores físicos, aplicaciones o datos a las plataformas en la nube.	s3- bucket-ssl-requests-only	Para ayudar a proteger los datos en tránsito, asegúrese de que los buckets de Amazon Simple Storage Service (Amazon S3) requieran solicitudes para usar la capa de sockets seguros (SSL). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
Appendix 10 Part B - 1 (f) i)	El uso cada vez mayor de las interfaces de programación de aplicaciones (API) por parte de las instituciones financieras para interconectarse con proveedores de servicios de aplicaciones externos podría aumentar la eficiencia en la prestación de nuevos servicios. Sin embargo, esto puede aumentar la superficie expuesta a ciberataques y cualquier mala gestión puede amplificar el impacto de un incidente de seguridad de la información. Una institución financiera debe asegurarse de estar sujeta a rigurosos mecanismos de gestión y control, entre los que APIs se incluyen los siguientes: i) APIs debe estar diseñada para ofrecer un servicio resiliente a fin de evitar el riesgo	api-gwv2- authorization-type-configured	Asegurarse de que la ruta de la API de Amazon API Gateway versión 2 tenga un tipo de autorización establecido para evitar el acceso no autorizado a los recursos de backend subyacentes.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
	de puntos únicos de fallo y configurarse de forma segura con los controles de acceso adecuados;		

ID de control	Descripción del control	AWS Regla de configuración	Directrices
Appendix 10 Part B - 1 (f) ii)	El uso cada vez mayor de las interfaces de programación de aplicaciones (API) por parte de las instituciones financieras para interconectarse con proveedores de servicios de aplicaciones externos podría aumentar la eficiencia en la prestación de nuevos servicios. Sin embargo, esto puede aumentar la superficie expuesta a ciberataques y cualquier mala gestión puede amplificar el impacto de un incidente de seguridad de la información. Una institución financiera debe asegurarse de estar sujeta a rigurosos mecanismos de gestión y control, entre los que se incluyen los siguientes: ii) APIs debe ser rastreada y monitoreada para evitar los ciberataques con	api-gw-associated-with-guerra	AWS El WAF le permite configurar un conjunto de reglas (denominadas listas de control de acceso web (ACL web)) que permiten, bloquean o cuentan las solicitudes web en función de las reglas y condiciones de seguridad web personalizables que usted defina. Asegúrese de que su etapa de Amazon API Gateway esté asociada a una ACL web de WAF para protegerla de ataques maliciosos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
	medidas adecuadas de respuesta a los incidentes y ser desmanteladas oportunamente cuando ya no estén en uso. APIs		

ID de control	Descripción del control	AWS Regla de configuración	Directrices
Appendix 10 Part B - 1 (f) ii)	El uso cada vez mayor de las interfaces de programación de aplicaciones (API) por parte de las instituciones financieras para interconectarse con proveedores de servicios de aplicaciones externos podría aumentar la eficiencia en la prestación de nuevos servicios. Sin embargo, esto puede aumentar la superficie expuesta a ciberataques y cualquier mala gestión puede amplificar el impacto de un incidente de seguridad de la información. Una institución financiera debe asegurarse de estar sujeta a rigurosos mecanismos de gestión y control, entre los que APIs se incluyen los siguientes: ii) APIs debe ser rastreada y supervisada contra los ciberataques con	api-gw-execution-logging-habilitado	El registro de API Gateway muestra vistas detalladas de los usuarios que han accedido a la API y la forma en que han accedido a la API. Esta información permite ver las actividades de los usuarios.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
	medidas adecuadas de respuesta a los incidentes y ser desmantelada puntualmente cuando ya no esté en uso.		

ID de control	Descripción del control	AWS Regla de configuración	Directrices
Appendix 10 Part B - 2 (b) ii)	Una institución financiera debe aprovechar continuamente las capacidades mejoradas de la nube para mejorar la seguridad de los servicios en la nube y, entre otras cosas, se la anima a: ii) aplicar prácticas de infraestructura inmutables para la implementación de los servicios a fin de reducir el riesgo de error mediante la creación de un nuevo entorno con la última versión estable del software. El monitoreo continuo del entorno de nube debe incluir la automatización de la detección de cambios en la infraestructura inmutable para mejorar la revisión del cumplimiento y combatir la evolución de los ciberataques.	cloudformation-stack-notification-check	Para detectar cambios imprevistos en los AWS recursos subyacentes, asegúrese de que su CloudFormation pila esté configurada para enviar notificaciones de eventos a un tema de Amazon SNS.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
Appendix 10 Part B - 3 (b) vi)	Una institución financiera debe garantizar que se configuren, protejan y monitoree n adecuadamente las imágenes de las máquinas virtuales y los contenedo res. Esto incluye lo siguiente: vi) las imágenes almacenad as están sujetas a un control de seguridad para evitar que se produzcan cambios o accesos no autorizad os.	cloudtrail-security-trail-enabled	Esta regla ayuda a garantizar el uso de las mejores prácticas de seguridad AWS recomendadas AWS CloudTrail, ya que comprueba la habilitación de varios ajustes. Estas incluyen el uso del cifrado de registros, la validación de registros y la habilitación AWS CloudTrail en varias regiones.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
Appendix 10 Part B - 5 (a) i)	Como parte de una capacidad de recuperación efectiva, las instituciones financieras deben garantizar que los procedimientos de copia de seguridad y recuperación existentes se extiendan a los servicios en la nube, lo que incluye lo siguiente: i) definir y formalizar la estrategia de copia de seguridad y recuperación en la fase de planificación de la adopción de la nube.	aurora-resources-protected-by-plan de respaldo	Para facilitar los procesos de backup de datos, asegúrese de que sus recursos de Amazon Aurora formen parte de un plan de AWS backup. AWS Backup es un servicio de respaldo totalmente administrado con una solución de respaldo basada en políticas. Esta solución simplifica la administración de copias de seguridad y le permite cumplir con sus requisitos empresariales y normativos de conformidad con las normas de copia de seguridad.

