Welcome

Amazon CloudWatch Logs enables you to monitor, store, and access your system, application, and custom log files. This guide provides detailed information about CloudWatch Logs actions, data types, parameters, and errors. For more information about CloudWatch Logs features, see the [Amazon CloudWatch Logs User Guide](#).

Use the following links to get started using the CloudWatch Logs Query API:

- [Actions](#): An alphabetical list of all CloudWatch Logs actions.
- [Data Types](#): An alphabetical list of all CloudWatch Logs data types.
- [Common Parameters](#): Parameters that all Query actions can use.
- [Common Errors](#): Client and server errors that all actions can return.
- [Regions and Endpoints](#): Supported regions and endpoints for all AWS products.

Alternatively, you can use one of the [AWS SDKs](#) to access CloudWatch Logs using an API tailored to your programming language or platform.

Developers in the AWS developer community also provide their own libraries, which you can find at the following AWS developer centers:

- [Java Developer Center](#)
- [JavaScript Developer Center](#)
- [AWS Mobile Services](#)
- [PHP Developer Center](#)
- [Python Developer Center](#)
- [Ruby Developer Center](#)
- [Windows and .NET Developer Center](#)

Actions

The following actions are supported:

- [AssociateKmsKey](#)
- [CancelExportTask](#)
- [CreateDelivery](#)
- [CreateExportTask](#)
- [CreateLogAnomalyDetector](#)
- [CreateLogGroup](#)
- [CreateLogStream](#)
- [DeleteAccountPolicy](#)
- [DeleteDataProtectionPolicy](#)
- [DeleteDelivery](#)
- [DeleteDeliveryDestination](#)
- [DeleteDeliveryDestinationPolicy](#)
- [DeleteDeliverySource](#)
- [DeleteDestination](#)

AssociateKmsKey

Associates the specified AWS KMS key with either one log group in the account, or with all stored CloudWatch Logs query insights results in the account.

When you use `AssociateKmsKey`, you specify either the `logGroupName` parameter or the `resourceIdentifier` parameter. You can't specify both of those parameters in the same operation.

- Specify the `logGroupName` parameter to cause log events ingested into that log group to be encrypted with that key. Only the log events ingested after the key is associated are encrypted with that key.

Associating a KMS key with a log group overrides any existing associations between the log group and a KMS key. After a KMS key is associated with a log group, all newly ingested data for the log group is encrypted using the KMS key. This association is stored as long as the data encrypted with the KMS key is still within CloudWatch Logs. This enables CloudWatch Logs to decrypt this data whenever it is requested.

Associating a key with a log group does not cause the results of queries of that log group to be encrypted with that key. To have query results encrypted with a AWS KMS key, you must use an `AssociateKmsKey` operation with the `resourceIdentifier` parameter that specifies a `query-result` resource.

- Specify the `resourceIdentifier` parameter with a `query-result` resource, to use that key to encrypt the stored results of all future [StartQuery](#) operations in the account. The response from a [GetQueryResults](#) operation will still return the query results in plain text.

Even if you have not associated a key with your query results, the query results are encrypted when stored, using the default CloudWatch Logs method.

If you run a query from a monitoring account that queries logs in a source account, the query results key from the monitoring account, if any, is used.

⚠ Important

If you delete the key that is used to encrypt log events or log group query results, then all the associated stored log events or query results that were encrypted with that key will be unencryptable and unusable.

ⓘ Note

CloudWatch Logs supports only symmetric KMS keys. Do not associate an asymmetric KMS key with your log group or query results. For more information, see [Using Symmetric and Asymmetric Keys](#).

It can take up to 5 minutes for this operation to take effect.

If you attempt to associate a KMS key with a log group but the KMS key does not exist or the KMS key is disabled, you receive an `InvalidParameterException` error.

Request Syntax

```
{  
  "kmsKeyId": "string",  
  "logGroupName": "string",  
  "resourceIdentifier": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

kmsKeyId

The Amazon Resource Name (ARN) of the KMS key to use when encrypting log data. This must be a symmetric KMS key. For more information, see [Amazon Resource Names](#) and [Using Symmetric and Asymmetric Keys](#).

Type: String

Length Constraints: Maximum length of 256.

Required: Yes

[logGroupName](#)

The name of the log group.

In your `AssociateKmsKey` operation, you must specify either the `resourceIdentifier` parameter or the `logGroup` parameter, but you can't specify both.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: `[\._\-_/\#A-Za-z0-9]+`

Required: No

[resourceIdentifier](#)

Specifies the target for this operation. You must specify one of the following:

- Specify the following ARN to have future [GetQueryResults](#) operations in this account encrypt the results with the specified AWS KMS key. Replace `REGION` and `ACCOUNT_ID` with your Region and account ID.

`arn:aws:logs:REGION:ACCOUNT_ID:query-result:*`

- Specify the ARN of a log group to have CloudWatch Logs use the AWS KMS key to encrypt log events that are ingested and stored by that log group. The log group ARN must be in the following format. Replace `REGION` and `ACCOUNT_ID` with your Region and account ID.

`arn:aws:logs:REGION:ACCOUNT_ID:log-group:LOG_GROUP_NAME`

In your `AssociateKmsKey` operation, you must specify either the `resourceIdentifier` parameter or the `logGroup` parameter, but you can't specify both.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: `[\w+=/:,.@\-\^\"]*`

Required: No

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To associate a log group with aKMS key

The following example associates the specified log group with the specified KMS key.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
```

```
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,  
Signature=<Signature>  
User-Agent: <UserAgentString>  
Accept: application/json  
Content-Type: application/x-amz-json-1.1  
Content-Length: <PayloadSizeBytes>  
Connection: Keep-Alive  
X-Amz-Target: Logs_20140328.AssociateKmsKey  
{  
    "logGroupName": "my-log-group",  
    "kmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/abcd1234-a123-456a-a12b-a123b456c789"  
}
```

Sample Response

```
HTTP/1.1 200 OK  
x-amzn-RequestId: <RequestId>  
Content-Type: application/x-amz-json-1.1  
Content-Length: <PayloadSizeBytes>  
Date: <Date>
```

To associate all future query results in this account with aKMS key

The following example associates all future CloudWatch Logs Insights query results with the specified KMS key.

Sample Request

```
POST / HTTP/1.1  
Host: logs.<region>.<domain>  
X-Amz-Date: <DATE>  
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,  
Signature=<Signature>  
User-Agent: <UserAgentString>  
Accept: application/json  
Content-Type: application/x-amz-json-1.1  
Content-Length: <PayloadSizeBytes>  
Connection: Keep-Alive  
X-Amz-Target: Logs_20140328.AssociateKmsKey
```

```
{  
    "resourceIdentifier": "arn:aws:logs:us-east-1:123456789012:query-result:*",  
    "kmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/abcd1234-a123-456a-a12b-  
a123b456c789"  
}
```

Sample Response

```
HTTP/1.1 200 OK  
x-amzn-RequestId: <RequestId>  
Content-Type: application/x-amz-json-1.1  
Content-Length: <PayloadSizeBytes>  
Date: <Date>
```

CancelExportTask

Cancels the specified export task.

The task must be in the PENDING or RUNNING state.

Request Syntax

```
{  
    "taskId": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

taskId

The ID of the export task.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidOperationException

The operation is not valid on the specified resource.

HTTP Status Code: 400

InvalidParameterException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To cancel an export task

The following example cancels the specified task.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.CancelExportTask
{
    "taskId": "exampleTaskId"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
```

CreateDelivery

Creates a *delivery*. A delivery is a connection between a logical *delivery source* and a logical *delivery destination* that you have already created.

Only some AWS services support being configured as a delivery source using this operation. These services are listed as **Supported [V2 Permissions]** in the table at [Enabling logging from AWS services](#).

A delivery destination can represent a log group in CloudWatch Logs, an Amazon S3 bucket, a delivery stream in Firehose, or X-Ray.

To configure logs delivery between a supported AWS service and a destination, you must do the following:

- Create a delivery source, which is a logical object that represents the resource that is actually sending the logs. For more information, see [PutDeliverySource](#).
- Create a *delivery destination*, which is a logical object that represents the actual delivery destination. For more information, see [PutDeliveryDestination](#).
- If you are delivering logs cross-account, you must use [PutDeliveryDestinationPolicy](#) in the destination account to assign an IAM policy to the destination. This policy allows delivery to that destination.
- Use `CreateDelivery` to create a *delivery* by pairing exactly one delivery source and one delivery destination.

You can configure a single delivery source to send logs to multiple destinations by creating multiple deliveries. You can also create multiple deliveries to configure multiple delivery sources to send logs to the same delivery destination.

To update an existing delivery configuration, use [UpdateDeliveryConfiguration](#).

Request Syntax

```
{  
  "deliveryDestinationArn": "string",  
  "deliverySourceName": "string",  
  "fieldDelimiter": "string",  
  "recordFields": [ "string" ],
```

```
"s3DeliveryConfiguration": {  
    "enableHiveCompatiblePathboolean,  
    "suffixPath": "string"  
},  
"tags": {  
    "string": "string"  
}  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

deliveryDestinationArn

The ARN of the delivery destination to use for this delivery.

Type: String

Required: Yes

deliverySourceName

The name of the delivery source to use for this delivery.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 60.

Pattern: [\w-]*

Required: Yes

fieldDelimiter

The field delimiter to use between record fields when the final output format of a delivery is in Plain, W3C, or Raw format.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 5.

Required: No

recordFields

The list of record fields to be delivered to the destination, in order. If the delivery's log source has mandatory fields, they must be included in this list.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 128 items.

Length Constraints: Minimum length of 1. Maximum length of 64.

Required: No

s3DeliveryConfiguration

This structure contains parameters that are valid only when the delivery's delivery destination is an S3 bucket.

Type: [S3DeliveryConfiguration](#) object

Required: No

tags

An optional list of key-value pairs to associate with the resource.

For more information about tagging, see [Tagging AWS resources](#)

Type: String to string map

Map Entries: Maximum number of 50 items.

Key Length Constraints: Minimum length of 1. Maximum length of 128.

Key Pattern: ^([\p{L}\p{Z}\p{N}_.:/=+\-@\]+)\$

Value Length Constraints: Maximum length of 256.

Value Pattern: ^([\p{L}\p{Z}\p{N}_.:/=+\-@\]*)\$

Required: No

Response Syntax

```
{
```

```
"delivery": {  
    "arn    "deliveryDestinationArn": "string",  
    "deliveryDestinationType": "string",  
    "deliverySourceName": "string",  
    "fieldDelimiter": "string",  
    "id": "string",  
    "recordFields": [ "string" ],  
    "s3DeliveryConfiguration": {  
        "enableHiveCompatiblePath": boolean,  
        "suffixPath": "string"  
    },  
    "tags": {  
        "string" : "string"  
    }  
}  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

delivery

A structure that contains information about the delivery that you just created.

Type: [Delivery](#) object

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

AccessDeniedException

You don't have sufficient permissions to perform this action.

HTTP Status Code: 400

ConflictException

This operation attempted to create a resource that already exists.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceQuotaExceededException

This request exceeds a service quota.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ThrottlingException

The request was throttled because of quota limits.

HTTP Status Code: 400

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

CreateExportTask

Creates an export task so that you can efficiently export data from a log group to an Amazon S3 bucket. When you perform a `CreateExportTask` operation, you must use credentials that have permission to write to the S3 bucket that you specify as the destination.

Exporting log data to S3 buckets that are encrypted by AWS KMS is supported. Exporting log data to Amazon S3 buckets that have S3 Object Lock enabled with a retention period is also supported.

Exporting to S3 buckets that are encrypted with AES-256 is supported.

This is an asynchronous call. If all the required information is provided, this operation initiates an export task and responds with the ID of the task. After the task has started, you can use [DescribeExportTasks](#) to get the status of the export task. Each account can only have one active (RUNNING or PENDING) export task at a time. To cancel an export task, use [CancelExportTask](#).

You can export logs from multiple log groups or multiple time ranges to the same S3 bucket. To separate log data for each export task, specify a prefix to be used as the Amazon S3 key prefix for all exported objects.

 **Note**

We recommend that you don't regularly export to Amazon S3 as a way to continuously archive your logs. For that use case, we instead recommend that you use subscriptions. For more information about subscriptions, see [Real-time processing of log data with subscriptions](#).

 **Note**

Time-based sorting on chunks of log data inside an exported file is not guaranteed. You can sort the exported log field data by using Linux utilities.

Request Syntax

```
{  
  "destination": "string",
```

```
"destinationPrefixfromlogGroupNamelogStreamNamePrefixtaskNameto
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

destination

The name of S3 bucket for the exported log data. The bucket must be in the same AWS Region.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Required: Yes

destinationPrefix

The prefix used as the start of the key for every object exported. If you don't specify a value, the default is `exportedlogs`.

The length of this parameter must comply with the S3 object key name length limits. The object key name is a sequence of Unicode characters with UTF-8 encoding, and can be up to 1,024 bytes.

Type: String

Required: No

from

The start time of the range for the request, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC. Events with a timestamp earlier than this time are not exported.

Type: Long

Valid Range: Minimum value of 0.

Required: Yes

[logGroupName](#)

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\._\-_/\#A-Za-z0-9]+

Required: Yes

[logStreamNamePrefix](#)

Export only log streams that match the provided prefix. If you don't specify a value, no prefix filter is applied.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]^{*}

Required: No

[taskName](#)

The name of the export task.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Required: No

[to](#)

The end time of the range for the request, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC. Events with a timestamp later than this time are not exported.

You must specify a time that is not earlier than when this log group was created.

Type: Long

Valid Range: Minimum value of 0.

Required: Yes

Response Syntax

```
{  
    "taskId": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

taskId

The ID of the export task.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceededException

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceAlreadyExistsException

The specified resource already exists.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To create an export task

The following example creates an export task that exports data from a log group to an S3 bucket.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.CreateExportTask
```

```
{  
  "taskName": "my-task",  
  "logGroupName": "my-log-group",  
  "from": 1437584472382,  
  "to": 1437584472833,  
  "destination": "my-destination",  
  "destinationPrefix": "my-prefix"  
}
```

Sample Response

```
HTTP/1.1 200 OK  
x-amzn-RequestId: <RequestId>  
Content-Type: application/x-amz-json-1.1  
Content-Length: <PayloadSizeBytes>  
Date: <Date>  
{  
  "taskId": "exampleTaskId"  
}
```

CreateLogAnomalyDetector

Creates an *anomaly detector* that regularly scans one or more log groups and look for patterns and anomalies in the logs.

An anomaly detector can help surface issues by automatically discovering anomalies in your log event traffic. An anomaly detector uses machine learning algorithms to scan log events and find *patterns*. A pattern is a shared text structure that recurs among your log fields. Patterns provide a useful tool for analyzing large sets of logs because a large number of log events can often be compressed into a few patterns.

The anomaly detector uses pattern recognition to find anomalies, which are unusual log events. It uses the `evaluationFrequency` to compare current log events and patterns with trained baselines.

Fields within a pattern are called *tokens*. Fields that vary within a pattern, such as a request ID or timestamp, are referred to as *dynamic tokens* and represented by `<*>`.

The following is an example of a pattern:

```
[INFO] Request time: <*> ms
```

This pattern represents log events like [INFO] Request time: 327 ms and other similar log events that differ only by the number, in this case 327. When the pattern is displayed, the different numbers are replaced by `<*>`

 **Note**

Any parts of log events that are masked as sensitive data are not scanned for anomalies.

For more information about masking sensitive data, see [Help protect sensitive log data with masking](#).

Request Syntax

```
{
  "anomalyVisibilityTime": number,
  "detectorName": "string",
  "evaluationFrequency": "string",
  "filterPattern": "string",
```

```
"kmsKeyId": "string",
"logGroupArnList": [ "string" ],
"tags": {
    "string" : "string"
}
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[anomalyVisibilityTime](#)

The number of days to have visibility on an anomaly. After this time period has elapsed for an anomaly, it will be automatically baselined and the anomaly detector will treat new occurrences of a similar anomaly as normal. Therefore, if you do not correct the cause of an anomaly during the time period specified in anomalyVisibilityTime, it will be considered normal going forward and will not be detected as an anomaly.

Type: Long

Valid Range: Minimum value of 7. Maximum value of 90.

Required: No

[detectorName](#)

A name for this anomaly detector.

Type: String

Length Constraints: Minimum length of 1.

Required: No

[evaluationFrequency](#)

Specifies how often the anomaly detector is to run and look for anomalies. Set this value according to the frequency that the log group receives new logs. For example, if the log group receives new log events every 10 minutes, then 15 minutes might be a good setting for evaluationFrequency .

Type: String

Valid Values: ONE_MIN | FIVE_MIN | TEN_MIN | FIFTEEN_MIN | THIRTY_MIN | ONE_HOUR

Required: No

filterPattern

You can use this parameter to limit the anomaly detection model to examine only log events that match the pattern you specify here. For more information, see [Filter and Pattern Syntax](#).

Type: String

Length Constraints: Minimum length of 0. Maximum length of 1024.

Required: No

kmsKeyId

Optionally assigns a AWS KMS key to secure this anomaly detector and its findings. If a key is assigned, the anomalies found and the model used by this detector are encrypted at rest with the key. If a key is assigned to an anomaly detector, a user must have permissions for both this key and for the anomaly detector to retrieve information about the anomalies that it finds.

Make sure the value provided is a valid AWS KMS key ARN. For more information about using a AWS KMS key and to see the required IAM policy, see [Use a AWS KMS key with an anomaly detector](#).

Type: String

Length Constraints: Maximum length of 256.

Pattern: ^arn:aws[a-z\-]*:kms:[-a-z0-9]*:[0-9]*:key/[-a-z0-9]*\$

Required: No

logGroupArnList

An array containing the ARN of the log group that this anomaly detector will watch. You can specify only one log group ARN.

Type: Array of strings

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: `[\w#+=/:,.@-]*`

Required: Yes

tags

An optional list of key-value pairs to associate with the resource.

For more information about tagging, see [Tagging AWS resources](#)

Type: String to string map

Map Entries: Maximum number of 50 items.

Key Length Constraints: Minimum length of 1. Maximum length of 128.

Key Pattern: `^([\p{L}\p{Z}\p{N}_.:/=+\-@]+)$`

Value Length Constraints: Maximum length of 256.

Value Pattern: `^([\p{L}\p{Z}\p{N}_.:/=+\-@]*)$`

Required: No

Response Syntax

```
{  
  "anomalyDetectorArn": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[anomalyDetectorArn](#)

The ARN of the log anomaly detector that you just created.

Type: String

Length Constraints: Minimum length of 1.

Pattern: [\w#+=/:,.@-]*

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidOperationException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceededException

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

CreateLogGroup

Creates a log group with the specified name. You can create up to 1,000,000 log groups per Region per account.

You must use the following guidelines when naming a log group:

- Log group names must be unique within a Region for an AWS account.
- Log group names can be between 1 and 512 characters long.
- Log group names consist of the following characters: a-z, A-Z, 0-9, '_' (underscore), '-' (hyphen), '/' (forward slash), '.' (period), and '#' (number sign)
- Log group names can't start with the string aws/

When you create a log group, by default the log events in the log group do not expire.

To set a retention policy so that events expire and are deleted after a specified time, use [PutRetentionPolicy](#).

If you associate an AWS KMS key with the log group, ingested data is encrypted using the KMS key. This association is stored as long as the data encrypted with the KMS key is still within CloudWatch Logs. This enables CloudWatch Logs to decrypt this data whenever it is requested.

If you attempt to associate a KMS key with the log group but the KMS key does not exist or the KMS key is disabled, you receive an `InvalidParameterException` error.

A **Important**

CloudWatch Logs supports only symmetric KMS keys. Do not associate an asymmetric KMS key with your log group. For more information, see [Using Symmetric and Asymmetric Keys](#).

Request Syntax

```
{  
  "kmsKeyId": "string",  
  "logGroupClass": "string",  
  "logGroupName": "string",  
  "tags": {  
    "string" : "string"  
  }  
}
```

```
    }  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

kmsKeyId

The Amazon Resource Name (ARN) of the KMS key to use when encrypting log data. For more information, see [Amazon Resource Names](#).

Type: String

Length Constraints: Maximum length of 256.

Required: No

logGroupClass

Use this parameter to specify the log group class for this log group. There are three classes:

- The Standard log class supports all CloudWatch Logs features.
- The Infrequent Access log class supports a subset of CloudWatch Logs features and incurs lower costs.
- Use the Delivery log class only for delivering AWS Lambda logs to store in Amazon S3 or Amazon Data Firehose. Log events in log groups in the Delivery class are kept in CloudWatch Logs for only one day. This log class doesn't offer rich CloudWatch Logs capabilities such as CloudWatch Logs Insights queries.

If you omit this parameter, the default of STANDARD is used.

⚠ Important

The value of logGroupClass can't be changed after a log group is created.

For details about the features supported by each class, see [Log classes](#)

Type: String

Valid Values: STANDARD | INFREQUENT_ACCESS | DELIVERY

Required: No

logGroupName

A name for the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: Yes

tags

The key-value pairs to use for the tags.

You can grant users access to certain log groups while preventing them from accessing other log groups. To do so, tag your groups and use IAM policies that refer to those tags. To assign tags when you create a log group, you must have either the logs:TagResource or logs:TagLogGroup permission. For more information about tagging, see [Tagging AWS resources](#). For more information about using tags to control access, see [Controlling access to Amazon Web Services resources using tags](#).

Type: String to string map

Map Entries: Maximum number of 50 items.

Key Length Constraints: Minimum length of 1. Maximum length of 128.

Key Pattern: ^([\p{L}\p{Z}]\p{N}_.:/=+\-@]+)\$

Value Length Constraints: Maximum length of 256.

Value Pattern: ^([\p{L}\p{Z}]\p{N}_.:/=+\-@]*\$

Required: No

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceededException

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceAlreadyExistsException

The specified resource already exists.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To create a log group

The following example creates a log group.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
```

```
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,  
Signature=<Signature>  
User-Agent: <UserAgentString>  
Accept: application/json  
Content-Type: application/x-amz-json-1.1  
Content-Length: <PayloadSizeBytes>  
Connection: Keep-Alive  
X-Amz-Target: Logs_20140328.CreateLogGroup  
{  
    "logGroupName": "my-log-group",  
    "kmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/abcd1234-a123-456a-a12b-a123b456c789"  
}
```

Sample Response

```
HTTP/1.1 200 OK  
x-amzn-RequestId: <RequestId>  
Content-Type: application/x-amz-json-1.1  
Content-Length: <PayloadSizeBytes>  
Date: <Date>
```

CreateLogStream

Creates a log stream for the specified log group. A log stream is a sequence of log events that originate from a single source, such as an application instance or a resource that is being monitored.

There is no limit on the number of log streams that you can create for a log group. There is a limit of 50 TPS on CreateLogStream operations, after which transactions are throttled.

You must use the following guidelines when naming a log stream:

- Log stream names must be unique within the log group.
- Log stream names can be between 1 and 512 characters long.
- Don't use ':' (colon) or '*' (asterisk) characters.

Request Syntax

```
{  
    "logGroupName": "string",  
    "logStreamName": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[logGroupName](#)

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/#A-Za-z0-9]+

Required: Yes

logStreamName

The name of the log stream.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]*

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceAlreadyExistsException

The specified resource already exists.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To create a log stream

The following example creates a log stream for the specified log group.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-
type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.CreateLogStream
{
    "logGroupName": "my-log-group",
    "logStreamName": "my-log-stream"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
```

DeleteAccountPolicy

Deletes a CloudWatch Logs account policy. This stops the account-wide policy from applying to log groups in the account. If you delete a data protection policy or subscription filter policy, any log-group level policies of those types remain in effect.

To use this operation, you must be signed on with the correct permissions depending on the type of policy that you are deleting.

- To delete a data protection policy, you must have the `logs:DeleteDataProtectionPolicy` and `logs:DeleteAccountPolicy` permissions.
- To delete a subscription filter policy, you must have the `logs:DeleteSubscriptionFilter` and `logs:DeleteAccountPolicy` permissions.
- To delete a transformer policy, you must have the `logs:DeleteTransformer` and `logs:DeleteAccountPolicy` permissions.
- To delete a field index policy, you must have the `logs:DeleteIndexPolicy` and `logs:DeleteAccountPolicy` permissions.

If you delete a field index policy, the indexing of the log events that happened before you deleted the policy will still be used for up to 30 days to improve CloudWatch Logs Insights queries.

Request Syntax

```
{  
    "policyName": "string",  
    "policyType": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[policyName](#)

The name of the policy to delete.

Type: String

Required: Yes

policyType

The type of policy to delete.

Type: String

Valid Values: DATA_PROTECTION_POLICY | SUBSCRIPTION_FILTER_POLICY | FIELD_INDEX_POLICY | TRANSFORMER_POLICY | METRIC_EXTRACTION_POLICY

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

DeleteDataProtectionPolicy

Deletes the data protection policy from the specified log group.

For more information about data protection policies, see [PutDataProtectionPolicy](#).

Request Syntax

```
{  
    "logGroupIdentifier": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

logGroupIdentifier

The name or ARN of the log group that you want to delete the data protection policy for.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#=+=/:,.@-]*

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

DeleteDelivery

Deletes a *delivery*. A delivery is a connection between a logical *delivery source* and a logical *delivery destination*. Deleting a delivery only deletes the connection between the delivery source and delivery destination. It does not delete the delivery destination or the delivery source.

Request Syntax

```
{  
  "id": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[id](#)

The unique ID of the delivery to delete. You can find the ID of a delivery with the [DescribeDeliveries](#) operation.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Pattern: ^[0-9A-Za-z]+\$

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

ConflictException

This operation attempted to create a resource that already exists.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceQuotaExceededException

This request exceeds a service quota.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ThrottlingException

The request was throttled because of quota limits.

HTTP Status Code: 400

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

DeleteDeliveryDestination

Deletes a *delivery destination*. A delivery is a connection between a logical *delivery source* and a logical *delivery destination*.

You can't delete a delivery destination if any current deliveries are associated with it. To find whether any deliveries are associated with this delivery destination, use the [DescribeDeliveries](#) operation and check the `deliveryDestinationArn` field in the results.

Request Syntax

```
{  
    "name": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

name

The name of the delivery destination that you want to delete. You can find a list of delivery destination names by using the [DescribeDeliveryDestinations](#) operation.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 60.

Pattern: `[\w-]*`

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

ConflictException

This operation attempted to create a resource that already exists.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceQuotaExceededException

This request exceeds a service quota.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ThrottlingException

The request was throttled because of quota limits.

HTTP Status Code: 400

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

DeleteDeliveryDestinationPolicy

Deletes a delivery destination policy. For more information about these policies, see [PutDeliveryDestinationPolicy](#).

Request Syntax

```
{  
    "deliveryDestinationName": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[deliveryDestinationName](#)

The name of the delivery destination that you want to delete the policy for.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 60.

Pattern: [\w-]*

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

ConflictException

This operation attempted to create a resource that already exists.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

See Also

DeleteDeliverySource

Deletes a *delivery source*. A delivery is a connection between a logical *delivery source* and a logical *delivery destination*.

You can't delete a delivery source if any current deliveries are associated with it. To find whether any deliveries are associated with this delivery source, use the [DescribeDeliveries](#) operation and check the `deliverySourceName` field in the results.

Request Syntax

```
{  
  "name": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

name

The name of the delivery source that you want to delete.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 60.

Pattern: [\w-]*

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

ConflictException

This operation attempted to create a resource that already exists.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceQuotaExceededException

This request exceeds a service quota.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ThrottlingException

The request was throttled because of quota limits.

HTTP Status Code: 400

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

See Also

- [AWS SDK for Ruby V3](#)

DeleteDestination

Deletes the specified destination, and eventually disables all the subscription filters that publish to it. This operation does not delete the physical resource encapsulated by the destination.

Request Syntax

```
{  
    "destinationName": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

destinationName

The name of the destination.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]^{*}

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To delete a destination

The following example deletes the specified destination.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.DeleteDestination
{
    "destinationName": my-destination"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
```

DeleteIndexPolicy

Deletes a log-group level field index policy that was applied to a single log group. The indexing of the log events that happened before you delete the policy will still be used for as many as 30 days to improve CloudWatch Logs Insights queries.

You can't use this operation to delete an account-level index policy. Instead, use [DeleteAccountPolicy](#).

If you delete a log-group level field index policy and there is an account-level field index policy, in a few minutes the log group begins using that account-wide policy to index new incoming log events.

Request Syntax

```
{  
    "logGroupIdentifier": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[logGroupIdentifier](#)

The log group to delete the index policy for. You can specify either the name or the ARN of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#=+=/:,.@-]*

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceededException

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

DeleteIntegration

Deletes the integration between CloudWatch Logs and OpenSearch Service. If your integration has active vended logs dashboards, you must specify true for the force parameter, otherwise the operation will fail. If you delete the integration by setting force to true, all your vended logs dashboards powered by OpenSearch Service will be deleted and the data that was on them will no longer be accessible.

Request Syntax

```
{  
    "force": boolean,  
    "integrationName": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

force

Specify true to force the deletion of the integration even if vended logs dashboards currently exist.

The default is false.

Type: Boolean

Required: No

integrationName

The name of the integration to delete. To find the name of your integration, use [ListIntegrations](#).

Type: String

Length Constraints: Minimum length of 1. Maximum length of 50.

Pattern: [\._\-_/\#A-Za-z0-9]+

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

DeleteLogAnomalyDetector

Deletes the specified CloudWatch Logs anomaly detector.

Request Syntax

```
{  
    "anomalyDetectorArn": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[anomalyDetectorArn](#)

The ARN of the anomaly detector to delete. You can find the ARNs of log anomaly detectors in your account by using the [ListLogAnomalyDetectors](#) operation.

Type: String

Length Constraints: Minimum length of 1.

Pattern: [\w#==/:, .@-]*

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidParameterException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

DeleteLogGroup

Deletes the specified log group and permanently deletes all the archived log events associated with the log group.

Request Syntax

```
{  
    "logGroupName": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[logGroupName](#)

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/#A-Za-z0-9]+

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidParameterException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To delete a log group

The following example deletes the specified log group.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.DeleteLogGroup
{
    "logGroupName": "my-log-group"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
```

DeleteLogStream

Deletes the specified log stream and permanently deletes all the archived log events associated with the log stream.

Request Syntax

```
{  
    "logGroupName": "string",  
    "logStreamName": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

logGroupName

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/#A-Za-z0-9]+

Required: Yes

logStreamName

The name of the log stream.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]*

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To delete a log stream

The following example deletes the specified log stream.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
```

```
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,  
Signature=<Signature>  
User-Agent: <UserAgentString>  
Accept: application/json  
Content-Type: application/x-amz-json-1.1  
Content-Length: <PayloadSizeBytes>  
Connection: Keep-Alive  
X-Amz-Target: Logs_20140328.DeleteLogStream  
{  
    "logGroupName": "my-log-group",  
    "logStreamName": "my-log-stream"  
}
```

Sample Response

```
HTTP/1.1 200 OK  
x-amzn-RequestId: <RequestId>  
Content-Type: application/x-amz-json-1.1  
Content-Length: <PayloadSizeBytes>  
Date: <Date>
```

DeleteMetricFilter

Deletes the specified metric filter.

Request Syntax

```
{  
    "filterName": "string",  
    "logGroupName": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

filterName

The name of the metric filter.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]*

Required: Yes

logGroupName

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To delete a metric filter

The following example deletes the specified filter for the specified log group.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
```

```
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,  
Signature=<Signature>  
User-Agent: <UserAgentString>  
Accept: application/json  
Content-Type: application/x-amz-json-1.1  
Content-Length: <PayloadSizeBytes>  
Connection: Keep-Alive  
X-Amz-Target: Logs_20140328.DeleteMetricFilter  
{  
    "logGroupName": "my-log-group",  
    "filterName": "my-metric-filter"  
}
```

Sample Response

```
HTTP/1.1 200 OK  
x-amzn-RequestId: <RequestId>  
Content-Type: application/x-amz-json-1.1  
Content-Length: <PayloadSizeBytes>  
Date: <Date>
```

DeleteQueryDefinition

Deletes a saved CloudWatch Logs Insights query definition. A query definition contains details about a saved CloudWatch Logs Insights query.

Each `DeleteQueryDefinition` operation can delete one query definition.

You must have the `logs:DeleteQueryDefinition` permission to be able to perform this operation.

Request Syntax

```
{  
  "queryDefinitionId": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

queryDefinitionId

The ID of the query definition that you want to delete. You can use [DescribeQueryDefinitions](#) to retrieve the IDs of your saved query definitions.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

Response Syntax

```
{  
  "success": boolean  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

success

A value of TRUE indicates that the operation succeeded. FALSE indicates that the operation failed.

Type: Boolean

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

Example

This example deletes a query definition.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid, Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.DeleteQueryDefinition
{
    "queryDefinitionId": "123456ab-12ab-123a-789e-1234567890ab"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "success": True
}
```

DeleteResourcePolicy

Deletes a resource policy from this account. This revokes the access of the identities in that policy to put log events to this account.

Request Syntax

```
{  
    "expectedRevisionId": "string",  
    "policyName": "string",  
    "resourceArn": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[expectedRevisionId](#)

The expected revision ID of the resource policy. Required when deleting a resource-scoped policy to prevent concurrent modifications.

Type: String

Length Constraints: Minimum length of 1.

Required: No

[policyName](#)

The name of the policy to be revoked. This parameter is required.

Type: String

Required: No

[resourceArn](#)

The ARN of the CloudWatch Logs resource for which the resource policy needs to be deleted

Type: String

Required: No

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

DeleteRetentionPolicy

Deletes the specified retention policy.

Log events do not expire if they belong to log groups without a retention policy.

Request Syntax

```
{  
    "logGroupName": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

logGroupName

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidParameterException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To delete a retention policy

The following example deletes the retention policy for the specified log group.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.DeleteRetentionPolicy
{
    "logGroupName": "my-log-group"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
```

DeleteSubscriptionFilter

Deletes the specified subscription filter.

Request Syntax

```
{  
    "filterName": "string",  
    "logGroupName": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

filterName

The name of the subscription filter.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]*

Required: Yes

logGroupName

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To delete a subscription filter

The following example deletes the specified subscription filter for the specified log group.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
```

```
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,  
Signature=<Signature>  
User-Agent: <UserAgentString>  
Accept: application/json  
Content-Type: application/x-amz-json-1.1  
Content-Length: <PayloadSizeBytes>  
Connection: Keep-Alive  
X-Amz-Target: Logs_20140328.DeleteSubscriptionFilter  
{  
    "logGroupName": "my-log-group",  
    "filterName": "my-subscription-filter"  
}
```

Sample Response

```
HTTP/1.1 200 OK  
x-amzn-RequestId: <RequestId>  
Content-Type: application/x-amz-json-1.1  
Content-Length: <PayloadSizeBytes>  
Date: <Date>
```

DeleteTransformer

Deletes the log transformer for the specified log group. As soon as you do this, the transformation of incoming log events according to that transformer stops. If this account has an account-level transformer that applies to this log group, the log group begins using that account-level transformer when this log-group level transformer is deleted.

After you delete a transformer, be sure to edit any metric filters or subscription filters that relied on the transformed versions of the log events.

