Service Authorization Reference

Service Authorization Reference

Service Authorization Reference: Service Authorization Reference

Table of Contents

Reference

The *Service Authorization Reference* provides a list of the actions, resources, and condition keys that are supported by each AWS service. You can specify actions, resources, and condition keys in AWS Identity and Access Management (IAM) policies to manage access to AWS resources.

Contents

Actions, resources, and condition keys for AWS services

Each AWS service can define actions, resources, and condition context keys for use in IAM policies. This topic describes how the elements provided for each service are documented.

Each topic consists of tables that provide the list of available actions, resources, and condition keys.

The actions table

The **Actions** table lists all the actions that you can use in an IAM policy statement's `Action` element. Not all API operations that are defined by a service can be used as an action in an IAM policy. Some services include permission-only actions that don't directly correspond to an API operation. These actions are indicated with **[permission only]**. Use this list to determine which actions you can use in an IAM policy. For more information about the `Action`, `Resource`, or `Condition` elements, see IAM JSON policy elements reference. The **Actions** and **Description** table columns are self-descriptive.

- The **Access level** column describes how the action is classified (List, Read, Write, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Understanding access level summaries within policy summaries.
- The **Resource types** column indicates whether the action supports resource-level permissions. If the column is empty, then the action does not support resource-level permissions and you must specify all resources ("*") in your policy. If the column includes a resource type, then you can specify the resource ARN in the `Resource` element of your policy. For more information about that resource, refer to that row in the **Resource types** table. All actions and resources that are

included in one statement must be compatible with each other. If you specify a resource that is not valid for the action, any request to use that action fails, and the statement's `Effect` does not apply.

Required resources are indicated in the table with an asterisk (*). If you specify a resource-level permission ARN in a statement using this action, then it must be of this type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one but not the other.

- The **Condition keys** column includes keys that you can specify in a policy statement's `Condition` element. Condition keys might be supported with an action, or with an action and a specific resource. Pay close attention to whether the key is in the same row as a specific resource type. This table does not include global condition keys that are available for any action or under unrelated circumstances. For more information about global condition keys, see AWS global condition context keys.
- The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

  Dependent actions are not required in all scenarios. Refer to the individual service's documentation for more information about providing granular permissions to users.

The resource types table

The **Resource types** table lists all the resource types that you can specify as an ARN in the `Resource` policy element. Not every resource type can be specified with every action. Some resource types work with only certain actions. If you specify a resource type in a statement with an action that does not support that resource type, then the statement doesn't allow access. For more information about the `Resource` element, see IAM JSON policy elements: Resource.

- The **ARN** column specifies the Amazon Resource Name (ARN) format that you must use to reference resources of this type. The portions that are preceded by a $ must be replaced by the actual values for your scenario. For example, if you see `$user-name` in an ARN, you must replace that string with either the actual user's name or a policy variable that contains a user's name. For more information about ARNs, see IAM ARNs.

- The **Condition keys** column specifies condition context keys that you can include in an IAM policy statement only when both this resource and a supporting action from the table above are included in the statement.

The condition keys table

The **condition keys** table lists all of the condition context keys that you can use in an IAM policy statement's `Condition` element. Not every key can be specified with every action or resource. Certain keys only work with certain types of actions and resources. For more information about the `Condition` element, see IAM JSON policy elements: Condition.

- The **Type** column specifies the data type of the condition key. This data type determines which condition operators you can use to compare values in the request with the values in the policy statement. You must use an operator that is appropriate for the data type. If you use an incorrect operator, then the match always fails and the policy statement never applies.

  If the **Type** column specifies a "List of …" one of the simple types, then you can use multiple keys and values in your policies. Do this using condition set prefixes with your operators. Use the `ForAllValues` prefix to specify that **all** values in the request must match a value in the policy statement. Use the `ForAnyValue` prefix to specify that **at least one** value in the request matches one of the values in the policy statement.

Actions, resources, and condition keys for AWS Account Management

AWS Account Management (service prefix: `account`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Account Management

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptPrimaryEmailUpdate	Grants permission to accept the process to update the primary email address of an account	Write	accountInOrganization		
				account:EmailTargetDomain	
CloseAccount [permission only]	Grants permission to close an account	Write	account		
DeleteAlternateContact	Grants permission to delete the alternate contacts for an account	Write	account		
			accountInOrganization		
				account:AlternateContactTypes	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableRegion	Grants permission to disable use of a Region	Write	account		
			accountInOrganization		
				account:TargetRegion	
EnableRegion	Grants permission to enable use of a Region	Write	account		
			accountInOrganization		
				account:TargetRegion	
GetAccountInformation	Grants permission to retrieve the account information for an account	Read	account		
			accountInOrganization		
GetAlternateContact	Grants permission to retrieve the alternate contacts for an account	Read	account		
			accountInOrganization		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				account:AlternateContactTypes	
GetContactInformation	Grants permission to retrieve the primary contact information for an account	Read	account		
			accountInOrganization		
GetGovCloudAccountInformation	Grants permission to retrieve the linked GovCloud account information for an account	Read	account		
			accountInOrganization		
GetPrimaryEmail	Grants permission to retrieve the primary email address of an account	Read	accountInOrganization		
GetRegionOptStatus	Grants permission to get the opt-in status of a Region	Read	account		
			accountInOrganization		
				account:TargetRegion	
ListRegions	Grants permission to list the available Regions	List	account		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			accountInOrganization		
PutAccountName	Grants permission to update the name for an account	Write	account		
			accountInOrganization		
PutAlternateContact	Grants permission to modify the alternate contacts for an account	Write	account		
			accountInOrganization		
				account:AlternateContactTypes	
PutContactInformation	Grants permission to update the primary contact information for an account	Write	account		
			accountInOrganization		
StartPrimaryEmailUpdate	Grants permission to start the process to update the primary email address of an account	Write	accountInOrganization		
				account:EmailTargetDomain	