Los valores reales deben reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
Appendix 10 Part B - 9 (a) ii)	El plano de administración es una diferencia de seguridad de claves entre la infraestructura tradicional y la computación en la nube, donde se admite el acceso remoto de forma predeterminada. Esta capa de acceso podría ser propensa a sufrir ciberataques, lo que pondría en peligro la integridad de toda la implementación en la nube. Por ello, las instituciones financieras deben garantizar el uso de controles rígidos para acceder al plano de administración, que pueden incluir lo siguiente: ii) implementar la autenticación multifactor (MFA) y los privilegios mínimos, como una contraseña segura, un token de software,	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la AWS nube. Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios de IAM. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseña. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios de IAM.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
Appendix 10 Part B - 14 (c) i)	Al desarrollar su CIRP, una institución financiera debe considerar las siguientes medidas adicionales: i) mejorar su capacidad para detectar incidentes de infracción de la seguridad a fin de lograr una gestión eficaz de los incidentes, incluida la capacidad de detectar la filtración de datos en la web oscura.	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
Appendix 10 Part B - 14 (c) i)	Al desarrollar su CIRP, una institución financiera debe considerar las siguientes medidas adicionales: i) mejorar su capacidad para detectar incidentes de infracción de la seguridad a fin de lograr una gestión eficaz de los incidentes, incluida la capacidad de detectar la filtración de datos en la web oscura.	guardduty-non-archived-findings	Amazon te GuardDuty ayuda a entender el impacto de un incidente mediante la clasificación de los hallazgos por gravedad: baja, media y alta. Puede utilizar estas clasificaciones para determinar las estrategias y prioridades de corrección. Esta regla le permite configurar de forma opcional los valores daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7) y daysHighSev (Config Default: 1) para los hallazgos no archivados, según lo exijan las políticas de su organización.

Plantilla

La plantilla está disponible en GitHub: Mejores prácticas operativas para BNM T. RMi

Prácticas operativas recomendadas para el Perfil medio de control de la nube del Centro Canadiense de Ciberseguridad (CCCS)

Los paquetes de conformidad proporcionan un marco de cumplimiento de uso general diseñado para permitirle crear controles de seguridad, operativos o de optimización de costes mediante reglas gestionadas o personalizadas AWS Config y acciones correctivas. AWS Config Los paquetes de conformidad, como plantillas de ejemplo, no están diseñados para garantizar plenamente el cumplimiento de una norma de gobernanza o de conformidad específicas. Usted debe evaluar si su uso de los servicios cumple con los requisitos legales y normativos aplicables.

A continuación, se proporciona un ejemplo de mapeo entre el perfil de control en la nube mediana del Centro Canadiense de Ciberseguridad (CCCS) y las reglas de Config AWS administradas. Cada regla de Config se aplica a un AWS recurso específico y se refiere a uno o más controles del perfil de control de CCCS Medium Cloud. Un control de Perfil medio de control de la nube del CCCS se puede relacionar con varias reglas de Config. Consulte la siguiente tabla para obtener más detalles y orientación relacionados con estas asignaciones.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-2(1)	AC-2(1) Administración de cuentas | Sistema automatizado de administración de cuentas	cloudtrail-enabled	AWS CloudTrail puede ayudar a evitar el repudio al registrar las acciones de la consola AWS de administración y las llamadas a la API. Puede identificar a los usuarios y a quién llamó a un AWS servicio, la dirección IP de origen en la Cuentas de AWS que se generaron las llamadas y los horarios de las llamadas. Los

			kms:ReEncryptFrom). Los valores reales deben reflejar las políticas de su organización.
CCCS-fPBMM-AC-2(1)	AC-2(1) Administración de cuentas | Sistema automatizado de administración de cuentas	iam-group-has-users-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios de privilegios mínimos y separación de funciones en los permisos y autorizaciones de acceso, garantizando que los grupos de IAM tengan al menos un usuario. Una forma de incorporar privilegios mínimos es colocar a los usuarios en grupos en función de los permisos o funciones laborales asociados.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-2(1)	AC-2(1) Administración de cuentas | Sistema automatizado de administración de cuentas	iam-inline-policy-blocked-kms-actions	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política en línea que permita bloquear acciones en todas las claves del Servicio de administración de claves. AWS AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administradas permiten la reutilización, el control de versiones, la reversión y la delegación de la administración de permisos. Esta regla le permite establecer el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms:descifrar, kms:ReEnc