Request Syntax

```
{  
    "logGroupIdentifier": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[logGroupIdentifier](#)

Specify either the name or ARN of the log group to delete the transformer for. If the log group is in a source account and you are using a monitoring account, you must use the log group ARN.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#\+=/:,.@-]*

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidOperationException

The operation is not valid on the specified resource.

HTTP Status Code: 400

InvalidOperationException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS Command Line Interface](#)
- [AWS SDK for .NET](#)

- [AWS SDK for Ruby V3](#)

DescribeAccountPolicies

Returns a list of all CloudWatch Logs account policies in the account.

To use this operation, you must be signed on with the correct permissions depending on the type of policy that you are retrieving information for.

- To see data protection policies, you must have the `logs:GetDataProtectionPolicy` and `logs:DescribeAccountPolicies` permissions.
- To see subscription filter policies, you must have the `logs:DescribeSubscriptionFilters` and `logs:DescribeAccountPolicies` permissions.
- To see transformer policies, you must have the `logs:GetTransformer` and `logs:DescribeAccountPolicies` permissions.
- To see field index policies, you must have the `logs:DescribeIndexPolicies` and `logs:DescribeAccountPolicies` permissions.

Request Syntax

```
{  
    "accountIdentifiers": [ "string" ],  
    "nextToken": "string",  
    "policyName": "string",  
    "policyType": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

accountIdentifiers

If you are using an account that is set up as a monitoring account for CloudWatch unified cross-account observability, you can use this to specify the account ID of a source account. If you do, the operation returns the account policy for the specified account. Currently, you can specify only one account ID in this parameter.

If you omit this parameter, only the policy in the current account is returned.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 1 item.

Length Constraints: Fixed length of 12.

Pattern: ^\d{12}\\$

Required: No

nextToken

The token for the next set of items to return. (You received this token from a previous call.)

Type: String

Length Constraints: Minimum length of 1.

Required: No

policyName

Use this parameter to limit the returned policies to only the policy with the name that you specify.

Type: String

Required: No

policyType

Use this parameter to limit the returned policies to only the policies that match the policy type that you specify.

Type: String

Valid Values: DATA_PROTECTION_POLICY | SUBSCRIPTION_FILTER_POLICY | FIELD_INDEX_POLICY | TRANSFORMER_POLICY | METRIC_EXTRACTION_POLICY

Required: Yes

Response Syntax

```
{
```

```
"accountPolicies": [  
    {  
        "accountId        "lastUpdatedTime": number,  
        "policyDocument": "string",  
        "policyName": "string",  
        "policyType": "string",  
        "scope": "string",  
        "selectionCriteria": "string"  
    },  
    ...  
],  
"nextToken": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

accountPolicies

An array of structures that contain information about the CloudWatch Logs account policies that match the specified filters.

Type: Array of [AccountPolicy](#) objects

nextToken

The token to use when requesting the next set of items. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

DescribeConfigurationTemplates

Use this operation to return the valid and default values that are used when creating delivery sources, delivery destinations, and deliveries. For more information about deliveries, see [CreateDelivery](#).

Request Syntax

```
{  
    "deliveryDestinationTypes": [ "string" ],  
    "limit": number,  
    "logTypes": [ "string" ],  
    "nextToken": "string",  
    "resourceTypes": [ "string" ],  
    "service": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[deliveryDestinationTypes](#)

Use this parameter to filter the response to include only the configuration templates that apply to the delivery destination types that you specify here.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 4 items.

Valid Values: S3 | CWL | FH | XRAY

Required: No

[limit](#)

Use this parameter to limit the number of configuration templates that are returned in the response.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 50.

Required: No

logTypes

Use this parameter to filter the response to include only the configuration templates that apply to the log types that you specify here.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 10 items.

Length Constraints: Minimum length of 1. Maximum length of 255.

Pattern: `[\w]*`

Required: No

nextToken

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Required: No

resourceTypes

Use this parameter to filter the response to include only the configuration templates that apply to the resource types that you specify here.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 10 items.

Length Constraints: Minimum length of 1. Maximum length of 255.

Pattern: `[\w-_]*`

Required: No

service

Use this parameter to filter the response to include only the configuration templates that apply to the AWS service that you specify here.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 255.

Pattern: [\w_-]*

Required: No

Response Syntax

```
{  
  "configurationTemplates": [  
    {  
      "allowedActionForAllowVendedLogsDeliveryForResource": "string",  
      "allowedFieldDelimiters": [ "string" ],  
      "allowedFields": [  
        {  
          "mandatory": boolean,  
          "name": "string"  
        }  
      ],  
      "allowedOutputFormats": [ "string" ],  
      "allowedSuffixPathFields": [ "string" ],  
      "defaultDeliveryConfigValues": {  
        "fieldDelimiter": "string",  
        "recordFields": [ "string" ],  
        "s3DeliveryConfiguration": {  
          "enableHiveCompatiblePath": boolean,  
          "suffixPath": "string"  
        }  
      },  
      "deliveryDestinationType": "string",  
      "logType": "string",  
      "resourceType": "string",  
      "service": "string"  
    }  
  ],  
  "nextToken": "string"
```

{}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[configurationTemplates](#)

An array of objects, where each object describes one configuration template that matches the filters that you specified in the request.

Type: Array of [ConfigurationTemplate](#) objects

[nextToken](#)

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ThrottlingException

The request was throttled because of quota limits.

HTTP Status Code: 400

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

DescribeDeliveries

Retrieves a list of the deliveries that have been created in the account.

A *delivery* is a connection between a [*delivery source*](#) and a [*delivery destination*](#).

A delivery source represents an AWS resource that sends logs to an logs delivery destination. The destination can be CloudWatch Logs, Amazon S3, Firehose or X-Ray. Only some AWS services support being configured as a delivery source. These services are listed in [Enable logging from AWS services](#).

Request Syntax

```
{  
    "limit": number,  
    "nextToken": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

limit

Optionally specify the maximum number of deliveries to return in the response.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 50.

Required: No

nextToken

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Required: No

Response Syntax

```
{  
  "deliveries": [  
    {  
      "arn": "string",  
      "deliveryDestinationArn": "string",  
      "deliveryDestinationType": "string",  
      "deliverySourceName": "string",  
      "fieldDelimiter": "string",  
      "id": "string",  
      "recordFields": [ "string" ],  
      "s3DeliveryConfiguration": {  
        "enableHiveCompatiblePath": boolean,  
        "suffixPath": "string"  
      },  
      "tags": {  
        "string" : "string"  
      }  
    }  
  ],  
  "nextToken": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[deliveries](#)

An array of structures. Each structure contains information about one delivery in the account.

Type: Array of [Delivery](#) objects

[nextToken](#)

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

ServiceQuotaExceededException

This request exceeds a service quota.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ThrottlingException

The request was throttled because of quota limits.

HTTP Status Code: 400

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

DescribeDeliveryDestinations

Retrieves a list of the delivery destinations that have been created in the account.

Request Syntax

```
{  
    "limit": number,  
    "nextToken": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

limit

Optionally specify the maximum number of delivery destinations to return in the response.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 50.

Required: No

nextToken

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Required: No

Response Syntax

```
{  
    "deliveryDestinations": [  
        {
```

```
"arn": "string",
"deliveryDestinationConfiguration": [
    "destinationResourceArn": "string"
],
"deliveryDestinationType": "string",
"name": "string",
"outputFormat": "string",
"tags": [
    "string" : "string"
]
},
],
"nextToken": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[deliveryDestinations](#)

An array of structures. Each structure contains information about one delivery destination in the account.

Type: Array of [DeliveryDestination](#) objects

[nextToken](#)

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

ServiceQuotaExceededException

This request exceeds a service quota.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ThrottlingException

The request was throttled because of quota limits.

HTTP Status Code: 400

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

DescribeDeliverySources

Retrieves a list of the delivery sources that have been created in the account.

Request Syntax

```
{  
    "limit": number,  
    "nextToken": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

limit

Optionally specify the maximum number of delivery sources to return in the response.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 50.

Required: No

nextToken

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Required: No

Response Syntax

```
{  
    "deliverySources": [  
        ...  
    ]  
}
```

```
{  
    "arn": "string",  
    "logType": "string",  
    "name": "string",  
    "resourceArns": [ "string" ],  
    "service": "string",  
    "tags": {  
        "string" : "string"  
    }  
},  
"nextToken": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[deliverySources](#)

An array of structures. Each structure contains information about one delivery source in the account.

Type: Array of [DeliverySource](#) objects

[nextToken](#)

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

ServiceQuotaExceededException

This request exceeds a service quota.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ThrottlingException

The request was throttled because of quota limits.

HTTP Status Code: 400

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

DescribeDestinations

Lists all your destinations. The results are ASCII-sorted by destination name.

Request Syntax

```
{  
    "DestinationNamePrefix": "string",  
    "limit": number,  
    "nextToken": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

DestinationNamePrefix

The prefix to match. If you don't specify a value, no prefix filter is applied.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]^{*}

Required: No

limit

The maximum number of items returned. If you don't specify a value, the default maximum value of 50 items is used.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 50.

Required: No

nextToken

The token for the next set of items to return. (You received this token from a previous call.)

Type: String

Length Constraints: Minimum length of 1.

Required: No

Response Syntax

```
{  
  "destinations": [  
    {  
      "accessPolicy": "string",  
      "arn": "string",  
      "creationTime": number,  
      "destinationName": "string",  
      "roleArn": "string",  
      "targetArn": "string"  
    }  
  ],  
  "nextToken": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

destinations

The destinations.

Type: Array of [Destination](#) objects

nextToken

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To list all destinations

The following example lists all the destinations for the account.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-
type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.DescribeDestinations
{
    "destinationNamePrefix": "my-prefix"
}
```

Sample Response

```
HTTP/1.1 200 OK
```

```
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
  "destination": [
    {
      "destinationName": "my-destination",
      "targetArn": "arn:aws:kinesis:us-east-1:123456789012:stream/my-kinesis-stream",
      "roleArn": "arn:aws:iam::123456789012:role/my-subscription-role",
      "arn": "arn:aws:logs:us-east-1:123456789012:destination:my-destination",
      "creationTime": 1437584472382
    }
  ]
}
```

DescribeExportTasks

Lists the specified export tasks. You can list all your export tasks or filter the results based on task ID or task status.

Request Syntax

```
{  
    "limit": number,  
    "nextToken": "string",  
    "statusCode": "string",  
    "taskId": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

limit

The maximum number of items returned. If you don't specify a value, the default is up to 50 items.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 50.

Required: No

nextToken

The token for the next set of items to return. (You received this token from a previous call.)

Type: String

Length Constraints: Minimum length of 1.

Required: No

statusCode

The status code of the export task. Specifying a status code filters the results to zero or more export tasks.

Type: String

Valid Values: CANCELLED | COMPLETED | FAILED | PENDING | PENDING_CANCEL | RUNNING

Required: No

taskId

The ID of the export task. Specifying a task ID filters the results to one or zero export tasks.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Required: No

Response Syntax

```
{  
  "exportTasks": [  
    {  
      "destination": "string",  
      "destinationPrefix": "string",  
      "executionInfo": {  
        "completionTime": number,  
        "creationTime": number  
      },  
      "from": number,  
      "logGroupName": "string",  
      "status": {  
        "code": "string",  
        "message": "string"  
      },  
      "taskId": "string",  
      "taskName": "string",  
      "to": number  
    }  
  ],
```

```
    "nextToken": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[exportTasks](#)

The export tasks.

Type: Array of [ExportTask](#) objects

[nextToken](#)

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To list the export tasks that are complete

The following example lists the export tasks with the COMPLETE status.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.DescribeExportTasks
{
    "statusCode": "COMPLETE"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "exportTasks": [
        {
            "taskId": "exampleTaskId",
            "taskName": "my-task-1",
            "logGroupName": "my-log-group",
            "from": 1437584472382,
            "to": 1437584472833,
            "destination": "my-destination",
            "destinationPrefix": "my-prefix",
            "status": {
                "code": "COMPLETE",
                "message": "Example message"
            },
            "executionInfo": {
                "creationTime": 1437584472856,
```

```
        "completionTime" : 1437584472986
    }
},
{
    "taskId": "exampleTaskId",
    "taskName": "my-task-2",
    "logGroupName": "my-log-group",
    "from": 1437584472382,
    "to": 1437584472833,
    "destination": "my-destination",
    "destinationPrefix": "my-prefix",
    "status":
    {
        "code": "COMPLETE",
        "message": "Example message"
    },
    "executionInfo":
    {
        "creationTime": 1437584472856,
        "completionTime" : 1437584472986
    }
}
]
```

DescribeFieldIndexes

Returns a list of field indexes listed in the field index policies of one or more log groups. For more information about field index policies, see [PutIndexPolicy](#).

Request Syntax

```
{  
    "logGroupIdentifiers": [ "string" ],  
    "nextToken": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[logGroupIdentifiers](#)

An array containing the names or ARNs of the log groups that you want to retrieve field indexes for.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#+=/:,.@-]*

Required: Yes

[nextToken](#)

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Required: No

Response Syntax

```
{  
  "fieldIndexes": [  
    {  
      "fieldIndexName": "string",  
      "firstEventTime": number,  
      "lastEventTime": number,  
      "lastScanTime": number,  
      "logGroupIdentifier": "string"  
    }  
  ],  
  "nextToken": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

fieldIndexes

An array containing the field index information.

Type: Array of [FieldIndex](#) objects

nextToken

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceeded

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

OperationAborted

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

See Also

- [AWS SDK for Python](#)
- [AWS SDK for Ruby V3](#)

DescribeIndexPolicies

Returns the field index policies of one or more log groups. For more information about field index policies, see [PutIndexPolicy](#).

If a specified log group has a log-group level index policy, that policy is returned by this operation.

If a specified log group doesn't have a log-group level index policy, but an account-wide index policy applies to it, that account-wide policy is returned by this operation.

To find information about only account-level policies, use [DescribeAccountPolicies](#) instead.

Request Syntax

```
{  
    "logGroupIdentifiers": [ "string" ],  
    "nextToken": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

logGroupIdentifiers

An array containing the name or ARN of the log group that you want to retrieve field index policies for.

Type: Array of strings

Array Members: Fixed number of 1 item.

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#=+=/:,.@-]*

Required: Yes

nextToken

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Required: No

Response Syntax

```
{  
    "indexPolicies": [  
        {  
            "lastUpdateTime": number,  
            "logGroupIdentifier": "string",  
            "policyDocument": "string",  
            "policyName": "string",  
            "source": "string"  
        }  
    ],  
    "nextToken": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[indexPolicies](#)

An array containing the field index policies.

Type: Array of [IndexPolicy](#) objects

[nextToken](#)

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceededException

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

DescribeLogGroups

Returns information about log groups. You can return all your log groups or filter the results by prefix. The results are ASCII-sorted by log group name.

CloudWatch Logs doesn't support IAM policies that control access to the `DescribeLogGroups` action by using the `aws:ResourceTag/key-name` condition key. Other CloudWatch Logs actions do support the use of the `aws:ResourceTag/key-name` condition key to control access. For more information about using tags to control access, see [Controlling access to Amazon Web Services resources using tags](#).

If you are using CloudWatch cross-account observability, you can use this operation in a monitoring account and view data from the linked source accounts. For more information, see [CloudWatch cross-account observability](#).

Request Syntax

```
{  
    "accountIdentifiers": [ "string" ],  
    "includeLinkedAccounts": boolean,  
    "limit": number,  
    "logGroupClass": "string",  
    "logGroupIdentifiers": [ "string" ],  
    "logGroupNamePattern": "string",  
    "logGroupNamePrefix": "string",  
    "nextToken": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

accountIdentifiers

When `includeLinkedAccounts` is set to `true`, use this parameter to specify the list of accounts to search. You can specify as many as 20 account IDs in the array.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 20 items.

Length Constraints: Fixed length of 12.

Pattern: ^\d{12}\\$

Required: No

[includeLinkedAccounts](#)

If you are using a monitoring account, set this to true to have the operation return log groups in the accounts listed in `accountIdentifiers`.

If this parameter is set to true and `accountIdentifiers` contains a null value, the operation returns all log groups in the monitoring account and all log groups in all source accounts that are linked to the monitoring account.

The default for this parameter is false.

Type: Boolean

Required: No

[limit](#)

The maximum number of items returned. If you don't specify a value, the default is up to 50 items.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 50.

Required: No

[logGroupClass](#)

Use this parameter to limit the results to only those log groups in the specified log group class. If you omit this parameter, log groups of all classes can be returned.

Specifies the log group class for this log group. There are three classes:

- The Standard log class supports all CloudWatch Logs features.
- The Infrequent Access log class supports a subset of CloudWatch Logs features and incurs lower costs.

- Use the Delivery log class only for delivering AWS Lambda logs to store in Amazon S3 or Amazon Data Firehose. Log events in log groups in the Delivery class are kept in CloudWatch Logs for only one day. This log class doesn't offer rich CloudWatch Logs capabilities such as CloudWatch Logs Insights queries.

For details about the features supported by each class, see [Log classes](#)

Type: String

Valid Values: STANDARD | INFREQUENT_ACCESS | DELIVERY

Required: No

[logGroupIdentifiers](#)

Use this array to filter the list of log groups returned. If you specify this parameter, the only other filter that you can choose to specify is `includeLinkedAccounts`.

If you are using this operation in a monitoring account, you can specify the ARNs of log groups in source accounts and in the monitoring account itself. If you are using this operation in an account that is not a cross-account monitoring account, you can specify only log group names in the same account as the operation.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 50 items.

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: `[\w#+=/:,.@-]*`

Required: No

[logGroupNamePattern](#)

If you specify a string for this parameter, the operation returns only log groups that have names that match the string based on a case-sensitive substring search. For example, if you specify `DataLogs`, log groups named `DataLogs`, `aws/DataLogs`, and `GroupDataLogs` would match, but `datalogs`, `Data/log/s` and `Groupdata` would not match.

If you specify `logGroupNamePattern` in your request, then only `arn`, `creationTime`, and `logGroupName` are included in the response.

Note

`logGroupNamePattern` and `logGroupNamePrefix` are mutually exclusive. Only one of these parameters can be passed.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 512.

Pattern: `[\._\-/_\#A-Za-z0-9]*`

Required: No

[logGroupNamePrefix](#)

The prefix to match.

Note

`logGroupNamePrefix` and `logGroupNamePattern` are mutually exclusive. Only one of these parameters can be passed.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: `[\._\-/_\#A-Za-z0-9]+`

Required: No

[nextToken](#)

The token for the next set of items to return. (You received this token from a previous call.)

Type: String

Length Constraints: Minimum length of 1.

Required: No

Response Syntax

```
{  
  "logGroups": [  
    {  
      "arn": "string",  
      "creationTime": number,  
      "dataProtectionStatus": "string",  
      "inheritedProperties": [ "string" ],  
      "kmsKeyId": "string",  
      "logGroupArn": "string",  
      "logGroupClass": "string",  
      "logGroupName": "string",  
      "metricFilterCount": number,  
      "retentionInDays": number,  
      "storedBytes": number  
    }  
  ],  
  "nextToken": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[logGroups](#)

An array of structures, where each structure contains the information about one log group.

Type: Array of [LogGroup](#) objects

[nextToken](#)

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To list all log groups

The following example lists all your log groups.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-
type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.DescribeLogGroups
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
```

```
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
  "logGroups": [
    {
      "storageBytes": 1048576,
      "arn": "arn:aws:logs:us-east-1:123456789012:log-group:my-log-group-1:*",
      "creationTime": 1393545600000,
      "logGroupName": "my-log-group-1",
      "metricFilterCount": 0,
      "retentionInDays": 14,
      "kmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/abcd1234-a123-456a-a12b-a123b4cd56ef"
    },
    {
      "storageBytes": 5242880,
      "arn": "arn:aws:logs:us-east-1:123456789012:log-group:my-log-group-2:*",
      "creationTime": 1396224000000,
      "logGroupName": "my-log-group-2",
      "metricFilterCount": 0,
      "retentionInDays": 30
    }
  ]
}
```

To list all of the log groups in a monitoring account and all linked source accounts that have logGroup in their name

The following example lists all of the log groups in a monitoring account and all linked source accounts that have logGroup in their name.

Sample Request

```
{
  "includeLinkedAccounts" : "true",
  "logGroupNamePattern": "logGroup"
}
```

Sample Response

```
{
  "logGroups": [
```

```
{  
    "arn": "arn:aws:logs:us-east-1:123456789012:log-group:monitoring-  
    logGroup-1234:*",  
    "creationTime": 1393545600000,  
    "logGroupName": "monitoring-logGroup-1234"  
},  
{  
    "arn": "arn:aws:logs:us-east-1:012345678901:log-group:source-loggroup-5678:*",  
    "creationTime": 1396224000000,  
    "logGroupName": "source-loggroup-5678"  
}  
]  
}
```

DescribeLogStreams

Lists the log streams for the specified log group. You can list all the log streams or filter the results by prefix. You can also control how the results are ordered.

You can specify the log group to search by using either `logGroupIdentifier` or `logGroupName`. You must include one of these two parameters, but you can't include both.

This operation has a limit of 25 transactions per second, after which transactions are throttled.

If you are using CloudWatch cross-account observability, you can use this operation in a monitoring account and view data from the linked source accounts. For more information, see [CloudWatch cross-account observability](#).

Request Syntax

```
{  
    "descending": boolean,  
    "limit": number,  
    "logGroupIdentifier": string,  
    "logGroupName": string,  
    "logStreamNamePrefix": string,  
    "nextToken": string,  
    "orderBy": string  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[descending](#)

If the value is true, results are returned in descending order. If the value is to false, results are returned in ascending order. The default value is false.

Type: Boolean

Required: No

limit

The maximum number of items returned. If you don't specify a value, the default is up to 50 items.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 50.

Required: No

logGroupIdentifier

Specify either the name or ARN of the log group to view. If the log group is in a source account and you are using a monitoring account, you must use the log group ARN.

 **Note**

You must include either `logGroupIdentifier` or `logGroupName`, but not both.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: `[\w#+=/:,.@-]*`

Required: No

logGroupName

The name of the log group.

 **Note**

You must include either `logGroupIdentifier` or `logGroupName`, but not both.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: No

logStreamNamePrefix

The prefix to match.

If `orderBy` is `LastEventTime`, you cannot specify this parameter.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]*

Required: No

nextToken

The token for the next set of items to return. (You received this token from a previous call.)

Type: String

Length Constraints: Minimum length of 1.

Required: No

orderBy

If the value is `LogStreamName`, the results are ordered by log stream name. If the value is `LastEventTime`, the results are ordered by the event time. The default value is `LogStreamName`.

If you order the results by event time, you cannot specify the `logStreamNamePrefix` parameter.

`lastEventTimestamp` represents the time of the most recent log event in the log stream in CloudWatch Logs. This number is expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC. `lastEventTimestamp` updates on an eventual consistency basis. It typically updates in less than an hour from ingestion, but in rare situations might take longer.

Type: String

Valid Values: LogStreamName | LastEventTime

Required: No

Response Syntax

```
{  
  "logStreams": [  
    {  
      "arn": "string",  
      "creationTime": number,  
      "firstEventTimestamp": number,  
      "lastEventTimestamp": number,  
      "lastIngestionTime": number,  
      "logStreamName": "string",  
      "storedBytes": number,  
      "uploadSequenceToken": "string"  
    }  
  ],  
  "nextToken": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[logStreams](#)

The log streams.

Type: Array of [LogStream](#) objects

[nextToken](#)

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To list the log streams for a log group

The following example lists the log streams associated with the specified log group.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid, Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.DescribeLogStreams
{
    "logGroupName": "my-log-group"
```

}

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "logStreams": [
        {
            "storedBytes": 0,
            "arn": "arn:aws:logs:us-east-1:123456789012:log-group:my-log-group-1:log-stream:my-log-stream-1",
            "creationTime": 1393545600000,
            "firstEventTimestamp": 1393545600000,
            "lastEventTimestamp": 1393567800000,
            "lastIngestionTime": 1393589200000,
            "logStreamName": "my-log-stream-1"
        },
        {
            "storedBytes": 0,
            "arn": "arn:aws:logs:us-east-1:123456789012:log-group:my-log-group-2:log-stream:my-log-stream-2",
            "creationTime": 1396224000000,
            "firstEventTimestamp": 1396224000000,
            "lastEventTimestamp": 1396235500000,
            "lastIngestionTime": 1396225560000,
            "logStreamName": "my-log-stream-2"
        }
    ]
}
```

Example

The following example lists the log streams associated with the specified log group.

Sample Request

```
{
    "logGroupIdentifier": "arn:aws:logs:us-east-1:123456789012:log-group:my-log-group-1:dli"
```

}

Sample Response

```
{  
    "logStreams": [  
        {  
            "storedBytes": 0,  
            "arn": "arn:aws:logs:us-east-1:123456789012:log-group:my-log-group-1:log-stream:my-log-stream-1",  
            "creationTime": 1393545600000,  
            "firstEventTimestamp": 1393545600000,  
            "lastEventTimestamp": 1393567800000,  
            "lastIngestionTime": 1393589200000,  
            "logStreamName": "my-log-stream-1"  
        },  
        {  
            "storedBytes": 0,  
            "arn": "arn:aws:logs:us-east-1:123456789012:log-group:my-log-group-2:log-stream:my-log-stream-2",  
            "creationTime": 1396224000000,  
            "firstEventTimestamp": 1396224000000,  
            "lastEventTimestamp": 1396235500000,  
            "lastIngestionTime": 1396225560000,  
            "logStreamName": "my-log-stream-2"  
        } ]  
    }  
}
```

DescribeMetricFilters

Lists the specified metric filters. You can list all of the metric filters or filter the results by log name, prefix, metric name, or metric namespace. The results are ASCII-sorted by filter name.

Request Syntax

```
{  
    "filterNamePrefix": "string",  
    "limit": number,  
    "logGroupName": "string",  
    "metricName": "string",  
    "metricNamespace": "string",  
    "nextToken": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[filterNamePrefix](#)

The prefix to match. CloudWatch Logs uses the value that you set here only if you also include the logGroupName parameter in your request.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]^{*}

Required: No

[limit](#)

The maximum number of items returned. If you don't specify a value, the default is up to 50 items.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 50.

Required: No

[logGroupName](#)

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: No

[metricName](#)

Filters results to include only those with the specified metric name. If you include this parameter in your request, you must also include the metricNamespace parameter.

Type: String

Length Constraints: Maximum length of 255.

Pattern: [^:*\$]*

Required: No

[metricNamespace](#)

Filters results to include only those in the specified namespace. If you include this parameter in your request, you must also include the metricName parameter.

Type: String

Length Constraints: Maximum length of 255.

Pattern: [^:*\$]*

Required: No

[nextToken](#)

The token for the next set of items to return. (You received this token from a previous call.)

Type: String

Length Constraints: Minimum length of 1.

Required: No

Response Syntax

```
{  
  "metricFilters": [  
    {  
      "applyOnTransformedLogs": boolean,  
      "creationTime": number,  
      "filterName": "string",  
      "filterPattern": "string",  
      "logGroupName": "string",  
      "metricTransformations": [  
        {  
          "defaultValue": number,  
          "dimensions": {  
            "string": "string"  
          },  
          "metricName": "string",  
          "metricNamespace": "string",  
          "metricValue": "string",  
          "unit": "string"  
        }  
      ]  
    }  
  ],  
  "nextToken": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[metricFilters](#)

The metric filters.

Type: Array of [MetricFilter](#) objects

nextToken

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To list the metric filters for a log group

The following example lists the metric filters for the specified log group.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid, Signature=<Signature>
```

```
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.DescribeMetricFilters
{
    "logGroupName": "my-log-group"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "metricFilters": [
        {
            "applyOnTransformedLogs": true,
            "creationTime": 1396224000000,
            "filterName": "my-metric-filter",
            "filterPattern": "[ip, identity, user_id, timestamp, request, status_code, size]",
            "logGroupName": "my-log-group",
            "metricTransformations": [
                {
                    "defaultValue": "0",
                    "metricValue": "$size",
                    "metricNamespace": "my-app",
                    "metricName": "Volume"
                }
            ]
        }
    ]
}
```

DescribeQueries

Returns a list of CloudWatch Logs Insights queries that are scheduled, running, or have been run recently in this account. You can request all queries or limit it to queries of a specific log group or queries with a certain status.

Request Syntax

```
{  
    "logGroupName": "string",  
    "maxResults": number,  
    "nextToken": "string",  
    "queryLanguage": "string",  
    "status": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

logGroupName

Limits the returned queries to only those for the specified log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: No

maxResults

Limits the number of returned queries to the specified number.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

nextToken

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Required: No

queryLanguage

Limits the returned queries to only the queries that use the specified query language.

Type: String

Valid Values: CWL1 | SQL | PPL

Required: No

status

Limits the returned queries to only those that have the specified status. Valid values are Cancelled, Complete, Failed, Running, and Scheduled.

Type: String

Valid Values: Scheduled | Running | Complete | Failed | Cancelled | Timeout
| Unknown

Required: No

Response Syntax

```
{  
  "nextToken": "string",  
  "queries": [  
    {  
      "createTime": number,  
      "logGroupName": "string",  
      "queryId": "string",  
      "queryLanguage": "string",  
      "queryString": "string",  
    }  
  ]  
}
```

```
        "status": "string"
    }
]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[nextToken](#)

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

[queries](#)

The list of queries that match the request.

Type: Array of [QueryInfo](#) objects

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

List the CloudWatch Logs Insights queries for a specific log group

The following example lists the successfully completed queries of the log group named MyLogGroup.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.DescribeQueries
{
    "logGroupName": "MyLogGroup",
    "status": "Completed"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "nextToken": "string",
    "queries": [
        {
            "createTime": 1540923785,
            "logGroupName": "MyLogGroup",
            "queryId": "12ab3456-12ab-123a-789e-1234567890ab",
            "status": "Completed"
        }
    ]
}
```

```
        "queryString": "filter @message like /Exception/ | stats count(*) as @exceptionCount by date_floor(@timestamp, 5m) | sort @exceptionCount desc",
        "status": "Completed"
    },
    {
        "createTime": 1540025601,
        "logGroupName": "MyLogGroup",
        "queryId": "98ab3456-12ab-123a-789e-1234567890ab",
        "queryString": "stats count(*) by eventSource, eventName, awsRegion",
        "status": "Running"
    }
]
```

DescribeQueryDefinitions

This operation returns a paginated list of your saved CloudWatch Logs Insights query definitions. You can retrieve query definitions from the current account or from a source account that is linked to the current account.

You can use the `queryDefinitionNamePrefix` parameter to limit the results to only the query definitions that have names that start with a certain string.

Request Syntax

```
{  
    "maxResults": number,  
    "nextToken": "string",  
    "queryDefinitionNamePrefix": "string",  
    "queryLanguage": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

maxResults

Limits the number of returned query definitions to the specified number.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

nextToken

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Required: No

[queryDefinitionNamePrefix](#)

Use this parameter to filter your results to only the query definitions that have names that start with the prefix you specify.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 255.

Required: No

[queryLanguage](#)

The query language used for this query. For more information about the query languages that CloudWatch Logs supports, see [Supported query languages](#).

Type: String

Valid Values: CWL | SQL | PPL

Required: No

Response Syntax

```
{  
    "nextToken": "string",  
    "queryDefinitions": [  
        {  
            "lastModified": number,  
            "logGroupNames": [ "string" ],  
            "name": "string",  
            "queryDefinitionId": "string",  
            "queryLanguage": "string",  
            "queryString": "string"  
        }  
    ]  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

nextToken

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

queryDefinitions

The list of query definitions that match your request.

Type: Array of [QueryDefinition](#) objects

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

Example

This example retrieves a list of query definitions that have names that begin with lambda.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
```

```
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.DescribeQueryDefinitions
{
    "queryDefinitionNamePrefix": "lambda",
    "maxResults": 2
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "nextToken": "abdcefghijklmn",
    "queryDefinitions": [
        {
            "lastModified": 1549321515,
            "logGroupNames": [ "VPC_Flow_Log1", "VPC_Flow_Log2" ],
            "name": "VPC-top15-packet-transfers",
            "queryDefinitionId": "123456ab-12ab-123a-789e-1234567890ab"
            "queryString": "stats sum(packets) as packetsTransferred by srcAddr, dstAddr | sort packetsTransferred desc | limit 15"
        },
        {
            "lastModified": 1557321299,
            "name": "25-most-recent-events",
            "queryDefinitionId": "456789ab-abcd-1234-789e-0987654321ab"
            "queryString": "fields @timestamp, @message | sort @timestamp desc | limit 25"
        }
    ]
}
```

DescribeResourcePolicies

Lists the resource policies in this account.

Request Syntax

```
{  
    "limit": number,  
    "nextToken": "string",  
    "policyScope": "string",  
    "resourceArn": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

limit

The maximum number of resource policies to be displayed with one call of this API.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 50.

Required: No

nextToken

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Required: No

policyScope

Specifies the scope of the resource policy. Valid values are ACCOUNT or RESOURCE. When not specified, defaults to ACCOUNT.

Type: String

Valid Values: ACCOUNT | RESOURCE

Required: No

[resourceArn](#)

The ARN of the CloudWatch Logs resource for which to query the resource policy.

Type: String

Required: No

Response Syntax

```
{  
    "nextToken    "resourcePolicies": \[  
        {  
            "lastUpdatedTime": number,  
            "policyDocument": "string",  
            "policyName": "string",  
            "policyScope": "string",  
            "resourceArn": "string",  
            "revisionId": "string"  
        }  
    \]  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[nextToken](#)

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

resourcePolicies

The resource policies that exist in this account.

Type: Array of [ResourcePolicy](#) objects

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

DescribeSubscriptionFilters

Lists the subscription filters for the specified log group. You can list all the subscription filters or filter the results by prefix. The results are ASCII-sorted by filter name.

Request Syntax

```
{  
    "filterNamePrefix": "string",  
    "limit": number,  
    "logGroupName": "string",  
    "nextToken": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

filterNamePrefix

The prefix to match. If you don't specify a value, no prefix filter is applied.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]*

Required: No

limit

The maximum number of items returned. If you don't specify a value, the default is up to 50 items.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 50.

Required: No

[logGroupName](#)

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/#A-Za-z0-9]+

Required: Yes

[nextToken](#)

The token for the next set of items to return. (You received this token from a previous call.)

Type: String

Length Constraints: Minimum length of 1.

Required: No

Response Syntax

```
{
  "nextToken": "string",
  "subscriptionFilters": [
    {
      "applyOnTransformedLogs": boolean,
      "creationTime": number,
      "destinationArn": "string",
      "distribution": "string",
      "filterName": "string",
      "filterPattern": "string",
      "logGroupName": "string",
      "roleArn": "string"
    }
  ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

nextToken

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

subscriptionFilters

The subscription filters.

Type: Array of [SubscriptionFilter](#) objects

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To list the subscription filters for a log group

The following example lists the subscription filters for the specified log group.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.DescribeSubscriptionFilters
{
    "logGroupName": "my-log-group"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "subscriptionFilters": [
        {
            "creationTime": 1396224000000,
            "logGroupName": "my-log-group",
            "filterName": "my-subscription-filter",
            "filterPattern": "[ip, identity, user_id, timestamp, request, status_code = 500, size]",
            "destinationArn": "arn:aws:kinesis:us-east-1:123456789012:stream/my-kinesis-stream",
            "roleArn": "arn:aws:iam::123456789012:role/my-subscription-role"
        }
    ]
}
```

DisassociateKmsKey

Disassociates the specified AWS KMS key from the specified log group or from all CloudWatch Logs Insights query results in the account.

When you use `DisassociateKmsKey`, you specify either the `logGroupName` parameter or the `resourceIdentifier` parameter. You can't specify both of those parameters in the same operation.

- Specify the `logGroupName` parameter to stop using the AWS KMS key to encrypt future log events ingested and stored in the log group. Instead, they will be encrypted with the default CloudWatch Logs method. The log events that were ingested while the key was associated with the log group are still encrypted with that key. Therefore, CloudWatch Logs will need permissions for the key whenever that data is accessed.
- Specify the `resourceIdentifier` parameter with the `query-result` resource to stop using the AWS KMS key to encrypt the results of all future [StartQuery](#) operations in the account. They will instead be encrypted with the default CloudWatch Logs method. The results from queries that ran while the key was associated with the account are still encrypted with that key. Therefore, CloudWatch Logs will need permissions for the key whenever that data is accessed.

It can take up to 5 minutes for this operation to take effect.

Request Syntax

```
{  
    "logGroupName": "string",  
    "resourceIdentifier": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[logGroupName](#)

The name of the log group.