Resource types defined by AWS Account Management

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
account	`arn:${Partition}:account::${Account}:account`	
accountInOrganization	`arn:${Partition}:account::${ManagementAccountId}:account/o-${OrganizationId}/${MemberAccountId}`	

Condition keys for AWS Account Management

AWS Account Management defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
account:AccountResourceOrgPaths	Filters access by the resource path for an account in an organization	ArrayOfString
account:AccountRes	Filters access by resource tags for an account in an organization	String

Condition keys	Description	Type
ourceOrgTags/${TagKey}		
account:AlternateContactTypes	Filters access by alternate contact types	ArrayOfString
account:EmailTargetDomain	Filters access by email domain of the target email address	String
account:TargetRegion	Filters access by a list of Regions. Enables or disables all the Regions specified here	String

Actions, resources, and condition keys for AWS Action Recommendations

AWS Action Recommendations (service prefix: `action-recommendations`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Action Recommendations

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListRecommendedActions	Grants permission to list recommended actions in the AWS Management Console	List			

Resource types defined by AWS Action Recommendations

AWS Action Recommendations does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Action Recommendations, specify `"Resource": "*"` in your policy.

Condition keys for AWS Action Recommendations

Action Recommendations has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Activate

AWS Activate (service prefix: `activate`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Activate

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateForm	Grants permission to submit an Activate application form	Write			
GetAccountContact	Grants permission to get the AWS account contact information	Read			
GetContentInfo	Grants permission to get Activate tech posts and offer information	Read			
GetCosts	Grants permission to get the AWS cost information	Read			
GetCredits	Grants permission to get the AWS credit information	Read			
GetMemberInfo	Grants permission to get the Activate member information	Read			
GetProgram	Grants permission to get an Activate program	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutMemberInfo	Grants permission to create or update the Activate member information	Write			

Resource types defined by AWS Activate

AWS Activate does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Activate, specify `"Resource": "*"` in your policy.

Condition keys for AWS Activate

Activate has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon AI Operations

Amazon AI Operations (service prefix: `aiops`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon AI Operations

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateInvestigation	Grants permission to create a new investigation in the specified investigation group	Write	investigation-group*		kms:Decrypt kms:GenerateDataKey sts:SetContext
CreateInvestigationEvent	Grants permission to create a new investigation event in the specified investigation group	Write	investigation-group*		cloudwatch:DescribeAlarmHistory cloudwatch:DescribeAlarms cloudwatch:GetInsightRuleReport cloudwatch:GetMetricData