ID de control	Descripción del control	AWS Regla de configuración	Directrices
			ryptFrom). Los valores reales deben reflejar las políticas de su organización.
CCCS-fPBMM-AC-2(1)	AC-2(1) Administración de cuentas | Sistema automatizado de administración de cuentas	iam-no-inline-policy-comprobar	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política integrada para controlar el acceso a los sistemas y activos. AWS recomiend a utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administr adas permiten la reutilización, el control de versiones , la reversión y la delegación de la administración de permisos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-2(1)	AC-2(1) Administración de cuentas | Sistema automatizado de administración de cuentas	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-2(1)	AC-2(1) Administración de cuentas | Sistema automatizado de administración de cuentas	iam-policy-no-statements-with-full-access	Asegúrese de que las acciones de IAM se limiten únicamente a las acciones necesarias. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.
CCCS-fPBMM-AC-2(1)	AC-2(1) Administración de cuentas | Sistema automatizado de administración de cuentas	iam-root-access-key-comprobar	El acceso a los sistemas y activos se puede controlar comprobando que el usuario raíz no tenga claves de acceso adjuntas a su función de AWS Identity and Access Management (IAM). Asegúrese de eliminar las claves de acceso raíz. En su lugar, cree y utilice el sistema basado en roles Cuentas de AWS para ayudar a incorporar el principio de funcionalidad mínima.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-2(1)	AC-2(1) Administración de cuentas | Sistema automatizado de administración de cuentas	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-2(1)	AC-2(1) Administración de cuentas | Sistema automatizado de administración de cuentas	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Management (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunidades de que una identidad reciba o conserve demasiados privilegios.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-2(1)	AC-2(1) Administración de cuentas | Sistema automatizado de administración de cuentas	iam-user-unused-credentials-comprobar	AWS Identity and Access Management (IAM) puede ayudarlo con los permisos y autorizaciones de acceso comprobando las contraseñas y claves de acceso de IAM que no se utilicen durante un período de tiempo específico. Si se identifican estas credenciales no utilizadas, debe deshabilitar la opción de and/or eliminar las credenciales, ya que esto podría infringir el principio del privilegio mínimo. Esta regla requiere que establezcas un valor en la maxCredentialUsage Edad (Config Default: 90). El valor real debe reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-2(1)	AC-2(1) Administración de cuentas | Sistema automatizado de administración de cuentas	multi-region-cloudtrail-enabled	AWS CloudTrail registra las acciones AWS de la consola de administración y las llamadas a la API. Puede identificar qué usuarios y cuentas llamaron AWS, la dirección IP de origen desde la que se realizaron las llamadas y cuándo se produjeron. CloudTrail entregará los archivos de registro de todas AWS las regiones a su bucket de S3 si MULTI_REGION_CLOUD_TRAIL_ENABLED está activado. Además, al AWS lanzar una nueva región, CloudTrail creará la misma ruta en la nueva región. En consecuencia, recibirá archivos de registro con la actividad de la API en la nueva región sin necesidad de realizar ninguna acción.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-2(3)	AC-2(3) Administración de cuentas | Deshabilitación de cuentas inactivas	iam-password-policy	Las identidades y las credenciales se emiten, administran y verifican en función de la política de contraseñas de IAM de la organización. Cumplen o superan los requisitos establecidos en la norma NIST SP 800-63 y en el estándar AWS fundamental de mejores prácticas de seguridad para la seguridad de las contraseñas. Esta regla le permite configurar opcionalmente RequireUppercaseCharacters (valor de las mejores prácticas de seguridad AWS fundamentales: verdadero), RequireLowercaseCharacters (valor de las mejores prácticas de seguridad AWS fundamentales: verdadero

ID de control	Descripción del control	AWS Regla de configuración	Directrices
			), RequireSy mbols (valor de las mejores prácticas de seguridad AWS fundament ales: verdadero), RequireNu mbers (valor de las mejores prácticas de seguridad AWS AWS funda mentales: verdadero), MinimumPa sswordLength (valor de las mejores prácticas de seguridad AWS fundamentales: 14), PasswordReusePreve ntion (valor de las mejores prácticas de seguridad AWS fundamentales: 24) y MaxPasswo rdAge (valor de las mejores prácticas de seguridad fundament ales: 90) para su IAM La política de contraseñas. Los valores reales deben reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-2(3)	AC-2(3) Administración de cuentas | Deshabilitación de cuentas inactivas	iam-user-unused-credentials-comprobar	AWS Identity and Access Management (IAM) puede ayudarlo con los permisos y autorizaciones de acceso comprobando las contraseñas y claves de acceso de IAM que no se utilicen durante un período de tiempo específico. Si se identifican estas credenciales no utilizadas, debe deshabilitar la opción de and/or eliminar las credenciales, ya que esto podría infringir el principio del privilegio mínimo. CCCS-fPBMM-AC-3.A	AC-3.A Aplicación de normas de acceso	emr-kerberos-enabled	Los permisos y autorizaciones de acceso se pueden administrar e incorporar con los principios de privilegio mínimo y separación de funciones al habilitar Kerberos para los clústeres de Amazon EMR. En Kerberos, los servicios y los usuarios que deben autenticarse se denominan entidades principales. Las entidades principales existen dentro de un ámbito de Kerberos. Dentro de ese ámbito, un servidor de Kerberos se conoce como el centro de distribución de claves (KDC). Este proporciona un medio para que las entidades principales se autentiquen. El KDC se autentica emitiendo tickets de autenticación. El

ID de control	Descripción del control	AWS Regla de configuración	Directrices
			KDC mantiene una base de datos de las entidades principales dentro de su ámbito, sus contraseñas y otros datos administrativos sobre cada una de las entidades principales.
CCCS-fPBMM-AC-3.A	AC-3.A Aplicación de normas de acceso	emr-master-no-public-IP	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a los nodos maestros del clúster de Amazon EMR. Los nodos maestros del clúster de Amazon EMR pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-3.A	AC-3.A Aplicación de normas de acceso	iam-customer-policy-blocked-kms-acciones	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, lo que impide que las políticas contengan acciones bloqueadas en todas AWS las claves del Servicio de Administración de Claves. Tener más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones. Esta regla le permite establecer el blockedActionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: desencriptar,