In your `DisassociateKmsKey` operation, you must specify either the `resourceIdentifier` parameter or the `logGroup` parameter, but you can't specify both.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: `[\._\-_/\#A-Za-z0-9]+`

Required: No

resourceIdentifier

Specifies the target for this operation. You must specify one of the following:

- Specify the ARN of a log group to stop having CloudWatch Logs use the AWS KMS key to encrypt log events that are ingested and stored by that log group. After you run this operation, CloudWatch Logs encrypts ingested log events with the default CloudWatch Logs method. The log group ARN must be in the following format. Replace `REGION` and `ACCOUNT_ID` with your Region and account ID.

`arn:aws:logs:REGION:ACCOUNT_ID:log-group:LOG_GROUP_NAME`

- Specify the following ARN to stop using this key to encrypt the results of future [StartQuery](#) operations in this account. Replace `REGION` and `ACCOUNT_ID` with your Region and account ID.

`arn:aws:logs:REGION:ACCOUNT_ID:query-result:*`

In your `DisssociateKmsKey` operation, you must specify either the `resourceIdentifier` parameter or the `logGroup` parameter, but you can't specify both.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: `[\w+=/:,.@\-*]*`

Required: No

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidParameterException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To disassociate an KMS key from a log group

The following example disassociates the associated KMS key from the specified log group.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
```

```
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.DisassociateKmsKey
{
    "logGroupName": "my-log-group",
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
```

FilterLogEvents

Lists log events from the specified log group. You can list all the log events or filter the results using one or more of the following:

- A filter pattern
- A time range
- The log stream name, or a log stream name prefix that matches multiple log streams

You must have the `logs:FilterLogEvents` permission to perform this operation.

You can specify the log group to search by using either `logGroupIdentifier` or `logGroupName`. You must include one of these two parameters, but you can't include both.

`FilterLogEvents` is a paginated operation. Each page returned can contain up to 1 MB of log events or up to 10,000 log events. A returned page might only be partially full, or even empty. For example, if the result of a query would return 15,000 log events, the first page isn't guaranteed to have 10,000 log events even if they all fit into 1 MB.

Partially full or empty pages don't necessarily mean that pagination is finished. If the results include a `nextToken`, there might be more log events available. You can return these additional log events by providing the `nextToken` in a subsequent `FilterLogEvents` operation. If the results don't include a `nextToken`, then pagination is finished.

Specifying the `limit` parameter only guarantees that a single page doesn't return more log events than the specified limit, but it might return fewer events than the limit. This is the expected API behavior.

The returned log events are sorted by event timestamp, the timestamp when the event was ingested by CloudWatch Logs, and the ID of the `PutLogEvents` request.

If you are using CloudWatch cross-account observability, you can use this operation in a monitoring account and view data from the linked source accounts. For more information, see [CloudWatch cross-account observability](#).

Note

If you are using [log transformation](#), the `FilterLogEvents` operation returns only the original versions of log events, before they were transformed. To view the transformed versions, you must use a [CloudWatch Logs query](#).

Request Syntax

```
{  
    "endTime": number,  
    "filterPattern": "string",  
    "interleaved": boolean,  
    "limit": number,  
    "logGroupIdentifier": "string",  
    "logGroupName": "string",  
    "logStreamNamePrefix": "string",  
    "logStreamNames": [ "string" ],  
    "nextToken": "string",  
    "startTime": number,  
    "unmask": boolean  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

endTime

The end of the time range, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC. Events with a timestamp later than this time are not returned.

Type: Long

Valid Range: Minimum value of 0.

Required: No

filterPattern

The filter pattern to use. For more information, see [Filter and Pattern Syntax](#).

If not provided, all the events are matched.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 1024.

Required: No

interleaved

This parameter has been deprecated.

If the value is true, the operation attempts to provide responses that contain events from multiple log streams within the log group, interleaved in a single response. If the value is false, all the matched log events in the first log stream are searched first, then those in the next log stream, and so on.

Important As of June 17, 2019, this parameter is ignored and the value is assumed to be true. The response from this operation always interleaves events from multiple log streams within a log group.

Type: Boolean

Required: No

limit

The maximum number of events to return. The default is 10,000 events.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 10000.

Required: No

logGroupIdentifier

Specify either the name or ARN of the log group to view log events from. If the log group is in a source account and you are using a monitoring account, you must use the log group ARN.

 **Note**

You must include either `logGroupIdentifier` or `logGroupName`, but not both.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#+=/:,.@-]*

Required: No

logGroupName

The name of the log group to search.

 Note

You must include either `logGroupIdentifier` or `logGroupName`, but not both.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\\-_/#A-Za-z0-9]+

Required: No

logStreamNamePrefix

Filters the results to include only events from log streams that have names starting with this prefix.

If you specify a value for both `logStreamNamePrefix` and `logStreamNames`, the action returns an `InvalidParameterException` error.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]*

Required: No

logStreamNames

Filters the results to only logs from the log streams in this list.

If you specify a value for both `logStreamNames` and `logStreamNamePrefix`, the action returns an `InvalidParameterException` error.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]*

Required: No

nextToken

The token for the next set of events to return. (You received this token from a previous call.)

Type: String

Length Constraints: Minimum length of 1.

Required: No

startTime

The start of the time range, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC. Events with a timestamp before this time are not returned.

Type: Long

Valid Range: Minimum value of 0.

Required: No

unmask

Specify `true` to display the log event fields with all sensitive data unmasked and visible. The default is `false`.

To use this operation with this parameter, you must be signed into an account with the `logs:Unmask` permission.

Type: Boolean

Required: No

Response Syntax

```
{  
    "events": [  
        {  
            "eventId": "string",  
            "ingestionTime": number,  
            "logStreamName": "string",  
            "message": "string",  
            "timestamp": number  
        }  
    ],  
    "nextToken": "string",  
    "searchedLogStreams": [  
        {  
            "logStreamName": "string",  
            "searchedCompletely": boolean  
        }  
    ]  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

events

The matched events.

Type: Array of [FilteredLogEvent](#) objects

nextToken

The token to use when requesting the next set of items. The token expires after 24 hours.

If the results don't include a nextToken, then pagination is finished.

Type: String

Length Constraints: Minimum length of 1.

[searchedLogStreams](#)

Important As of May 15, 2020, this parameter is no longer supported. This parameter returns an empty list.

Indicates which log streams have been searched and whether each has been searched completely.

Type: Array of [SearchedLogStream](#) objects

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To list the events in a log group that contain a pattern

The following example lists the events for the specified log group that contain ERROR.

Sample Request

```
POST / HTTP/1.1
```

```
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.FilterLogEvents
{
    "logGroupName": "my-log-group",
    "filterPattern": "ERROR"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "events": [
        {
            "ingestionTime": 1396035394997,
            "timestamp": 1396035378988,
            "message": "ERROR Event 1",
            "logStreamName": "my-log-stream-1",
            "eventId": "31132629274945519779805322857203735586714454643391594505"
        },
        {
            "ingestionTime": 1396035394997,
            "timestamp": 1396035378988,
            "message": "ERROR Event 2",
            "logStreamName": "my-log-stream-2",
            "eventId": "31132629274945519779805322857203735586814454643391594505"
        },
        {
            "ingestionTime": 1396035394997,
            "timestamp": 1396035378989,
            "message": "ERROR Event 3",
        }
    ]
}
```

```
"logStreamName": "my-log-stream-3"
"eventId": "31132629274945519779805322857203735586824454643391594505"
},
],
"searchedLogStreams": [
{
  "searchedCompletely": true,
  "logStreamName": "my-log-stream-1"
},
{
  "searchedCompletely": true,
  "logStreamName": "my-log-stream-2"
},
{
  "searchedCompletely": false,
  "logStreamName": "my-log-stream-3"
},
],
"nextToken": "ZNUEP17FcQuXbIH4Swk9D9eFu2XBg-ijZIZ1vzz4ea9zZRjw-
MMtQtvc0Mdmq4T29K7Q6Y1e_KvyfpcT_f_tUw"
}
```

Example

The following example lists the events for the specified log group that contain ERROR.

Sample Request

```
{
  "logGroupIdentifier": "arn:aws:logs:us-east-1:123456789012:log-group:monitoring-
logGroup-1234:/*",
  "filterPattern": "ERROR"
}
```

Sample Response

```
{
  "events": [
    {
      "ingestionTime": 1396035394997,
      "timestamp": 1396035378988,
      "message": "ERROR Event 1",
      "logStreamName": "my-log-stream-1",
    }
  ]
}
```

```
"eventId": "31132629274945519779805322857203735586714454643391594505"
},
{
  "ingestionTime": 1396035394997,
  "timestamp": 1396035378988,
  "message": "ERROR Event 2",
  "logStreamName": "my-log-stream-2",
  "eventId": "31132629274945519779805322857203735586814454643391594505"
},
{
  "ingestionTime": 1396035394997,
  "timestamp": 1396035378989,
  "message": "ERROR Event 3",
  "logStreamName": "my-log-stream-3"
  "eventId": "31132629274945519779805322857203735586824454643391594505"
} ],
"searchedLogStreams": [
{
  "searchedCompletely": true,
  "logStreamName": "my-log-stream-1"
},
{
  "searchedCompletely": true,
  "logStreamName": "my-log-stream-2"
},
{
  "searchedCompletely": false,
  "logStreamName": "my-log-stream-3"
}
],
"nextToken": "ZNUEP17FcQuXbIH4Swk9D9eFu2XBg-ijZIZlvzz4ea9zZRjw-
MMtQtvcoMdmq4T29K7Q6Y1e_KvyfpcT_f_tUw"
}
```

GetDataProtectionPolicy

Returns information about a log group data protection policy.

Request Syntax

```
{  
    "logGroupIdentifier": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[logGroupIdentifier](#)

The name or ARN of the log group that contains the data protection policy that you want to see.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#=+=/:,.@-]*

Required: Yes

Response Syntax

```
{  
    "lastUpdatedTime": number,  
    "logGroupIdentifier": "string",  
    "policyDocument": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

lastUpdatedTime

The date and time that this policy was most recently updated.

Type: Long

Valid Range: Minimum value of 0.

logGroupIdentifier

The log group name or ARN that you specified in your request.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#+=/:,.@-]*

policyDocument

The data protection policy document for this log group.

Type: String

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

GetDelivery

Returns complete information about one logical *delivery*. A delivery is a connection between a [delivery source](#) and a [delivery destination](#).

A delivery source represents an AWS resource that sends logs to an logs delivery destination. The destination can be CloudWatch Logs, Amazon S3, or Firehose. Only some AWS services support being configured as a delivery source. These services are listed in [Enable logging from AWS services](#).

You need to specify the delivery `id` in this operation. You can find the IDs of the deliveries in your account with the [DescribeDeliveries](#) operation.

Request Syntax

```
{  
  "id": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

id

The ID of the delivery that you want to retrieve.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Pattern: ^[0-9A-Za-z]+\$

Required: Yes

Response Syntax

```
{
```

```
"delivery": {  
    "arn    "deliveryDestinationArn": "string",  
    "deliveryDestinationType": "string",  
    "deliverySourceName": "string",  
    "fieldDelimiter": "string",  
    "id": "string",  
    "recordFields": [ "string" ],  
    "s3DeliveryConfiguration": {  
        "enableHiveCompatiblePath": boolean,  
        "suffixPath": "string"  
    },  
    "tags": {  
        "string" : "string"  
    }  
}  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

delivery

A structure that contains information about the delivery.

Type: [Delivery](#) object

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceQuotaExceededException

This request exceeds a service quota.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ThrottlingException

The request was throttled because of quota limits.

HTTP Status Code: 400

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

GetDeliveryDestination

Retrieves complete information about one delivery destination.

Request Syntax

```
{  
    "name": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

name

The name of the delivery destination that you want to retrieve.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 60.

Pattern: [\w-]*

Required: Yes

Response Syntax

```
{  
    "deliveryDestination": {  
        "arn": "string",  
        "deliveryDestinationConfiguration": {  
            "destinationResourceArn": "string"  
        },  
        "deliveryDestinationType": "string",  
        "name": "string",  
        "outputFormat": "string",  
        "tags": {  
    }
```

```
    "string" : "string"
}
}
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[deliveryDestination](#)

A structure containing information about the delivery destination.

Type: [DeliveryDestination](#) object

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceQuotaExceededException

This request exceeds a service quota.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ThrottlingException

The request was throttled because of quota limits.

HTTP Status Code: 400

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

GetDeliveryDestinationPolicy

Retrieves the delivery destination policy assigned to the delivery destination that you specify. For more information about delivery destinations and their policies, see [PutDeliveryDestinationPolicy](#).

Request Syntax

```
{  
    "deliveryDestinationName": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[deliveryDestinationName](#)

The name of the delivery destination that you want to retrieve the policy of.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 60.

Pattern: [\w-]*

Required: Yes

Response Syntax

```
{  
    "policy": {  
        "deliveryDestinationPolicy": "string"  
    }  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

policy

The IAM policy for this delivery destination.

Type: [Policy](#) object

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

GetDeliverySource

Retrieves complete information about one delivery source.

Request Syntax

```
{  
    "name": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

name

The name of the delivery source that you want to retrieve.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 60.

Pattern: [\w-]*

Required: Yes

Response Syntax

```
{  
    "deliverySource": {  
        "arn": "string",  
        "logType": "string",  
        "name": "string",  
        "resourceArns": [ "string" ],  
        "service": "string",  
        "tags": {  
            "string": "string"  
        }  
    }  
}
```

{}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[deliverySource](#)

A structure containing information about the delivery source.

Type: [DeliverySource](#) object

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceQuotaExceededException

This request exceeds a service quota.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ThrottlingException

The request was throttled because of quota limits.

HTTP Status Code: 400

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

GetIntegration

Returns information about one integration between CloudWatch Logs and OpenSearch Service.

Request Syntax

```
{  
    "integrationName": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

integrationName

The name of the integration that you want to find information about. To find the name of your integration, use [ListIntegrations](#)

Type: String

Length Constraints: Minimum length of 1. Maximum length of 50.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: Yes

Response Syntax

```
{  
    "integrationDetails": { ... },  
    "integrationName": "string",  
    "integrationStatus": "string",  
    "integrationType": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

integrationDetails

A structure that contains information about the integration configuration. For an integration with OpenSearch Service, this includes information about OpenSearch Service resources such as the collection, the workspace, and policies.

Type: [IntegrationDetails](#) object

Note: This object is a Union. Only one member of this object can be specified or returned.

integrationName

The name of the integration.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 50.

Pattern: [\.\-_/\#A-Za-z0-9]+

integrationStatus

The current status of this integration.

Type: String

Valid Values: PROVISIONING | ACTIVE | FAILED

integrationType

The type of integration. Integrations with OpenSearch Service have the type OPENSEARCH.

Type: String

Valid Values: OPENSEARCH

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

GetLogAnomalyDetector

Retrieves information about the log anomaly detector that you specify. The AWS KMS key ARN detected is valid.

Request Syntax

```
{  
    "anomalyDetectorArn": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[anomalyDetectorArn](#)

The ARN of the anomaly detector to retrieve information about. You can find the ARNs of log anomaly detectors in your account by using the [ListLogAnomalyDetectors](#) operation.

Type: String

Length Constraints: Minimum length of 1.

Pattern: [\w#+=/:,.@-]*

Required: Yes

Response Syntax

```
{  
    "anomalyDetectorStatus": "string",  
    "anomalyVisibilityTime": number,  
    "creationTimeStamp": number,  
    "detectorName": "string",  
    "evaluationFrequency": "string",  
    "filterPattern": "string",  
    "kmsKeyId": "string",
```

```
"lastModifiedTimeStamp": number,  
"logGroupArnList": [ "string" ]  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[anomalyDetectorStatus](#)

Specifies whether the anomaly detector is currently active. To change its status, use the `enabled` parameter in the [UpdateLogAnomalyDetector](#) operation.

Type: String

Valid Values: INITIALIZING | TRAINING | ANALYZING | FAILED | DELETED | PAUSED

[anomalyVisibilityTime](#)

The number of days used as the life cycle of anomalies. After this time, anomalies are automatically baselined and the anomaly detector model will treat new occurrences of similar event as normal.

Type: Long

Valid Range: Minimum value of 7. Maximum value of 90.

[creationTimeStamp](#)

The date and time when this anomaly detector was created.

Type: Long

Valid Range: Minimum value of 0.

[detectorName](#)

The name of the log anomaly detector

Type: String

Length Constraints: Minimum length of 1.

[evaluationFrequency](#)

Specifies how often the anomaly detector runs and look for anomalies. Set this value according to the frequency that the log group receives new logs. For example, if the log group receives new log events every 10 minutes, then setting evaluationFrequency to FIFTEEN_MIN might be appropriate.

Type: String

Valid Values: ONE_MIN | FIVE_MIN | TEN_MIN | FIFTEEN_MIN | THIRTY_MIN | ONE_HOUR

[filterPattern](#)

A symbolic description of how CloudWatch Logs should interpret the data in each log event. For example, a log event can contain timestamps, IP addresses, strings, and so on. You use the filter pattern to specify what to look for in the log event message.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 1024.

[kmsKeyId](#)

The ARN of the AWS KMS key assigned to this anomaly detector, if any.

Type: String

Length Constraints: Maximum length of 256.

[lastModifiedTimeStamp](#)

The date and time when this anomaly detector was most recently modified.

Type: Long

Valid Range: Minimum value of 0.

[logGroupArnList](#)

An array of structures, where each structure contains the ARN of a log group associated with this anomaly detector.

Type: Array of strings

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#+=/:,.@-]*

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

GetLogEvents

Lists log events from the specified log stream. You can list all of the log events or filter using a time range.

GetLogEvents is a paginated operation. Each page returned can contain up to 1 MB of log events or up to 10,000 log events. A returned page might only be partially full, or even empty. For example, if the result of a query would return 15,000 log events, the first page isn't guaranteed to have 10,000 log events even if they all fit into 1 MB.

Partially full or empty pages don't necessarily mean that pagination is finished. As long as the `nextBackwardToken` or `nextForwardToken` returned is NOT equal to the `nextToken` that you passed into the API call, there might be more log events available. The token that you use depends on the direction you want to move in along the log stream. The returned tokens are never null.

 **Note**

If you set `startFromHead` to `true` and you don't include `endTime` in your request, you can end up in a situation where the pagination doesn't terminate. This can happen when the new log events are being added to the target log streams faster than they are being read. This situation is a good use case for the CloudWatch Logs [Live Tail](#) feature.

If you are using CloudWatch cross-account observability, you can use this operation in a monitoring account and view data from the linked source accounts. For more information, see [CloudWatch cross-account observability](#).

You can specify the log group to search by using either `logGroupIdentifier` or `logGroupName`. You must include one of these two parameters, but you can't include both.

 **Note**

If you are using [log transformation](#), the GetLogEvents operation returns only the original versions of log events, before they were transformed. To view the transformed versions, you must use a [CloudWatch Logs query](#).

Request Syntax

```
{  
    "endTime": number,  
    "limit": number,  
    "logGroupIdentifier": "string",  
    "logGroupName": "string",  
    "logStreamName": "string",  
    "nextToken": "string",  
    "startFromHead": boolean,  
    "startTime": number,  
    "unmask": boolean  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[endTime](#)

The end of the time range, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC. Events with a timestamp equal to or later than this time are not included.

Type: Long

Valid Range: Minimum value of 0.

Required: No

[limit](#)

The maximum number of log events returned. If you don't specify a limit, the default is as many log events as can fit in a response size of 1 MB (up to 10,000 log events).

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 10000.

Required: No

logGroupIdentifier

Specify either the name or ARN of the log group to view events from. If the log group is in a source account and you are using a monitoring account, you must use the log group ARN.

 **Note**

You must include either `logGroupIdentifier` or `logGroupName`, but not both.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: `[\w#=+=/:,.@-]*`

Required: No

logGroupName

The name of the log group.

 **Note**

You must include either `logGroupIdentifier` or `logGroupName`, but not both.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: `[\.\-_/#A-Za-z0-9]+`

Required: No

logStreamName

The name of the log stream.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: `[^:*]*`

Required: Yes

nextToken

The token for the next set of items to return. (You received this token from a previous call.)

Type: String

Length Constraints: Minimum length of 1.

Required: No

startFromHead

If the value is true, the earliest log events are returned first. If the value is false, the latest log events are returned first. The default value is false.

If you are using a previous nextForwardToken value as the nextToken in this operation, you must specify true for startFromHead.

Type: Boolean

Required: No

startTime

The start of the time range, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC. Events with a timestamp equal to this time or later than this time are included. Events with a timestamp earlier than this time are not included.

Type: Long

Valid Range: Minimum value of 0.

Required: No

unmask

Specify true to display the log event fields with all sensitive data unmasked and visible. The default is false.

To use this operation with this parameter, you must be signed into an account with the logs:Unmask permission.

Type: Boolean

Required: No

Response Syntax

```
{  
  "events": [  
    {  
      "ingestionTime": number,  
      "message": "string",  
      "timestamp": number  
    }  
  ],  
  "nextBackwardToken": "string",  
  "nextForwardToken": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

events

The events.

Type: Array of [OutputLogEvent](#) objects

nextBackwardToken

The token for the next set of items in the backward direction. The token expires after 24 hours. This token is not null. If you have reached the end of the stream, it returns the same token you passed in.

Type: String

Length Constraints: Minimum length of 1.

nextForwardToken

The token for the next set of items in the forward direction. The token expires after 24 hours. If you have reached the end of the stream, it returns the same token you passed in.

Type: String

Length Constraints: Minimum length of 1.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidParameterException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To list all the events for a log stream

The following example lists all events for the specified log stream.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.GetLogEvents
{
```

```
"logGroupName": "my-log-group",
"logStreamName": "my-log-stream"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
  "events": [
    {
      "ingestionTime": 1396035394997,
      "timestamp": 1396035378988,
      "message": "Example event 1"
    },
    {
      "ingestionTime": 1396035394997,
      "timestamp": 1396035378988,
      "message": "Example event 2"
    },
    {
      "ingestionTime": 1396035394997,
      "timestamp": 1396035378989,
      "message": "Example event 3"
    }
  ],
  "nextBackwardToken": "b/31132629274945519779805322857203735586714454643391594505",
  "nextForwardToken": "f/31132629323784151764587387538205132201699397759403884544"
}
```

Example

The following example lists all events for the specified log stream.

Sample Request

```
{
  "logGroupIdentifier": "arn:aws:logs:us-east-1:123456789012:log-group:monitoring-
logGroup-1234:/*",
  "logStreamName": "my-log-stream"
}
```

}

Sample Response

```
{  
    "events": [  
        {  
            "ingestionTime": 1396035394997,  
            "timestamp": 1396035378988,  
            "message": "Example event 1"  
        },  
        {  
            "ingestionTime": 1396035394997,  
            "timestamp": 1396035378988,  
            "message": "Example event 2"  
        },  
        {  
            "ingestionTime": 1396035394997,  
            "timestamp": 1396035378989,  
            "message": "Example event 3"  
        } ],  
        "nextBackwardToken": "b/31132629274945519779805322857203735586714454643391594505",  
        "nextForwardToken": "f/31132629323784151764587387538205132201699397759403884544"  
    }  
}
```

GetLogGroupFields

Returns a list of the fields that are included in log events in the specified log group. Includes the percentage of log events that contain each field. The search is limited to a time period that you specify.

You can specify the log group to search by using either `logGroupIdentifier` or `logGroupName`. You must specify one of these parameters, but you can't specify both.

In the results, fields that start with @ are fields generated by CloudWatch Logs. For example, `@timestamp` is the timestamp of each log event. For more information about the fields that are generated by CloudWatch logs, see [Supported Logs and Discovered Fields](#).

The response results are sorted by the frequency percentage, starting with the highest percentage.

If you are using CloudWatch cross-account observability, you can use this operation in a monitoring account and view data from the linked source accounts. For more information, see [CloudWatch cross-account observability](#).

Request Syntax

```
{  
    "logGroupIdentifier": "string",  
    "logGroupName": "string",  
    "time": number  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[logGroupIdentifier](#)

Specify either the name or ARN of the log group to view. If the log group is in a source account and you are using a monitoring account, you must specify the ARN.

 **Note**

You must include either `logGroupIdentifier` or `logGroupName`, but not both.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#+=/:,.@-]*

Required: No

logGroupName

The name of the log group to search.

 **Note**

You must include either `logGroupIdentifier` or `logGroupName`, but not both.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\._\-_/#A-Za-z0-9]+

Required: No

time

The time to set as the center of the query. If you specify `time`, the 8 minutes before and 8 minutes after this time are searched. If you omit `time`, the most recent 15 minutes up to the current time are searched.

The `time` value is specified as epoch time, which is the number of seconds since January 1, 1970, 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: No

Response Syntax

{

```
"logGroupFields": [  
    {  
        "name        "percent    }  
]
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

logGroupFields

The array of fields found in the query. Each object in the array contains the name of the field, along with the percentage of time it appeared in the log events that were queried.

Type: Array of [LogGroupField](#) objects

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidParameterException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceededException

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

Retrieve fields found in log events in a log group

The following example lists the log events and how often they occur in MyLogGroup for the 15 minutes before November 1, 2018, 00:00:00UTC.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-
type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.GetLogGroupFields
{
    "logGroupName": "MyLogGroup",
    "time": 1541030400
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "logGroupFields": [
        {
            "logGroupField": {
                "logGroup": "MyLogGroup",
                "logEvent": {
                    "logEvent": "This is a test log event."}
```

```
        "name": "@timestamp",
        "percent": 100
    },
    {
        "name": "@message",
        "percent": 100
    },
    {
        "name": "@logStream",
        "percent": 100
    },
    {
        "name": "type",
        "percent": 57
    },
    {
        "name": "duration",
        "percent": 13
    }
]
}
```

Example

The following example lists the log events and how often they occur in MyLogGroup for the 15 minutes before November 1, 2018, 00:00:00UTC.

Sample Request

```
{
    "logGroupIdentifier": "arn:aws:logs:us-east-1:123456789012:log-group:monitoring-
logGroup-1234:/*",
    "time": 1541030400
}
```

Sample Response

```
{
    "logGroupFields": [
        {
            "name": "@timestamp",
            "percent": 100
        }
    ]
}
```

```
 },
{
  "name": "@message",
  "percent": 100
},
{
  "name": "@logStream",
  "percent": 100
},
{
  "name": "type",
  "percent": 57
},
{
  "name": "duration",
  "percent": 13
}
]
```

GetLogObject

Retrieves a large logging object (LLO) and streams it back. This API is used to fetch the content of large portions of log events that have been ingested through the PutOpenTelemetryLogs API. When log events contain fields that would cause the total event size to exceed 1MB, CloudWatch Logs automatically processes up to 10 fields, starting with the largest fields. Each field is truncated as needed to keep the total event size as close to 1MB as possible. The excess portions are stored as Large Log Objects (LLOs) and these fields are processed separately and LLO reference system fields (in the format `@ptr.$[path.to.field]`) are added. The path in the reference field reflects the original JSON structure where the large field was located. For example, this could be `@ptr.$['input']['message']`, `@ptr.$['AAA']['BBB']['CCC']['DDD']`, `@ptr.$['AAA']`, or any other path matching your log structure.

Request Syntax

```
{  
    "logObjectPointer": "string",  
    "unmask": boolean  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[logObjectPointer](#)

A pointer to the specific log object to retrieve. This is a required parameter that uniquely identifies the log object within CloudWatch Logs. The pointer is typically obtained from a previous query or filter operation.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Required: Yes

unmask

A boolean flag that indicates whether to unmask sensitive log data. When set to true, any masked or redacted data in the log object will be displayed in its original form. Default is false.

Type: Boolean

Required: No

Response Syntax

```
{  
  "fieldStream": {  
    "fields": {  
      "data": blob  
    },  
    "InternalStreamingException": {}  
  }  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

fieldStream

A stream of structured log data returned by the GetLogObject operation. This stream contains log events with their associated metadata and extracted fields.

Type: [GetLogObjectResponseStream](#) object

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

AccessDeniedException

You don't have sufficient permissions to perform this action.

HTTP Status Code: 400

InvalidOperationException

The operation is not valid on the specified resource.

HTTP Status Code: 400

InvalidOperationException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceededException

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

See Also

- [AWS SDK for Ruby V3](#)

GetLogRecord

Retrieves all of the fields and values of a single log event. All fields are retrieved, even if the original query that produced the `logRecordPointer` retrieved only a subset of fields. Fields are returned as field name/field value pairs.

The full unparsed log event is returned within `@message`.

Request Syntax

```
{  
    "logRecordPointer": "string",  
    "unmask": boolean  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[logRecordPointer](#)

The pointer corresponding to the log event record you want to retrieve. You get this from the response of a `GetQueryResults` operation. In that response, the value of the `@ptr` field for a log event is the value to use as `logRecordPointer` to retrieve that complete log event record.

Type: String

Required: Yes

[unmask](#)

Specify `true` to display the log event fields with all sensitive data unmasked and visible. The default is `false`.

To use this operation with this parameter, you must be signed into an account with the `logs:Unmask` permission.

Type: Boolean

Required: No

Response Syntax

```
{  
  "logRecord": {  
    "string" : "string"  
  }  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[logRecord](#)

The requested log event, as a JSON string.

Type: String to string map

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceededException

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To retrieve all fields for a specified log event

The following example retrieves the fields for a specified log event.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.GetLogRecord
{
    "logRecordPointer": "123456789"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "logRecord": {
        "@timestamp" : "1536857812",
```

```
    "@message" : "123456789012 eni-1234567890abcde123 6 33 ACCEPT"
    "accountId" : "123456789012",
    "interfaceId" : "eni-1234567890abcde123",
    "protocol" : "6",
    "packets" : "33",
    "action" : "ACCEPT"
}
}
```

GetQueryResults

Returns the results from the specified query.

Only the fields requested in the query are returned, along with a @ptr field, which is the identifier for the log record. You can use the value of @ptr in a [GetLogRecord](#) operation to get the full log record.

`GetQueryResults` does not start running a query. To run a query, use [StartQuery](#). For more information about how long results of previous queries are available, see [CloudWatch Logs quotas](#).

If the value of the Status field in the output is Running, this operation returns only partial results. If you see a value of Scheduled or Running for the status, you can retry the operation later to see the final results.

If you are using CloudWatch cross-account observability, you can use this operation in a monitoring account to start queries in linked source accounts. For more information, see [CloudWatch cross-account observability](#).

Request Syntax

```
{  
    "queryId": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

queryId

The ID number of the query.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

Response Syntax

```
{  
    "encryptionKey": "string",  
    "queryLanguage": "string",  
    "results": [  
        [  
            {  
                "field": "string",  
                "value": "string"  
            }  
        ]  
    ],  
    "statistics": {  
        "bytesScanned": number,  
        "estimatedBytesSkipped": number,  
        "estimatedRecordsSkipped": number,  
        "logGroupsScanned": number,  
        "recordsMatched": number,  
        "recordsScanned": number  
    },  
    "status": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[encryptionKey](#)

If you associated an AWS KMS key with the CloudWatch Logs Insights query results in this account, this field displays the ARN of the key that's used to encrypt the query results when [StartQuery](#) stores them.

Type: String

Length Constraints: Maximum length of 256.

[queryLanguage](#)

The query language used for this query. For more information about the query languages that CloudWatch Logs supports, see [Supported query languages](#).

Type: String

Valid Values: CWL1 | SQL | PPL

[results](#)

The log events that matched the query criteria during the most recent time it ran.

The `results` value is an array of arrays. Each log event is one object in the top-level array. Each of these log event objects is an array of field/value pairs.

Type: Array of arrays of [ResultField](#) objects

[statistics](#)

Includes the number of log events scanned by the query, the number of log events that matched the query criteria, and the total number of bytes in the scanned log events. These values reflect the full raw results of the query.

Type: [QueryStatistics](#) object

[status](#)

The status of the most recent running of the query. Possible values are Cancelled, Complete, Failed, Running, Scheduled, Timeout, and Unknown.

Queries time out after 60 minutes of runtime. To avoid having your queries time out, reduce the time range being searched or partition your query into a number of queries.

Type: String

Valid Values: Scheduled | Running | Complete | Failed | Cancelled | Timeout | Unknown

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidOperationException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

Get results from a recent query

The following returns the results from a specified query.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.GetQueryResults
{
    "queryId": "12ab3456-12ab-123a-789e-1234567890ab"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "results": [
        [
            {
                "field": "LogEvent1-field1-name",
                "value": "LogEvent1-field1-value"
            },
            {
                "field": "LogEvent1-field2-name",
                "value": "LogEvent1-field2-value"
            },
            ...
            {
                "field": "LogEvent1-fieldX-name",
                "value": "LogEvent1-fieldX-value"
            }
        ],
        [
            {

GetTransformer

Returns the information about the log transformer associated with this log group.

This operation returns data only for transformers created at the log group level. To get information for an account-level transformer, use [DescribeAccountPolicies](#).

Request Syntax

```
{  
    "logGroupIdentifier": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

logGroupIdentifier

Specify either the name or ARN of the log group to return transformer information for. If the log group is in a source account and you are using a monitoring account, you must use the log group ARN.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#+=/:,.@-]*

Required: Yes

Response Syntax

```
{  
    "creationTime": number,  
    "lastModifiedTime": number,  
    "logGroupIdentifier": "string",  
    "transformerConfig": [  
        {
```

```
"addKeys    "entries        {  
            "key            "overwriteIfExists            "value        }  
    ]  
},  
"copyValue    "entries        {  
            "overwriteIfExists            "source            "target        }  
    ]  
},  
"csv    "columns    "delimiter    "quoteCharacter    "source},  
"dateTimeConverter    "locale    "matchPatterns    "source    "sourceTimezone    "target    "targetFormat    "targetTimezone},  
"deleteKeys    "withKeys},  
"grok    "match    "source},  
"listToMap    "flatten    "flattenedElement    "key}
```

```
        "source": "string",
        "target": "string",
        "valueKey": "string"
    },
    "lowerCaseString": {
        "withKeys": [ "string" ]
    },
    "moveKeys": {
        "entries": [
            {
                "overwriteIfExists": boolean,

    "entries": [
        {
            "key": "string",
            "type": "string"
        }
    ]
},
"upperCaseString": {
    "withKeys": [ "string" ]
}
```

```
        }  
    }  
}  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[creationTime](#)

The creation time of the transformer, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

[lastModifiedTime](#)

The date and time when this transformer was most recently modified, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

[logGroupIdentifier](#)

The ARN of the log group that you specified in your request.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#\+=/:,.@-]*

[transformerConfig](#)

This structure contains the configuration of the requested transformer.

Type: Array of [Processor](#) objects

Array Members: Minimum number of 1 item. Maximum number of 20 items.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidOperationException

The operation is not valid on the specified resource.

HTTP Status Code: 400

InvalidOperationException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ListAnomalies

Returns a list of anomalies that log anomaly detectors have found. For details about the structure format of each anomaly object that is returned, see the example in this section.

Request Syntax

```
{  
    "anomalyDetectorArn": "string",  
    "limit": number,  
    "nextToken": "string",  
    "suppressionState": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[anomalyDetectorArn](#)

Use this to optionally limit the results to only the anomalies found by a certain anomaly detector.

Type: String

Length Constraints: Minimum length of 1.

Pattern: [\w#+=/:,.@-]*

Required: No

[limit](#)

The maximum number of items to return. If you don't specify a value, the default maximum value of 50 items is used.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 50.

Required: No

nextToken

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Required: No

suppressionState

You can specify this parameter if you want the operation to return only anomalies that are currently either suppressed or unsuppressed.