Actions defined by Alexa for Business

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ApproveSkill	Grants permission to associate a skill with the organization under the customer's AWS account	Write			
AssociateContactWithAddressBook	Grants permission to associate a contact with a given address book	Write	addressbook*		
			contact*		
AssociateDeviceWit	Grants permission to associate a device with the specified network profile	Write	device*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
hNetworkProfile			networkprofile*		
AssociateDeviceWithRoom	Grants permission to associate device with given room	Write	device* room*		
AssociateSkillGroupWithRoom	Grants permission to associate the skill group with given room	Write	room* skillgroup*		
AssociateSkillWithSkillGroup	Grants permission to associate a skill with a skill group	Write	skillgroup*		
AssociateSkillWithUsers	Grants permission to make a private skill available for enrolled users to enable on their devices	Write			
CompleteRegistration [permission only]	Grants permission to complete the operation of registering an Alexa device	Write			
CreateAddressBook	Grants permission to create an address book with the specified details	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateBusinessReportSchedule	Grants permission to create a recurring schedule for usage reports to deliver to the specified S3 location with a specified daily or weekly interval	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateConferenceProvider	Grants permission to add a new conference provider under the user's AWS account	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateContact	Grants permission to create a contact with the specified details	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateGatewayGroup	Grants permission to create a gateway group with the specified details	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateNetworkProfile	Grants permission to create a network profile with the specified details	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateProfile	Grants permission to create a new profile	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateRoom	Grants permission to create room with the specified details	Write	profile*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSkillGroup	Grants permission to create a skill group with given name and description	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateUser	Grants permission to create a user	Write	user*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAddressBook	Grants permission to delete an address book by the address book ARN	Write	addressbook*		
DeleteBusinessReportSchedule	Grants permission to delete the recurring report delivery schedule with the specified schedule ARN	Write	schedule*		
DeleteConferenceProvider	Grants permission to delete a conference provider	Write	conferenceprovider*		
DeleteContact	Grants permission to delete a contact by the contact ARN	Write	contact*		
DeleteDevice	Grants permission to remove a device from Alexa For Business	Write	device*		
DeleteDeviceUsageData	Grants permission to delete the device's entire previous history of voice input data and associated response data	Write	device*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteGatewayGroup	Grants permission to delete a gateway group	Write	gatewaygroup*		
DeleteNetworkProfile	Grants permission to delete a network profile by the network profile ARN	Write	networkprofile*		
DeleteProfile	Grants permission to delete profile by profile ARN	Write	profile*		
DeleteRoom	Grants permission to delete room	Write	room*		
DeleteRoomSkillParameter	Grants permission to delete a parameter from a skill and room	Write	room*		
DeleteSkillAuthorization	Grants permission to unlink a third-party account from a skill	Write	room*		
DeleteSkillGroup	Grants permission to delete skill group with skill group ARN	Write	skillgroup*		
DeleteUser	Grants permission to delete a user	Write	user*		
DisassociateContactFromAddressBook	Grants permission to disassociate a contact from a given address book	Write	addressbook*		
			contact*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateDeviceFromRoom	Grants permission to disassociate device from its current room	Write	device*		
DisassociateSkillFromSkillGroup	Grants permission to disassociate a skill from a skill group	Write	skillgroup*		
DisassociateSkillFromUsers	Grants permission to make a private skill unavailable for enrolled users and prevent them from enabling it on their devices	Write	user*		
DisassociateSkillGroupFromRoom	Grants permission to disassociate the skill group from given room	Write	room* skillgroup*		
ForgetSmartHomeAppliances	Grants permission to forget smart home appliances associated to a room	Write	room*		
GetAddressBook	Grants permission to get the address book details by the address book ARN	Read	addressbook*		
GetConferencePreference	Grants permission to retrieve the existing conference preferences	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetConferenceProvider	Grants permission to get details about a specific conference provider	Read	conferenceprovider*		
GetContact	Grants permission to get the contact details by the contact ARN	Read	contact*		
GetDevice	Grants permission to get device details	Read	device*		
GetGateway	Grants permission to retrieve the details of a gateway	Read	gateway*		
GetGatewayGroup	Grants permission to retrieve the details of a gateway group	Read	gatewaygroup*		
GetInvitationConfiguration	Grants permission to retrieve the configured values for the user enrollment invitation email template	Read			
GetNetworkProfile	Grants permission to get the network profile details by the network profile ARN	Read	networkprofile*		
GetProfile	Grants permission to get profile when provided with Profile ARN	Read	profile*		
GetRoom	Grants permission to get room details	Read	room*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetRoomSkillParameter	Grants permission to get an existing parameter that has been set for a skill and room	Read	room*		
GetSkillGroup	Grants permission to get skill group details with skill group ARN	Read	skillgroup*		
ListBusinessReportSchedules	Grants permission to list the details of the schedules that a user configured	List			
ListConferenceProviders	Grants permission to list conference providers under a specific AWS account	List			
ListDeviceEvents	Grants permission to list the device event history, including device connection status, for up to 30 days	List	device*		
ListGatewayGroups	Grants permission to list gateway group summaries	List			
ListGateways	Grants permission to list gateway summaries	List	gatewaygroup*		
ListSkills	Grants permission to list skills	List			
ListSkillsStoreCategories	Grants permission to list all categories in the Alexa skill store	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListSkillsStoreSkillsByCategory	Grants permission to list all skills in the Alexa skill store by category	List			
ListSmartHomeAppliances	Grants permission to list all of the smart home appliances associated with a room	List	room*		
ListTags	Grants permission to list all tags on a resource	Read	device		
			room		
			user		
PutConferencePreference	Grants permission to set the conference preferences on a specific conference provider at the account level	Write			
PutDeviceSetupEvents [permission only]	Grants permission to publish Alexa device setup events	Write			
PutInvitationConfiguration	Grants permission to configure the email template for the user enrollment invitation with the specified attributes	Write			
PutRoomSkillParameter	Grants permission to put a room specific parameter for a skill	Write	room*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutSkillAuthorization	Grants permission to link a user's account to a third-party skill provider	Write	room*		
RegisterAVSDevice	Grants permission to register an Alexa-enabled device built by an Original Equipment Manufacturer (OEM) using Alexa Voice Service (AVS)	Write		aws:RequestTag/${TagKey} aws:TagKeys	
RegisterDevice [permission only]	Grants permission to register an Alexa device	Write			
RejectSkill	Grants permission to disassociate a skill from the organization under a user's AWS account	Write			
ResolveRoom	Grants permission to resolve room information	Read			
RevokeInvitation	Grants permission to revoke an invitation	Write	user*		
SearchAddressBooks	Grants permission to search address books and list the ones that meet a set of filter and sort criteria	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SearchContacts	Grants permission to search contacts and list the ones that meet a set of filter and sort criteria	List			
SearchDevices	Grants permission to search for devices	List			
SearchNetworkProfiles	Grants permission to search network profiles and list the ones that meet a set of filter and sort criteria	List			
SearchProfiles	Grants permission to search for profiles	List			
SearchRooms	Grants permission to search for rooms	List			
SearchSkillGroups	Grants permission to search for skill groups	List			
SearchUsers	Grants permission to search for users	List			
SendAnnouncement	Grants permission to trigger an asynchronous flow to send text, SSML, or audio announcements to rooms that are identified by a search or filter	Write			
SendInvitation	Grants permission to send an invitation to a user	Write	user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartDeviceSync	Grants permission to restore the device and its account to its known, default settings by clearing all information and settings set by its previous users	Write			
StartSmartHomeApplianceDiscovery	Grants permission to initiate the discovery of any smart home appliances associated with the room	Read	room*		
TagResource	Grants permission to add metadata tags to a resource	Tagging	device		
			room		
			user		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove metadata tags from a resource	Tagging	device		
			room		
			user		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAddressBook	Grants permission to update address book details by the address book ARN	Write	addressbook*		
UpdateBusinessReportSchedule	Grants permission to update the configuration of the report delivery schedule with the specified schedule ARN	Write	schedule*		
UpdateConferenceProvider	Grants permission to update an existing conference provider's settings	Write	conferenceprovider*		
UpdateContact	Grants permission to update the contact details by the contact ARN	Write	contact*		
UpdateDevice	Grants permission to update device name	Write	device*		
UpdateGateway	Grants permission to update the details of a gateway	Write	gateway*		
UpdateGatewayGroup	Grants permission to update the details of a gateway group	Write	gatewaygroup*		
UpdateNetworkProfile	Grants permission to update a network profile by the network profile ARN	Write	networkprofile*		
UpdateProfile	Grants permission to update an existing profile	Write	profile*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateRoom	Grants permission to update room details	Write	room*		
UpdateSkillGroup	Grants permission to update skill group details with skill group ARN	Write	skillgroup*		