ID de control	Descripción del control	AWS Regla de configuración	Directrices
			kms:ReEncryptFrom). Los valores reales deben reflejar las políticas de su organización.
CCCS-fPBMM-AC-3.A	AC-3.A Aplicación de normas de acceso	iam-group-has-users-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a incorporar los principios de privilegios mínimos y separación de funciones en los permisos y autorizaciones de acceso, garantizando que los grupos de IAM tengan al menos un usuario. Una forma de incorporar privilegios mínimos es colocar a los usuarios en grupos en función de los permisos o funciones laborales asociados.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-3.A	AC-3.A Aplicación de normas de acceso	iam-inline-policy-blocked-kms-actions	Asegúrese de que un usuario de AWS Identity and Access Management (IAM), un rol de IAM o un grupo de IAM no tengan una política en línea que permita bloquear acciones en todas las claves del Servicio de administración de claves. AWS AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administr adas permiten la reutilización, el control de versiones , la reversión y la delegación de la administración de permisos. Esta regla le permite establece r el blockedAc tionsPatterns parámetro. (Valor AWS fundamental de las mejores prácticas de seguridad: kms: descifrar, kms:ReEnc

ID de control	Descripción del control	AWS Regla de configuración	Directrices
			ryptFrom). Los valores reales deben reflejar las políticas de su organización.
CCCS-fPBMM-AC-3.A	AC-3.A Aplicación de normas de acceso	iam-no-inline-policy-comprobar	Asegúrese de que un usuario, rol de IAM o grupo de IAM (AWS Identity and Access Managemen t) no tenga una política integrada para controlar el acceso a los sistemas y activos. AWS recomienda utilizar políticas gestionadas en lugar de políticas integradas. Las políticas administr adas permiten la reutilización, el control de versiones , la reversión y la delegación de la administración de permisos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-3.A	AC-3.A Aplicación de normas de acceso	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) puede ayudarlo a incorporar los principios del mínimo privilegio y la separación de funciones en los permisos y autorizaciones de acceso, impidiendo que las políticas contengan «Efecto»: «Permitir» con «Acción»: «*» en lugar de «Recurso»: «*». Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-3.A	AC-3.A Aplicación de normas de acceso	iam-user-group-membership-comprobar	AWS Identity and Access Management (IAM) puede ayudarle a restringir los permisos y autorizaciones de acceso al garantizar que los usuarios sean miembros de al menos un grupo. Permitir que los usuarios tengan más privilegios de los necesarios para completar una tarea puede infringir el principio de privilegio mínimo y la separación de funciones.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-3.A	AC-3.A Aplicación de normas de acceso	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseñ a. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-3.A	AC-3.A Aplicación de normas de acceso	iam-user-no-policies-comprobar	Esta regla garantiza que las políticas de AWS Identity and Access Managemen t (IAM) se adjunten únicamente a grupos o funciones para controlar el acceso a los sistemas y activos. La asignación de privilegios en el nivel de grupo o rol ayuda a reducir las oportunid ades de que una identidad reciba o conserve demasiados privilegios.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-3.A	AC-3.A Aplicación de normas de acceso	iam-user-unused-credentials-comprobar	AWS Identity and Access Management (IAM) puede ayudarlo con los permisos y autorizaciones de acceso comprobando las contraseñas y claves de acceso de IAM que no se utilicen durante un período de tiempo específico. Si se identifican estas credenciales no utilizadas, debe deshabilitar la opción de and/or eliminar las credenciales, ya que esto podría infringir el principio del privilegio mínimo. Esta regla requiere que establezcas un valor en la maxCredentialUsage Edad (Config Default: 90). El valor real debe reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-3.A	AC-3.A Aplicación de normas de acceso	internet-gateway-authorized-vpc-solo	Gestione el acceso a los recursos de la AWS nube asegurándose de que las puertas de enlace de Internet solo estén conectadas a Amazon Virtual Private Cloud (Amazon VPC) autorizada. Las puertas de enlace de Internet permiten el acceso bidireccional a internet desde y hacia la Amazon VPC, lo que puede provocar un acceso no autorizado a los recursos de Amazon VPC.
CCCS-fPBMM-AC-3.A	AC-3.A Aplicación de normas de acceso	lambda-function-public-access-prohibido	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a las funciones de AWS Lambda. El acceso público puede degradar la disponibilidad de los recursos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-3.A	AC-3.A Aplicación de normas de acceso	lambda-inside-vpc	Implemente funciones de AWS Lambda en una Amazon Virtual Private Cloud (Amazon VPC) para una comunicac ión segura entre una función y otros servicios de la Amazon VPC. Con esta configuración, no se requiere ninguna puerta de enlace de internet, dispositivo NAT ni conexión de VPN. Todo el tráfico permanece de forma segura en la nube. AWS Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Para gestionar correctamente el acceso, las funciones de AWS Lambda

ID de control	Descripción del control	AWS Regla de configuración	Directrices
			deben asignarse a una VPC.
CCCS-fPBMM-AC-3.A	AC-3.A Aplicación de normas de acceso	mfa-enabled-for-iam-acceso a la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidentes de cuentas comprometidas y evitar que usuarios no autorizados accedan a los datos confidenciales.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-3.A	AC-3.A Aplicación de normas de acceso	opensearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch Service estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de Amazon OpenSearch Service dentro de una Amazon VPC permite una comunicación segura entre Amazon OpenSearch Service y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.