Type: String

Valid Values: SUPPRESSED | UNSUPPRESSED

Required: No

Response Syntax

```
{  
  "anomalies": [  
    {  
      "active": boolean,  
      "anomalyDetectorArn": "string",  
      "anomalyId": "string",  
      "description": "string",  
      "firstSeen": number,  
      "histogram": {  
        "string": number  
      },  
      "isPatternLevelSuppression": boolean,  
      "lastSeen": number,  
      "logGroupArnList": [ "string" ],  
      "logSamples": [  
        {  
          "message": "string",  
          "timestamp": number  
        }  
      ],  
    },  
  ]  
}
```

```
"patternId": "string",
"patternRegex": "string",
"patternString": "string",
"patternTokens": [
    {
        "dynamicTokenPositionenumerations": {
            "string" : number
        },
        "inferredTokenName": "string",
        "isDynamic": boolean,
        "tokenString": "string"
    }
],
"priority": "string",
"state": "string",
"suppressed": boolean,
"suppressedDate": number,
"suppressedUntil": number
}
],
"nextToken": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

anomalies

An array of structures, where each structure contains information about one anomaly that a log anomaly detector has found.

Type: Array of [Anomaly](#) objects

nextToken

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidParameterException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To retrieve a list of anomalies found by logs anomaly detectors

This example illustrates one usage of ListAnomalies.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
```

```
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.ListAnomalies
{
    "anomalyDetectorArn": "arn:aws:logs:us-west-1:123456789012:anomaly-
detector:EXAMPLE-1234-5678-abcd-111111111111",
    "limit": 50,
}
```

Sample Response

```
{
    "anomalies": [
        {
            "active": false,
            "anomalyDetectorArn": "arn:aws:logs:us-west-1:123456789012:anomaly-
detector:EXAMPLE-1234-5678-abcd-111111111111",
            "anomalyId": "EXAMPLE-529d-4e1e-bea9-123EXAMPLE",
            "description": "Count of ErrorCode: 200 at token: 9 deviated expected by:
20.00%",
            "firstSeen": 1698488280000,

ListIntegrations

Returns a list of integrations between CloudWatch Logs and other services in this account. Currently, only one integration can be created in an account, and this integration must be with OpenSearch Service.

Request Syntax

```
{  
    "integrationNamePrefix": "string",  
    "integrationStatus": "string",  
    "integrationType": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

integrationNamePrefix

To limit the results to integrations that start with a certain name prefix, specify that name prefix here.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 50.

Pattern: [\.\-_/#A-Za-z0-9]+

Required: No

integrationStatus

To limit the results to integrations with a certain status, specify that status here.

Type: String

Valid Values: PROVISIONING | ACTIVE | FAILED

Required: No

[integrationType](#)

To limit the results to integrations of a certain type, specify that type here.

Type: String

Valid Values: OPENSEARCH

Required: No

Response Syntax

```
{  
  "integrationSummaries": [  
    {  
      "integrationName": "string",  
      "integrationStatus": "string",  
      "integrationType": "string"  
    }  
  ]  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[integrationSummaries](#)

An array, where each object in the array contains information about one CloudWatch Logs integration in this account.

Type: Array of [IntegrationSummary](#) objects

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidOperationException

A parameter is specified incorrectly.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ListLogAnomalyDetectors

Retrieves a list of the log anomaly detectors in the account.

Request Syntax

```
{  
    "filterLogGroupArn": "string",  
    "limit": number,  
    "nextToken": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[filterLogGroupArn](#)

Use this to optionally filter the results to only include anomaly detectors that are associated with the specified log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#==/:, .@-]*

Required: No

[limit](#)

The maximum number of items to return. If you don't specify a value, the default maximum value of 50 items is used.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 50.

Required: No

nextToken

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Required: No

Response Syntax

```
{  
    "anomalyDetectors": [  
        {  
            "anomalyDetectorArn": "string",  
            "anomalyDetectorStatus": "string",  
            "anomalyVisibilityTime": number,  
            "creationTimeStamp": number,  
            "detectorName": "string",  
            "evaluationFrequency": "string",  
            "filterPattern": "string",  
            "kmsKeyId": "string",  
            "lastModifiedTimeStamp": number,  
            "logGroupArnList": [ "string" ]  
        }  
    ],  
    "nextToken": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

anomalyDetectors

An array of structures, where each structure in the array contains information about one anomaly detector.

Type: Array of [AnomalyDetector](#) objects

nextToken

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ListLogGroups

Returns a list of log groups in the Region in your account. If you are performing this action in a monitoring account, you can choose to also return log groups from source accounts that are linked to the monitoring account. For more information about using cross-account observability to set up monitoring accounts and source accounts, see [CloudWatch cross-account observability](#).

You can optionally filter the list by log group class and by using regular expressions in your request to match strings in the log group names.

This operation is paginated. By default, your first use of this operation returns 50 results, and includes a token to use in a subsequent operation to return more results.

Request Syntax

```
{  
    "accountIdentifiers": [ "string" ],  
    "includeLinkedAccounts": boolean,  
    "limit": number,  
    "logGroupClass": "string",  
    "logGroupNamePattern": "string",  
    "nextToken": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

accountIdentifiers

When `includeLinkedAccounts` is set to `true`, use this parameter to specify the list of accounts to search. You can specify as many as 20 account IDs in the array.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 20 items.

Length Constraints: Fixed length of 12.

Pattern: ^\d{12}\\$

Required: No

[includeLinkedAccounts](#)

If you are using a monitoring account, set this to true to have the operation return log groups in the accounts listed in accountIdentifiers.

If this parameter is set to true and accountIdentifiers contains a null value, the operation returns all log groups in the monitoring account and all log groups in all source accounts that are linked to the monitoring account.

The default for this parameter is false.

Type: Boolean

Required: No

[limit](#)

The maximum number of log groups to return. If you omit this parameter, the default is up to 50 log groups.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

[logGroupClass](#)

Use this parameter to limit the results to only those log groups in the specified log group class. If you omit this parameter, log groups of all classes can be returned.

Type: String

Valid Values: STANDARD | INFREQUENT_ACCESS | DELIVERY

Required: No

[logGroupNamePattern](#)

Use this parameter to limit the returned log groups to only those with names that match the pattern that you specify. This parameter is a regular expression that can match prefixes and

substrings, and supports wildcard matching and matching multiple patterns, as in the following examples.

- Use ^ to match log group names by prefix.
- For a substring match, specify the string to match. All matches are case sensitive
- To match multiple patterns, separate them with a | as in the example ^/aws/lambda | discovery

You can specify as many as five different regular expression patterns in this field, each of which must be between 3 and 24 characters. You can include the ^ symbol as many as five times, and include the | symbol as many as four times.

Type: String

Length Constraints: Minimum length of 3. Maximum length of 129.

Pattern: (\^?[\.\-_\#/A-Za-z0-9]{3,24})(\|\^?[\.\-_\#/A-Za-z0-9]{3,24}){0,4}

Required: No

[nextToken](#)

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Required: No

Response Syntax

```
{  
  "logGroups": [  
    {  
      "logGroupArn": "string",  
      "logGroupClass": "string",  
      "logGroupName": "string"  
    }  
  ],  
  "nextToken": "string"  
}
```

}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[logGroups](#)

An array of structures, where each structure contains the information about one log group.

Type: Array of [LogGroupSummary](#) objects

[nextToken](#)

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ListLogGroupsForQuery

Returns a list of the log groups that were analyzed during a single CloudWatch Logs Insights query. This can be useful for queries that use log group name prefixes or the `filterIndex` command, because the log groups are dynamically selected in these cases.

For more information about field indexes, see [Create field indexes to improve query performance and reduce costs](#).

Request Syntax

```
{  
    "maxResults": number,  
    "nextToken": "string",  
    "queryId": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[maxResults](#)

Limits the number of returned log groups to the specified number.

Type: Integer

Valid Range: Minimum value of 50. Maximum value of 500.

Required: No

[nextToken](#)

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Required: No

queryId

The ID of the query to use. This query ID is from the response to your [StartQuery](#) operation.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

Response Syntax

```
{  
    "logGroupIdentifiers": [ "string" ],  
    "nextToken": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

logGroupIdentifiers

An array of the names and ARNs of the log groups that were processed in the query.

Type: Array of strings

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#+=/:,.@-]*

nextToken

The token for the next set of items to return. The token expires after 24 hours.

Type: String

Length Constraints: Minimum length of 1.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

AccessDeniedException

You don't have sufficient permissions to perform this action.

HTTP Status Code: 400

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To list the log groups that were analyzed during a specific query

The following example returns the log groups that were analyzed during the query with the 71bacb5a-30f1-4ed6-9959-2797EXAMPLE ID.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
```

```
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.ListLogGroupsForQuery
{
    "queryId": "71bacb5a-30f1-4ed6-9959-2797EXAMPLE"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "logGroupIdentifiers": [
        "arn:aws:logs:us-east-1:112233445566:log-group:/aws/lambda/applogs",
        "arn:aws:logs:us-east-1:112233445566:log-group:/aws/lambda/servicelogs",
        "arn:aws:logs:us-east-1:112233445566:log-group:/aws/lambda/errorlogs"
    ]
}
```

ListTagsForResource

Displays the tags associated with a CloudWatch Logs resource. Currently, log groups and destinations support tagging.

Request Syntax

```
{  
    "resourceArn": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[resourceArn](#)

The ARN of the resource that you want to view tags for.

The ARN format of a log group is `arn:aws:logs:Region:account-id:log-group:log-group-name`

The ARN format of a destination is `arn:aws:logs:Region:account-id:destination:destination-name`

For more information about ARN format, see [CloudWatch Logs resources and operations](#).

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1011.

Pattern: `[\w+=/:,.@-]*`

Required: Yes

Response Syntax

```
{
```

```
"tags": {  
    "string" : "string"  
}  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

tags

The list of tags associated with the requested resource.>

Type: String to string map

Map Entries: Maximum number of 50 items.

Key Length Constraints: Minimum length of 1. Maximum length of 128.

Key Pattern: ^([\\p{L}\\p{Z}\\p{N}_.:/=+\\-@]+)\$

Value Length Constraints: Maximum length of 256.

Value Pattern: ^([\\p{L}\\p{Z}\\p{N}_.:/=+\\-@]*)\$

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ListTagsLogGroup

This action has been deprecated.

Important

The ListTagsLogGroup operation is on the path to deprecation. We recommend that you use [ListTagsForResource](#) instead.

Lists the tags for the specified log group.

Request Syntax

```
{  
    "logGroupName": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

logGroupName

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: Yes

Response Syntax

```
{
```

```
"tags": {  
    "string" : "string"  
}  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

tags

The tags for the log group.

Type: String to string map

Map Entries: Maximum number of 50 items.

Key Length Constraints: Minimum length of 1. Maximum length of 128.

Key Pattern: ^([\p{L}\p{Z}]\p{N}_.:/=+\-@]+)\$

Value Length Constraints: Maximum length of 256.

Value Pattern: ^([\p{L}\p{Z}]\p{N}_.:/=+\-@]*\$

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

PutAccountPolicy

Creates an account-level data protection policy, subscription filter policy, field index policy, transformer policy, or metric extraction policy that applies to all log groups or a subset of log groups in the account.

To use this operation, you must be signed on with the correct permissions depending on the type of policy that you are creating.

- To create a data protection policy, you must have the `logs:PutDataProtectionPolicy` and `logs:PutAccountPolicy` permissions.
- To create a subscription filter policy, you must have the `logs:PutSubscriptionFilter` and `logs:PutAccountPolicy` permissions.
- To create a transformer policy, you must have the `logs:PutTransformer` and `logs:PutAccountPolicy` permissions.
- To create a field index policy, you must have the `logs:PutIndexPolicy` and `logs:PutAccountPolicy` permissions.
- To create a metric extraction policy, you must have the `logs:PutMetricExtractionPolicy` and `logs:PutAccountPolicy` permissions.

Data protection policy

A data protection policy can help safeguard sensitive data that's ingested by your log groups by auditing and masking the sensitive log data. Each account can have only one account-level data protection policy.

Important

Sensitive data is detected and masked when it is ingested into a log group. When you set a data protection policy, log events ingested into the log groups before that time are not masked.

If you use `PutAccountPolicy` to create a data protection policy for your whole account, it applies to both existing log groups and all log groups that are created later in this account. The account-level policy is applied to existing log groups with eventual consistency. It might take up to 5 minutes before sensitive data in existing log groups begins to be masked.

By default, when a user views a log event that includes masked data, the sensitive data is replaced by asterisks. A user who has the `logs:Unmask` permission can use a [GetLogEvents](#) or [FilterLogEvents](#) operation with the `unmask` parameter set to `true` to view the unmasked log events. Users with the `logs:Unmask` can also view unmasked data in the CloudWatch Logs console by running a CloudWatch Logs Insights query with the `unmask` query command.

For more information, including a list of types of data that can be audited and masked, see [Protect sensitive log data with masking](#).

To use the `PutAccountPolicy` operation for a data protection policy, you must be signed on with the `logs:PutDataProtectionPolicy` and `logs:PutAccountPolicy` permissions.

The `PutAccountPolicy` operation applies to all log groups in the account. You can use [PutDataProtectionPolicy](#) to create a data protection policy that applies to just one log group. If a log group has its own data protection policy and the account also has an account-level data protection policy, then the two policies are cumulative. Any sensitive term specified in either policy is masked.

Subscription filter policy

A subscription filter policy sets up a real-time feed of log events from CloudWatch Logs to other AWS services. Account-level subscription filter policies apply to both existing log groups and log groups that are created later in this account. Supported destinations are Kinesis Data Streams, Firehose, and Lambda. When log events are sent to the receiving service, they are Base64 encoded and compressed with the GZIP format.

The following destinations are supported for subscription filters:

- An Kinesis Data Streams data stream in the same account as the subscription policy, for same-account delivery.
- An Firehose data stream in the same account as the subscription policy, for same-account delivery.
- A Lambda function in the same account as the subscription policy, for same-account delivery.
- A logical destination in a different account created with [PutDestination](#), for cross-account delivery. Kinesis Data Streams and Firehose are supported as logical destinations.

Each account can have one account-level subscription filter policy per Region. If you are updating an existing filter, you must specify the correct name in `PolicyName`. To perform a

`PutAccountPolicy` subscription filter operation for any destination except a Lambda function, you must also have the `iam:PassRole` permission.

Transformer policy

Creates or updates a *log transformer policy* for your account. You use log transformers to transform log events into a different format, making them easier for you to process and analyze. You can also transform logs from different sources into standardized formats that contain relevant, source-specific information. After you have created a transformer, CloudWatch Logs performs this transformation at the time of log ingestion. You can then refer to the transformed versions of the logs during operations such as querying with CloudWatch Logs Insights or creating metric filters or subscription filters.

You can also use a transformer to copy metadata from metadata keys into the log events themselves. This metadata can include log group name, log stream name, account ID and Region.

A transformer for a log group is a series of processors, where each processor applies one type of transformation to the log events ingested into this log group. For more information about the available processors to use in a transformer, see [Processors that you can use](#).

Having log events in standardized format enables visibility across your applications for your log analysis, reporting, and alarming needs. CloudWatch Logs provides transformation for common log types with out-of-the-box transformation templates for major AWS log sources such as VPC flow logs, Lambda, and Amazon RDS. You can use pre-built transformation templates or create custom transformation policies.

You can create transformers only for the log groups in the Standard log class.

You can have one account-level transformer policy that applies to all log groups in the account. Or you can create as many as 20 account-level transformer policies that are each scoped to a subset of log groups with the `selectionCriteria` parameter. If you have multiple account-level transformer policies with selection criteria, no two of them can use the same or overlapping log group name prefixes. For example, if you have one policy filtered to log groups that start with `my-log`, you can't have another field index policy filtered to `my-logpprod` or `my-logging`.

You can also set up a transformer at the log-group level. For more information, see [PutTransformer](#). If there is both a log-group level transformer created with `PutTransformer` and an account-level transformer that could apply to the same log group, the log group uses only the log-group level transformer. It ignores the account-level transformer.

Field index policy

You can use field index policies to create indexes on fields found in log events in the log group. Creating field indexes can help lower the scan volume for CloudWatch Logs Insights queries that reference those fields, because these queries attempt to skip the processing of log events that are known to not match the indexed field. Good fields to index are fields that you often need to query for and fields or values that match only a small fraction of the total log events. Common examples of indexes include request ID, session ID, user IDs, or instance IDs. For more information, see [Create field indexes to improve query performance and reduce costs](#)

To find the fields that are in your log group events, use the [GetLogGroupFields](#) operation.

For example, suppose you have created a field index for `requestId`. Then, any CloudWatch Logs Insights query on that log group that includes `requestId = value` or `requestId in [value, value, ...]` will attempt to process only the log events where the indexed field matches the specified value.

Matches of log events to the names of indexed fields are case-sensitive. For example, an indexed field of `RequestId` won't match a log event containing `requestId`.

You can have one account-level field index policy that applies to all log groups in the account. Or you can create as many as 20 account-level field index policies that are each scoped to a subset of log groups with the `selectionCriteria` parameter. If you have multiple account-level index policies with selection criteria, no two of them can use the same or overlapping log group name prefixes. For example, if you have one policy filtered to log groups that start with `my-log`, you can't have another field index policy filtered to `my-logprod` or `my-logging`.

If you create an account-level field index policy in a monitoring account in cross-account observability, the policy is applied only to the monitoring account and not to any source accounts.

If you want to create a field index policy for a single log group, you can use [PutIndexPolicy](#) instead of [PutAccountPolicy](#). If you do so, that log group will use only that log-group level policy, and will ignore the account-level policy that you create with [PutAccountPolicy](#).

Metric extraction policy

A metric extraction policy controls whether CloudWatch Metrics can be created through the Embedded Metrics Format (EMF) for log groups in your account. By default, EMF metric creation is enabled for all log groups. You can use metric extraction policies to disable EMF metric creation for your entire account or specific log groups.

When a policy disables EMF metric creation for a log group, log events in the EMF format are still ingested, but no CloudWatch Metrics are created from them.

Important

Creating a policy disables metrics for AWS features that use EMF to create metrics, such as CloudWatch Container Insights and CloudWatch Application Signals. To prevent turning off those features by accident, we recommend that you exclude the underlying log-groups through a selection-criteria such as LogGroupNamePrefix NOT IN ["/aws/containerinsights", "/aws/ecs/containerinsights", "/aws/application-signals/data"].

Each account can have either one account-level metric extraction policy that applies to all log groups, or up to 5 policies that are each scoped to a subset of log groups with the `selectionCriteria` parameter. The selection criteria supports filtering by `LogGroupName` and `LogGroupNamePrefix` using the operators `IN` and `NOT IN`. You can specify up to 50 values in each `IN` or `NOT IN` list.

The selection criteria can be specified in these formats:

`LogGroupName IN ["log-group-1", "log-group-2"]`

`LogGroupNamePrefix NOT IN ["/aws/prefix1", "/aws/prefix2"]`

If you have multiple account-level metric extraction policies with selection criteria, no two of them can have overlapping criteria. For example, if you have one policy with selection criteria `LogGroupNamePrefix IN ["my-log"]`, you can't have another metric extraction policy with selection criteria `LogGroupNamePrefix IN ["/my-log-prod"]` or `LogGroupNamePrefix IN ["/my-logging"]`, as the set of log groups matching these prefixes would be a subset of the log groups matching the first policy's prefix, creating an overlap.

When using `NOT IN`, only one policy with this operator is allowed per account.

When combining policies with `IN` and `NOT IN` operators, the overlap check ensures that policies don't have conflicting effects. Two policies with `IN` and `NOT IN` operators do not overlap if and only if every value in the `IN` policy is completely contained within some value in the `NOT IN` policy. For example:

- If you have a `NOT IN` policy for prefix `"/aws/lambda"`, you can create an `IN` policy for the exact log group name `"/aws/lambda/function1"` because the set of log groups matching `"/aws/lambda/function1"` is a subset of the log groups matching `"/aws/lambda"`.

- If you have a NOT IN policy for prefix "/aws/lambda", you cannot create an IN policy for prefix "/aws" because the set of log groups matching "/aws" is not a subset of the log groups matching "/aws/lambda".

Request Syntax

```
{  
    "policyDocument": "string",  
    "policyName": "string",  
    "policyType": "string",  
    "scope": "string",  
    "selectionCriteria": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[policyDocument](#)

Specify the policy, in JSON.

Data protection policy

A data protection policy must include two JSON blocks:

- The first block must include both a `DataIdentifier` array and an `Operation` property with an `Audit` action. The `DataIdentifier` array lists the types of sensitive data that you want to mask. For more information about the available options, see [Types of data that you can mask](#).

The `Operation` property with an `Audit` action is required to find the sensitive data terms. This `Audit` action must contain a `FindingsDestination` object. You can optionally use that `FindingsDestination` object to list one or more destinations to send audit findings to. If you specify destinations such as log groups, Firehose streams, and S3 buckets, they must already exist.

- The second block must include both a `DataIdentifier` array and an `Operation` property with an `Deidentify` action. The `DataIdentifier` array must exactly match the `DataIdentifier` array in the first block of the policy.

The `Operation` property with the `Deidentify` action is what actually masks the data, and it must contain the `"MaskConfig": {}` object. The `"MaskConfig": {}` object must be empty.

For an example data protection policy, see the **Examples** section on this page.

⚠️ Important

The contents of the two `DataIdentifier` arrays must match exactly.

In addition to the two JSON blocks, the `policyDocument` can also include `Name`, `Description`, and `Version` fields. The `Name` is different than the operation's `policyName` parameter, and is used as a dimension when CloudWatch Logs reports audit findings metrics to CloudWatch.

The JSON specified in `policyDocument` can be up to 30,720 characters long.

Subscription filter policy

A subscription filter policy can include the following attributes in a JSON block:

- **DestinationArn** The ARN of the destination to deliver log events to. Supported destinations are:
 - An Kinesis Data Streams data stream in the same account as the subscription policy, for same-account delivery.
 - An Firehose data stream in the same account as the subscription policy, for same-account delivery.
 - A Lambda function in the same account as the subscription policy, for same-account delivery.
 - A logical destination in a different account created with [PutDestination](#), for cross-account delivery. Kinesis Data Streams and Firehose are supported as logical destinations.
- **RoleArn** The ARN of an IAM role that grants CloudWatch Logs permissions to deliver ingested log events to the destination stream. You don't need to provide the ARN when you are working with a logical destination for cross-account delivery.
- **FilterPattern** A filter pattern for subscribing to a filtered stream of log events.

- **Distribution** The method used to distribute log data to the destination. By default, log data is grouped by log stream, but the grouping can be set to Random for a more even distribution. This property is only applicable when the destination is an Kinesis Data Streams data stream.

Transformer policy

A transformer policy must include one JSON block with the array of processors and their configurations. For more information about available processors, see [Processors that you can use](#).

Field index policy

A field index filter policy can include the following attribute in a JSON block:

- **Fields** The array of field indexes to create.

It must contain at least one field index.

The following is an example of an index policy document that creates two indexes, RequestId and TransactionId.

```
"policyDocument": "{ \"Fields\": [ \"RequestId\", \"TransactionId\" ] }"
```

Type: String

Required: Yes

policyName

A name for the policy. This must be unique within the account.

Type: String

Required: Yes

policyType

The type of policy that you're creating or updating.

Type: String

Valid Values: DATA_PROTECTION_POLICY | SUBSCRIPTION_FILTER_POLICY | FIELD_INDEX_POLICY | TRANSFORMER_POLICY | METRIC_EXTRACTION_POLICY

Required: Yes

scope

Currently the only valid value for this parameter is ALL, which specifies that the data protection policy applies to all log groups in the account. If you omit this parameter, the default of ALL is used.

Type: String

Valid Values: ALL

Required: No

selectionCriteria

Use this parameter to apply the new policy to a subset of log groups in the account.

Specifying selectionCriteria is valid only when you specify SUBSCRIPTION_FILTER_POLICY, FIELD_INDEX_POLICY or TRANSFORMER_POLICY for policyType.

If policyType is SUBSCRIPTION_FILTER_POLICY, the only supported selectionCriteria filter is LogGroupName NOT IN []

If policyType is FIELD_INDEX_POLICY or TRANSFORMER_POLICY, the only supported selectionCriteria filter is LogGroupNamePrefix

The selectionCriteria string can be up to 25KB in length. The length is determined by using its UTF-8 bytes.

Using the selectionCriteria parameter with SUBSCRIPTION_FILTER_POLICY is useful to help prevent infinite loops. For more information, see [Log recursion prevention](#).

Type: String

Required: No

Response Syntax

```
{  
  "accountPolicy": {  
    "accountId": "string",  
    "lastUpdatedTime": number,  
  }  
}
```

```
"policyDocument": "string",
"policyName": "string",
"policyType": "string",
"scope": "string",
"selectionCriteria": "string"
}
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[accountPolicy](#)

The account policy that you created.

Type: [AccountPolicy](#) object

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceededException

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To create a log transformer policy

The following example creates a log transformer that applies to log groups have names that start with test-

Sample Request

```
POST / HTTP/1.1
[... existing transformer policy example content ...]
```

To create a metric extraction policy

The following example creates a metric extraction policy that disables EMF metric creation for all log groups except Container Insights log groups.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.PutAccountPolicy
{
    "policyName": "DisableEMFMetrics",
    "policyType": "METRIC_EXTRACTION_POLICY",
    "policyDocument": {
        "EmbeddedMetricFormat": {
            "Status": "Disabled"
        }
    },
}
```

```
    "selectionCriteria": 'LogGroupNamePrefix NOT IN ["/aws/containerinsights", "/aws/ecs/containerinsights"]'  
}
```

To create an account-wide data protection policy

The following example creates an account-wide log group data protection policy.

Sample Request

```
POST / HTTP/1.1  
[... existing data protection policy example content ...]
```

To create an account-wide subscription filter policy

The following example creates an account-wide subscription filter policy that forwards log events containing the string ERROR to a Kinesis Data Streams stream. The policy applies to all log groups in the account except for LogGroupToExclude1 and LogGroupToExclude12.

Sample Request

```
POST / HTTP/1.1  
[... existing subscription filter policy example content ...]
```

To create an account-wide field index policy

The following example creates an account-wide field index policy for log groups with names that start with lambda.

Sample Request

```
POST / HTTP/1.1  
[... existing field index policy example content ...]
```

PutDataProtectionPolicy

Creates a data protection policy for the specified log group. A data protection policy can help safeguard sensitive data that's ingested by the log group by auditing and masking the sensitive log data.

Important

Sensitive data is detected and masked when it is ingested into the log group. When you set a data protection policy, log events ingested into the log group before that time are not masked.

By default, when a user views a log event that includes masked data, the sensitive data is replaced by asterisks. A user who has the `logs:Unmask` permission can use a [GetLogEvents](#) or [FilterLogEvents](#) operation with the `unmask` parameter set to `true` to view the unmasked log events. Users with the `logs:Unmask` can also view unmasked data in the CloudWatch Logs console by running a CloudWatch Logs Insights query with the `unmask` query command.

For more information, including a list of types of data that can be audited and masked, see [Protect sensitive log data with masking](#).

The `PutDataProtectionPolicy` operation applies to only the specified log group. You can also use [PutAccountPolicy](#) to create an account-level data protection policy that applies to all log groups in the account, including both existing log groups and log groups that are created level. If a log group has its own data protection policy and the account also has an account-level data protection policy, then the two policies are cumulative. Any sensitive term specified in either policy is masked.

Request Syntax

```
{  
  "logGroupIdentifier": "string",  
  "policyDocument": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

logGroupIdentifier

Specify either the log group name or log group ARN.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#+=/:,.@-]*

Required: Yes

policyDocument

Specify the data protection policy, in JSON.

This policy must include two JSON blocks:

- The first block must include both a `DataIdentifier` array and an `Operation` property with an `Audit` action. The `DataIdentifier` array lists the types of sensitive data that you want to mask. For more information about the available options, see [Types of data that you can mask](#).

The `Operation` property with an `Audit` action is required to find the sensitive data terms.

This `Audit` action must contain a `FindingsDestination` object. You can optionally use that `FindingsDestination` object to list one or more destinations to send audit findings to. If you specify destinations such as log groups, Firehose streams, and S3 buckets, they must already exist.

- The second block must include both a `DataIdentifier` array and an `Operation` property with an `Deidentify` action. The `DataIdentifier` array must exactly match the `DataIdentifier` array in the first block of the policy.

The `Operation` property with the `Deidentify` action is what actually masks the data, and it must contain the `"MaskConfig": {}` object. The `"MaskConfig": {}` object must be empty.

For an example data protection policy, see the **Examples** section on this page.

⚠ Important

The contents of the two `DataIdentifier` arrays must match exactly.

In addition to the two JSON blocks, the `policyDocument` can also include `Name`, `Description`, and `Version` fields. The `Name` is used as a dimension when CloudWatch Logs reports audit findings metrics to CloudWatch.

The JSON specified in `policyDocument` can be up to 30,720 characters.

Type: String

Required: Yes

Response Syntax

```
{  
  "lastUpdatedTime": number,  
  "logGroupIdentifier": "string",  
  "policyDocument": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[lastUpdatedTime](#)

The date and time that this policy was most recently updated.

Type: Long

Valid Range: Minimum value of 0.

[logGroupIdentifier](#)

The log group name or ARN that you specified in your request.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: `[\w#+=/:,.@-]*`

policyDocument

The data protection policy used for this log group.

Type: String

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceededException

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To create a data protection policy

The following example creates a data protection policy in the log group.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid, Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.PutDataProtectionPolicy
{
    "logGroupIdentifier": "my-log-group",
    "policyDocument": {
        "Name": "data-protection-policy",
        "Description": "test description",
        "Version": "2021-06-01",
        "Statement": [
            {
                "Sid": "audit-policy test",
                "DataIdentifier": [
                    "arn:aws:dataprotection::aws:data-identifier/EmailAddress",
                    "arn:aws:dataprotection::aws:data-identifier/DriversLicense-US"
                ],
                "Operation": {
                    "Audit": {
                        "FindingsDestination": {
                            "CloudWatchLogs": {
                                "LogGroup": "EXISTING_LOG_GROUP_IN_YOUR_ACCOUNT"
                            },
                            "Firehose": {
                                "DeliveryStream": "EXISTING_STREAM_IN_YOUR_ACCOUNT"
                            },
                            "S3": {
                                "Bucket": "EXISTING_BUCKET"
                            }
                        }
                    }
                }
            },
            {
        ]}
```

```
        "Sid": "redact-policy",
        "DataIdentifier": [
            "arn:aws:dataprotection::aws:data-identifier/EmailAddress",
            "arn:aws:dataprotection::aws:data-identifier/DriversLicense-US"
        ],
        "Operation": {
            "Deidentify": {
                "MaskConfig": {}
            }
        }
    }
]
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
```

To create a log transformer policy

The following example creates a log transformer policy in the account that applies to all log groups with names that start with `test-`.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.PutDataProtectionPolicy
```

```
{  
    "policyName": "ExampleTransformerPolicy",  
    "policyType": "TRANSFORMER_POLICY",  
    "selectionCriteria": 'LogGroupNamePrefix = "test-"'  
    "policyDocument": [  
        {  
            "parseJSON": {}  
        },  
        {  
            "addKeys": {  
                "entries": [  
                    {  
                        "key": "metadata.transformed_in",  
                        "value": "CloudWatchLogs"  
                    }  
                ]  
            }  
        },  
        {  
            "trimString": {  
                "withKeys": [  
                    "status"  
                ]  
            }  
        },  
        {  
            "lowerCaseString": {  
                "withKeys": [  
                    "status"  
                ]  
            }  
        }  
    ]  
}
```

Sample Response

```
HTTP/1.1 200 OK  
x-amzn-RequestId: <RequestId>  
Content-Type: application/x-amz-json-1.1  
Content-Length: <PayloadSizeBytes>  
Date: <Date>
```

To create a field index policy

The following example creates an account-level field index policy that is scoped to log groups that have names that begin with test. The policy indexed two fields in these log groups, RequestId and TransactionId

Sample Request

```
{  
    "policyName": "my_indexing_account_policy",  
    "policyType": "FIELD_INDEX_POLICY",  
    "policyDocument": {  
        "Fields": ["RequestId", "TransactionId"]  
    },  
    "selectionCriteria": 'LogGroupNamePrefix = "test"'  
}
```

PutDeliveryDestination

Creates or updates a logical *delivery destination*. A delivery destination is an AWS resource that represents an AWS service that logs can be sent to. CloudWatch Logs, Amazon S3, and Firehose are supported as logs delivery destinations and X-Ray as the trace delivery destination.

To configure logs delivery between a supported AWS service and a destination, you must do the following:

- Create a delivery source, which is a logical object that represents the resource that is actually sending the logs. For more information, see [PutDeliverySource](#).
- Use `PutDeliveryDestination` to create a *delivery destination* in the same account of the actual delivery destination. The delivery destination that you create is a logical object that represents the actual delivery destination.
- If you are delivering logs cross-account, you must use [PutDeliveryDestinationPolicy](#) in the destination account to assign an IAM policy to the destination. This policy allows delivery to that destination.
- Use `CreateDelivery` to create a *delivery* by pairing exactly one delivery source and one delivery destination. For more information, see [CreateDelivery](#).

You can configure a single delivery source to send logs to multiple destinations by creating multiple deliveries. You can also create multiple deliveries to configure multiple delivery sources to send logs to the same delivery destination.

Only some AWS services support being configured as a delivery source. These services are listed as **Supported [V2 Permissions]** in the table at [Enabling logging from AWS services](#).

If you use this operation to update an existing delivery destination, all the current delivery destination parameters are overwritten with the new parameter values that you specify.

Request Syntax

```
{  
  "deliveryDestinationConfiguration": {  
    "destinationResourceArn": "string"  
  },  
  "deliveryDestinationType": "string",  
  "name": "string",
```

```
"outputFormat": "string",
"tags": {
    "string" : "string"
}
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[deliveryDestinationConfiguration](#)

A structure that contains the ARN of the AWS resource that will receive the logs.

 **Note**

`deliveryDestinationConfiguration` is required for CloudWatch Logs, Amazon S3, Firehose log delivery destinations and not required for X-Ray trace delivery destinations. `deliveryDestinationType` is needed for X-Ray trace delivery destinations but not required for other logs delivery destinations.

Type: [DeliveryDestinationConfiguration](#) object

Required: No

[deliveryDestinationType](#)

The type of delivery destination. This parameter specifies the target service where log data will be delivered. Valid values include:

- S3 - Amazon S3 for long-term storage and analytics
- CWL - CloudWatch Logs for centralized log management
- FH - Amazon Kinesis Data Firehose for real-time data streaming
- XRAY - AWS X-Ray for distributed tracing and application monitoring

The delivery destination type determines the format and configuration options available for log delivery.

Type: String

Valid Values: S3 | CWL | FH | XRAY

Required: No

name

A name for this delivery destination. This name must be unique for all delivery destinations in your account.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 60.

Pattern: [\w-]*

Required: Yes

outputFormat

The format for the logs that this delivery destination will receive.

Type: String

Valid Values: json | plain | w3c | raw | parquet

Required: No

tags

An optional list of key-value pairs to associate with the resource.

For more information about tagging, see [Tagging AWS resources](#)

Type: String to string map

Map Entries: Maximum number of 50 items.

Key Length Constraints: Minimum length of 1. Maximum length of 128.

Key Pattern: ^([\p{L}\p{Z}\p{N}_.:/=+\-@]+)\$

Value Length Constraints: Maximum length of 256.

Value Pattern: ^([\p{L}\p{Z}\p{N}_.:/=+\-@]*)\$

Required: No

Response Syntax

```
{  
  "deliveryDestination": {  
    "arn": "string",  
    "deliveryDestinationConfiguration": {  
      "destinationResourceArn": "string"  
    },  
    "deliveryDestinationType": "string",  
    "name": "string",  
    "outputFormat": "string",  
    "tags": {  
      "string" : "string"  
    }  
  }  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[deliveryDestination](#)

A structure containing information about the delivery destination that you just created or updated.

Type: [DeliveryDestination](#) object

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

ConflictException

This operation attempted to create a resource that already exists.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceQuotaExceededException

This request exceeds a service quota.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ThrottlingException

The request was throttled because of quota limits.