Resource types defined by Alexa for Business

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
profile	`arn:${Partition}:a4b:${Region}:${Account}:profile/${ResourceId}`	
room	`arn:${Partition}:a4b:${Region}:${Account}:room/${ResourceId}`	aws:ResourceTag/${TagKey}
device	`arn:${Partition}:a4b:${Region}:${Account}:device/${ResourceId}`	aws:ResourceTag/${TagKey}
skillgroup	`arn:${Partition}:a4b:${Region}:${Account}:skill-group/${ResourceId}`	
user	`arn:${Partition}:a4b:${Region}:${Account}:user/${ResourceId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
addressbook	arn:${Partition}:a4b:${Region}:${Account}:address-book/${ResourceId}	
conferenceprovider	arn:${Partition}:a4b:${Region}:${Account}:conference-provider/${ResourceId}	
contact	arn:${Partition}:a4b:${Region}:${Account}:contact/${ResourceId}	
schedule	arn:${Partition}:a4b:${Region}:${Account}:schedule/${ResourceId}	
networkprofile	arn:${Partition}:a4b:${Region}:${Account}:network-profile/${ResourceId}	
gateway	arn:${Partition}:a4b:${Region}:${Account}:gateway/${ResourceId}	
gatewaygroup	arn:${Partition}:a4b:${Region}:${Account}:gateway-group/${ResourceId}	

Condition keys for Alexa for Business

Alexa for Business defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
a4b:amazonId	Filters actions based on the Amazon Id in the request	String

Condition keys	Description	Type
a4b:filters_deviceType	Filters actions based on the device type in the request	ArrayOfString
aws:RequestTag/${TagKey}	Filters actions based on the allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters actions based on tag-value assoicated with the resource	String
aws:TagKeys	Filters actions based on the presence of mandatory tags in the request	ArrayOfString

Actions, resources, and condition keys for AmazonMediaImport

AmazonMediaImport (service prefix: `mediaimport`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

- Actions defined by AmazonMediaImport
- Resource types defined by AmazonMediaImport
- Condition keys for AmazonMediaImport

Actions defined by AmazonMediaImport

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateDatabaseBinarySnapshot [permission only]	Grants permission to create a database binary snapshot on the customer's aws account	Write			

Resource types defined by AmazonMediaImport

AmazonMediaImport does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AmazonMediaImport, specify `"Resource": "*"` in your policy.