			Amazon VPC para gestionar correctamente el acceso.
CCCS-fPBMM-AC-6.A	AC-6.A Privilegio mínimo	internet-gateway-authorized-vpc-solo	Gestione el acceso a los recursos de la AWS nube asegurándose de que las puertas de enlace de Internet solo estén conectadas a Amazon Virtual Private Cloud (Amazon VPC) autorizada. Las puertas de enlace de Internet permiten el acceso bidireccional a internet desde y hacia la Amazon VPC, lo que puede provocar un acceso no autorizado a los recursos de Amazon VPC.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-6.A	AC-6.A Privilegio mínimo	lambda-function-public-access-prohibido	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a las funciones de AWS Lambda. El acceso público puede degradar la disponibilidad de los recursos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-6.A	AC-6.A Privilegio mínimo	lambda-inside-vpc	Implemente funciones de AWS Lambda en una Amazon Virtual Private Cloud (Amazon VPC) para una comunicac ión segura entre una función y otros servicios de la Amazon VPC. Con esta configuración, no se requiere ninguna puerta de enlace de internet, dispositivo NAT ni conexión de VPN. Todo el tráfico permanece de forma segura en la nube. AWS Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Para gestionar correctamente el acceso, las funciones de AWS Lambda

ID de control	Descripción del control	AWS Regla de configuración	Directrices
			deben asignarse a una VPC.
CCCS-fPBMM-AC-6.A	AC-6.A Privilegio mínimo	opensearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch Service estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de Amazon OpenSearch Service dentro de una Amazon VPC permite una comunicación segura entre Amazon OpenSearch Service y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-6.A	AC-6.A Privilegio mínimo	rds-instance-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relational Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidencial y principios. Además, dichas cuentas requieren control de acceso.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-6.A	AC-6.A Privilegio mínimo	rds-snapshots-public-prohibited	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relationa l Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidenc ial y principios. Además, dichas cuentas requieren control de acceso.
CCCS-fPBMM-AC-6.A	AC-6.A Privilegio mínimo	redshift-cluster-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que los clústeres de Amazon Redshift no sean públicos. Los clústeres de Amazon Redshift pueden contener informaci ón confidencial y principios. Además dichas cuentas requieren control de acceso.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-6.A	AC-6.A Privilegio mínimo	s3- -bloques-periodicos account-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configurar opcionalmente los restrictPublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-6.A	AC-6.A Privilegio mínimo	s3- bucket-level-public-access -prohibido	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público en el nivel del bucket.
CCCS-fPBMM-AC-6.A	AC-6.A Privilegio mínimo	s3- bucket-public-read-prohibited	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositivos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-6.A	AC-6.A Privilegio mínimo	s3- bucket-public-write-prohibited	Gestione el acceso a los recursos de la AWS nube permitiendo que solo los usuarios, procesos y dispositivos autorizados accedan a los depósitos de Amazon Simple Storage Service (Amazon S3). La administración del acceso debe ser coherente con la clasificación de los datos.
CCCS-fPBMM-AC-6.A	AC-6.A Privilegio mínimo	sagemaker-notebook-no-direct-acceso a internet	Gestione el acceso a los recursos en la AWS nube asegurándose de que las SageMaker libretas de Amazon no permitan el acceso directo a Internet. Al impedir el acceso directo a internet, puede evitar que usuarios no autorizados accedan a los datos confidenciales.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-6.A	AC-6.A Privilegio mínimo	subnet-auto-assign-public-IP deshabilitada	Gestione el acceso a la AWS nube asegurándose de que a las subredes de Amazon Virtual Private Cloud (VPC) no se les asigne automáticamente una dirección IP pública. Las instancias de Amazon Elastic Compute Cloud (EC2) que se lanzan en subredes que tienen este atributo habilitado o tienen una dirección IP pública asignada a su interfaz de red principal.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	alb-waf-enabled	Asegúrese de que AWS WAF esté habilitado en Elastic Load Balancers (ELB) para ayudar a proteger las aplicaciones web. Un WAF ayuda a proteger sus aplicaciones web o APIs contra los ataques web más comunes. Estas vulnerabilidades de la web pueden afectar a la disponibilidad, comprometer la seguridad o consumir recursos excesivos en su entorno.
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	api-gw-execution-logging-habilitado	El registro de API Gateway muestra vistas detalladas de los usuarios que han accedido a la API y la forma en que han accedido a la API. Esta información permite ver las actividades de los usuarios.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	cloud-trail-cloud-watch-habilitado para registros	Usa Amazon CloudWatch para recopilar y gestionar de forma centralizada la actividad de los eventos de registro. La inclusión de AWS CloudTrail datos proporciona detalles de la actividad de llamadas a la API en su interior Cuenta de AWS.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	cloudtrail-enabled	AWS CloudTrai l puede ayudar a evitar el repudio al registrar las acciones de la consola AWS de administración y las llamadas a la API. Puede identific ar a los usuarios y a quién llamó a un AWS servicio, la dirección IP de origen en la Cuentas de AWS que se generaron las llamadas y los horarios de las llamadas. Los detalles de los datos capturados se muestran en el contenido del AWS CloudTrail registro.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	dms-replication-not-public	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de replicación del DMS. Las instancias de replicación de DMS pueden contener información confidencial y dichas cuentas requieren control de acceso.
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	ebs-snapshot-public-restorable-comprobar	Gestione el acceso a la AWS nube asegurándose de que las instantáneas de EBS no se puedan restaurar públicamente. Las instantáneas de volumen de EBS pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	ec2- instance-no-public-ip	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a las instancias de Amazon Elastic Compute Cloud (Amazon EC2). Las instancias de Amazon EC2 pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	elasticsearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch OpenSearch Service (Service) estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de OpenSearch servicio dentro de una Amazon VPC permite una comunicac ión segura entre el OpenSearch Servicio y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	elb-logging-enabled	La actividad de Elastic Load Balancing es un punto central de comunicación dentro de un entorno. Asegúrese de que el registro de ELB esté habilitado. Los datos recopilados proporcio nan información detallada sobre las solicitudes enviadas al ELB. Cada registro contiene distintos datos, como el momento en que se recibió la solicitud , la dirección IP del cliente, las latencias, las rutas de solicitud y las respuestas del servidor.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	emr-master-no-public-IP	Gestione el acceso a la AWS nube asegurándose de que no se pueda acceder públicamente a los nodos maestros del clúster de Amazon EMR. Los nodos maestros del clúster de Amazon EMR pueden contener información confidencial y dichas cuentas requieren control de acceso.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	guardduty-enabled-centralized	Amazon GuardDuty puede ayudar a supervisar y detectar posibles eventos de ciberseguridad mediante fuentes de inteligencia sobre amenazas. Estas incluyen listas de datos maliciosos IPs y de aprendizaje automático para identificar actividades inesperadas, no autorizadas y maliciosas en su entorno de AWS nube.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	restricted-ssh	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a administrar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS Al no permitir el tráfico de entrada (o el tráfico remoto) desde 0.0.0.0/0 al puerto 22 en sus recursos, podrá restringir el acceso remoto.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	ec2- instances-in-vpc	Implemente instancias de Amazon Elastic Compute Cloud (Amazon EC2) dentro de una Amazon Virtual Private Cloud (Amazon VPC) para permitir una comunicación segura entre una instancia y otros servicios dentro de la Amazon VPC, sin necesidad de utilizar una puerta de enlace de internet, un dispositivo NAT ni una conexión de VPN. Todo el tráfico permanece seguro dentro de la AWS nube. Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Asigne instancias de Amazon EC2 a una