HTTP Status Code: 400

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

PutDeliveryDestinationPolicy

Creates and assigns an IAM policy that grants permissions to CloudWatch Logs to deliver logs cross-account to a specified destination in this account. To configure the delivery of logs from an AWS service in another account to a logs delivery destination in the current account, you must do the following:

- Create a delivery source, which is a logical object that represents the resource that is actually sending the logs. For more information, see [PutDeliverySource](#).
- Create a *delivery destination*, which is a logical object that represents the actual delivery destination. For more information, see [PutDeliveryDestination](#).
- Use this operation in the destination account to assign an IAM policy to the destination. This policy allows delivery to that destination.
- Create a *delivery* by pairing exactly one delivery source and one delivery destination. For more information, see [CreateDelivery](#).

Only some AWS services support being configured as a delivery source. These services are listed as **Supported [V2 Permissions]** in the table at [Enabling logging from AWS services](#).

The contents of the policy must include two statements. One statement enables general logs delivery, and the other allows delivery to the chosen destination. See the examples for the needed policies.

Request Syntax

```
{  
    "deliveryDestinationName": "string",  
    "deliveryDestinationPolicy": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[deliveryDestinationName](#)

The name of the delivery destination to assign this policy to.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 60.

Pattern: [\w-]*

Required: Yes

[deliveryDestinationPolicy](#)

The contents of the policy.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 51200.

Required: Yes

Response Syntax

```
{  
  "policy": {  
    "deliveryDestinationPolicy": "string"  
  }  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[policy](#)

The contents of the policy that you just created.

Type: [Policy](#) object

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

ConflictException

This operation attempted to create a resource that already exists.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

Examples

Policy to use with PutDeliveryDestination

The following example creates a policy that grants permission to CloudWatch Logs to deliver logs cross-account to a destination in the current account.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
```

```
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.PutDeliveryDestinationPolicy
{
    "deliveryDestinationName": "DeliveryDestinationName",
    "deliveryDestinationPolicy": "{"
        "Version": "2012-10-17",
        "Statement": [
            {
                "Sid": "AllowLogDeliveryActions",
                "Effect": "Allow",
                "Principal": {
                    "AWS": "arn:aws:iam::AccountID:root"
                },
                "Action": "logs>CreateDelivery",
                "Resource": [
                    "arn:aws:logs:us-east-1:AccountID:delivery-source:*",
                    "arn:aws:logs:us-east-1:AccountID:delivery:*",
                    "arn:aws:logs:us-east-1:AccountID:delivery-destination:*
```

PutDeliverySource

Creates or updates a logical *delivery source*. A delivery source represents an AWS resource that sends logs to an logs delivery destination. The destination can be CloudWatch Logs, Amazon S3, Firehose or X-Ray for sending traces.

To configure logs delivery between a delivery destination and an AWS service that is supported as a delivery source, you must do the following:

- Use `PutDeliverySource` to create a delivery source, which is a logical object that represents the resource that is actually sending the logs.
- Use `PutDeliveryDestination` to create a *delivery destination*, which is a logical object that represents the actual delivery destination. For more information, see [PutDeliveryDestination](#).
- If you are delivering logs cross-account, you must use [PutDeliveryDestinationPolicy](#) in the destination account to assign an IAM policy to the destination. This policy allows delivery to that destination.
- Use `CreateDelivery` to create a *delivery* by pairing exactly one delivery source and one delivery destination. For more information, see [CreateDelivery](#).

You can configure a single delivery source to send logs to multiple destinations by creating multiple deliveries. You can also create multiple deliveries to configure multiple delivery sources to send logs to the same delivery destination.

Only some AWS services support being configured as a delivery source. These services are listed as **Supported [V2 Permissions]** in the table at [Enabling logging from AWS services](#).

If you use this operation to update an existing delivery source, all the current delivery source parameters are overwritten with the new parameter values that you specify.

Request Syntax

```
{  
  "logType": "string",  
  "name": "string",  
  "resourceArn": "string",  
  "tags": {  
    "string" : "string"  
  }  
}
```

}

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

logType

Defines the type of log that the source is sending.

- For Amazon Bedrock, the valid value is APPLICATION_LOGS and TRACES.
- For CloudFront, the valid value is ACCESS_LOGS.
- For Amazon CodeWhisperer, the valid value is EVENT_LOGS.
- For Elemental MediaPackage, the valid values are EGRESS_ACCESS_LOGS and INGRESS_ACCESS_LOGS.
- For Elemental MediaTailor, the valid values are AD_DECISION_SERVER_LOGS, MANIFEST_SERVICE_LOGS, and TRANSCODE_LOGS.
- For AWS Entity Resolution, the valid value is WORKFLOW_LOGS.
- For IAM Identity Center, the valid value is ERROR_LOGS.
- For AWS PCS, the valid values are PCS_SCHEDULER_LOGS and PCS_JOBCOMP_LOGS.
- For Amazon Q, the valid value is EVENT_LOGS.
- For Amazon SES mail manager, the valid values are APPLICATION_LOG and TRAFFIC_POLICY_DEBUG_LOGS.
- For Amazon WorkMail, the valid values are ACCESS_CONTROL_LOGS, AUTHENTICATION_LOGS, WORKMAIL_AVAILABILITY_PROVIDER_LOGS, WORKMAIL_MAILBOX_ACCESS_LOGS, and WORKMAIL_PERSONAL_ACCESS_TOKEN_LOGS.
- For Amazon VPC Route Server, the valid value is EVENT_LOGS.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 255.

Pattern: [\w]*

Required: Yes

[name](#)

A name for this delivery source. This name must be unique for all delivery sources in your account.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 60.

Pattern: [\w-]*

Required: Yes

[resourceArn](#)

The ARN of the AWS resource that is generating and sending logs. For example,
arn:aws:workmail:us-east-1:123456789012:organization/
m-1234EXAMPLEabcd1234abcd1234abcd1234

Type: String

Required: Yes

[tags](#)

An optional list of key-value pairs to associate with the resource.

For more information about tagging, see [Tagging AWS resources](#)

Type: String to string map

Map Entries: Maximum number of 50 items.

Key Length Constraints: Minimum length of 1. Maximum length of 128.

Key Pattern: ^([\p{L}\p{Z}\p{N}_.:/=+\-\@]+)\$

Value Length Constraints: Maximum length of 256.

Value Pattern: ^([\p{L}\p{Z}\p{N}_.:/=+\-\@]*)\$

Required: No

Response Syntax

```
{  
  "deliverySource": {  
    "arn": "string",  
    "logType": "string",  
    "name": "string",  
    "resourceArns": [ "string" ],  
    "service": "string",  
    "tags": {  
      "string" : "string"  
    }  
  }  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[deliverySource](#)

A structure containing information about the delivery source that was just created or updated.

Type: [DeliverySource object](#)

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

ConflictException

This operation attempted to create a resource that already exists.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceQuotaExceededException

This request exceeds a service quota.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ThrottlingException

The request was throttled because of quota limits.

HTTP Status Code: 400

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

See Also

- [AWS SDK for Python](#)
- [AWS SDK for Ruby V3](#)

PutDestination

Creates or updates a destination. This operation is used only to create destinations for cross-account subscriptions.

A destination encapsulates a physical resource (such as an Amazon Kinesis stream). With a destination, you can subscribe to a real-time stream of log events for a different account, ingested using [PutLogEvents](#).

Through an access policy, a destination controls what is written to it. By default, PutDestination does not set any access policy with the destination, which means a cross-account user cannot call [PutSubscriptionFilter](#) against this destination. To enable this, the destination owner must call [PutDestinationPolicy](#) after PutDestination.

To perform a PutDestination operation, you must also have the `iam:PassRole` permission.

Request Syntax

```
{  
    "destinationName": "string",  
    "roleArn": "string",  
    "tags": {  
        "string" : "string"  
    },  
    "targetArn": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[destinationName](#)

A name for the destination.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]^{*}

Required: Yes

[roleArn](#)

The ARN of an IAM role that grants CloudWatch Logs permissions to call the Amazon Kinesis PutRecord operation on the destination stream.

Type: String

Length Constraints: Minimum length of 1.

Required: Yes

[tags](#)

An optional list of key-value pairs to associate with the resource.

For more information about tagging, see [Tagging AWS resources](#)

Type: String to string map

Map Entries: Maximum number of 50 items.

Key Length Constraints: Minimum length of 1. Maximum length of 128.

Key Pattern: ^([\\p{L}\\p{Z}]\\p{N}_.:/=+\\-@]+)\$

Value Length Constraints: Maximum length of 256.

Value Pattern: ^([\\p{L}\\p{Z}]\\p{N}_.:/=+\\-@]*\$

Required: No

[targetArn](#)

The ARN of an Amazon Kinesis stream to which to deliver matching log events.

Type: String

Length Constraints: Minimum length of 1.

Required: Yes

Response Syntax

```
{
```

```
"destination    "accessPolicy    "arn    "creationTime    "destinationName    "roleArn    "targetArn}  
}  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

destination

The destination.

Type: [Destination](#) object

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To create or update a destination

The following example creates the specified destination.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-
type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.PutDestination
{
  "destinationName": "my-destination",
  "targetArn": "arn:aws:kinesis:us-east-1:123456789012:stream/my-kinesis-stream",
  "roleArn": "arn:aws:iam::123456789012:role/my-subscription-role"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
  "destination": [
    {
      "destinationName": "my-destination",
      "targetArn": "arn:aws:kinesis:us-east-1:123456789012:stream/my-kinesis-stream",
      "roleArn": "arn:aws:iam::123456789012:role/my-subscription-role",
      "arn": "arn:aws:logs:us-east-1:123456789012:destination:my-destination",
      "creationTime": 1437584472382
    }
  ]
}
```

{}

See Also

PutDestinationPolicy

Creates or updates an access policy associated with an existing destination. An access policy is an [IAM policy document](#) that is used to authorize claims to register a subscription filter against a given destination.

Request Syntax

```
{  
    "accessPolicy": "string",  
    "destinationName": "string",  
    "forceUpdate": boolean  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[accessPolicy](#)

An IAM policy document that authorizes cross-account users to deliver their log events to the associated destination. This can be up to 5120 bytes.

Type: String

Length Constraints: Minimum length of 1.

Required: Yes

[destinationName](#)

A name for an existing destination.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]*

Required: Yes

forceUpdate

Specify true if you are updating an existing destination policy to grant permission to an organization ID instead of granting permission to individual AWS accounts. Before you update a destination policy this way, you must first update the subscription filters in the accounts that send logs to this destination. If you do not, the subscription filters might stop working. By specifying true for forceUpdate, you are affirming that you have already updated the subscription filters. For more information, see [Updating an existing cross-account subscription](#)

If you omit this parameter, the default of false is used.

Type: Boolean

Required: No

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To create or update an access policy of a destination

The following example updates the access policy of the specified destination.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-
type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.PutDestinationPolicy
{
  "destinationName": "my-destination",
  "accessPolicy": "{ \"Version\": \"2012-10-17\", \"Statement\": [{ \"Effect\":
\"Allow\", \"Principal\": { \"Service\": \"logs.us-east-1.amazonaws.com\"},
\"Action\": \"logs:PutSubscriptionFilter\", \"Resource\": \"arn:aws:logs:us-
east-1:123456789012:destination:my-destination\"]}]"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
```

PutIndexPolicy

Creates or updates a *field index policy* for the specified log group. Only log groups in the Standard log class support field index policies. For more information about log classes, see [Log classes](#).

You can use field index policies to create *field indexes* on fields found in log events in the log group. Creating field indexes speeds up and lowers the costs for CloudWatch Logs Insights queries that reference those field indexes, because these queries attempt to skip the processing of log events that are known to not match the indexed field. Good fields to index are fields that you often need to query for and fields or values that match only a small fraction of the total log events. Common examples of indexes include request ID, session ID, userID, and instance IDs. For more information, see [Create field indexes to improve query performance and reduce costs](#).

To find the fields that are in your log group events, use the [GetLogGroupFields](#) operation.

For example, suppose you have created a field index for `requestId`. Then, any CloudWatch Logs Insights query on that log group that includes `requestId = value` or `requestId IN [value, value, ...]` will process fewer log events to reduce costs, and have improved performance.

Each index policy has the following quotas and restrictions:

- As many as 20 fields can be included in the policy.
- Each field name can include as many as 100 characters.

Matches of log events to the names of indexed fields are case-sensitive. For example, a field index of `RequestId` won't match a log event containing `requestId`.

Log group-level field index policies created with `PutIndexPolicy` override account-level field index policies created with [PutAccountPolicy](#). If you use `PutIndexPolicy` to create a field index policy for a log group, that log group uses only that policy. The log group ignores any account-wide field index policy that you might have created.

Request Syntax

```
{  
  "logGroupIdentifier": "string",  
  "policyDocument": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

logGroupIdentifier

Specify either the log group name or log group ARN to apply this field index policy to. If you specify an ARN, use the format `arn:aws:logs:region:account-id:log-group:log_group_name`. Don't include an * at the end.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: `[\w#+=/:,.@-]*`

Required: Yes

policyDocument

The index policy document, in JSON format. The following is an example of an index policy document that creates two indexes, RequestId and TransactionId.

```
"policyDocument": "{ \"Fields\": [ \"RequestId\", \"TransactionId\" ] }"
```

The policy document must include at least one field index. For more information about the fields that can be included and other restrictions, see [Field index syntax and quotas](#).

Type: String

Length Constraints: Minimum length of 1. Maximum length of 5120.

Required: Yes

Response Syntax

```
{  
  "indexPolicy": {  
    "lastUpdateTime": number,  
    "logGroupIdentifier": "string",  
  },  
}
```

```
"policyDocument": "string",
"policyName": "string",
"source": "string"
}
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[indexPolicy](#)

The index policy that you just created or updated.

Type: [IndexPolicy](#) object

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceededException

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

Create index policy for a log group

The following example creates an index policy that indexes two fields, RequestId and TransactionId.

Sample Request

```
{  
    "logGroupIdentifier": "service-logs",  
    "policyDocument": {  
        "Fields": ["RequestId", "TransactionId"]  
    }  
}
```

PutIntegration

Creates an integration between CloudWatch Logs and another service in this account. Currently, only integrations with OpenSearch Service are supported, and currently you can have only one integration in your account.

Integrating with OpenSearch Service makes it possible for you to create curated vended logs dashboards, powered by OpenSearch Service analytics. For more information, see [Vended log dashboards powered by Amazon OpenSearch Service](#).

You can use this operation only to create a new integration. You can't modify an existing integration.

Request Syntax

```
{  
    "integrationName": "string",  
    "integrationType": "string",  
    "resourceConfig": { ... }  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

integrationName

A name for the integration.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 50.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: Yes

integrationType

The type of integration. Currently, the only supported type is OPENSEARCH.

Type: String

Valid Values: OPENSEARCH

Required: Yes

resourceConfig

A structure that contains configuration information for the integration that you are creating.

Type: [ResourceConfig object](#)

Note: This object is a Union. Only one member of this object can be specified or returned.

Required: Yes

Response Syntax

```
{  
    "integrationName": "string",  
    "integrationStatus": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

integrationName

The name of the integration that you just created.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 50.

Pattern: [\.\-_/\#A-Za-z0-9]+

integrationStatus

The status of the integration that you just created.

After you create an integration, it takes a few minutes to complete. During this time, you'll see the status as PROVISIONING.

Type: String

Valid Values: PROVISIONING | ACTIVE | FAILED

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceededException

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

PutLogEvents

Uploads a batch of log events to the specified log stream.

Important

The sequence token is now ignored in PutLogEvents actions. PutLogEvents actions are always accepted and never return `InvalidSequenceTokenException` or `DataAlreadyAcceptedException` even if the sequence token is not valid. You can use parallel PutLogEvents actions on the same log stream.

The batch of events must satisfy the following constraints:

- The maximum batch size is 1,048,576 bytes. This size is calculated as the sum of all event messages in UTF-8, plus 26 bytes for each log event.
- Events more than 2 hours in the future are rejected while processing remaining valid events.
- Events older than 14 days or preceding the log group's retention period are rejected while processing remaining valid events.
- The log events in the batch must be in chronological order by their timestamp. The timestamp is the time that the event occurred, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC. (In AWS Tools for PowerShell and the AWS SDK for .NET, the timestamp is specified in .NET format: yyyy-mm-ddThh:mm:ss. For example, 2017-09-15T13:45:30.)
- A batch of log events in a single request must be in a chronological order. Otherwise, the operation fails.
- Each log event can be no larger than 1 MB.
- The maximum number of log events in a batch is 10,000.
- For valid events (within 14 days in the past to 2 hours in future), the time span in a single batch cannot exceed 24 hours. Otherwise, the operation fails.

Important

The quota of five requests per second per log stream has been removed. Instead, PutLogEvents actions are throttled based on a per-second per-account quota. You can request an increase to the per-second throttling quota by using the Service Quotas service.

If a call to PutLogEvents returns "UnrecognizedClientException" the most likely cause is a non-valid AWS access key ID or secret key.

Request Syntax

```
{  
    "entity": {  
        "attributes": {  
            "string" : "string"  
        },  
        "keyAttributes": {  
            "string" : "string"  
        }  
    },  
    "logEvents": [  
        {  
            "message": "string",  
            "timestamp": number  
        }  
    ],  
    "logGroupName": "string",  
    "logStreamName": "string",  
    "sequenceToken": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

entity

The entity associated with the log events.

Type: [Entity](#) object

Required: No

logEvents

The log events.

Type: Array of [InputLogEvent](#) objects

Array Members: Minimum number of 1 item. Maximum number of 10000 items.

Required: Yes

[logGroupName](#)

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: Yes

[logStreamName](#)

The name of the log stream.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]*

Required: Yes

[sequenceToken](#)

The sequence token obtained from the response of the previous PutLogEvents call.

⚠ Important

The sequenceToken parameter is now ignored in PutLogEvents actions. PutLogEvents actions are now accepted and never return InvalidSequenceTokenException or DataAlreadyAcceptedException even if the sequence token is not valid.

Type: String

Length Constraints: Minimum length of 1.

Required: No

Response Syntax

```
{  
    "nextSequenceToken": "string",  
    "rejectedEntityInfo": {  
        "errorType": "string"  
    },  
    "rejectedLogEventsInfo": {  
        "expiredLogEventEndIndex": number,  
        "tooNewLogEventStartIndex": number,  
        "tooOldLogEventEndIndex": number  
    }  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

nextSequenceToken

The next sequence token.

⚠ Important

This field has been deprecated.

The sequence token is now ignored in PutLogEvents actions. PutLogEvents actions are always accepted even if the sequence token is not valid. You can use parallel PutLogEvents actions on the same log stream and you do not need to wait for the response of a previous PutLogEvents action to obtain the nextSequenceToken value.

Type: String

Length Constraints: Minimum length of 1.

[rejectedEntityInfo](#)

Information about why the entity is rejected when calling PutLogEvents. Only returned when the entity is rejected.

 **Note**

When the entity is rejected, the events may still be accepted.

Type: [RejectedEntityInfo](#) object

[rejectedLogEventsInfo](#)

The rejected events.

Type: [RejectedLogEventsInfo](#) object

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

DataAlreadyAcceptedException

The event was already logged.

 **Important**

PutLogEvents actions are now always accepted and never return DataAlreadyAcceptedException regardless of whether a given batch of log events has already been accepted.

HTTP Status Code: 400

InvalidParameterException

A parameter is specified incorrectly.

HTTP Status Code: 400

InvalidSequenceTokenException

The sequence token is not valid. You can get the correct sequence token in the expectedSequenceToken field in the InvalidSequenceTokenException message.

Important

PutLogEvents actions are now always accepted and never return InvalidSequenceTokenException regardless of receiving an invalid sequence token.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

UnrecognizedClientException

The most likely cause is an AWS access key ID or secret key that's not valid.

HTTP Status Code: 400

Examples

To upload log events into a log stream

The following example uploads the specified log events to the specified log stream.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
```

```
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,  
Signature=<Signature>  
User-Agent: <UserAgentString>  
Accept: application/json  
Content-Type: application/x-amz-json-1.1  
Content-Length: <PayloadSizeBytes>  
Connection: Keep-Alive  
X-Amz-Target: Logs_20140328.PutLogEvents  
{  
    "logGroupName": "my-log-group",  
    "logStreamName": "my-log-stream",  
    "logEvents": [  
        {  
            "timestamp": 1396035378988,  
            "message": "Example event 1"  
        },  
        {  
            "timestamp": 1396035378988,  
            "message": "Example event 2"  
        },  
        {  
            "timestamp": 1396035378989,  
            "message": "Example event 3"  
        }  
    ]  
}
```

Sample Response

```
HTTP/1.1 200 OK  
x-amzn-RequestId: <RequestId>  
Content-Type: application/x-amz-json-1.1  
Content-Length: <PayloadSizeBytes>  
Date: <Date>  
{  
    "nextSequenceToken": "49536701251539826331025683274032969384950891766572122113"  
}
```

PutMetricFilter

Creates or updates a metric filter and associates it with the specified log group. With metric filters, you can configure rules to extract metric data from log events ingested through [PutLogEvents](#).

The maximum number of metric filters that can be associated with a log group is 100.

Using regular expressions in filter patterns is supported. For these filters, there is a quota of two regular expression patterns within a single filter pattern. There is also a quota of five regular expression patterns per log group. For more information about using regular expressions in filter patterns, see [Filter pattern syntax for metric filters, subscription filters, filter log events, and Live Tail](#).

When you create a metric filter, you can also optionally assign a unit and dimensions to the metric that is created.

Important

Metrics extracted from log events are charged as custom metrics. To prevent unexpected high charges, do not specify high-cardinality fields such as `IPAddress` or `requestID` as dimensions. Each different value found for a dimension is treated as a separate metric and accrues charges as a separate custom metric.

CloudWatch Logs might disable a metric filter if it generates 1,000 different name/value pairs for your specified dimensions within one hour.

You can also set up a billing alarm to alert you if your charges are higher than expected. For more information, see [Creating a Billing Alarm to Monitor Your Estimated AWS Charges](#).

Request Syntax

```
{  
  "applyOnTransformedLogs": boolean,  
  "filterName": "string",  
  "filterPattern": "string",  
  "logGroupName": "string",  
  "metricTransformations": [  
    {  
      "defaultValue": number,  
      "dimensions": {
```

```
        "string" : "string"
    },
    "metricName": "string",
    "metricNamespace": "string",
    "metricValue": "string",
    "unit": "string"
}
]
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[applyOnTransformedLogs](#)

This parameter is valid only for log groups that have an active log transformer. For more information about log transformers, see [PutTransformer](#).

If the log group uses either a log-group level or account-level transformer, and you specify true, the metric filter will be applied on the transformed version of the log events instead of the original ingested log events.

Type: Boolean

Required: No

[filterName](#)

A name for the metric filter.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]*

Required: Yes

[filterPattern](#)

A filter pattern for extracting metric data out of ingested log events.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 1024.

Required: Yes

[logGroupName](#)

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: Yes

[metricTransformations](#)

A collection of information that defines how metric data gets emitted.

Type: Array of [MetricTransformation](#) objects

Array Members: Fixed number of 1 item.

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidOperationException

The operation is not valid on the specified resource.

HTTP Status Code: 400

InvalidParameterException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceeded

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

OperationAborted

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To create or update a metric filter

The following example creates a metric filter for the specified log group.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid, Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
```

```
X-Amz-Target: Logs_20140328.PutMetricFilter
{
    "logGroupName": "my-log-group",
    "filterName": "my-metric-filter",
    "filterPattern": "[ip, identity, user_id, timestamp, request, status_code, size]",
    "metricTransformations": [
        {
            "defaultValue": "0",
            "metricValue": "$size",
            "metricNamespace": "MyApp",
            "metricName": "Volume",
            "dimensions": {"Request": "$request", "UserId": "$user_id"},
            "unit": "Count"
        }
    ]
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
```

PutQueryDefinition

Creates or updates a query definition for CloudWatch Logs Insights. For more information, see [Analyzing Log Data with CloudWatch Logs Insights](#).

To update a query definition, specify its `queryDefinitionId` in your request. The values of `name`, `queryString`, and `logGroupNames` are changed to the values that you specify in your update operation. No current values are retained from the current query definition. For example, imagine updating a current query definition that includes log groups. If you don't specify the `logGroupNames` parameter in your update operation, the query definition changes to contain no log groups.

You must have the `logs:PutQueryDefinition` permission to be able to perform this operation.

Request Syntax

```
{  
  "clientToken": "string",  
  "logGroupNames": [ "string" ],  
  "name": "string",  
  "queryDefinitionId": "string",  
  "queryLanguage": "string",  
  "queryString": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[clientToken](#)

Used as an idempotency token, to avoid returning an exception if the service receives the same request twice because of a network error.

Type: String

Length Constraints: Minimum length of 36. Maximum length of 128.

Pattern: \S{36,128}

Required: No

logGroupNames

Use this parameter to include specific log groups as part of your query definition. If your query uses the OpenSearch Service query language, you specify the log group names inside the `querystring` instead of here.

If you are updating an existing query definition for the Logs Insights QL or OpenSearch Service PPL and you omit this parameter, then the updated definition will contain no log groups.

Type: Array of strings

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: `[\.\-_/#A-Za-z0-9]+`

Required: No

name

A name for the query definition. If you are saving numerous query definitions, we recommend that you name them. This way, you can find the ones you want by using the first part of the name as a filter in the `queryDefinitionNamePrefix` parameter of [DescribeQueryDefinitions](#).

Type: String

Length Constraints: Minimum length of 1. Maximum length of 255.

Required: Yes

queryDefinitionId

If you are updating a query definition, use this parameter to specify the ID of the query definition that you want to update. You can use [DescribeQueryDefinitions](#) to retrieve the IDs of your saved query definitions.

If you are creating a query definition, do not specify this parameter. CloudWatch generates a unique ID for the new query definition and include it in the response to this operation.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: No

queryLanguage

Specify the query language to use for this query. The options are Logs Insights QL, OpenSearch PPL, and OpenSearch SQL. For more information about the query languages that CloudWatch Logs supports, see [Supported query languages](#).

Type: String

Valid Values: CWLI | SQL | PPL

Required: No

queryString

The query string to use for this definition. For more information, see [CloudWatch Logs Insights Query Syntax](#).

Type: String

Length Constraints: Minimum length of 1. Maximum length of 10000.

Required: Yes

Response Syntax

```
{  
  "queryDefinitionId": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

queryDefinitionId

The ID of the query definition.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceededException

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

Create a new query definition

This example creates a query definition.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
```

```
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.PutQueryDefinition
{
    "querystring": "stats sum(packets) as packetsTransferred by srcAddr, dstAddr | sort
packetsTransferred desc | limit 15",
    "name": "VPC-top15-packet-transfers",
    "logGroupNames": [ "VPC_Flow_Log1", "VPC_Flow_Log2" ],
}
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "queryDefinitionId": "123456ab-12ab-123a-789e-1234567890ab"
}
```

Update a query definition

This example updates the query definition that was created in the previous example. The query is changed to show the top 25 responses instead of the top 15, and the name of the query is changed to reflect this.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-
type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.PutQueryDefinition
```

```
{  
    "queryDefinitionId": "123456ab-12ab-123a-789e-1234567890ab",  
    "querystring": "stats sum(packets) as packetsTransferred by srcAddr, dstAddr | sort  
    packetsTransferred desc | limit 25",  
    "name": "VPC-top25-packet-transfers",  
}
```

Sample Response

```
HTTP/1.1 200 OK  
x-amzn-RequestId: <RequestId>  
Content-Type: application/x-amz-json-1.1  
Content-Length: <PayloadSizeBytes>  
Date: <Date>  
{  
    "success": True  
}
```

PutResourcePolicy

Creates or updates a resource policy allowing other AWS services to put log events to this account, such as Amazon Route 53. An account can have up to 10 resource policies per AWS Region.

Request Syntax

```
{  
    "expectedRevisionId": "string",  
    "policyDocument": "string",  
    "policyName": "string",  
    "resourceArn": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[expectedRevisionId](#)

The expected revision ID of the resource policy. Required when `resourceArn` is provided to prevent concurrent modifications. Use `null` when creating a resource policy for the first time.

Type: String

Length Constraints: Minimum length of 1.

Required: No

[policyDocument](#)

Details of the new policy, including the identity of the principal that is enabled to put logs to this account. This is formatted as a JSON string. This parameter is required.

The following example creates a resource policy enabling the Route 53 service to put DNS query logs in to the specified log group. Replace "`logArn`" with the ARN of your CloudWatch Logs resource, such as a log group or log stream.

CloudWatch Logs also supports [aws:SourceArn](#) and [aws:SourceAccount](#) condition context keys.

In the example resource policy, you would replace the value of SourceArn with the resource making the call from Route 53 to CloudWatch Logs. You would also replace the value of SourceAccount with the AWS account ID making that call.

```
{ "Version": "2012-10-17", "Statement": [ { "Sid": "Route53LogsToCloudWatchLogs", "Effect": "Allow", "Principal": { "Service": [ "route53.amazonaws.com" ] }, "Action": "logs:PutLogEvents", "Resource": "logArn", "Condition": { "ArnLike": { "aws:SourceArn": "myRoute53ResourceArn" }, "StringEquals": { "aws:SourceAccount": "myAwsAccountId" } } } ] }
```

Type: String

Length Constraints: Minimum length of 1. Maximum length of 5120.

Required: No

[policyName](#)

Name of the new policy. This parameter is required.

Type: String

Required: No

[resourceArn](#)

The ARN of the CloudWatch Logs resource to which the resource policy needs to be added or attached. Currently only supports LogGroup ARN.

Type: String

Required: No

Response Syntax

```
{  
  "resourcePolicy    "lastUpdatedTimenumber,  
    "policyDocumentstring",  
    "policyNamestring",  
  },  
}
```

```
"policyScope": "string",  
"resourceArn": "string",  
"revisionId": "string"  
},  
"revisionId": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

resourcePolicy

The new policy.

Type: [ResourcePolicy](#) object

revisionId

The revision ID of the created or updated resource policy. Only returned for resource-scoped policies.

Type: String

Length Constraints: Minimum length of 1.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceededException

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

PutRetentionPolicy

Sets the retention of the specified log group. With a retention policy, you can configure the number of days for which to retain log events in the specified log group.

Note

CloudWatch Logs doesn't immediately delete log events when they reach their retention setting. It typically takes up to 72 hours after that before log events are deleted, but in rare situations might take longer.

To illustrate, imagine that you change a log group to have a longer retention setting when it contains log events that are past the expiration date, but haven't been deleted. Those log events will take up to 72 hours to be deleted after the new retention date is reached.

To make sure that log data is deleted permanently, keep a log group at its lower retention setting until 72 hours after the previous retention period ends. Alternatively, wait to change the retention setting until you confirm that the earlier log events are deleted.

When log events reach their retention setting they are marked for deletion. After they are marked for deletion, they do not add to your archival storage costs anymore, even if they are not actually deleted until later. These log events marked for deletion are also not included when you use an API to retrieve the `storedBytes` value to see how many bytes a log group is storing.

Request Syntax

```
{  
  "logGroupName": "string",  
  "retentionInDays": number  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[logGroupName](#)

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: Yes

[retentionInDays](#)

The number of days to retain the log events in the specified log group. Possible values are: 1, 3, 5, 7, 14, 30, 60, 90, 120, 150, 180, 365, 400, 545, 731, 1096, 1827, 2192, 2557, 2922, 3288, and 3653.

To set a log group so that its log events do not expire, use [DeleteRetentionPolicy](#).

Type: Integer

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To create or update a retention policy for a log group

The following example creates a 30-day retention policy for the specified log group.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.PutRetentionPolicy
{
    "logGroupName": "my-log-group",
    "retentionInDays": 30
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
```

PutSubscriptionFilter

Creates or updates a subscription filter and associates it with the specified log group. With subscription filters, you can subscribe to a real-time stream of log events ingested through [PutLogEvents](#) and have them delivered to a specific destination. When log events are sent to the receiving service, they are Base64 encoded and compressed with the GZIP format.

The following destinations are supported for subscription filters:

- An Amazon Kinesis data stream belonging to the same account as the subscription filter, for same-account delivery.
- A logical destination created with [PutDestination](#) that belongs to a different account, for cross-account delivery. We currently support Kinesis Data Streams and Firehose as logical destinations.
- An Amazon Kinesis Data Firehose delivery stream that belongs to the same account as the subscription filter, for same-account delivery.
- An AWS Lambda function that belongs to the same account as the subscription filter, for same-account delivery.

Each log group can have up to two subscription filters associated with it. If you are updating an existing filter, you must specify the correct name in `filterName`.

Using regular expressions in filter patterns is supported. For these filters, there is a quota of two regular expression patterns within a single filter pattern. There is also a quota of five regular expression patterns per log group. For more information about using regular expressions in filter patterns, see [Filter pattern syntax for metric filters, subscription filters, filter log events, and Live Tail](#).

To perform a `PutSubscriptionFilter` operation for any destination except a Lambda function, you must also have the `iam:PassRole` permission.

Request Syntax

```
{  
  "applyOnTransformedLogs": boolean,  
  "destinationArn": "string",  
  "distribution": "string",  
  "filterName": "string",  
  "filterPattern": "string",
```

```
"logGroupName": "string",
"roleArn": "string"
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[applyOnTransformedLogs](#)

This parameter is valid only for log groups that have an active log transformer. For more information about log transformers, see [PutTransformer](#).

If the log group uses either a log-group level or account-level transformer, and you specify true, the subscription filter will be applied on the transformed version of the log events instead of the original ingested log events.

Type: Boolean

Required: No

[destinationArn](#)

The ARN of the destination to deliver matching log events to. Currently, the supported destinations are:

- An Amazon Kinesis stream belonging to the same account as the subscription filter, for same-account delivery.
- A logical destination (specified using an ARN) belonging to a different account, for cross-account delivery.

If you're setting up a cross-account subscription, the destination must have an IAM policy associated with it. The IAM policy must allow the sender to send logs to the destination. For more information, see [PutDestinationPolicy](#).

- A Kinesis Data Firehose delivery stream belonging to the same account as the subscription filter, for same-account delivery.
- A Lambda function belonging to the same account as the subscription filter, for same-account delivery.

Type: String

Length Constraints: Minimum length of 1.

Required: Yes

[distribution](#)

The method used to distribute log data to the destination. By default, log data is grouped by log stream, but the grouping can be set to random for a more even distribution. This property is only applicable when the destination is an Amazon Kinesis data stream.

Type: String

Valid Values: Random | ByLogStream

Required: No

[filterName](#)

A name for the subscription filter. If you are updating an existing filter, you must specify the correct name in `filterName`. To find the name of the filter currently associated with a log group, use [DescribeSubscriptionFilters](#).

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]^{*}

Required: Yes

[filterPattern](#)

A filter pattern for subscribing to a filtered stream of log events.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 1024.

Required: Yes

[logGroupName](#)

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: Yes

roleArn

The ARN of an IAM role that grants CloudWatch Logs permissions to deliver ingested log events to the destination stream. You don't need to provide the ARN when you are working with a logical destination for cross-account delivery.

Type: String

Length Constraints: Minimum length of 1.

Required: No

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidOperationException

The operation is not valid on the specified resource.

HTTP Status Code: 400

InvalidParameterException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceededException

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To create or update a subscription filter

The following example creates a subscription filter.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.PutSubscriptionFilter
{
    "logGroupName": "my-log-group",
    "filterName": "my-subscription-filter",
    "filterPattern": "[ip, identity, user_id, timestamp, request, status_code = 500, size]",
    "destinationArn": "arn:aws:kinesis:us-east-1:123456789012:stream/my-kinesis-stream",
```

```
"roleArn": "arn:aws:iam::123456789012:role/my-subscription-role",
"applyOnTransformedLogs" : true
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
```

PutTransformer

Creates or updates a *log transformer* for a single log group. You use log transformers to transform log events into a different format, making them easier for you to process and analyze. You can also transform logs from different sources into standardized formats that contains relevant, source-specific information.

After you have created a transformer, CloudWatch Logs performs the transformations at the time of log ingestion. You can then refer to the transformed versions of the logs during operations such as querying with CloudWatch Logs Insights or creating metric filters or subscription filers.