Condition keys for AmazonMediaImport

mediaimport has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Amplify

AWS Amplify (service prefix: `amplify`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Actions defined by AWS Amplify

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateWebACL	Grants permission to associate a WebACL to a Resource	Write	apps*		
CreateApp	Grants permission to create a new Amplify App	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateBackendEnvironment	Grants permission to create a new backend environment for an Amplify App	Write	apps*		
CreateBranch	Grants permission to create a new Branch for an Amplify App	Write	branches*		
				aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
CreateDeployment	Grants permission to create a deployment for manual deploy apps. (Apps are not connected to repository)	Write	branches*		
CreateDomainAssociation	Grants permission to create a new DomainAssociation on an App	Write	domains*		
CreateWebHook	Grants permission to create a new webhook on an App	Write	branches*		
DeleteApp	Grants permission to delete an existing Amplify App by appId	Write	apps*		
DeleteBackendEnvironment	Grants permission to delete a branch for an Amplify App	Write	apps*		
DeleteBranch	Grants permission to delete a branch for an Amplify App	Write	branches*		
DeleteDomainAssociation	Grants permission to delete a DomainAssociation	Write	domains*		
DeleteJob	Grants permission to delete a job, for an Amplify branch, part of Amplify App	Write	jobs*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteWebHook	Grants permission to delete a webhook by id	Write	webhooks*		
DisassociateWebACL	Grants permission to disassociate a WebACL from a Resource	Write	apps*		
GenerateAccessLogs	Grants permission to generate website access logs for a specific time range via a pre-signed URL	Write	apps*		
GetApp	Grants permission to retrieve an existing Amplify App by appId	Read	apps*		
GetArtifactUrl	Grants permission to retrieve artifact info that corresponds to a artifactId	Read	apps*		
GetBackendEnvironment	Grants permission to retrieve a backend environment for an Amplify App	Read	apps*		
GetBranch	Grants permission to retrieve a branch for an Amplify App	Read	branches*		
GetDomainAssociation	Grants permission to retrieve domain info that corresponds to an appId and domainName	Read	domains*		
GetJob	Grants permission to get a job for a branch, part of an Amplify App	Read	jobs*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetWebACLForResource	Grants permission to retrieve the WebACL associated with a Resource	Read	apps*		
GetWebHook	Grants permission to retrieve webhook info that corresponds to a webhookId	Read	webhooks*		
ListApps	Grants permission to list existing Amplify Apps	List			
ListArtifacts	Grants permission to list artifacts with an app, a branch, a job and an artifact type	List	apps*		
ListBackendEnvironments	Grants permission to list backend environments for an Amplify App	List	apps*		
ListBranches	Grants permission to list branches for an Amplify App	List	apps*		
ListDomainAssociations	Grants permission to list domains with an app	List	apps*		
ListJobs	Grants permission to list Jobs for a branch, part of an Amplify App	List	branches*		
ListResourcesForWebACL	Grants permission to list the Resources associated with a WebACL	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTagsForResource	Grants permission to list tags for an AWS Amplify Console resource	Read	apps		
			branches		
			domains		
			webhooks		
ListWebHooks	Grants permission to list webhooks on an App	List	apps*		
StartDeployment	Grants permission to start a deployment for manual deploy apps. (Apps are not connected to repository)	Write	branches*		
StartJob	Grants permission to start a new job for a branch, part of an Amplify App	Write	jobs*		
StopJob	Grants permission to stop a job that is in progress, for an Amplify branch, part of Amplify App	Write	jobs*		
TagResource	Grants permission to tag an AWS Amplify Console resource	Tagging	apps		
			branches		
			domains		
			webhooks		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove a tag from an AWS Amplify Console resource	Tagging	apps		
			branches		
			domains		
			webhooks		
				aws:TagKeys	
UpdateApp	Grants permission to update an existing Amplify App	Write	apps*		
UpdateBranch	Grants permission to update a branch for an Amplify App	Write	branches*		
UpdateDomainAssociation	Grants permission to update a DomainAssociation on an App	Write	domains*		
UpdateWebHook	Grants permission to update a webhook	Write	webhooks*		

Resource types defined by AWS Amplify

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
apps	`arn:${Partition}:amplify:${Region}:${Account}:apps/${AppId}`	aws:ResourceTag/${TagKey}
branches	`arn:${Partition}:amplify:${Region}:${Account}:apps/${AppId}/branches/${BranchName}`	aws:ResourceTag/${TagKey}
jobs	`arn:${Partition}:amplify:${Region}:${Account}:apps/${AppId}/branches/${BranchName}/jobs/${JobId}`	
domains	`arn:${Partition}:amplify:${Region}:${Account}:apps/${AppId}/domains/${DomainName}`	aws:ResourceTag/${TagKey}
webhooks	`arn:${Partition}:amplify:${Region}:${Account}:webhooks/${WebhookId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Amplify

AWS Amplify defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag's key and value in a request	String
aws:ResourceTag/${TagKey}	Filters access by a tag's key associated with the resource	String
aws:TagKeys	Filters access by the tag keys in a request	ArrayOfString

Actions, resources, and condition keys for AWS Amplify Admin

AWS Amplify Admin (service prefix: `amplifybackend`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Amplify Admin