ID de control	Descripción del control	AWS Regla de configuración	Directrices
			Amazon VPC para gestionar correctamente el acceso.
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	internet-gateway-authorized-vpc-solo	Gestione el acceso a los recursos de la AWS nube asegurándose de que las puertas de enlace de Internet solo estén conectadas a Amazon Virtual Private Cloud (Amazon VPC) autorizada. Las puertas de enlace de Internet permiten el acceso bidireccional a internet desde y hacia la Amazon VPC, lo que puede provocar un acceso no autorizado a los recursos de Amazon VPC.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	lambda-function-public-access-prohibido	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a las funciones de AWS Lambda. El acceso público puede degradar la disponibilidad de los recursos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	lambda-inside-vpc	Implemente funciones de AWS Lambda en una Amazon Virtual Private Cloud (Amazon VPC) para una comunicac ión segura entre una función y otros servicios de la Amazon VPC. Con esta configuración, no se requiere ninguna puerta de enlace de internet, dispositivo NAT ni conexión de VPN. Todo el tráfico permanece de forma segura en la nube. AWS Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Para gestionar correctamente el acceso, las funciones de AWS Lambda

ID de control	Descripción del control	AWS Regla de configuración	Directrices
			deben asignarse a una VPC.
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	opensearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch Service estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de Amazon OpenSearch Service dentro de una Amazon VPC permite una comunicación segura entre Amazon OpenSearch Service y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	rds-instance-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relationa l Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidenc ial y principios. Además, dichas cuentas requieren control de acceso.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	rds-snapshots-public-prohibited	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relationa l Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidenc ial y principios. Además, dichas cuentas requieren control de acceso.
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	redshift-cluster-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que los clústeres de Amazon Redshift no sean públicos. Los clústeres de Amazon Redshift pueden contener informaci ón confidencial y principios. Además dichas cuentas requieren control de acceso.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	restricted-common-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integridad y confidencialidad de los sistemas. Esta regla le permite configurar de forma opcional los parámetros blockedPort1 a blockedPort5 (valores predeterminados de Config: 20,21,3389,3306,4333). Los valores reales deben reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	s3- -bloques-periódicos account-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configurar opcionalmente los restrictPublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices

La administración del acceso debe ser coherente con la clasificación de los datos.
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	sagemaker-notebook-no-direct-acceso a internet	Gestione el acceso a los recursos en la AWS nube asegurándose de que las SageMaker libretas de Amazon no permitan el acceso directo a Internet. Al impedir el acceso directo a internet, puede evitar que usuarios no autorizados accedan a los datos confidenciales.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	subnet-auto-assign-public-IP deshabilitada	Gestione el acceso a la AWS nube asegurándose de que a las subredes de Amazon Virtual Private Cloud (VPC) no se les asigne automáticamente una dirección IP pública. Las instancias de Amazon Elastic Compute Cloud (EC2) que se lanzan en subredes que tienen este atributo habilitado o tienen una dirección IP pública asignada a su interfaz de red principal.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	vpc-default-security-group-cerrado	Los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2) pueden ayudar a gestionar el acceso a la red al proporcionar un filtrado continuo del tráfico de red de entrada y salida a los recursos. AWS Restringir todo el tráfico en el grupo de seguridad predeterm inado ayuda a restringir el acceso remoto a los recursos. AWS