You can also use a transformer to copy metadata from metadata keys into the log events themselves. This metadata can include log group name, log stream name, account ID and Region.

A transformer for a log group is a series of processors, where each processor applies one type of transformation to the log events ingested into this log group. The processors work one after another, in the order that you list them, like a pipeline. For more information about the available processors to use in a transformer, see [Processors that you can use](#).

Having log events in standardized format enables visibility across your applications for your log analysis, reporting, and alarming needs. CloudWatch Logs provides transformation for common log types with out-of-the-box transformation templates for major AWS log sources such as VPC flow logs, Lambda, and Amazon RDS. You can use pre-built transformation templates or create custom transformation policies.

You can create transformers only for the log groups in the Standard log class.

You can also set up a transformer at the account level. For more information, see [PutAccountPolicy](#). If there is both a log-group level transformer created with PutTransformer and an account-level transformer that could apply to the same log group, the log group uses only the log-group level transformer. It ignores the account-level transformer.

Request Syntax

```
{  
  "logGroupIdentifier": "string",  
  "transformerConfig": [  
    {  
      "addKeys": {  
        "entries": [  
          {  
            "key": "string",  
            "value": "string"  
          }  
        ]  
      }  
    }  
  ]  
}
```

```
        "key": "string",
        "overwriteIfExists": boolean,
        "value": "string"
    }
]
},
"copyValue": {
    "entries": [
        {
            "overwriteIfExists": boolean,
            "source": "string",
            "target": "string"
        }
    ]
},
"csv": {
    "columns": [ "string" ],
    "delimiter": "string",
    "quoteCharacter": "string",
    "source": "string"
},

    "eventSource": "string",
    "ocsfVersion": "string",
    "source": "string"
  },
  "parseVPC": {
    "source": "string"
  },
  "parseWAF": {
```

```
        "source": "string"
    },
    "renameKeys": {
        "entries": [
            {
                "key": "string",
                "overwriteIfExists": boolean,
                "renameTo": "string"
            }
        ]
    },
    "splitString": {
        "entries": [
            {
                "delimiter": "string",
                "source": "string"
            }
        ]
    },
    "substituteString": {
        "entries": [
            {
                "from": "string",
                "source": "string",
                "to": "string"
            }
        ]
    },
    "trimString": {
        "withKeys": [ "string" ]
    },
    "typeConverter": {
        "entries": [
            {
                "key": "string",
                "type": "string"
            }
        ]
    },
    "upperCaseString": {
        "withKeys": [ "string" ]
    }
}
```

```
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[logGroupIdentifier](#)

Specify either the name or ARN of the log group to create the transformer for.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#=+=/:,.@-]*

Required: Yes

[transformerConfig](#)

This structure contains the configuration of this log transformer. A log transformer is an array of processors, where each processor applies one type of transformation to the log events that are ingested.

Type: Array of [Processor](#) objects

Array Members: Minimum number of 1 item. Maximum number of 20 items.

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidOperationException

The operation is not valid on the specified resource.

HTTP Status Code: 400

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceededException

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To create a log transformer

The following example creates a log transformer for the specified log group.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid, Signature=<Signature>
```

```
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.PutTransformer
{
    "logGroupIdentifier": "my-log-group-name",
    "transformerConfig": [
        {
            "parseJSON": {}
        },
        {
            "addKeys": {
                "entries": [
                    {
                        "key": "metadata.transformed_in",
                        "value": "CloudWatchLogs"
                    }
                ]
            }
        },
        {
            "trimString": {
                "withKeys": [
                    "status"
                ]
            }
        },
        {
            "lowerCaseString": {
                "withKeys": [
                    "status"
                ]
            }
        }
    ]
}
```

StartLiveTail

Starts a Live Tail streaming session for one or more log groups. A Live Tail session returns a stream of log events that have been recently ingested in the log groups. For more information, see [Use Live Tail to view logs in near real time](#).

The response to this operation is a response stream, over which the server sends live log events and the client receives them.

The following objects are sent over the stream:

- A single [LiveTailSessionStart](#) object is sent at the start of the session.
- Every second, a [LiveTailSessionUpdate](#) object is sent. Each of these objects contains an array of the actual log events.

If no new log events were ingested in the past second, the `LiveTailSessionUpdate` object will contain an empty array.

The array of log events contained in a `LiveTailSessionUpdate` can include as many as 500 log events. If the number of log events matching the request exceeds 500 per second, the log events are sampled down to 500 log events to be included in each `LiveTailSessionUpdate` object.

If your client consumes the log events slower than the server produces them, CloudWatch Logs buffers up to 10 `LiveTailSessionUpdate` events or 5000 log events, after which it starts dropping the oldest events.

- A [SessionStreamingException](#) object is returned if an unknown error occurs on the server side.
- A [SessionTimeoutException](#) object is returned when the session times out, after it has been kept open for three hours.

 **Note**

The `StartLiveTail` API routes requests to `streaming-logs.Region.amazonaws.com` using SDK host prefix injection. VPC endpoint support is not available for this API.

⚠ Important

You can end a session before it times out by closing the session stream or by closing the client that is receiving the stream. The session also ends if the established connection between the client and the server breaks.

For examples of using an SDK to start a Live Tail session, see [Start a Live Tail session using an AWS SDK](#).

Request Syntax

```
{  
    "logEventFilterPattern": "string",  
    "logGroupIdentifiers": [ "string" ],  
    "logStreamNamePrefixes": [ "string" ],  
    "logStreamNames": [ "string" ]  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[logEventFilterPattern](#)

An optional pattern to use to filter the results to include only log events that match the pattern.

For example, a filter pattern of `error 404` causes only log events that include both `error` and `404` to be included in the Live Tail stream.

Regular expression filter patterns are supported.

For more information about filter pattern syntax, see [Filter and Pattern Syntax](#).

Type: String

Length Constraints: Minimum length of 0. Maximum length of 1024.

Required: No

logGroupIdentifiers

An array where each item in the array is a log group to include in the Live Tail session.

Specify each log group by its ARN.

If you specify an ARN, the ARN can't end with an asterisk (*).

 **Note**

You can include up to 10 log groups.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 10 items.

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: `[\w#+=/:,.@-]*`

Required: Yes

logStreamNamePrefixes

If you specify this parameter, then only log events in the log streams that have names that start with the prefixes that you specify here are included in the Live Tail session.

If you specify this field, you can't also specify the `logStreamNames` field.

 **Note**

You can specify this parameter only if you specify only one log group in `logGroupIdentifiers`.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: `[^:]*`

Required: No

logStreamNames

If you specify this parameter, then only log events in the log streams that you specify here are included in the Live Tail session.

If you specify this field, you can't also specify the `logStreamNamePrefixes` field.

 **Note**

You can specify this parameter only if you specify only one log group in `logGroupIdentifiers`.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: `[^:]^*`

Required: No

Response Syntax

```
{  
    "responseStream": {  
        "sessionStart": {  
            "logEventFilterPattern": "string",  
            "logGroupIdentifiers": [ "string" ],  
            "logStreamNamePrefixes": [ "string" ],  
            "logStreamNames": [ "string" ],  
            "requestId": "string",  
            "sessionId": "string"  
        },  
        "SessionStreamingException": {  
        },  
        "SessionTimeoutException": {  
        },  
        "sessionUpdate": {  
    }  
}
```

```
"sessionMetadata    "sampledboolean  
},  
"sessionResults    {  
        "ingestionTimenumber,  
        "logGroupIdentifierstring",  
        "logStreamNamestring",  
        "messagestring",  
        "timestampnumber  
    }  
]  
}  
}  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

responseStream

An object that includes the stream returned by your request. It can include both log events and exceptions.

Type: [StartLiveTailResponseStream](#) object

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

AccessDeniedException

You don't have sufficient permissions to perform this action.

HTTP Status Code: 400

InvalidOperationException

The operation is not valid on the specified resource.

HTTP Status Code: 400

InvalidParameterException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceededException

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

StartQuery

Starts a query of one or more log groups using CloudWatch Logs Insights. You specify the log groups and time range to query and the query string to use.

For more information, see [CloudWatch Logs Insights Query Syntax](#).

After you run a query using `StartQuery`, the query results are stored by CloudWatch Logs. You can use [GetQueryResults](#) to retrieve the results of a query, using the `queryId` that `StartQuery` returns.

Note

To specify the log groups to query, a `StartQuery` operation must include one of the following:

- Either exactly one of the following parameters: `logGroupName`, `logGroupNames`, or `logGroupIdentifiers`
- Or the `queryString` must include a `SOURCE` command to select log groups for the query. The `SOURCE` command can select log groups based on log group name prefix, account ID, and log class.

For more information about the `SOURCE` command, see [SOURCE](#).

If you have associated a AWS KMS key with the query results in this account, then [StartQuery](#) uses that key to encrypt the results when it stores them. If no key is associated with query results, the query results are encrypted with the default CloudWatch Logs encryption method.

Queries time out after 60 minutes of runtime. If your queries are timing out, reduce the time range being searched or partition your query into a number of queries.

If you are using CloudWatch cross-account observability, you can use this operation in a monitoring account to start a query in a linked source account. For more information, see [CloudWatch cross-account observability](#). For a cross-account `StartQuery` operation, the query definition must be defined in the monitoring account.

You can have up to 30 concurrent CloudWatch Logs insights queries, including queries that have been added to dashboards.

Request Syntax

```
{  
    "endTime": number,  
    "limit": number,  
    "logGroupIdentifiers": [ "string" ],  
    "logGroupName": "string",  
    "logGroupNames": [ "string" ],  
    "queryLanguage": "string",  
    "queryString": "string",  
    "startTime": number  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[endTime](#)

The end of the time range to query. The range is inclusive, so the specified end time is included in the query. Specified as epoch time, the number of seconds since January 1, 1970, 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: Yes

[limit](#)

The maximum number of log events to return in the query. If the query string uses the fields command, only the specified fields and their values are returned. The default is 10,000.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 10000.

Required: No

logGroupIdentifiers

The list of log groups to query. You can include up to 50 log groups.

You can specify them by the log group name or ARN. If a log group that you're querying is in a source account and you're using a monitoring account, you must specify the ARN of the log group here. The query definition must also be defined in the monitoring account.

If you specify an ARN, use the format `arn:aws:logs:region:account-id:log-group:log_group_name`. Don't include an * at the end.

A StartQuery operation must include exactly one of the following parameters:

`logGroupName`, `logGroupNames`, or `logGroupIdentifiers`. The exception is queries using the OpenSearch Service SQL query language, where you specify the log group names inside the `querystring` instead of here.

Type: Array of strings

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: `[\w#+=/:,.@-]*`

Required: No

logGroupName

The log group on which to perform the query.

Note

A StartQuery operation must include exactly one of the following parameters: `logGroupName`, `logGroupNames`, or `logGroupIdentifiers`. The exception is queries using the OpenSearch Service SQL query language, where you specify the log group names inside the `querystring` instead of here.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: `[\._\-_/\#A-Za-z0-9]+`

Required: No

[logGroupNames](#)

The list of log groups to be queried. You can include up to 50 log groups.

 **Note**

A StartQuery operation must include exactly one of the following parameters: `logGroupName`, `logGroupNames`, or `logGroupIdentifiers`. The exception is queries using the OpenSearch Service SQL query language, where you specify the log group names inside the `querystring` instead of here.

Type: Array of strings

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: `[\.\-_/\#A-Za-z0-9]+`

Required: No

[queryLanguage](#)

Specify the query language to use for this query. The options are Logs Insights QL, OpenSearch PPL, and OpenSearch SQL. For more information about the query languages that CloudWatch Logs supports, see [Supported query languages](#).

Type: String

Valid Values: CWLI | SQL | PPL

Required: No

[queryString](#)

The query string to use. For more information, see [CloudWatch Logs Insights Query Syntax](#).

Type: String

Length Constraints: Minimum length of 0. Maximum length of 10000.

Required: Yes

startTime

The beginning of the time range to query. The range is inclusive, so the specified start time is included in the query. Specified as epoch time, the number of seconds since January 1, 1970, 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: Yes

Response Syntax

```
{  
    "queryId": "string"  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

queryId

The unique ID of the query.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

LimitExceededException

You have reached the maximum number of resources that can be created.

HTTP Status Code: 400

MalformedQueryException

The query string is not valid. Details about this error are displayed in a `QueryCompileError` object. For more information, see [QueryCompileError](#).

For more information about valid query syntax, see [CloudWatch Logs Insights Query Syntax](#).

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

Example: Start a query

This example starts a query of three log groups, specifying the query string and start time. It also limits the results to the most recent 100 matching events.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid, Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
```

```
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.StartQuery
{
    "limit": 100,
    "logGroupNames": [
        "LogGroupName1",
        "LogGroupName2",
        "LogGroupName3"
    ],
    "queryString": "stats count(*) by eventSource, eventName, awsRegion",
    "startTime": 1546300800,
    "endTime": 1546309800
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "queryId": "12ab3456-12ab-123a-789e-1234567890ab"
}
```

Example: Start a query

This example starts a query for a log group ARN and specifies a query string. It also specifies the request start and end times.

Sample Request

```
{
    "limit": 100,
    "logGroupIdentifiers": [
        "arn:aws:logs:us-east-1:123456789012:log-group:monitoring-logGroup-1234"
    ],
    "queryString": "stats count(*) by eventSource, eventName, awsRegion",
    "startTime": 1546300800,
    "endTime": 1546309800
}
```

Sample Response

```
{  
    "queryId": "12ab3456-12ab-123a-789e-1234567890ab"  
}
```

Example: Start a query using field indexing and the source command

This example queries all log groups in the 111122223333 account that have log group names that start with my-log. It leverages field indexing so that only log groups and log events known to match the indexed field transactionId are processed. Only log events that include the value tx-001 for the transactionId field will be returned.

Sample Request

```
POST / HTTP/1.1  
Host: logs.<region>.<domain>  
X-Amz-Date: <DATE>  
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,  
Signature=<Signature>  
User-Agent: <UserAgentString>  
Accept: application/json  
Content-Type: application/x-amz-json-1.1  
Content-Length: <PayloadSizeBytes>  
Connection: Keep-Alive  
X-Amz-Target: Logs_20140328.StartQuery  
{  
    "queryString":  
        "source logGroups(namePrefix: ['my-log'], accountIdentifiers: ['accountId' =  
        '111122223333'])  
        | filterIndex transactionId = 'tx-001'',  
        "startTime": 1722704400000,  
        "endTime": 1722705229849  
}
```

StopQuery

Stops a CloudWatch Logs Insights query that is in progress. If the query has already ended, the operation returns an error indicating that the specified query is not running.

Request Syntax

```
{  
  "queryId": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

queryId

The ID number of the query to stop. To find this ID number, use `DescribeQueries`.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

Response Syntax

```
{  
  "success": boolean  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

success

This is true if the query was stopped by the StopQuery operation.

Type: Boolean

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

Stop a query that is currently running

The following example stops the specified query, if it is currently running.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid, Signature=<Signature>
```

```
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.StopQuery
{
    "queryId": "12ab3456-12ab-123a-789e-1234567890ab"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "success": True
}
```

TagLogGroup

A Important

The TagLogGroup operation is on the path to deprecation. We recommend that you use [TagResource](#) instead.

Adds or updates the specified tags for the specified log group.

To list the tags for a log group, use [ListTagsForResource](#). To remove tags, use [UntagResource](#).

For more information about tags, see [Tag Log Groups in Amazon CloudWatch Logs](#) in the *Amazon CloudWatch Logs User Guide*.

CloudWatch Logs doesn't support IAM policies that prevent users from assigning specified tags to log groups using the `aws:Resource/key-name` or `aws:TagKeys` condition keys. For more information about using tags to control access, see [Controlling access to Amazon Web Services resources using tags](#).

Request Syntax

```
{  
  "logGroupName": "string",  
  "tags": {  
    "string" : "string"  
  }  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[logGroupName](#)

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: Yes

tags

The key-value pairs to use for the tags.

Type: String to string map

Map Entries: Maximum number of 50 items.

Key Length Constraints: Minimum length of 1. Maximum length of 128.

Key Pattern: ^([\p{L}\p{Z}\p{N}_.:/=+\-@]+)\$

Value Length Constraints: Maximum length of 256.

Value Pattern: ^([\p{L}\p{Z}\p{N}_.:/=+\-@]*)\$

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

Examples

To add tags for a log group

The following example adds the specified tags for the specified log group.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-
type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.TagLogGroup
{
    "logGroupName": "my-log-group",
    "tags": {
        "Project": "A",
        "Environment": "test"
    }
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
```

TagResource

Assigns one or more tags (key-value pairs) to the specified CloudWatch Logs resource. Currently, the only CloudWatch Logs resources that can be tagged are log groups and destinations.

Tags can help you organize and categorize your resources. You can also use them to scope user permissions by granting a user permission to access or change only resources with certain tag values.

Tags don't have any semantic meaning to AWS and are interpreted strictly as strings of characters.

You can use the TagResource action with a resource that already has tags. If you specify a new tag key for the alarm, this tag is appended to the list of tags associated with the alarm. If you specify a tag key that is already associated with the alarm, the new tag value that you specify replaces the previous value for that tag.

You can associate as many as 50 tags with a CloudWatch Logs resource.

Request Syntax

```
{  
    "resourceArn": "string",  
    "tags": {  
        "string" : "string"  
    }  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[resourceArn](#)

The ARN of the resource that you're adding tags to.

The ARN format of a log group is `arn:aws:logs:Region:account-id:log-group:log-group-name`

The ARN format of a destination is `arn:aws:logs:Region:account-id:destination:destination-name`

For more information about ARN format, see [CloudWatch Logs resources and operations](#).

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1011.

Pattern: `[\w+=/:,.@-]*`

Required: Yes

tags

The list of key-value pairs to associate with the resource.

Type: String to string map

Map Entries: Maximum number of 50 items.

Key Length Constraints: Minimum length of 1. Maximum length of 128.

Key Pattern: `^([\p{L}\p{Z}\p{N}_.:/=+\-@\]+)$`

Value Length Constraints: Maximum length of 256.

Value Pattern: `^([\p{L}\p{Z}\p{N}_.:/=+\-@\]+)$`

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

TooManyTagsException

A resource can have no more than 50 tags.

HTTP Status Code: 400

TestMetricFilter

Tests the filter pattern of a metric filter against a sample of log event messages. You can use this operation to validate the correctness of a metric filter pattern.

Request Syntax

```
{  
    "filterPattern": "string",  
    "logEventMessages": [ "string" ]  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[filterPattern](#)

A symbolic description of how CloudWatch Logs should interpret the data in each log event. For example, a log event can contain timestamps, IP addresses, strings, and so on. You use the filter pattern to specify what to look for in the log event message.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 1024.

Required: Yes

[logEventMessages](#)

The log event messages to test.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 50 items.

Length Constraints: Minimum length of 1.

Required: Yes

Response Syntax

```
{  
  "matches": [  
    {  
      "eventMessage": "string",  
      "eventNumber": number,  
      "extractedValues": {  
        "string" : "string"  
      }  
    }  
  ]  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

matches

The matched events.

Type: Array of [MetricFilterMatchRecord](#) objects

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidParameterException

A parameter is specified incorrectly.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Examples

To test a metric filter pattern on Apache access.log events

The following example tests the specified metric filter pattern.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.TestMetricFilter
{
  "filterPattern": "[ip, identity, user_id, timestamp, request, status_code, size]",
  "logEventMessages": [
    "127.0.0.1 - frank [10/Oct/2000:13:25:15 -0700] \"GET /apache_pb.gif HTTP/1.0\" 200
1534",
    "127.0.0.1 - frank [10/Oct/2000:13:35:22 -0700] \"GET /apache_pb.gif HTTP/1.0\" 500
5324",
    "127.0.0.1 - frank [10/Oct/2000:13:50:35 -0700] \"GET /apache_pb.gif HTTP/1.0\" 200
4355"

            "$1": "127.0.0.1"
        }
    }
]
```

To test a metric filter pattern that matches occurrences of "[ERROR]" in log events

The following example tests the specified metric filter pattern.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,
Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.TestMetricFilter
{
    "filterPattern": "\[ERROR\]\\"",
    "logEventMessages": [
        "02 May 2014 00:34:12,525 [INFO] Starting the application",
        "02 May 2014 00:35:14,245 [DEBUG] Database connection established",
        "02 May 2014 00:34:14,663 [INFO] Executing SQL Query",
        "02 May 2014 00:34:16,142 [ERROR] Unhandled exception: InvalidQueryException",
        "02 May 2014 00:34:16,224 [ERROR] Terminating the application"
    ]
}
```

}

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
  "matches": [
    {
      "eventNumber": 3,
      "eventMessage": "02 May 2014 00:34:16,142 [ERROR] Unhandled exception: InvalidQueryException",
      "extractedValues": {}
    },
    {
      "eventNumber": 4,
      "eventMessage": "02 May 2014 00:34:16,224 [ERROR] Terminating the application",
      "extractedValues": {}
    }
  ]
}
```

To test a metric filter pattern that matches occurrences of "[ERROR]" and "Exception" in log events

The following example tests the specified metric filter pattern.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid, Signature=<Signature>
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
```

```
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.TestMetricFilter
{
  "filterPattern": "\"[ERROR]\\\" Exception",
  "logEventMessages": [
    "02 May 2014 00:34:12,525 [INFO] Starting the application",
    "02 May 2014 00:35:14,245 [DEBUG] Database connection established",
    "02 May 2014 00:34:14,663 [INFO] Executing SQL Query",
    "02 May 2014 00:34:16,142 [ERROR] Unhandled exception: InvalidQueryException",
    "02 May 2014 00:34:16,224 [ERROR] Terminating the application"
  ]
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
  "matches": [
    {
      "eventNumber": 3,
      "eventMessage": "02 May 2014 00:34:16,142 [ERROR] Unhandled exception: InvalidQueryException",
      "extractedValues": {}
    }
  ]
}
```

TestTransformer

Use this operation to test a log transformer. You enter the transformer configuration and a set of log events to test with. The operation responds with an array that includes the original log events and the transformed versions.

Request Syntax

```
{  
    "logEventMessages": [ "string" ],  
    "transformerConfig": [  
        {  
            "addKeys": {  
                "entries": [  
                    {  
                        "key": "string",  
                        "overwriteIfExists": boolean,  
                        "value": "string"  
                    }  
                ]  
            },  
            "copyValue": {  
                "entries": [  
                    {  
                        "overwriteIfExists": boolean,  
                        "source": "string",  
                        "target": "string"  
                    }  
                ]  
            },  
            "csv": {  
                "columns": [ "string" ],  
                "delimiter": "string",  
                "quoteCharacter": "string",  
                "source": "string"  
            },  
            "dateTimeConverter": {  
                "locale": "string",

                    "type": "string"
                }
            ]
        },
        "upperCaseString": {
            "withKeys": [ "string" ]
        }
    }
]
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[logEventMessages](#)

An array of the raw log events that you want to use to test this transformer.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 50 items.

Length Constraints: Minimum length of 1.

Required: Yes

[transformerConfig](#)

This structure contains the configuration of this log transformer that you want to test. A log transformer is an array of processors, where each processor applies one type of transformation to the log events that are ingested.

Type: Array of [Processor](#) objects

Array Members: Minimum number of 1 item. Maximum number of 20 items.

Required: Yes

Response Syntax

```
{  
  "transformedLogs": [  
    {  
      "eventMessage": "string",  
      "eventNumber": number,  
      "transformedEventMessage": "string"  
    }  
  ]  
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

[transformedLogs](#)

An array where each member of the array includes both the original version and the transformed version of one of the log events that you input.

Type: Array of [TransformedLogRecord](#) objects

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidOperationException

The operation is not valid on the specified resource.

HTTP Status Code: 400

InvalidParameterException

A parameter is specified incorrectly.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

UntagLogGroup

Important

The UntagLogGroup operation is on the path to deprecation. We recommend that you use [UntagResource](#) instead.

Removes the specified tags from the specified log group.

To list the tags for a log group, use [ListTagsForResource](#). To add tags, use [TagResource](#).

When using IAM policies to control tag management for CloudWatch Logs log groups, the condition keys `aws:Resource/key-name` and `aws:TagKeys` cannot be used to restrict which tags users can assign.

Request Syntax

```
{  
  "logGroupName": "string",  
  "tags": [ "string" ]  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[logGroupName](#)

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: `[\._\-/_\#A-Za-z0-9]+`

Required: Yes

tags

The tag keys. The corresponding tags are removed from the log group.

Type: Array of strings

Array Members: Minimum number of 1 item.

Length Constraints: Minimum length of 1. Maximum length of 128.

Pattern: ^([\p{L}\p{Z}\p{N}_.:=/=+\-@\]+)\$

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

Examples

To remove tags from a log group

The following example removes the specified tags for the specified log group.

Sample Request

```
POST / HTTP/1.1
Host: logs.<region>.<domain>
X-Amz-Date: <DATE>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid, Signature=<Signature>
```

```
User-Agent: <UserAgentString>
Accept: application/json
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: Logs_20140328.UntagLogGroup
{
    "logGroupName": "my-log-group",
    "tags": {"Project", "Environment"}
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
```

UntagResource

Removes one or more tags from the specified resource.

Request Syntax

```
{  
    "resourceArn": "string",  
    "tagKeys": [ "string" ]  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

resourceArn

The ARN of the CloudWatch Logs resource that you're removing tags from.

The ARN format of a log group is `arn:aws:logs:Region:account-id:log-group:log-group-name`

The ARN format of a destination is `arn:aws:logs:Region:account-id:destination:destination-name`

For more information about ARN format, see [CloudWatch Logs resources and operations](#).

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1011.

Pattern: `[\w+=/:,.@-]*`

Required: Yes

tagKeys

The list of tag keys to remove from the resource.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 50 items.

Length Constraints: Minimum length of 1. Maximum length of 128.

Pattern: ^([\p{L}\p{Z}\p{N}_.:=/=-@\]+)\$

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

UpdateAnomaly

Use this operation to *suppress* anomaly detection for a specified anomaly or pattern. If you suppress an anomaly, CloudWatch Logs won't report new occurrences of that anomaly and won't update that anomaly with new data. If you suppress a pattern, CloudWatch Logs won't report any anomalies related to that pattern.

You must specify either `anomalyId` or `patternId`, but you can't specify both parameters in the same operation.

If you have previously used this operation to suppress detection of a pattern or anomaly, you can use it again to cause CloudWatch Logs to end the suppression. To do this, use this operation and specify the anomaly or pattern to stop suppressing, and omit the `suppressionType` and `suppressionPeriod` parameters.

Request Syntax

```
{  
    "anomalyDetectorArn": "string",  
    "anomalyId": "string",  
    "baseline": boolean,  
    "patternId": "string",  
    "suppressionPeriod": {  
        "suppressionUnit": "string",  
        "value": number  
    },  
    "suppressionType": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[anomalyDetectorArn](#)

The ARN of the anomaly detector that this operation is to act on.

Type: String

Length Constraints: Minimum length of 1.

Pattern: [\w#==/:, .@-]*

Required: Yes

[anomalyId](#)

If you are suppressing or unsuppressing an anomaly, specify its unique ID here. You can find anomaly IDs by using the [ListAnomalies](#) operation.

Type: String

Length Constraints: Fixed length of 36.

Required: No

[baseline](#)

Set this to true to prevent CloudWatch Logs from displaying this behavior as an anomaly in the future. The behavior is then treated as baseline behavior. However, if similar but more severe occurrences of this behavior occur in the future, those will still be reported as anomalies.

The default is false

Type: Boolean

Required: No

[patternId](#)

If you are suppressing or unsuppressing an pattern, specify its unique ID here. You can find pattern IDs by using the [ListAnomalies](#) operation.

Type: String

Length Constraints: Fixed length of 32.

Required: No

[suppressionPeriod](#)

If you are temporarily suppressing an anomaly or pattern, use this structure to specify how long the suppression is to last.

Type: [SuppressionPeriod](#) object

Required: No

suppressionType

Use this to specify whether the suppression to be temporary or infinite. If you specify LIMITED, you must also specify a suppressionPeriod. If you specify INFINITE, any value for suppressionPeriod is ignored.

Type: String

Valid Values: LIMITED | INFINITE

Required: No

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidArgumentException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

UpdateDeliveryConfiguration

Use this operation to update the configuration of a [delivery](#) to change either the S3 path pattern or the format of the delivered logs. You can't use this operation to change the source or destination of the delivery.

Request Syntax

```
{  
    "fieldDelimiter": "string",  
    "id": "string",  
    "recordFields": [ "string" ],  
    "s3DeliveryConfiguration": {  
        "enableHiveCompatiblePath": boolean,  
        "suffixPath": "string"  
    }  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

fieldDelimiter

The field delimiter to use between record fields when the final output format of a delivery is in Plain, W3C, or Raw format.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 5.

Required: No

id

The ID of the delivery to be updated by this request.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Pattern: ^[0-9A-Za-z]+\$

Required: Yes

recordFields

The list of record fields to be delivered to the destination, in order. If the delivery's log source has mandatory fields, they must be included in this list.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 128 items.

Length Constraints: Minimum length of 1. Maximum length of 64.

Required: No

s3DeliveryConfiguration

This structure contains parameters that are valid only when the delivery's delivery destination is an S3 bucket.

Type: [S3DeliveryConfiguration](#) object

Required: No

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

AccessDeniedException

You don't have sufficient permissions to perform this action.

HTTP Status Code: 400

ConflictException

This operation attempted to create a resource that already exists.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

ThrottlingException

The request was throttled because of quota limits.

HTTP Status Code: 400

ValidationException

One of the parameters for the request is not valid.

HTTP Status Code: 400

UpdateLogAnomalyDetector

Updates an existing log anomaly detector.

Request Syntax

```
{  
    "anomalyDetectorArn": "string",  
    "anomalyVisibilityTime": number,  
    "enabled": boolean,  
    "evaluationFrequency": "string",  
    "filterPattern": "string"  
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

[anomalyDetectorArn](#)

The ARN of the anomaly detector that you want to update.

Type: String

Length Constraints: Minimum length of 1.

Pattern: [\w#+=/:,.@-]*

Required: Yes

[anomalyVisibilityTime](#)

The number of days to use as the life cycle of anomalies. After this time, anomalies are automatically baselined and the anomaly detector model will treat new occurrences of similar event as normal. Therefore, if you do not correct the cause of an anomaly during this time, it will be considered normal going forward and will not be detected.

Type: Long

Valid Range: Minimum value of 7. Maximum value of 90.

Required: No

enabled

Use this parameter to pause or restart the anomaly detector.

Type: Boolean

Required: Yes

evaluationFrequency

Specifies how often the anomaly detector runs and look for anomalies. Set this value according to the frequency that the log group receives new logs. For example, if the log group receives new log events every 10 minutes, then setting evaluationFrequency to FIFTEEN_MIN might be appropriate.

Type: String

Valid Values: ONE_MIN | FIVE_MIN | TEN_MIN | FIFTEEN_MIN | THIRTY_MIN | ONE_HOUR

Required: No

filterPattern

A symbolic description of how CloudWatch Logs should interpret the data in each log event. For example, a log event can contain timestamps, IP addresses, strings, and so on. You use the filter pattern to specify what to look for in the log event message.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 1024.

Required: No

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

InvalidOperationException

A parameter is specified incorrectly.

HTTP Status Code: 400

OperationAbortedException

Multiple concurrent requests to update the same resource were in conflict.

HTTP Status Code: 400

ResourceNotFoundException

The specified resource does not exist.

HTTP Status Code: 400

ServiceUnavailableException

The service cannot complete the request.

HTTP Status Code: 500

Data Types

The Amazon CloudWatch Logs API contains several data types that various actions use. This section describes each data type in detail.

 **Note**

The order of each element in a data type structure is not guaranteed. Applications should not assume a particular order.

The following data types are supported:

- [AccountPolicy](#)
- [AddKeyEntry](#)
- [AddKeys](#)
- [Anomaly](#)
- [AnomalyDetector](#)
- [ConfigurationTemplate](#)
- [ConfigurationTemplateDeliveryConfigValues](#)
- [CopyValue](#)
- [CopyValueEntry](#)
- [CSV](#)
- [DateTimeConverter](#)
- [DeleteKeys](#)
- [Delivery](#)
- [DeliveryDestination](#)
- [DeliveryDestinationConfiguration](#)
- [DeliverySource](#)

AccountPolicy

A structure that contains information about one CloudWatch Logs account policy.

Contents

accountId

The AWS account ID that the policy applies to.

Type: String

Length Constraints: Fixed length of 12.

Pattern: ^\d{12}\\$

Required: No

lastUpdatedTime

The date and time that this policy was most recently updated.

Type: Long

Valid Range: Minimum value of 0.

Required: No

policyDocument

The policy document for this account policy.

The JSON specified in policyDocument can be up to 30,720 characters.

Type: String

Required: No

policyName

The name of the account policy.

Type: String

Required: No

policyType

The type of policy for this account policy.

Type: String

Valid Values: DATA_PROTECTION_POLICY | SUBSCRIPTION_FILTER_POLICY | FIELD_INDEX_POLICY | TRANSFORMER_POLICY | METRIC_EXTRACTION_POLICY

Required: No

scope

The scope of the account policy.

Type: String

Valid Values: ALL

Required: No

selectionCriteria

The log group selection criteria that is used for this policy.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

AddKeyEntry

This object defines one key that will be added with the [addKeys](#) processor.

Contents

key

The key of the new entry to be added to the log event

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: Yes

value

The value of the new entry to be added to the log event

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: Yes

overwriteIfExists

Specifies whether to overwrite the value if the key already exists in the log event. If you omit this, the default is false.

Type: Boolean

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)

- [AWS SDK for Ruby V3](#)

AddKeys

This processor adds new key-value pairs to the log event.

For more information about this processor including examples, see [addKeys](#) in the *CloudWatch Logs User Guide*.

Contents

entries

An array of objects, where each object contains the information about one key to add to the log event.

Type: Array of [AddKeyEntry](#) objects

Array Members: Minimum number of 1 item. Maximum number of 5 items.

Required: Yes

See Also

Anomaly

This structure represents one anomaly that has been found by a logs anomaly detector.

For more information about patterns and anomalies, see [CreateLogAnomalyDetector](#).

Contents

active

Specifies whether this anomaly is still ongoing.

Type: Boolean

Required: Yes

anomalyDetectorArn

The ARN of the anomaly detector that identified this anomaly.

Type: String

Length Constraints: Minimum length of 1.

Pattern: [\w#=+=/:,.@-]*

Required: Yes

anomalyId

The unique ID that CloudWatch Logs assigned to this anomaly.

Type: String

Length Constraints: Fixed length of 36.

Required: Yes

description

A human-readable description of the anomaly. This description is generated by CloudWatch Logs.

Type: String

Length Constraints: Minimum length of 1.

Required: Yes

firstSeen

The date and time when the anomaly detector first saw this anomaly. It is specified as epoch time, which is the number of seconds since January 1, 1970, 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: Yes

histogram

A map showing times when the anomaly detector ran, and the number of occurrences of this anomaly that were detected at each of those runs. The times are specified in epoch time, which is the number of seconds since January 1, 1970, 00:00:00 UTC.

Type: String to long map

Key Length Constraints: Minimum length of 1.

Required: Yes

lastSeen

The date and time when the anomaly detector most recently saw this anomaly. It is specified as epoch time, which is the number of seconds since January 1, 1970, 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: Yes

logGroupArnList

An array of ARNs of the log groups that contained log events considered to be part of this anomaly.

Type: Array of strings

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: `[\w#+=/:,.@-]*`

Required: Yes

logSamples

An array of sample log event messages that are considered to be part of this anomaly.

Type: Array of [LogEvent](#) objects

Required: Yes

patternId

The ID of the pattern used to help identify this anomaly.

Type: String

Length Constraints: Fixed length of 32.

Required: Yes

patternString

The pattern used to help identify this anomaly, in string format.

Type: String

Length Constraints: Minimum length of 1.

Required: Yes

patternTokens

An array of structures where each structure contains information about one token that makes up the pattern.