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CloneBackend	Grants permission to clone an existing Amplify Admin backend environment into a new Amplify Admin backend enviroment	Write	backend*		
CreateBackend	Grants permission to create a new Amplify Admin backend environment by Amplify appId	Write	created-backend*		
CreateBackendAPI	Grants permission to create an API for an existing Amplify Admin backend environment by appId and backendEnvironmentName	Write	api* backend* environment*		
CreateBackendAuth	Grants permission to create an auth resource for an existing Amplify Admin backend environment by appId and backendEnvironmentName	Write	auth* backend* environment*		
CreateBackendConfig	Grants permission to create a new Amplify Admin backend config by Amplify appId	Write	config*		
CreateBackendStorage	Grants permission to create a backend storage resource	Write	backend* environment*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			storage*		
CreateToken	Grants permission to create an Amplify Admin challenge token by appId	Write	backend*		
			token*		
DeleteBackend	Grants permission to delete an existing Amplify Admin backend environment by appId and backendEnvironmentName	Write	backend*		
			environment*		
DeleteBackendAPI	Grants permission to delete an API of an existing Amplify Admin backend environment by appId and backendEnvironmentName	Write	api*		
			backend*		
			environment*		
DeleteBackendAuth	Grants permission to delete an auth resource of an existing Amplify Admin backend environment by appId and backendEnvironmentName	Write	auth*		
			backend*		
			environment*

			job*		
UpdateBackendStorage	Grants permission to update a backend storage resource	Write	backend*		
			environment*		
			storage*		

Resource types defined by AWS Amplify Admin

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
created-backend	`arn:${Partition}:amplifybackend:${Region}:${Account}:/backend/*`	

Resource types	ARN	Condition keys
backend	arn:${Partition}:amplifybackend:${Region}:${Account}:/backend/${AppId}/*	
environment	arn:${Partition}:amplifybackend:${Region}:${Account}:/backend/${AppId}/environments/*	
api	arn:${Partition}:amplifybackend:${Region}:${Account}:/backend/${AppId}/api/*	
auth	arn:${Partition}:amplifybackend:${Region}:${Account}:/backend/${AppId}/auth/*	
job	arn:${Partition}:amplifybackend:${Region}:${Account}:/backend/${AppId}/job/*	
config	arn:${Partition}:amplifybackend:${Region}:${Account}:/backend/${AppId}/config/*	
token	arn:${Partition}:amplifybackend:${Region}:${Account}:/backend/${AppId}/challenge/*	
storage	arn:${Partition}:amplifybackend:${Region}:${Account}:/backend/${AppId}/storage/*	

Condition keys for AWS Amplify Admin

Amplify Admin has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Amplify UI Builder

AWS Amplify UI Builder (service prefix: `amplifyuibuilder`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Amplify UI Builder

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a

resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateComponent	Grants permission to create a component	Write		aws:RequestTag/${TagKey}	amplify:GetApp amplifyuibuilder:G

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	etComponent amplifyuibuilder:TagResource
CreateForm	Grants permission to create a form	Write		aws:RequestTag/${TagKey} aws:TagKeys	amplify:GetApp amplifyuibuilder:GetForm amplifyuibuilder:TagResource amplifyuibuilder:UntagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTheme	Grants permission to create a theme	Write		aws:RequestTag/${TagKey} aws:TagKeys	amplify:GetApp amplifyuibuilder:GetTheme amplifyuibuilder:TagResource
DeleteComponent	Grants permission to delete a component	Write	Component Resource*		amplify:GetApp amplifyuibuilder:UntagResource
DeleteForm	Grants permission to delete a form	Write	FormResource*		amplify:GetApp amplifyuibuilder:TagResource amplifyuibuilder:UntagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteTheme	Grants permission to delete a theme	Write	ThemeResource*		amplify:GetApp amplifyuibuilder:UntagResource
ExchangeCodeForToken	Grants permission to exchange a code for a token	Write			
ExportComponents	Grants permission to export components	Read			
ExportForms	Grants permission to export forms	Read			
ExportThemes	Grants permission to export themes	Read			
GetCodegenJob	Grants permission to get an existing codegen job	Read	CodegenJobResource*		amplify:GetApp
GetComponent	Grants permission to get an existing component	Read	ComponentResource*		amplify:GetApp
GetForm	Grants permission to get an existing form	Read	FormResource*		amplify:GetApp
GetMetadata	Grants permission to get an existing metadata	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTheme	Grants permission to get an existing theme	Read	ThemeResource*		amplify:GetApp
ListCodegenJobs	Grants permission to list codegen jobs	List			amplify:GetApp
ListComponents	Grants permission to list components	List			amplify:GetApp
ListForms	Grants permission to list forms	List			amplify:GetApp
ListTagsForResource	Grants permission to list tags for a specified Amazon Resource Name (ARN)	List	CodegenJobResource		
			ComponentResource		
			FormResource		
			ThemeResource		
ListThemes	Grants permission to list themes	List			amplify:GetApp
PutMetadataFlag	Grants permission to put an existing metadata	Write			
RefreshToken	Grants permission to refresh an access token	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ResetMetadataFlag	Grants permission to reset an existing metadata	Write			
StartCodegenJob	Grants permission to start a codegen job	Write		aws:RequestTag/${TagKey} aws:TagKeys	amplify:GetApp
TagResource	Grants permission to tag the resource with a tag key and value	Tagging	CodegenJobResource		
			ComponentResource		
			FormResource		
			ThemeResource		
				aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UntagResource	Grants permission to untag a resource with a specified Amazon Resource Name (ARN)	Tagging	CodegenJobResource		
			ComponentResource		
			FormResource		
			ThemeResource		
				aws:TagKeys	
UpdateComponent	Grants permission to update a component	Write	ComponentResource*		amplify:GetApp amplifyuibuilder:TagResource amplifyuibuilder:UntagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateForm	Grants permission to update a form	Write	FormResource*		amplify:GetApp amplifyuibuilder:GetForm amplifyuibuilder:TagResource amplifyuibuilder:UntagResource
UpdateTheme	Grants permission to update a theme	Write	ThemeResource*		amplify:GetApp amplifyuibuilder:GetTheme amplifyuibuilder:TagResource amplifyuibuilder:UntagResource