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	vpc-flow-logs-enabled	Los registros del flujo de la VPC proporcionan registros detallados acerca del tráfico IP entrante y saliente de las interfaces de red en su Amazon Virtual Private Cloud (Amazon VPC). De forma predeterm inada, el registro de flujo incluye valores para los distintos componentes del flujo de IP, incluido el origen, el destino y el protocolo.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	vpc-sg-open-only-to-authorized-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integridad y confidencialidad de los sistemas. Al restringir el acceso a los recursos dentro de un grupo de seguridad desde internet (0.0.0.0/0), se puede controlar el acceso remoto a los sistemas internos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(1)	AC-17(1) Acceso remoto | Monitoreo y control automatizados	wafv2-logging-enabled	Para facilitar el registro y la supervisión en su entorno, habilite el registro AWS WAF (V2) en la web regional y global. ACLs AWS El registro WAF proporciona información detallada sobre el tráfico que analiza su ACL web. Los registros registran la hora en que AWS WAF recibió la solicitud de su AWS recurso, la información sobre la solicitud y una acción para la regla según la cual cada solicitud coincidió.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(2)	AC-17(2) Acceso remoto | Protección de la confidencialidad e integridad mediante el cifrado	alb-http-to-https-verificación de redireccionamiento	Para ayudar a proteger los datos en tránsito, asegúrese de que el equilibrador de carga de aplicació n redirija automátic amente las solicitud es HTTP no cifradas hacia HTTPS. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.
CCCS-fPBMM-AC-17(2)	AC-17(2) Acceso remoto | Protección de la confidencialidad e integridad mediante el cifrado	api-gw-ssl-enabled	Asegúrese de que las etapas de la API de REST de Amazon API Gateway estén configuradas con certificados SSL para permitir que los sistemas de backend autentiquen que las solicitudes se originan en API Gateway.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(2)	AC-17(2) Acceso remoto | Protección de la confidencialidad e integridad mediante el cifrado	elb-acm-certificate-required	Dado que pueden existir datos confidenciales, para ayudar a proteger los datos en tránsito, debe asegurarse de que el cifrado esté habilitado para su Elastic Load Balancing. Use AWS Certificate Manager para administrar, aprovisionar e implementar SSL/TLS certificados públicos y privados con AWS servicios y recursos internos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(2)	AC-17(2) Acceso remoto | Protección de la confidencialidad e integridad mediante el cifrado	elb-predefined-security-policy-ssl-check	Para ayudar a proteger los datos en tránsito, asegúrese de que sus oyentes de SSL de su Classic Elastic Load Balancing utilicen una política de seguridad predefinida. Elastic Load Balancing proporciona configuraciones predefinidas de negociación SSL que se utilizan para la negociación SSL cuando se establece una conexión entre un cliente y el equilibrador de carga. Las configuraciones de la negociación SSL proporcionan compatibilidad con una amplia variedad de clientes y utilizan algoritmos criptográficos de alta seguridad. Esta regla requiere que establezca una política de seguridad predefinida para sus oyentes de SSL. La

ID de control	Descripción del control	AWS Regla de configuración	Directrices
			política de seguridad predeterminada es: Policy-TLS-1-2-2017-0. ELBSecurity El valor real debe reflejar las políticas de su organización.
CCCS-fPBMM-AC-17(2)	AC-17(2) Acceso remoto | Protección de la confidencialidad e integridad mediante el cifrado	elb-tls-https-listeners-solo	Asegúrese de que sus Elastic Load Balancers (ELBs) estén configurados con agentes de escucha SSL o HTTPS. Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(2)	AC-17(2) Acceso remoto | Protección de la confidencialidad e integridad mediante el cifrado	s3- bucket-ssl-requests-only	Para ayudar a proteger los datos en tránsito, asegúrese de que los buckets de Amazon Simple Storage Service (Amazon S3) requieran solicitudes para usar la capa de sockets seguros (SSL). Puesto que puede haber datos confidenciales, habilite el cifrado en tránsito para proteger esos datos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(3)	AC-17(3) Acceso remoto | Puntos de control de acceso administrados	internet-gateway-authorized-vpc-solo	Gestione el acceso a los recursos de la AWS nube asegurándose de que las puertas de enlace de Internet solo estén conectadas a Amazon Virtual Private Cloud (Amazon VPC) autorizada. Las puertas de enlace de Internet permiten el acceso bidireccional a internet desde y hacia la Amazon VPC, lo que puede provocar un acceso no autorizado a los recursos de Amazon VPC.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(4)	AC-17(4) Acceso remoto | Comandos privilegiados y acceso	iam-user-mfa-enabled	Active esta regla para restringir el acceso a los recursos en la nube de AWS . Esta regla garantiza que la autenticación multifactor (MFA) esté habilitada para todos los usuarios. La MFA aporta una capa adicional de protección además de un nombre de usuario y una contraseñ a. Reduzca los incidentes de cuentas comprometidas exigiendo la MFA a los usuarios.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(4)	AC-17(4) Acceso remoto | Comandos privilegiados y acceso	mfa-enabled-for-iam-acceso desde la consola	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para todos los usuarios de AWS Identity and Access Management (IAM) que tengan una contraseña de consola. La MFA agrega una capa adicional de protección a las credenciales de inicio de sesión. Al requerir la MFA para los usuarios, puede reducir los incidentes de cuentas comprometidas y evitar que usuarios no autorizados accedan a los datos confidenciales.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17(4)	AC-17(4) Acceso remoto | Comandos privilegiados y acceso	root-account-mfa-enabled	Gestione el acceso a los recursos en la AWS nube asegurándose de que la MFA esté habilitada para el usuario raíz. El usuario raíz es el usuario de Cuenta de AWS con más privilegios. La MFA añade una capa adicional de protección además de un nombre de usuario y una contraseña. Al requerir MFA para el usuario root, puede reducir los incidentes de amenazas. Cuentas de AWS