Type: Array of [PatternToken](#) objects

Required: Yes

state

Indicates the current state of this anomaly. If it is still being treated as an anomaly, the value is Active. If you have suppressed this anomaly by using the [UpdateAnomaly](#) operation, the value is Suppressed. If this behavior is now considered to be normal, the value is Baseline.

Type: String

Valid Values: Active | Suppressed | Baseline

Required: Yes

isPatternLevelSuppression

If this anomaly is suppressed, this field is true if the suppression is because the pattern is suppressed. If false, then only this particular anomaly is suppressed.

Type: Boolean

Required: No

patternRegex

The pattern used to help identify this anomaly, in regular expression format.

Type: String

Length Constraints: Minimum length of 1.

Required: No

priority

The priority level of this anomaly, as determined by CloudWatch Logs. Priority is computed based on log severity labels such as FATAL and ERROR and the amount of deviation from the baseline. Possible values are HIGH, MEDIUM, and LOW.

Type: String

Length Constraints: Minimum length of 1.

Required: No

suppressed

Indicates whether this anomaly is currently suppressed. To suppress an anomaly, use [UpdateAnomaly](#).

Type: Boolean

Required: No

suppressedDate

If the anomaly is suppressed, this indicates when it was suppressed.

Type: Long

Valid Range: Minimum value of 0.

Required: No

suppressedUntil

If the anomaly is suppressed, this indicates when the suppression will end. If this value is 0, the anomaly was suppressed with no expiration, with the INFINITE value.

Type: Long

Valid Range: Minimum value of 0.

Required: No

See Also

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

AnomalyDetector

Contains information about one anomaly detector in the account.

Contents

anomalyDetectorArn

The ARN of the anomaly detector.

Type: String

Length Constraints: Minimum length of 1.

Pattern: [\w#+=/:,.@-]*

Required: No

anomalyDetectorStatus

Specifies the current status of the anomaly detector. To pause an anomaly detector, use the enabled parameter in the [UpdateLogAnomalyDetector](#) operation.

Type: String

Valid Values: INITIALIZING | TRAINING | ANALYZING | FAILED | DELETED | PAUSED

Required: No

anomalyVisibilityTime

The number of days used as the life cycle of anomalies. After this time, anomalies are automatically baselined and the anomaly detector model will treat new occurrences of similar event as normal.

Type: Long

Valid Range: Minimum value of 7. Maximum value of 90.

Required: No

creationTimeStamp

The date and time when this anomaly detector was created.

Type: Long

Valid Range: Minimum value of 0.

Required: No

detectorName

The name of the anomaly detector.

Type: String

Length Constraints: Minimum length of 1.

Required: No

evaluationFrequency

Specifies how often the anomaly detector runs and look for anomalies.

Type: String

Valid Values: ONE_MIN | FIVE_MIN | TEN_MIN | FIFTEEN_MIN | THIRTY_MIN | ONE_HOUR

Required: No

filterPattern

A symbolic description of how CloudWatch Logs should interpret the data in each log event. For example, a log event can contain timestamps, IP addresses, strings, and so on. You use the filter pattern to specify what to look for in the log event message.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 1024.

Required: No

kmsKeyId

The ARN of the AWS KMS key assigned to this anomaly detector, if any.

Type: String

Length Constraints: Maximum length of 256.

Required: No

lastModifiedTimeStamp

The date and time when this anomaly detector was most recently modified.

Type: Long

Valid Range: Minimum value of 0.

Required: No

logGroupArnList

A list of the ARNs of the log groups that this anomaly detector watches.

Type: Array of strings

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#+=/:,.@-]*

Required: No

See Also

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

ConfigurationTemplate

A structure containing information about the default settings and available settings that you can use to configure a [delivery](#) or a [delivery destination](#).

Contents

allowedActionForAllowVendedLogsDeliveryForResource

The action permissions that a caller needs to have to be able to successfully create a delivery source on the desired resource type when calling [PutDeliverySource](#).

Type: String

Required: No

allowedFieldDelimiters

The valid values that a caller can use as field delimiters when calling [CreateDelivery](#) or [UpdateDeliveryConfiguration](#) on a delivery that delivers in Plain, W3C, or Raw format.

Type: Array of strings

Length Constraints: Minimum length of 0. Maximum length of 5.

Required: No

allowedFields

The allowed fields that a caller can use in the recordFields parameter of a [CreateDelivery](#) or [UpdateDeliveryConfiguration](#) operation.

Type: Array of [RecordField](#) objects

Required: No

allowedOutputFormats

The list of delivery destination output formats that are supported by this log source.

Type: Array of strings

Valid Values: json | plain | w3c | raw | parquet

Required: No

allowedSuffixPathFields

The list of variable fields that can be used in the suffix path of a delivery that delivers to an S3 bucket.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 128 items.

Length Constraints: Minimum length of 1. Maximum length of 64.

Required: No

defaultDeliveryConfigValues

A mapping that displays the default value of each property within a delivery's configuration, if it is not specified in the request.

Type: [ConfigurationTemplateDeliveryConfigValues](#) object

Required: No

deliveryDestinationType

A string specifying which destination type this configuration template applies to.

Type: String

Valid Values: S3 | CWL | FH | XRAY

Required: No

logType

A string specifying which log type this configuration template applies to.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 255.

Pattern: [\w]*

Required: No

resourceType

A string specifying which resource type this configuration template applies to.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 255.

Pattern: [\w-_]*

Required: No

service

A string specifying which service this configuration template applies to. For more information about supported services see [Enable logging from AWS services..](#)

Type: String

Length Constraints: Minimum length of 1. Maximum length of 255.

Pattern: [\w-_]*

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

ConfigurationTemplateDeliveryConfigValues

This structure contains the default values that are used for each configuration parameter when you use [CreateDelivery](#) to create a delivery under the current service type, resource type, and log type.

Contents

fieldDelimiter

The default field delimiter that is used in a [CreateDelivery](#) operation when the field delimiter is not specified in that operation. The field delimiter is used only when the final output delivery is in Plain, W3C, or Raw format.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 5.

Required: No

recordFields

The default record fields that will be delivered when a list of record fields is not provided in a [CreateDelivery](#) operation.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 128 items.

Length Constraints: Minimum length of 1. Maximum length of 64.

Required: No

s3DeliveryConfiguration

The delivery parameters that are used when you create a delivery to a delivery destination that is an S3 Bucket.

Type: [S3DeliveryConfiguration](#) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

CopyValue

This processor copies values within a log event. You can also use this processor to add metadata to log events by copying the values of the following metadata keys into the log events: @logGroupName, @logGroupStream, @accountId, @regionName.

For more information about this processor including examples, see [copyValue](#) in the *CloudWatch Logs User Guide*.

Contents

entries

An array of CopyValueEntry objects, where each object contains the information about one field value to copy.

Type: Array of [CopyValueEntry](#) objects

Array Members: Minimum number of 1 item. Maximum number of 5 items.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

CopyValueEntry

This object defines one value to be copied with the [copyValue](#) processor.

Contents

source

The key to copy.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: Yes

target

The key of the field to copy the value to.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: Yes

overwriteIfExists

Specifies whether to overwrite the value if the destination key already exists. If you omit this, the default is false.

Type: Boolean

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)

- [AWS SDK for Ruby V3](#)

CSV

The CSV processor parses comma-separated values (CSV) from the log events into columns.

For more information about this processor including examples, see [CSV](#) in the *CloudWatch Logs User Guide*.

Contents

columns

An array of names to use for the columns in the transformed log event.

If you omit this, default column names ([column_1, column_2 ...]) are used.

Type: Array of strings

Array Members: Maximum number of 100 items.

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

delimiter

The character used to separate each column in the original comma-separated value log event. If you omit this, the processor looks for the comma , character as the delimiter.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2.

Required: No

quoteCharacter

The character used used as a text qualifier for a single column of data. If you omit this, the double quotation mark " character is used.

Type: String

Length Constraints: Fixed length of 1.

Required: No

source

The path to the field in the log event that has the comma separated values to be parsed. If you omit this value, the whole log message is processed.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

DateTimeConverter

This processor converts a datetime string into a format that you specify.

For more information about this processor including examples, see [datetimeConverter](#) in the *CloudWatch Logs User Guide*.

Contents

matchPatterns

A list of patterns to match against the `source` field.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 5 items.

Length Constraints: Minimum length of 1.

Required: Yes

source

The key to apply the date conversion to.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: Yes

target

The JSON field to store the result in.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: Yes

locale

The locale of the source field. If you omit this, the default of `locale.ROOT` is used.

Type: String

Length Constraints: Minimum length of 1.

Required: No

sourceTimezone

The time zone of the source field. If you omit this, the default used is the UTC zone.

Type: String

Length Constraints: Minimum length of 1.

Required: No

targetFormat

The datetime format to use for the converted data in the target field.

If you omit this, the default of `'yyyy-MM-dd'T'HH:mm:ss.SSS'Z'` is used.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Required: No

targetTimezone

The time zone of the target field. If you omit this, the default used is the UTC zone.

Type: String

Length Constraints: Minimum length of 1.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)

- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

DeleteKeys

This processor deletes entries from a log event. These entries are key-value pairs.

For more information about this processor including examples, see [deleteKeys](#) in the *CloudWatch Logs User Guide*.

Contents

withKeys

The list of keys to delete.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 5 items.

Length Constraints: Minimum length of 1.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

Delivery

This structure contains information about one *delivery* in your account.

A delivery is a connection between a logical *delivery source* and a logical *delivery destination*.

For more information, see [CreateDelivery](#).

To update an existing delivery configuration, use [UpdateDeliveryConfiguration](#).

Contents

arn

The Amazon Resource Name (ARN) that uniquely identifies this delivery.

Type: String

Required: No

deliveryDestinationArn

The ARN of the delivery destination that is associated with this delivery.

Type: String

Required: No

deliveryDestinationType

Displays whether the delivery destination associated with this delivery is CloudWatch Logs, Amazon S3, Firehose, or X-Ray.

Type: String

Valid Values: S3 | CWL | FH | XRAY

Required: No

deliverySourceName

The name of the delivery source that is associated with this delivery.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 60.

Pattern: `[\w-]*`

Required: No

fieldDelimiter

The field delimiter that is used between record fields when the final output format of a delivery is in Plain, W3C, or Raw format.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 5.

Required: No

id

The unique ID that identifies this delivery in your account.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Pattern: `^[0-9A-Za-z]+$`

Required: No

recordFields

The record fields used in this delivery.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 128 items.

Length Constraints: Minimum length of 1. Maximum length of 64.

Required: No

s3DeliveryConfiguration

This structure contains delivery configurations that apply only when the delivery destination resource is an S3 bucket.

Type: [S3DeliveryConfiguration](#) object

Required: No

tags

The tags that have been assigned to this delivery.

Type: String to string map

Map Entries: Maximum number of 50 items.

Key Length Constraints: Minimum length of 1. Maximum length of 128.

Key Pattern: ^([\p{L}\p{Z}\p{N}_.:/=+\-@]+)\$

Value Length Constraints: Maximum length of 256.

Value Pattern: ^([\p{L}\p{Z}\p{N}_.:/=+\-@]*)\$

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

DeliveryDestination

This structure contains information about one *delivery destination* in your account. A delivery destination is an AWS resource that represents an AWS service that logs can be sent to. CloudWatch Logs, Amazon S3, Firehose, and X-Ray are supported as delivery destinations.

To configure logs delivery between a supported AWS service and a destination, you must do the following:

- Create a delivery source, which is a logical object that represents the resource that is actually sending the logs. For more information, see [PutDeliverySource](#).
- Create a *delivery destination*, which is a logical object that represents the actual delivery destination.
- If you are delivering logs cross-account, you must use [PutDeliveryDestinationPolicy](#) in the destination account to assign an IAM policy to the destination. This policy allows delivery to that destination.
- Create a *delivery* by pairing exactly one delivery source and one delivery destination. For more information, see [CreateDelivery](#).

You can configure a single delivery source to send logs to multiple destinations by creating multiple deliveries. You can also create multiple deliveries to configure multiple delivery sources to send logs to the same delivery destination.

Contents

arn

The Amazon Resource Name (ARN) that uniquely identifies this delivery destination.

Type: String

Required: No

deliveryDestinationConfiguration

A structure that contains the ARN of the AWS resource that will receive the logs.

Type: [DeliveryDestinationConfiguration](#) object

Required: No

deliveryDestinationType

Displays whether this delivery destination is CloudWatch Logs, Amazon S3, Firehose, or X-Ray.

Type: String

Valid Values: S3 | CWL | FH | XRAY

Required: No

name

The name of this delivery destination.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 60.

Pattern: [\w-]*

Required: No

outputFormat

The format of the logs that are sent to this delivery destination.

Type: String

Valid Values: json | plain | w3c | raw | parquet

Required: No

tags

The tags that have been assigned to this delivery destination.

Type: String to string map

Map Entries: Maximum number of 50 items.

Key Length Constraints: Minimum length of 1. Maximum length of 128.

Key Pattern: ^([\p{L}\p{Z}\p{N}_.:/=-\@]+)\$

Value Length Constraints: Maximum length of 256.

Value Pattern: ^([\p{L}\p{Z}\p{N}_.:/-@]*)\$

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

DeliveryDestinationConfiguration

A structure that contains information about one logs delivery destination.

Contents

destinationResourceArn

The ARN of the AWS destination that this delivery destination represents. That AWS destination can be a log group in CloudWatch Logs, an Amazon S3 bucket, or a delivery stream in Firehose.

Type: String

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

DeliverySource

This structure contains information about one *delivery source* in your account. A delivery source is an AWS resource that sends logs to an AWS destination. The destination can be CloudWatch Logs, Amazon S3, or Firehose.

Only some AWS services support being configured as a delivery source. These services are listed as **Supported [V2 Permissions]** in the table at [Enabling logging from AWS services](#).

To configure logs delivery between a supported AWS service and a destination, you must do the following:

- Create a delivery source, which is a logical object that represents the resource that is actually sending the logs. For more information, see [PutDeliverySource](#).
- Create a *delivery destination*, which is a logical object that represents the actual delivery destination. For more information, see [PutDeliveryDestination](#).
- If you are delivering logs cross-account, you must use [PutDeliveryDestinationPolicy](#) in the destination account to assign an IAM policy to the destination. This policy allows delivery to that destination.
- Create a *delivery* by pairing exactly one delivery source and one delivery destination. For more information, see [CreateDelivery](#).

You can configure a single delivery source to send logs to multiple destinations by creating multiple deliveries. You can also create multiple deliveries to configure multiple delivery sources to send logs to the same delivery destination.

Contents

arn

The Amazon Resource Name (ARN) that uniquely identifies this delivery source.

Type: String

Required: No

logType

The type of log that the source is sending. For valid values for this parameter, see the documentation for the source service.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 255.

Pattern: [\w]*

Required: No

name

The unique name of the delivery source.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 60.

Pattern: [\w-]*

Required: No

resourceArns

This array contains the ARN of the AWS resource that sends logs and is represented by this delivery source. Currently, only one ARN can be in the array.

Type: Array of strings

Required: No

service

The AWS service that is sending logs.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 255.

Pattern: [\w_-]*

Required: No

tags

The tags that have been assigned to this delivery source.

Type: String to string map

Map Entries: Maximum number of 50 items.

Key Length Constraints: Minimum length of 1. Maximum length of 128.

Key Pattern: `^([\p{L}\p{Z}]\p{N}_.:/=+\-@]+)$`

Value Length Constraints: Maximum length of 256.

Value Pattern: `^([\p{L}\p{Z}]\p{N}_.:/=+\-@]*$)`

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

Destination

Represents a cross-account destination that receives subscription log events.

Contents

accessPolicy

An IAM policy document that governs which AWS accounts can create subscription filters against this destination.

Type: String

Length Constraints: Minimum length of 1.

Required: No

arn

The ARN of this destination.

Type: String

Required: No

creationTime

The creation time of the destination, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: No

destinationName

The name of the destination.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]^{*}

Required: No

roleArn

A role for impersonation, used when delivering log events to the target.

Type: String

Length Constraints: Minimum length of 1.

Required: No

targetArn

The Amazon Resource Name (ARN) of the physical target where the log events are delivered (for example, a Kinesis stream).

Type: String

Length Constraints: Minimum length of 1.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

Entity

The entity associated with the log events in a PutLogEvents call.

Contents

attributes

Additional attributes of the entity that are not used to specify the identity of the entity. A list of key-value pairs.

For details about how to use the attributes, see [How to add related information to telemetry](#) in the *CloudWatch User Guide*.

Type: String to string map

Map Entries: Minimum number of 0 items. Maximum number of 10 items.

Key Length Constraints: Minimum length of 1. Maximum length of 256.

Value Length Constraints: Minimum length of 1. Maximum length of 512.

Required: No

keyAttributes

The attributes of the entity which identify the specific entity, as a list of key-value pairs. Entities with the same keyAttributes are considered to be the same entity.

There are five allowed attributes (key names): Type, ResourceType, Identifier Name, and Environment.

For details about how to use the key attributes, see [How to add related information to telemetry](#) in the *CloudWatch User Guide*.

Type: String to string map

Map Entries: Minimum number of 2 items. Maximum number of 4 items.

Key Length Constraints: Minimum length of 1. Maximum length of 32.

Value Length Constraints: Minimum length of 1. Maximum length of 512.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

ExportTask

Represents an export task.

Contents

destination

The name of the S3 bucket to which the log data was exported.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Required: No

destinationPrefix

The prefix that was used as the start of Amazon S3 key for every object exported.

Type: String

Required: No

executionInfo

Execution information about the export task.

Type: [ExportTaskExecutionInfo](#) object

Required: No

from

The start time, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC. Events with a timestamp before this time are not exported.

Type: Long

Valid Range: Minimum value of 0.

Required: No

logGroupName

The name of the log group from which logs data was exported.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: No

status

The status of the export task.

Type: [ExportTaskStatus](#) object

Required: No

taskId

The ID of the export task.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Required: No

taskName

The name of the export task.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Required: No

to

The end time, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC. Events with a timestamp later than this time are not exported.

Type: Long

Valid Range: Minimum value of 0.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

ExportTaskExecutionInfo

Represents the status of an export task.

Contents

completionTime

The completion time of the export task, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: No

creationTime

The creation time of the export task, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

ExportTaskStatus

Represents the status of an export task.

Contents

code

The status code of the export task.

Type: String

Valid Values: CANCELLED | COMPLETED | FAILED | PENDING | PENDING_CANCEL | RUNNING

Required: No

message

The status message related to the status code.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

FieldIndex

This structure describes one log event field that is used as an index in at least one index policy in this account.

Contents

fieldIndexName

The string that this field index matches.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\._\-_/\#A-Za-z0-9]+

Required: No

firstEventTime

The time and date of the earliest log event that matches this field index, after the index policy that contains it was created.

Type: Long

Valid Range: Minimum value of 0.

Required: No

lastEventTime

The time and date of the most recent log event that matches this field index.

Type: Long

Valid Range: Minimum value of 0.

Required: No

lastScanTime

The most recent time that CloudWatch Logs scanned ingested log events to search for this field index to improve the speed of future CloudWatch Logs Insights queries that search for this field index.

Type: Long

Valid Range: Minimum value of 0.

Required: No

logGroupIdentifier

If this field index appears in an index policy that applies only to a single log group, the ARN of that log group is displayed here.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#+=/:,.@-]*

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

FieldsData

A structure containing the extracted fields from a log event. These fields are extracted based on the log format and can be used for structured querying and analysis.

Contents

data

The actual log data content returned in the streaming response. This contains the fields and values of the log event in a structured format that can be parsed and processed by the client.

Type: Base64-encoded binary data object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

FilteredLogEvent

Represents a matched event.

Contents

eventId

The ID of the event.

Type: String

Required: No

ingestionTime

The time the event was ingested, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: No

logStreamName

The name of the log stream to which this event belongs.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]*

Required: No

message

The data contained in the log event.

Type: String

Length Constraints: Minimum length of 1.

Required: No

timestamp

The time the event occurred, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

GetLogObjectResponseStream

A stream of structured log data returned by the GetLogObject operation. This stream contains log events with their associated metadata and extracted fields.

Contents

fields

A structure containing the extracted fields from a log event. These fields are extracted based on the log format and can be used for structured querying and analysis.

Type: [FieldsData](#) object

Required: No

InternalStreamingException

An internal error occurred during the streaming of log data. This exception is thrown when there's an issue with the internal streaming mechanism used by the GetLogObject operation.

Type: Exception

HTTP Status Code:

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

Grok

This processor uses pattern matching to parse and structure unstructured data. This processor can also extract fields from log messages.

For more information about this processor including examples, see [grok](#) in the *CloudWatch Logs User Guide*.

Contents

match

The grok pattern to match against the log event. For a list of supported grok patterns, see [Supported grok patterns](#).

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Required: Yes

source

The path to the field in the log event that you want to parse. If you omit this value, the whole log message is parsed.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

IndexPolicy

This structure contains information about one field index policy in this account.

Contents

lastUpdateTime

The date and time that this index policy was most recently updated.

Type: Long

Valid Range: Minimum value of 0.

Required: No

logGroupIdentifier

The ARN of the log group that this index policy applies to.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#=+=/:,.@-]*

Required: No

policyDocument

The policy document for this index policy, in JSON format.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 5120.

Required: No

policyName

The name of this policy. Responses about log group-level field index policies don't have this field, because those policies don't have names.

Type: String

Required: No

source

This field indicates whether this is an account-level index policy or an index policy that applies only to a single log group.

Type: String

Valid Values: ACCOUNT | LOG_GROUP

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

InputLogEvent

Represents a log event, which is a record of activity that was recorded by the application or resource being monitored.

Contents

message

The raw event message. Each log event can be no larger than 1 MB.

Type: String

Length Constraints: Minimum length of 1.

Required: Yes

timestamp

The time the event occurred, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

IntegrationDetails

This structure contains information about the integration configuration. For an integration with OpenSearch Service, this includes information about OpenSearch Service resources such as the collection, the workspace, and policies.

This structure is returned by a [GetIntegration](#) operation.

Contents

Important

This data type is a UNION, so only one of the following members can be specified when used or returned.

openSearchIntegrationDetails

This structure contains complete information about one integration between CloudWatch Logs and OpenSearch Service.

Type: [OpenSearchIntegrationDetails](#) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

IntegrationSummary

This structure contains information about one CloudWatch Logs integration. This structure is returned by a [ListIntegrations](#) operation.

Contents

integrationName

The name of this integration.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 50.

Pattern: [\._\-_/\#A-Za-z0-9]+

Required: No

integrationStatus

The current status of this integration.

Type: String

Valid Values: PROVISIONING | ACTIVE | FAILED

Required: No

integrationType

The type of integration. Integrations with OpenSearch Service have the type OPENSEARCH.

Type: String

Valid Values: OPENSEARCH

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

ListToMap

This processor takes a list of objects that contain key fields, and converts them into a map of target keys.

For more information about this processor including examples, see [listToMap](#) in the *CloudWatch Logs User Guide*.

Contents

key

The key of the field to be extracted as keys in the generated map

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: Yes

source

The key in the log event that has a list of objects that will be converted to a map.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: Yes

flatten

A Boolean value to indicate whether the list will be flattened into single items. Specify true to flatten the list. The default is false

Type: Boolean

Required: No

flattenedElement

If you set flatten to true, use flattenedElement to specify which element, first or last, to keep.

You must specify this parameter if `flatten` is `true`

Type: String

Valid Values: `first` | `last`

Required: No

target

The key of the field that will hold the generated map

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

valueKey

If this is specified, the values that you specify in this parameter will be extracted from the source objects and put into the values of the generated map. Otherwise, original objects in the source list will be put into the values of the generated map.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

LiveTailSessionLogEvent

This object contains the information for one log event returned in a Live Tail stream.

Contents

ingestionTime

The timestamp specifying when this log event was ingested into the log group.

Type: Long

Valid Range: Minimum value of 0.

Required: No

logGroupIdentifier

The name or ARN of the log group that ingested this log event.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: [\w#=+=/:,.@-]*

Required: No

logStreamName

The name of the log stream that ingested this log event.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]*

Required: No

message

The log event message text.

Type: String

Length Constraints: Minimum length of 1.

Required: No

timestamp

The timestamp specifying when this log event was created.

Type: Long

Valid Range: Minimum value of 0.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

LiveTailSessionMetadata

This object contains the metadata for one `LiveTailSessionUpdate` structure. It indicates whether that update includes only a sample of 500 log events out of a larger number of ingested log events, or if it contains all of the matching log events ingested during that second of time.

Contents

sampled

If this is `true`, then more than 500 log events matched the request for this update, and the `sessionResults` includes a sample of 500 of those events.

If this is `false`, then 500 or fewer log events matched the request for this update, so no sampling was necessary. In this case, the `sessionResults` array includes all log events that matched your request during this time.

Type: Boolean

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

LiveTailSessionStart

This object contains information about this Live Tail session, including the log groups included and the log stream filters, if any.

Contents

logEventFilterPattern

An optional pattern to filter the results to include only log events that match the pattern. For example, a filter pattern of `error 404` displays only log events that include both `error` and `404`.

For more information about filter pattern syntax, see [Filter and Pattern Syntax](#).

Type: String

Length Constraints: Minimum length of 0. Maximum length of 1024.

Required: No

logGroupIdentifiers

An array of the names and ARNs of the log groups included in this Live Tail session.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 10 items.

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: `[\w\#+=/:,.@-]*`

Required: No

logStreamNamePrefixes

If your StartLiveTail operation request included a `logStreamNamePrefixes` parameter that filtered the session to only include log streams that have names that start with certain prefixes, these prefixes are listed here.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]^{*}

Required: No

logStreamNames

If your StartLiveTail operation request included a logStreamNames parameter that filtered the session to only include certain log streams, these streams are listed here.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]^{*}

Required: No

requestId

The unique ID generated by CloudWatch Logs to identify this Live Tail session request.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 256.

Required: No

sessionId

The unique ID generated by CloudWatch Logs to identify this Live Tail session.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 256.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

LiveTailSessionUpdate

This object contains the log events and metadata for a Live Tail session.

Contents

sessionMetadata

This object contains the session metadata for a Live Tail session.

Type: [LiveTailSessionMetadata](#) object

Required: No

sessionResults

An array, where each member of the array includes the information for one log event in the Live Tail session.

A sessionResults array can include as many as 500 log events. If the number of log events matching the request exceeds 500 per second, the log events are sampled down to 500 log events to be included in each sessionUpdate structure.

Type: Array of [LiveTailSessionLogEvent](#) objects

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

LogEvent

This structure contains the information for one sample log event that is associated with an anomaly found by a log anomaly detector.

Contents

message

The message content of the log event.

Type: String

Length Constraints: Minimum length of 1.

Required: No

timestamp

The time stamp of the log event.

Type: Long

Valid Range: Minimum value of 0.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

LogGroup

Represents a log group.

Contents

arn

The Amazon Resource Name (ARN) of the log group. This version of the ARN includes a trailing : * after the log group name.

Use this version to refer to the ARN in IAM policies when specifying permissions for most API actions. The exception is when specifying permissions for [TagResource](#), [UntagResource](#), and [ListTagsForResource](#). The permissions for those three actions require the ARN version that doesn't include a trailing : *.

Type: String

Required: No

creationTime

The creation time of the log group, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: No

dataProtectionStatus

Displays whether this log group has a protection policy, or whether it had one in the past. For more information, see [PutDataProtectionPolicy](#).

Type: String

Valid Values: ACTIVATED | DELETED | ARCHIVED | DISABLED

Required: No

inheritedProperties

Displays all the properties that this log group has inherited from account-level settings.

Type: Array of strings

Valid Values: ACCOUNT_DATA_PROTECTION

Required: No

kmsKeyId

The Amazon Resource Name (ARN) of the AWS KMS key to use when encrypting log data.

Type: String

Length Constraints: Maximum length of 256.

Required: No

logGroupArn

The Amazon Resource Name (ARN) of the log group. This version of the ARN doesn't include a trailing :* after the log group name.

Use this version to refer to the ARN in the following situations:

- In the `logGroupIdentifier` input field in many CloudWatch Logs APIs.
- In the `resourceArn` field in tagging APIs
- In IAM policies, when specifying permissions for [TagResource](#), [UntagResource](#), and [ListTagsForResource](#).

Type: String

Required: No

logGroupClass

This specifies the log group class for this log group. There are three classes:

- The Standard log class supports all CloudWatch Logs features.
- The Infrequent Access log class supports a subset of CloudWatch Logs features and incurs lower costs.
- Use the Delivery log class only for delivering AWS Lambda logs to store in Amazon S3 or Amazon Data Firehose. Log events in log groups in the Delivery class are kept in CloudWatch Logs for only one day. This log class doesn't offer rich CloudWatch Logs capabilities such as CloudWatch Logs Insights queries.

For details about the features supported by the Standard and Infrequent Access classes, see [Log classes](#)

Type: String

Valid Values: STANDARD | INFREQUENT_ACCESS | DELIVERY

Required: No

logGroupName

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: No

metricFilterCount

The number of metric filters.

Type: Integer

Required: No

retentionInDays

The number of days to retain the log events in the specified log group. Possible values are: 1, 3, 5, 7, 14, 30, 60, 90, 120, 150, 180, 365, 400, 545, 731, 1096, 1827, 2192, 2557, 2922, 3288, and 3653.

To set a log group so that its log events do not expire, use [DeleteRetentionPolicy](#).

Type: Integer

Required: No

storedBytes

The number of bytes stored.

Type: Long

Valid Range: Minimum value of 0.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

LogGroupField

The fields contained in log events found by a `GetLogGroupFields` operation, along with the percentage of queried log events in which each field appears.

Contents

name

The name of a log field.

Type: String

Required: No

percent

The percentage of log events queried that contained the field.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 100.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

LogGroupSummary

This structure contains information about one log group in your account.

Contents

logGroupArn

The Amazon Resource Name (ARN) of the log group.

Type: String

Required: No

logGroupClass

The log group class for this log group. For details about the features supported by each log group class, see [Log classes](#)

Type: String

Valid Values: STANDARD | INFREQUENT_ACCESS | DELIVERY

Required: No

logGroupName

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)

- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

LogStream

Represents a log stream, which is a sequence of log events from a single emitter of logs.

Contents

arn

The Amazon Resource Name (ARN) of the log stream.

Type: String

Required: No

creationTime

The creation time of the stream, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: No

firstEventTimestamp

The time of the first event, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: No

lastEventTimestamp

The time of the most recent log event in the log stream in CloudWatch Logs. This number is expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC. The lastEventTime value updates on an eventual consistency basis. It typically updates in less than an hour from ingestion, but in rare situations might take longer.

Type: Long

Valid Range: Minimum value of 0.

Required: No

lastIngestionTime

The ingestion time, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC The lastIngestionTime value updates on an eventual consistency basis. It typically updates in less than an hour after ingestion, but in rare situations might take longer.

Type: Long

Valid Range: Minimum value of 0.

Required: No

logStreamName

The name of the log stream.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]^{*}

Required: No

storedBytes

This member has been deprecated.

The number of bytes stored.

Important: As of June 17, 2019, this parameter is no longer supported for log streams, and is always reported as zero. This change applies only to log streams. The storedBytes parameter for log groups is not affected.

Type: Long

Valid Range: Minimum value of 0.

Required: No

uploadSequenceToken

The sequence token.

⚠ Important

The sequence token is now ignored in PutLogEvents actions. PutLogEvents actions are always accepted regardless of receiving an invalid sequence token. You don't need to obtain uploadSequenceToken to use a PutLogEvents action.

Type: String

Length Constraints: Minimum length of 1.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

LowerCaseString

This processor converts a string to lowercase.

For more information about this processor including examples, see [lowerCaseString](#) in the *CloudWatch Logs User Guide*.

Contents

withKeys

The array containing the keys of the fields to convert to lowercase.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 10 items.

Length Constraints: Minimum length of 1.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

MetricFilter

Metric filters express how CloudWatch Logs would extract metric observations from ingested log events and transform them into metric data in a CloudWatch metric.

Contents

applyOnTransformedLogs

This parameter is valid only for log groups that have an active log transformer. For more information about log transformers, see [PutTransformer](#).

If this value is true, the metric filter is applied on the transformed version of the log events instead of the original ingested log events.

Type: Boolean

Required: No

creationTime

The creation time of the metric filter, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: No

filterName

The name of the metric filter.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]*

Required: No

filterPattern

A symbolic description of how CloudWatch Logs should interpret the data in each log event. For example, a log event can contain timestamps, IP addresses, strings, and so on. You use the filter pattern to specify what to look for in the log event message.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 1024.

Required: No

logGroupName

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\._\-_/\#A-Za-z0-9]+

Required: No

metricTransformations

The metric transformations.

Type: Array of [MetricTransformation](#) objects

Array Members: Fixed number of 1 item.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

MetricFilterMatchRecord

Represents a matched event.

Contents

eventMessage

The raw event data.

Type: String

Length Constraints: Minimum length of 1.

Required: No

eventNumber

The event number.

Type: Long

Required: No

extractedValues

The values extracted from the event data by the filter.

Type: String to string map

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

MetricTransformation

Indicates how to transform ingested log events to metric data in a CloudWatch metric.

Contents

metricName

The name of the CloudWatch metric.

Type: String

Length Constraints: Maximum length of 255.

Pattern: [^:*\$]*

Required: Yes

metricNamespace

A custom namespace to contain your metric in CloudWatch. Use namespaces to group together metrics that are similar. For more information, see [Namespaces](#).

Type: String

Length Constraints: Maximum length of 255.

Pattern: [^:*\$]*

Required: Yes

metricValue

The value to publish to the CloudWatch metric when a filter pattern matches a log event.

Type: String

Length Constraints: Maximum length of 100.

Required: Yes

defaultValue

(Optional) The value to emit when a filter pattern does not match a log event. This value can be null.

Type: Double

Required: No

dimensions

The fields to use as dimensions for the metric. One metric filter can include as many as three dimensions.

Important

Metrics extracted from log events are charged as custom metrics. To prevent unexpected high charges, do not specify high-cardinality fields such as `IPAddress` or `requestID` as dimensions. Each different value found for a dimension is treated as a separate metric and accrues charges as a separate custom metric.

CloudWatch Logs disables a metric filter if it generates 1000 different name/value pairs for your specified dimensions within a certain amount of time. This helps to prevent accidental high charges.

You can also set up a billing alarm to alert you if your charges are higher than expected.

For more information, see [Creating a Billing Alarm to Monitor Your Estimated AWS Charges](#).

Type: String to string map

Key Length Constraints: Maximum length of 255.

Value Length Constraints: Maximum length of 255.

Required: No

unit

The unit to assign to the metric. If you omit this, the unit is set as None.

Type: String

Valid Values: Seconds | Microseconds | Milliseconds | Bytes | Kilobytes | Megabytes | Gigabytes | Terabytes | Bits | Kilobits | Megabits | Gigabits | Terabits | Percent | Count | Bytes/Second | Kilobytes/Second | Megabytes/Second | Gigabytes/Second | Terabytes/Second | Bits/Second |

Kilobits/Second | Megabits/Second | Gigabits/Second | Terabits/Second | Count/Second | None

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

MoveKeyEntry

This object defines one key that will be moved with the [moveKey](#) processor.

Contents

source

The key to move.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: Yes

target

The key to move to.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: Yes

overwriteIfExists

Specifies whether to overwrite the value if the destination key already exists. If you omit this, the default is false.

Type: Boolean

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)

- [AWS SDK for Ruby V3](#)

MoveKeys

This processor moves a key from one field to another. The original key is deleted.

For more information about this processor including examples, see [moveKeys](#) in the *CloudWatch Logs User Guide*.

Contents

entries

An array of objects, where each object contains the information about one key to move.

Type: Array of [MoveKeyEntry](#) objects

Array Members: Minimum number of 1 item. Maximum number of 5 items.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

OpenSearchApplication

This structure contains information about the OpenSearch Service application used for this integration. An OpenSearch Service application is the web application created by the integration with CloudWatch Logs. It hosts the vended logs dashboards.