Resource types defined by AWS Amplify UI Builder

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
CodegenJobResource	`arn:${Partition}:amplifyuibuilder:${Region}:${Account}:app/${AppId}/environment/${EnvironmentName}/codegen-jobs/${Id}`	amplifyuibuilder:CodegenJobResourceAppId amplifyuibuilder:CodegenJobResourceEnvironmentName amplifyuibuilder:CodegenJobResourceId aws:ResourceTag/${TagKey}
ComponentResource	`arn:${Partition}:amplifyuibuilder:${Region}:${Account}:app/${AppId}/environment/${EnvironmentName}/components/${Id}`	amplifyuibuilder:ComponentResourceAppId amplifyuibuilder:ComponentResourceEnvironmentName amplifyuibuilder:ComponentResourceId aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
FormResource	arn:${Partition}:amplifyuibuilder:${Region}:${Account}:app/${AppId}/environment/${EnvironmentName}/forms/${Id}	amplifyuibuilder:FormResourceAppId amplifyuibuilder:FormResourceEnvironmentName amplifyuibuilder:FormResourceId aws:ResourceTag/${TagKey}
ThemeResource	arn:${Partition}:amplifyuibuilder:${Region}:${Account}:app/${AppId}/environment/${EnvironmentName}/themes/${Id}	amplifyuibuilder:ThemeResourceAppId amplifyuibuilder:ThemeResourceEnvironmentName amplifyuibuilder:ThemeResourceId aws:ResourceTag/${TagKey}

Condition keys for AWS Amplify UI Builder

AWS Amplify UI Builder defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
amplifyuibuilder:CodegenJobResourceAppId	Filters access by the app ID	String
amplifyuibuilder:CodegenJobResourceEnvironmentName	Filters access by the backend environment name	String
amplifyuibuilder:CodegenJobResourceId	Filters access by the codegen job ID	String
amplifyuibuilder:ComponentResourceAppId	Filters access by the app ID	String
amplifyuibuilder:ComponentResourceEnvironmentName	Filters access by the backend environment name	String
amplifyuibuilder:ComponentResourceId	Filters access by the component ID	String
amplifyuibuilder:F	Filters access by the app ID	String

Condition keys	Description	Type
ormResourceAppId		
amplifyuibuilder:FormResourceEnvironmentName	Filters access by the backend environment name	String
amplifyuibuilder:FormResourceId	Filters access by the form ID	String
amplifyuibuilder:ThemeResourceAppId	Filters access by the app ID	String
amplifyuibuilder:ThemeResourceEnvironmentName	Filters access by the backend environment name	String
amplifyuibuilder:ThemeResourceId	Filters access by the theme ID	String
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Apache Kafka APIs for Amazon MSK clusters

Apache Kafka APIs for Amazon MSK clusters (service prefix: `kafka-cluster`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Apache Kafka APIs for Amazon MSK clusters

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit

resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AlterCluster	Grants permission to alter various aspects of the cluster, equivalent to Apache Kafka's ALTER CLUSTER ACL	Write	cluster*		kafka-cluster:Connect kafka-cluster:DescribeCluster

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AlterClusterDynamicConfiguration	Grants permission to alter the dynamic configuration of a cluster, equivalent to Apache Kafka's ALTER_CONFIGS CLUSTER ACL	Write	cluster*		kafka-cluster:Connect kafka-cluster:DescribeClusterDynamicConfiguration
AlterGroup	Grants permission to join groups on a cluster, equivalent to Apache Kafka's READ GROUP ACL	Write	group*		kafka-cluster:Connect kafka-cluster:DescribeGroup
AlterTopic	Grants permission to alter topics on a cluster, equivalent to Apache Kafka's ALTER TOPIC ACL	Write	topic*		kafka-cluster:Connect kafka-cluster:DescribeTopic