			Amazon VPC para gestionar correctam ente el acceso.
CCCS-fPBMM-AC-17.A	AC-17.A Acceso remoto	internet-gateway-authorized-vpc-solo	Gestione el acceso a los recursos de la AWS nube asegurándose de que las puertas de enlace de Internet solo estén conectadas a Amazon Virtual Private Cloud (Amazon VPC) autorizada. Las puertas de enlace de Internet permiten el acceso bidireccional a internet desde y hacia la Amazon VPC, lo que puede provocar un acceso no autorizado a los recursos de Amazon VPC.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17.A	AC-17.A Acceso remoto	lambda-function-public-access-prohibido	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a las funciones de AWS Lambda. El acceso público puede degradar la disponibilidad de los recursos.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17.A	AC-17.A Acceso remoto	lambda-inside-vpc	Implemente funciones de AWS Lambda en una Amazon Virtual Private Cloud (Amazon VPC) para una comunicac ión segura entre una función y otros servicios de la Amazon VPC. Con esta configuración, no se requiere ninguna puerta de enlace de internet, dispositivo NAT ni conexión de VPN. Todo el tráfico permanece de forma segura en la nube. AWS Debido a su aislamiento lógico, los dominios que residen dentro de una Amazon VPC tienen una capa adicional de seguridad en comparación con los dominios que utilizan puntos de conexión públicos. Para gestionar correctamente el acceso, las funciones de AWS Lambda

ID de control	Descripción del control	AWS Regla de configuración	Directrices
			deben asignarse a una VPC.
CCCS-fPBMM-AC-17.A	AC-17.A Acceso remoto	opensearch-in-vpc-only	Gestione el acceso a la AWS nube asegurándose de que los dominios de Amazon OpenSearch Service estén dentro de una Amazon Virtual Private Cloud (Amazon VPC). Un dominio de Amazon OpenSearch Service dentro de una Amazon VPC permite una comunicación segura entre Amazon OpenSearch Service y otros servicios de la Amazon VPC sin necesidad de una pasarela de Internet, un dispositivo NAT o una conexión VPN.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17.A	AC-17.A Acceso remoto	rds-instance-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relationa l Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidenc ial y principios. Además, dichas cuentas requieren control de acceso.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17.A	AC-17.A Acceso remoto	rds-snapshots-public-prohibited	Gestione el acceso a los recursos en la AWS nube asegurándose de que las instancias de Amazon Relationa l Database Service (Amazon RDS) no sean públicas. Las instancias de base de datos de Amazon RDS pueden contener información confidenc ial y principios. Además, dichas cuentas requieren control de acceso.
CCCS-fPBMM-AC-17.A	AC-17.A Acceso remoto	redshift-cluster-public-access-comprobar	Gestione el acceso a los recursos en la AWS nube asegurándose de que los clústeres de Amazon Redshift no sean públicos. Los clústeres de Amazon Redshift pueden contener informaci ón confidencial y principios. Además dichas cuentas requieren control de acceso.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17.A	AC-17.A Acceso remoto	restricted-common-ports	Gestione el acceso a los recursos de la AWS nube asegurándose de que los puertos comunes estén restringidos en los grupos de seguridad de Amazon Elastic Compute Cloud (Amazon EC2). No restringir el acceso a los puertos a solamente fuentes fiables puede afectar a la disponibilidad, integridad y confidencialidad de los sistemas. Esta regla le permite configurar de forma opcional los parámetros blockedPort1 a blockedPort5 (valores predeterminados de Config: 20,21,3389,3306,4333). Los valores reales deben reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices
CCCS-fPBMM-AC-17.A	AC-17.A Acceso remoto	s3- -bloques-periódicos account-level-public-access	Gestione el acceso a los recursos en la AWS nube asegurándose de que no se pueda acceder públicamente a los depósitos de Amazon Simple Storage Service (Amazon S3). Esta regla ayuda a proteger los datos confidenciales de usuarios remotos no autorizados al impedir el acceso público. Esta regla le permite configurar opcionalmente los restrictPublicBuckets parámetros ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True) y (Config Default: True). Los valores reales deben reflejar las políticas de su organización.

ID de control	Descripción del control	AWS Regla de configuración	Directrices

CCCS-fPBMM-AU-2.A	AU-2.A Eventos de auditoría	multi-region-cloudtrail-enabled	AWS CloudTrail registra las acciones AWS de la consola de administración y las llamadas a la API. Puede identificar qué usuarios y cuentas llamaron AWS, la dirección IP de origen desde la que se realizaron las llamadas y cuándo se produjeron. CloudTrail entregará los archivos de registro de todas AWS las regiones a su bucket de S3 si MULTI_REGION_CLOUD_TRAIL_ENABLED está activado. Además, al AWS lanzar una nueva región, CloudTrail creará la misma ruta en la nueva región. En consecuencia, recibirá archivos de registro con la actividad de la API en la nueva región sin necesidad de realizar ninguna acción.