Contents

applicationArn

The Amazon Resource Name (ARN) of the application.

Type: String

Required: No

applicationEndpoint

The endpoint of the application.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Pattern: ^https://[\.\-_/\#:A-Za-z0-9]+\.\com\$

Required: No

applicationId

The ID of the application.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Pattern: [\.\-_/\#:A-Za-z0-9]+

Required: No

status

This structure contains information about the status of this OpenSearch Service resource.

Type: [OpenSearchResourceStatus](#) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

OpenSearchCollection

This structure contains information about the OpenSearch Service collection used for this integration. An OpenSearch Service collection is a logical grouping of one or more indexes that represent an analytics workload. For more information, see [Creating and managing OpenSearch Service Serverless collections](#).

Contents

collectionArn

The ARN of the collection.

Type: String

Required: No

collectionEndpoint

The endpoint of the collection.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Pattern: ^https://[\.\-_/\#:A-Za-z0-9]+\.\com\$

Required: No

status

This structure contains information about the status of this OpenSearch Service resource.

Type: [OpenSearchResourceStatus](#) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)

- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

OpenSearchDataAccessPolicy

This structure contains information about the OpenSearch Service data access policy used for this integration. The access policy defines the access controls for the collection. This data access policy was automatically created as part of the integration setup. For more information about OpenSearch Service data access policies, see [Data access control for Amazon OpenSearch Serverless](#) in the OpenSearch Service Developer Guide.

Contents

policyName

The name of the data access policy.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: No

status

This structure contains information about the status of this OpenSearch Service resource.

Type: [OpenSearchResourceStatus](#) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

OpenSearchDataSource

This structure contains information about the OpenSearch Service data source used for this integration. This data source was created as part of the integration setup. An OpenSearch Service data source defines the source and destination for OpenSearch Service queries. It includes the role required to execute queries and write to collections.

For more information about OpenSearch Service data sources , see [Creating OpenSearch Service data source integrations with Amazon S3](#).

Contents

dataSourceName

The name of the OpenSearch Service data source.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Pattern: [\._\-/_#A-Za-z0-9]+

Required: No

status

This structure contains information about the status of this OpenSearch Service resource.

Type: [OpenSearchResourceStatus](#) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

OpenSearchEncryptionPolicy

This structure contains information about the OpenSearch Service encryption policy used for this integration. The encryption policy was created automatically when you created the integration. For more information, see [Encryption policies](#) in the OpenSearch Service Developer Guide.

Contents

policyName

The name of the encryption policy.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: No

status

This structure contains information about the status of this OpenSearch Service resource.

Type: [OpenSearchResourceStatus](#) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

OpenSearchIntegrationDetails

This structure contains complete information about one CloudWatch Logs integration. This structure is returned by a [GetIntegration](#) operation.

Contents

accessPolicy

This structure contains information about the OpenSearch Service data access policy used for this integration. The access policy defines the access controls for the collection. This data access policy was automatically created as part of the integration setup. For more information about OpenSearch Service data access policies, see [Data access control for Amazon OpenSearch Serverless](#) in the OpenSearch Service Developer Guide.

Type: [OpenSearchDataAccessPolicy](#) object

Required: No

application

This structure contains information about the OpenSearch Service application used for this integration. An OpenSearch Service application is the web application that was created by the integration with CloudWatch Logs. It hosts the vended logs dashboards.

Type: [OpenSearchApplication](#) object

Required: No

collection

This structure contains information about the OpenSearch Service collection used for this integration. This collection was created as part of the integration setup. An OpenSearch Service collection is a logical grouping of one or more indexes that represent an analytics workload. For more information, see [Creating and managing OpenSearch Service Serverless collections](#).

Type: [OpenSearchCollection](#) object

Required: No

dataSource

This structure contains information about the OpenSearch Service data source used for this integration. This data source was created as part of the integration setup. An OpenSearch

Service data source defines the source and destination for OpenSearch Service queries. It includes the role required to execute queries and write to collections.

For more information about OpenSearch Service data sources , see [Creating OpenSearch Service data source integrations with Amazon S3](#).

Type: [OpenSearchDataSource](#) object

Required: No

encryptionPolicy

This structure contains information about the OpenSearch Service encryption policy used for this integration. The encryption policy was created automatically when you created the integration. For more information, see [Encryption policies](#) in the OpenSearch Service Developer Guide.

Type: [OpenSearchEncryptionPolicy](#) object

Required: No

lifecyclePolicy

This structure contains information about the OpenSearch Service data lifecycle policy used for this integration. The lifecycle policy determines the lifespan of the data in the collection. It was automatically created as part of the integration setup.

For more information, see [Using data lifecycle policies with OpenSearch Service Serverless](#) in the OpenSearch Service Developer Guide.

Type: [OpenSearchLifecyclePolicy](#) object

Required: No

networkPolicy

This structure contains information about the OpenSearch Service network policy used for this integration. The network policy assigns network access settings to collections. For more information, see [Network policies](#) in the OpenSearch Service Developer Guide.

Type: [OpenSearchNetworkPolicy](#) object

Required: No

workspace

This structure contains information about the OpenSearch Service workspace used for this integration. An OpenSearch Service workspace is the collection of dashboards along with other OpenSearch Service tools. This workspace was created automatically as part of the integration setup. For more information, see [Centralized OpenSearch user interface \(Dashboards\) with OpenSearch Service](#).

Type: [OpenSearchWorkspace object](#)

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

OpenSearchLifecyclePolicy

This structure contains information about the OpenSearch Service data lifecycle policy used for this integration. The lifecycle policy determines the lifespan of the data in the collection. It was automatically created as part of the integration setup.

For more information, see [Using data lifecycle policies with OpenSearch Service Serverless](#) in the OpenSearch Service Developer Guide.

Contents

policyName

The name of the lifecycle policy.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Pattern: [\._\-_/\#A-Za-z0-9]+

Required: No

status

This structure contains information about the status of this OpenSearch Service resource.

Type: [OpenSearchResourceStatus](#) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

OpenSearchNetworkPolicy

This structure contains information about the OpenSearch Service network policy used for this integration. The network policy assigns network access settings to collections. For more information, see [Network policies](#) in the OpenSearch Service Developer Guide.

Contents

policyName

The name of the network policy.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: No

status

This structure contains information about the status of this OpenSearch Service resource.

Type: [OpenSearchResourceStatus](#) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

OpenSearchResourceConfig

This structure contains configuration details about an integration between CloudWatch Logs and OpenSearch Service.

Contents

dashboardViewerPrincipals

Specify the ARNs of IAM roles and IAM users who you want to grant permission to for viewing the dashboards.

 **Important**

In addition to specifying these users here, you must also grant them the **CloudWatchOpenSearchDashboardAccess** IAM policy. For more information, see [IAM policies for users](#).

Type: Array of strings

Required: Yes

dataSourceRoleArn

Specify the ARN of an IAM role that CloudWatch Logs will use to create the integration. This role must have the permissions necessary to access the OpenSearch Service collection to be able to create the dashboards. For more information about the permissions needed, see [Permissions that the integration needs](#) in the CloudWatch Logs User Guide.

Type: String

Required: Yes

retentionDays

Specify how many days that you want the data derived by OpenSearch Service to be retained in the index that the dashboard refers to. This also sets the maximum time period that you can choose when viewing data in the dashboard. Choosing a longer time frame will incur additional costs.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 30.

Required: Yes

applicationArn

If you want to use an existing OpenSearch Service application for your integration with OpenSearch Service, specify it here. If you omit this, a new application will be created.

Type: String

Required: No

kmsKeyArn

To have the vended dashboard data encrypted with AWS KMS instead of the CloudWatch Logs default encryption method, specify the ARN of the AWS KMS key that you want to use.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

OpenSearchResourceStatus

This structure contains information about the status of an OpenSearch Service resource.

Contents

status

The current status of this resource.

Type: String

Valid Values: ACTIVE | NOT_FOUND | ERROR

Required: No

statusMessage

A message with additional information about the status of this resource.

Type: String

Length Constraints: Minimum length of 1.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

OpenSearchWorkspace

This structure contains information about the OpenSearch Service workspace used for this integration. An OpenSearch Service workspace is the collection of dashboards along with other OpenSearch Service tools. This workspace was created automatically as part of the integration setup. For more information, see [Centralized OpenSearch user interface \(Dashboards\) with OpenSearch Service](#).

Contents

status

This structure contains information about the status of an OpenSearch Service resource.

Type: [OpenSearchResourceStatus](#) object

Required: No

workspaceId

The ID of this workspace.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Pattern: [\.\-_/\#A-Za-z0-9]+

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

OutputLogEvent

Represents a log event.

Contents

ingestionTime

The time the event was ingested, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: No

message

The data contained in the log event.

Type: String

Length Constraints: Minimum length of 1.

Required: No

timestamp

The time the event occurred, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

ParseCloudfront

This processor parses CloudFront vended logs, extract fields, and convert them into JSON format. Encoded field values are decoded. Values that are integers and doubles are treated as such. For more information about this processor including examples, see [parseCloudfront](#)

For more information about CloudFront log format, see [Configure and use standard logs \(access logs\)](#).

If you use this processor, it must be the first processor in your transformer.

Contents

source

Omit this parameter and the whole log message will be processed by this processor. No other value than @message is allowed for source.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

ParseJSON

This processor parses log events that are in JSON format. It can extract JSON key-value pairs and place them under a destination that you specify.

Additionally, because you must have at least one parse-type processor in a transformer, you can use ParseJSON as that processor for JSON-format logs, so that you can also apply other processors, such as mutate processors, to these logs.

For more information about this processor including examples, see [parseJSON](#) in the *CloudWatch Logs User Guide*.

Contents

destination

The location to put the parsed key value pair into. If you omit this parameter, it is placed under the root node.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

source

Path to the field in the log event that will be parsed. Use dot notation to access child fields. For example, store.book

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)

- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

ParseKeyValue

This processor parses a specified field in the original log event into key-value pairs.

For more information about this processor including examples, see [parseKeyValue](#) in the *CloudWatch Logs User Guide*.

Contents

destination

The destination field to put the extracted key-value pairs into

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

fieldDelimiter

The field delimiter string that is used between key-value pairs in the original log events. If you omit this, the ampersand & character is used.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

keyPrefix

If you want to add a prefix to all transformed keys, specify it here.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

keyValueDelimiter

The delimiter string to use between the key and value in each pair in the transformed log event.

If you omit this, the equal = character is used.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

nonMatchValue

A value to insert into the value field in the result, when a key-value pair is not successfully split.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

overwriteIfExists

Specifies whether to overwrite the value if the destination key already exists. If you omit this, the default is false.

Type: Boolean

Required: No

source

Path to the field in the log event that will be parsed. Use dot notation to access child fields. For example, store.book

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)

- [AWS SDK for Ruby V3](#)

ParsePostgres

Use this processor to parse RDS for PostgreSQL vended logs, extract fields, and convert them into a JSON format. This processor always processes the entire log event message. For more information about this processor including examples, see [parsePostgres](#).

For more information about RDS for PostgreSQL log format, see [RDS for PostgreSQL database log filesTCP flag sequence](#).

Important

If you use this processor, it must be the first processor in your transformer.

Contents

source

Omit this parameter and the whole log message will be processed by this processor. No other value than @message is allowed for source.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

ParseRoute53

Use this processor to parse Route 53 vended logs, extract fields, and convert them into a JSON format. This processor always processes the entire log event message. For more information about this processor including examples, see [parseRoute53](#).

Important

If you use this processor, it must be the first processor in your transformer.

Contents

source

Omit this parameter and the whole log message will be processed by this processor. No other value than @message is allowed for source.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

ParseToOCSF

This processor converts logs into [Open Cybersecurity Schema Framework \(OCSF\)](#) events.

For more information about this processor including examples, see [parseToOCSF](#) in the *CloudWatch Logs User Guide*.

Contents

eventSource

Specify the service or process that produces the log events that will be converted with this processor.

Type: String

Valid Values: CloudTrail | Route53Resolver | VPCFlow | EKSAudit | AWSWAF

Required: Yes

ocsfVersion

Specify which version of the OCSF schema to use for the transformed log events.

Type: String

Valid Values: V1.1

Required: Yes

source

The path to the field in the log event that you want to parse. If you omit this value, the whole log message is parsed.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

ParseVPC

Use this processor to parse Amazon VPC vended logs, extract fields, and convert them into a JSON format. This processor always processes the entire log event message.

This processor doesn't support custom log formats, such as NAT gateway logs. For more information about custom log formats in Amazon VPC, see [parseVPC](#). For more information about this processor including examples, see [parseVPC](#).

 **Important**

If you use this processor, it must be the first processor in your transformer.

Contents

source

Omit this parameter and the whole log message will be processed by this processor. No other value than @message is allowed for source.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

ParseWAF

Use this processor to parse AWS WAF vended logs, extract fields, and convert them into a JSON format. This processor always processes the entire log event message. For more information about this processor including examples, see [parseWAF](#).

For more information about AWS WAF log format, see [Log examples for web ACL traffic](#).

Important

If you use this processor, it must be the first processor in your transformer.

Contents

source

Omit this parameter and the whole log message will be processed by this processor. No other value than @message is allowed for source.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

PatternToken

A structure that contains information about one pattern token related to an anomaly.

For more information about patterns and tokens, see [CreateLogAnomalyDetector](#).

Contents

dynamicTokenPosition

For a dynamic token, this indicates where in the pattern that this token appears, related to other dynamic tokens. The dynamic token that appears first has a value of 1, the one that appears second is 2, and so on.

Type: Integer

Required: No

enumerations

Contains the values found for a dynamic token, and the number of times each value was found.

Type: String to long map

Key Length Constraints: Minimum length of 1.

Required: No

inferredTokenName

A name that CloudWatch Logs assigned to this dynamic token to make the pattern more readable. The string part of the inferredTokenName gives you a clearer idea of the content of this token. The number part of the inferredTokenName shows where in the pattern this token appears, compared to other dynamic tokens. CloudWatch Logs assigns the string part of the name based on analyzing the content of the log events that contain it.

For example, an inferred token name of IPAddress-3 means that the token represents an IP address, and this token is the third dynamic token in the pattern.

Type: String

Length Constraints: Minimum length of 1.

Required: No

isDynamic

Specifies whether this is a dynamic token.

Type: Boolean

Required: No

tokenString

The string represented by this token. If this is a dynamic token, the value will be <*>

Type: String

Length Constraints: Minimum length of 1.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

Policy

A structure that contains information about one delivery destination policy.

Contents

deliveryDestinationPolicy

The contents of the delivery destination policy.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 51200.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

Processor

This structure contains the information about one processor in a log transformer.

Contents

addKeys

Use this parameter to include the [addKeys](#) processor in your transformer.

Type: [AddKeys](#) object

Required: No

copyValue

Use this parameter to include the [copyValue](#) processor in your transformer.

Type: [CopyValue](#) object

Required: No

csv

Use this parameter to include the [CSV](#) processor in your transformer.

Type: [CSV](#) object

Required: No

dateTimeConverter

Use this parameter to include the [datetimeConverter](#) processor in your transformer.

Type: [DateTimeConverter](#) object

Required: No

deleteKeys

Use this parameter to include the [deleteKeys](#) processor in your transformer.

Type: [DeleteKeys](#) object

Required: No

grok

Use this parameter to include the [grok](#) processor in your transformer.

Type: [Grok](#) object

Required: No

listToMap

Use this parameter to include the [listToMap](#) processor in your transformer.

Type: [ListToMap](#) object

Required: No

lowerCaseString

Use this parameter to include the [lowerCaseString](#) processor in your transformer.

Type: [LowerCaseString](#) object

Required: No

moveKeys

Use this parameter to include the [moveKeys](#) processor in your transformer.

Type: [MoveKeys](#) object

Required: No

parseCloudfront

Use this parameter to include the [parseCloudfront](#) processor in your transformer.

If you use this processor, it must be the first processor in your transformer.

Type: [ParseCloudfront](#) object

Required: No

parseJSON

Use this parameter to include the [parseJSON](#) processor in your transformer.

Type: [ParseJSON](#) object

Required: No

parseKeyValue

Use this parameter to include the [parseKeyValue](#) processor in your transformer.

Type: [ParseKeyValue](#) object

Required: No

parsePostgres

Use this parameter to include the [parsePostgres](#) processor in your transformer.

If you use this processor, it must be the first processor in your transformer.

Type: [ParsePostgres](#) object

Required: No

parseRoute53

Use this parameter to include the [parseRoute53](#) processor in your transformer.

If you use this processor, it must be the first processor in your transformer.

Type: [ParseRoute53](#) object

Required: No

parseToOCSF

Use this parameter to convert logs into Open Cybersecurity Schema (OCSF) format.

Type: [ParseToOCSF](#) object

Required: No

parseVPC

Use this parameter to include the [parseVPC](#) processor in your transformer.

If you use this processor, it must be the first processor in your transformer.

Type: [ParseVPC](#) object

Required: No

parseWAF

Use this parameter to include the [parseWAF](#) processor in your transformer.

If you use this processor, it must be the first processor in your transformer.

Type: [ParseWAF](#) object

Required: No

renameKeys

Use this parameter to include the [renameKeys](#) processor in your transformer.

Type: [RenameKeys](#) object

Required: No

splitString

Use this parameter to include the [splitString](#) processor in your transformer.

Type: [SplitString](#) object

Required: No

substituteString

Use this parameter to include the [substituteString](#) processor in your transformer.

Type: [SubstituteString](#) object

Required: No

trimString

Use this parameter to include the [trimString](#) processor in your transformer.

Type: [TrimString](#) object

Required: No

typeConverter

Use this parameter to include the [typeConverter](#) processor in your transformer.

Type: [TypeConverter](#) object

Required: No

upperCaseString

Use this parameter to include the [upperCaseString](#) processor in your transformer.

Type: [UpperCaseString](#) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

QueryCompileError

Reserved.

Contents

location

Reserved.

Type: [QueryCompileErrorLocation](#) object

Required: No

message

Reserved.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

QueryCompileErrorLocation

Reserved.

Contents

endCharOffset

Reserved.

Type: Integer

Required: No

startCharOffset

Reserved.

Type: Integer

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

QueryDefinition

This structure contains details about a saved CloudWatch Logs Insights query definition.

Contents

lastModified

The date that the query definition was most recently modified.

Type: Long

Valid Range: Minimum value of 0.

Required: No

logGroupNames

If this query definition contains a list of log groups that it is limited to, that list appears here.

Type: Array of strings

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\._\-/_#A-Za-z0-9]+

Required: No

name

The name of the query definition.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 255.

Required: No

queryDefinitionId

The unique ID of the query definition.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: No

queryLanguage

The query language used for this query. For more information about the query languages that CloudWatch Logs supports, see [Supported query languages](#).

Type: String

Valid Values: CWL I | SQL | PPL

Required: No

queryString

The query string to use for this definition. For more information, see [CloudWatch Logs Insights Query Syntax](#).

Type: String

Length Constraints: Minimum length of 1. Maximum length of 10000.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

QueryInfo

Information about one CloudWatch Logs Insights query that matches the request in a `DescribeQueries` operation.

Contents

createTime

The date and time that this query was created.

Type: Long

Valid Range: Minimum value of 0.

Required: No

logGroupName

The name of the log group scanned by this query.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/#A-Za-z0-9]+

Required: No

queryId

The unique ID number of this query.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: No

queryLanguage

The query language used for this query. For more information about the query languages that CloudWatch Logs supports, see [Supported query languages](#).

Type: String

Valid Values: CWLI | SQL | PPL

Required: No

queryString

The query string used in this query.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 10000.

Required: No

status

The status of this query. Possible values are Cancelled, Complete, Failed, Running, Scheduled, and Unknown.

Type: String

Valid Values: Scheduled | Running | Complete | Failed | Cancelled | Timeout | Unknown

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

QueryStatistics

Contains the number of log events scanned by the query, the number of log events that matched the query criteria, and the total number of bytes in the log events that were scanned.

If the query involved log groups that have field index policies, the estimated number of skipped log events and the total bytes of those skipped log events are included. Using field indexes to skip log events in queries reduces scan volume and improves performance. For more information, see [Create field indexes to improve query performance and reduce scan volume](#).

Contents

bytesScanned

The total number of bytes in the log events scanned during the query.

Type: Double

Required: No

estimatedBytesSkipped

An estimate of the number of bytes in the log events that were skipped when processing this query, because the query contained an indexed field. Skipping these entries lowers query costs and improves the query performance time. For more information about field indexes, see [PutIndexPolicy](#).

Type: Double

Required: No

estimatedRecordsSkipped

An estimate of the number of log events that were skipped when processing this query, because the query contained an indexed field. Skipping these entries lowers query costs and improves the query performance time. For more information about field indexes, see [PutIndexPolicy](#).

Type: Double

Required: No

logGroupsScanned

The number of log groups that were scanned by this query.

Type: Double

Required: No

recordsMatched

The number of log events that matched the query string.

Type: Double

Required: No

recordsScanned

The total number of log events scanned during the query.

Type: Double

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

RecordField

A structure that represents a valid record field header and whether it is mandatory.

Contents

mandatory

If this is true, the record field must be present in the recordFields parameter provided to a [CreateDelivery](#) or [UpdateDeliveryConfiguration](#) operation.

Type: Boolean

Required: No

name

The name to use when specifying this record field in a [CreateDelivery](#) or [UpdateDeliveryConfiguration](#) operation.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

RejectedEntityInfo

If an entity is rejected when a PutLogEvents request was made, this includes details about the reason for the rejection.

Contents

errorType

The type of error that caused the rejection of the entity when calling PutLogEvents.

Type: String

Valid Values: InvalidEntity | InvalidTypeValue | InvalidKeyAttributes | InvalidAttributes | EntitySizeTooLarge | UnsupportedLogGroupType | MissingRequiredFields

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

RejectedLogEventsInfo

Represents the rejected events.

Contents

expiredLogEventEndIndex

The expired log events.

Type: Integer

Required: No

tooNewLogEventStartIndex

The index of the first log event that is too new. This field is inclusive.

Type: Integer

Required: No

tooOldLogEventEndIndex

The index of the last log event that is too old. This field is exclusive.

Type: Integer

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

RenameKeyEntry

This object defines one key that will be renamed with the [renameKey](#) processor.

Contents

key

The key to rename

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: Yes

renameTo

The string to use for the new key name

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: Yes

overwriteIfExists

Specifies whether to overwrite the existing value if the destination key already exists. The default is false

Type: Boolean

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)

- [AWS SDK for Ruby V3](#)

RenameKeys

Use this processor to rename keys in a log event.

For more information about this processor including examples, see [renameKeys](#) in the *CloudWatch Logs User Guide*.

Contents

entries

An array of RenameKeyEntry objects, where each object contains the information about a single key to rename.

Type: Array of [RenameKeyEntry](#) objects

Array Members: Minimum number of 1 item. Maximum number of 5 items.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

ResourceConfig

This structure contains configuration details about an integration between CloudWatch Logs and another entity.

Contents

Important

This data type is a UNION, so only one of the following members can be specified when used or returned.

openSearchResourceConfig

This structure contains configuration details about an integration between CloudWatch Logs and OpenSearch Service.

Type: [OpenSearchResourceConfig](#) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

ResourcePolicy

A policy enabling one or more entities to put logs to a log group in this account.

Contents

lastUpdatedTime

Timestamp showing when this policy was last updated, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: No

policyDocument

The details of the policy.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 5120.

Required: No

policyName

The name of the resource policy.

Type: String

Required: No

policyScope

Specifies scope of the resource policy. Valid values are ACCOUNT or RESOURCE.

Type: String

Valid Values: ACCOUNT | RESOURCE

Required: No

resourceArn

The ARN of the CloudWatch Logs resource to which the resource policy is attached. Only populated for resource-scoped policies.

Type: String

Required: No

revisionId

The revision ID of the resource policy. Only populated for resource-scoped policies.

Type: String

Length Constraints: Minimum length of 1.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

ResultField

Contains one field from one log event returned by a CloudWatch Logs Insights query, along with the value of that field.

For more information about the fields that are generated by CloudWatch logs, see [Supported Logs and Discovered Fields](#).

Contents

field

The log event field.

Type: String

Required: No

value

The value of this field.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

S3DeliveryConfiguration

This structure contains delivery configurations that apply only when the delivery destination resource is an S3 bucket.

Contents

enableHiveCompatiblePath

This parameter causes the S3 objects that contain delivered logs to use a prefix structure that allows for integration with Apache Hive.

Type: Boolean

Required: No

suffixPath

This string allows re-configuring the S3 object prefix to contain either static or variable sections. The valid variables to use in the suffix path will vary by each log source. To find the values supported for the suffix path for each log source, use the [DescribeConfigurationTemplates](#) operation and check the allowedSuffixPathFields field in the response.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

SearchedLogStream

Represents the search status of a log stream.

Contents

logStreamName

The name of the log stream.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]^{*}

Required: No

searchedCompletely

Indicates whether all the events in this log stream were searched.

Type: Boolean

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

SplitString

Use this processor to split a field into an array of strings using a delimiting character.

For more information about this processor including examples, see [splitString](#) in the *CloudWatch Logs User Guide*.

Contents

entries

An array of SplitStringEntry objects, where each object contains the information about one field to split.

Type: Array of [SplitStringEntry](#) objects

Array Members: Minimum number of 1 item. Maximum number of 10 items.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

SplitStringEntry

This object defines one log field that will be split with the [splitString](#) processor.

Contents

delimiter

The separator characters to split the string entry on.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: Yes

source

The key of the field to split.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

StartLiveTailResponseStream

This object includes the stream returned by your [StartLiveTail](#) request.

Contents

sessionStart

This object contains information about this Live Tail session, including the log groups included and the log stream filters, if any.

Type: [LiveTailSessionStart](#) object

Required: No

SessionStreamingException

This exception is returned if an unknown error occurs.

Type: Exception

HTTP Status Code:

Required: No

SessionTimeoutException

This exception is returned in the stream when the Live Tail session times out. Live Tail sessions time out after three hours.

Type: Exception

HTTP Status Code:

Required: No

sessionUpdate

This object contains the log events and session metadata.

Type: [LiveTailSessionUpdate](#) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

SubscriptionFilter

Represents a subscription filter.

Contents

applyOnTransformedLogs

This parameter is valid only for log groups that have an active log transformer. For more information about log transformers, see [PutTransformer](#).

If this value is `true`, the subscription filter is applied on the transformed version of the log events instead of the original ingested log events.

Type: Boolean

Required: No

creationTime

The creation time of the subscription filter, expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC.

Type: Long

Valid Range: Minimum value of 0.

Required: No

destinationArn

The Amazon Resource Name (ARN) of the destination.

Type: String

Length Constraints: Minimum length of 1.

Required: No

distribution

The method used to distribute log data to the destination, which can be either random or grouped by log stream.

Type: String

Valid Values: Random | ByLogStream

Required: No

filterName

The name of the subscription filter.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [^:]*

Required: No

filterPattern

A symbolic description of how CloudWatch Logs should interpret the data in each log event. For example, a log event can contain timestamps, IP addresses, strings, and so on. You use the filter pattern to specify what to look for in the log event message.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 1024.

Required: No

logGroupName

The name of the log group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 512.

Pattern: [\.\-_/#A-Za-z0-9]+

Required: No

roleArn

Type: String

Length Constraints: Minimum length of 1.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

SubstituteString

This processor matches a key's value against a regular expression and replaces all matches with a replacement string.

For more information about this processor including examples, see [substituteString](#) in the *CloudWatch Logs User Guide*.

Contents

entries

An array of objects, where each object contains the information about one key to match and replace.

Type: Array of [SubstituteStringEntry](#) objects

Array Members: Minimum number of 1 item. Maximum number of 10 items.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

SubstituteStringEntry

This object defines one log field key that will be replaced using the [substituteString](#) processor.

Contents

from

The regular expression string to be replaced. Special regex characters such as [and] must be escaped using \\ when using double quotes and with \ when using single quotes. For more information, see [Class Pattern](#) on the Oracle web site.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: Yes

source

The key to modify

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: Yes

to

The string to be substituted for each match of from

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

SuppressionPeriod

If you are suppressing an anomaly temporariliy, this structure defines how long the suppression period is to be.

Contents

suppressionUnit

Specifies whether the value of `value` is in seconds, minutes, or hours.

Type: String

Valid Values: SECONDS | MINUTES | HOURS

Required: No

value

Specifies the number of seconds, minutes or hours to suppress this anomaly. There is no maximum.

Type: Integer

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

TransformedLogRecord

This structure contains information for one log event that has been processed by a log transformer.

Contents

eventMessage

The original log event message before it was transformed.

Type: String

Length Constraints: Minimum length of 1.

Required: No

eventNumber

The event number.

Type: Long

Required: No

transformedEventMessage

The log event message after being transformed.

Type: String

Length Constraints: Minimum length of 1.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

TrimString

Use this processor to remove leading and trailing whitespace.

For more information about this processor including examples, see [trimString](#) in the *CloudWatch Logs User Guide*.

Contents

withKeys

The array containing the keys of the fields to trim.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 10 items.

Length Constraints: Minimum length of 1.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

TypeConverter

Use this processor to convert a value type associated with the specified key to the specified type. It's a casting processor that changes the types of the specified fields. Values can be converted into one of the following datatypes: `integer`, `double`, `string` and `boolean`.

For more information about this processor including examples, see [trimString](#) in the *CloudWatch Logs User Guide*.

Contents

entries

An array of TypeConverterEntry objects, where each object contains the information about one field to change the type of.

Type: Array of [TypeConverterEntry](#) objects

Array Members: Minimum number of 1 item. Maximum number of 5 items.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

TypeConverterEntry

This object defines one value type that will be converted using the [typeConverter](#) processor.

Contents

key

The key with the value that is to be converted to a different type.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: Yes

type

The type to convert the field value to. Valid values are `integer`, `double`, `string` and `boolean`.

Type: String

Valid Values: `boolean` | `integer` | `double` | `string`

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

UpperCaseString

This processor converts a string field to uppercase.

For more information about this processor including examples, see [upperCaseString](#) in the *CloudWatch Logs User Guide*.

Contents

withKeys

The array of containing the keys of the field to convert to uppercase.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 10 items.

Length Constraints: Minimum length of 1.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

Making API Requests

Query requests used with CloudWatch Logs are HTTP or HTTPS requests that use the HTTP verb GET or POST and a Query parameter named Action or Operation. This documentation uses Action, although Operation is supported for backward compatibility.

Note

CloudWatch Logs might log request contents for fields that aren't considered sensitive, such as API request parameters for CloudWatch Logs actions. This provides debugging information for failed API requests.

CloudWatch Logs Endpoints

An endpoint is a URL that serves as an entry point for a web service. You can select a regional endpoint when you make your requests to reduce latency. For information about the endpoints used with CloudWatch Logs, see [Regions and Endpoints](#) in the *Amazon Web Services General Reference*.

Query Parameters

Each query request must include some common parameters to handle authentication and selection of an action. For more information, see [Common Parameters](#).

Some API operations take lists of parameters. These lists are specified using the following notation: param.member.n. Values of n are integers starting from 1. All lists of parameters must follow this notation, including lists that contain only one parameter. For example, a Query parameter list looks like this:

```
&attribute.member.1=this  
&attribute.member.2=that
```

Request Identifiers

In every response from an AWS Query API, there is a ResponseMetadata element, which contains a RequestId element. This string is a unique identifier that AWS assigns to provide tracking

information. Although RequestId is included as part of every response, it is not listed on the individual API documentation pages to improve readability and to reduce redundancy.

Query API Authentication

You can send query requests over either HTTP or HTTPS. Regardless of which protocol you use, you must include a signature in every query request. For more information about creating and including a signature, see [Signing AWS API Requests](#) in the *Amazon Web Services General Reference*.

Available Libraries

AWS provides libraries, sample code, tutorials, and other resources for software developers who prefer to build applications using language-specific APIs instead of the command-line tools and Query API. These libraries provide basic functions (not included in the APIs), such as request authentication, request retries, and error handling so that it is easier to get started. Libraries and resources are available for the following languages and platforms:

- [AWS Mobile SDK for Android](#)
- [AWS SDK for Go](#)
- [AWS Mobile SDK for iOS](#)
- [AWS SDK for Java 2.x](#)
- [AWS SDK for Java](#)
- [AWS SDK for JavaScript](#)
- [AWS SDK for JavaScript in Node.js](#)
- [AWS SDK for .NET](#)
- [AWS SDK for PHP](#)
- [AWS SDK for Python \(Boto\)](#)
- [AWS SDK for Ruby](#)

For libraries and sample code in all languages, see [Sample Code & Libraries](#).

Common Parameters

The following list contains the parameters that all actions use for signing Signature Version 4 requests with a query string. Any action-specific parameters are listed in the topic for that action. For more information about Signature Version 4, see [Signing AWS API requests in the IAM User Guide](#).

Action

The action to be performed.

Type: string

Required: Yes

Version

The API version that the request is written for, expressed in the format YYYY-MM-DD.

Type: string

Required: Yes

X-Amz-Algorithm

The hash algorithm that you used to create the request signature.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Valid Values: AWS4-HMAC-SHA256

Required: Conditional

X-Amz-Credential

The credential scope value, which is a string that includes your access key, the date, the region you are targeting, the service you are requesting, and a termination string ("aws4_request").

The value is expressed in the following format: *access_key/YYYYMMDD/region/service/aws4_request*.

For more information, see [Create a signed AWS API request](#) in the *IAM User Guide*.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional

X-Amz-Date

The date that is used to create the signature. The format must be ISO 8601 basic format (YYYYMMDD'T'HHMMSS'Z'). For example, the following date time is a valid X-Amz-Date value: 20120325T120000Z.

Condition: X-Amz-Date is optional for all requests; it can be used to override the date used for signing requests. If the Date header is specified in the ISO 8601 basic format, X-Amz-Date is not required. When X-Amz-Date is used, it always overrides the value of the Date header. For more information, see [Elements of an AWS API request signature](#) in the *IAM User Guide*.

Type: string

Required: Conditional

X-Amz-Security-Token

The temporary security token that was obtained through a call to AWS Security Token Service (AWS STS). For a list of services that support temporary security credentials from AWS STS, see [AWS services that work with IAM](#) in the *IAM User Guide*.

Condition: If you're using temporary security credentials from AWS STS, you must include the security token.

Type: string

Required: Conditional

X-Amz-Signature

Specifies the hex-encoded signature that was calculated from the string to sign and the derived signing key.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional

X-Amz-SignedHeaders

Specifies all the HTTP headers that were included as part of the canonical request. For more information about specifying signed headers, see [Create a signed AWS API request](#) in the *IAM User Guide*.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional

Common Errors

This section lists the errors common to the API actions of all AWS services. For errors specific to an API action for this service, see the topic for that API action.

AccessDeniedException

You do not have sufficient access to perform this action.

HTTP Status Code: 400

IncompleteSignature

The request signature does not conform to AWS standards.

HTTP Status Code: 400

InternalFailure

The request processing has failed because of an unknown error, exception or failure.

HTTP Status Code: 500

InvalidAction

The action or operation requested is invalid. Verify that the action is typed correctly.

HTTP Status Code: 400

InvalidClientTokenId

The X.509 certificate or AWS access key ID provided does not exist in our records.

HTTP Status Code: 403

NotAuthorized

You do not have permission to perform this action.

HTTP Status Code: 400

OptInRequired

The AWS access key ID needs a subscription for the service.

HTTP Status Code: 403

RequestExpired

The request reached the service more than 15 minutes after the date stamp on the request or more than 15 minutes after the request expiration date (such as for pre-signed URLs), or the date stamp on the request is more than 15 minutes in the future.

HTTP Status Code: 400

ServiceUnavailable

The request has failed due to a temporary failure of the server.

HTTP Status Code: 503

ThrottlingException

The request was denied due to request throttling.

HTTP Status Code: 400

ValidationException

The input fails to satisfy the constraints specified by an AWS service.

HTTP Status Code: 400