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AlterTopicDynamicConfiguration	Grants permission to alter the dynamic configuration of topics on a cluster, equivalent to Apache Kafka's ALTER_CONFIGS TOPIC ACL	Write	topic*		kafka-cluster:Connect kafka-cluster:DescribeTopicDynamicConfiguration
AlterTransactionalId	Grants permission to alter transactional IDs on a cluster, equivalent to Apache Kafka's WRITE TRANSACTIONAL_ID ACL	Write	transactional-id*		kafka-cluster:Connect kafka-cluster:DescribeTransactionalId kafka-cluster:WriteData
Connect	Grants permission to connect and authenticate to the cluster	Write	cluster*		
CreateTopic	Grants permission to create topics on a cluster, equivalent to Apache Kafka's CREATE CLUSTER/TOPIC ACL	Write	topic*		kafka-cluster:Connect

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteGroup	Grants permission to delete groups on a cluster, equivalent to Apache Kafka's DELETE GROUP ACL	Write	group*		kafka-cluster:Connect kafka-cluster:DescribeGroup
DeleteTopic	Grants permission to delete topics on a cluster, equivalent to Apache Kafka's DELETE TOPIC ACL	Write	topic*		kafka-cluster:Connect kafka-cluster:DescribeTopic
DescribeCluster	Grants permission to describe various aspects of the cluster, equivalent to Apache Kafka's DESCRIBE CLUSTER ACL	List	cluster*		kafka-cluster:Connect
DescribeClusterDynamicConfiguration	Grants permission to describe the dynamic configuration of a cluster, equivalent to Apache Kafka's DESCRIBE_CONFIGS CLUSTER ACL	List	cluster*		kafka-cluster:Connect
DescribeGroup	Grants permission to describe groups on a cluster, equivalent to Apache Kafka's DESCRIBE GROUP ACL	List	group*		kafka-cluster:Connect

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeTopic	Grants permission to describe topics on a cluster, equivalent to Apache Kafka's DESCRIBE TOPIC ACL	List	topic*		kafka-cluster:Connect
DescribeTopicDynamicConfiguration	Grants permission to describe the dynamic configuration of topics on a cluster, equivalent to Apache Kafka's DESCRIBE_CONFIGS TOPIC ACL	List	topic*		kafka-cluster:Connect
DescribeTransactionalId	Grants permission to describe transactional IDs on a cluster, equivalent to Apache Kafka's DESCRIBE TRANSACTIONAL_ID ACL	List	transactional-id*		kafka-cluster:Connect
ReadData	Grants permission to read data from topics on a cluster, equivalent to Apache Kafka's READ TOPIC ACL	Read	topic*		kafka-cluster:AlterGroup kafka-cluster:Connect kafka-cluster:DescribeTopic

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
WriteData	Grants permission to write data to topics on a cluster, equivalent to Apache Kafka's WRITE TOPIC ACL	Write	topic*		kafka-cluster:Connect kafka-cluster:DescribeTopic
WriteDataIdempotently	Grants permission to write data idempotently on a cluster, equivalent to Apache Kafka's IDEMPOTENT_WRITE CLUSTER ACL	Write	cluster*		kafka-cluster:Connect kafka-cluster:WriteData

Resource types defined by Apache Kafka APIs for Amazon MSK clusters

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
cluster	`arn:${Partition}:kafka:${Region}:${Account}:cluster/${ClusterName}/${ClusterUuid}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
topic	arn:${Partition}:kafka:${Region}:${Account}:topic/${ClusterName}/${ClusterUuid}/${TopicName}	
group	arn:${Partition}:kafka:${Region}:${Account}:group/${ClusterName}/${ClusterUuid}/${GroupName}	
transactional-id	arn:${Partition}:kafka:${Region}:${Account}:transactional-id/${ClusterName}/${ClusterUuid}/${TransactionalId}	

Condition keys for Apache Kafka APIs for Amazon MSK clusters

Apache Kafka APIs for Amazon MSK clusters defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters actions based on tag key-value pairs attached to the resource. The resource tag context key will only apply to the cluster resource, not topics, groups and transactional IDs	String

Actions, resources, and condition keys for Amazon API Gateway

Amazon API Gateway (service prefix: `execute-api`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Condition keys for Amazon API Gateway Management

Amazon API Gateway Management defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
apigateway:Request/AccessAssociationSource	Filters access by access association source. Available during the CreateDomainNameAccessAssociation operation	String

Condition keys	Description	Type
apigateway:Request/AccessLoggingDestination	Filters access by access log destination. Available during the CreateStage and UpdateStage operations	String
apigateway:Request/AccessLoggingFormat	Filters access by access log format. Available during the CreateStage and UpdateStage operations	String
apigateway:Request/ApiKeyRequired	Filters access by whether an API key is required or not. Available during the CreateMethod and PutMethod operations. Also available as a collection during import and reimport	ArrayOfBool
apigateway:Request/ApiName	Filters access by API name. Available during the CreateRestApi and UpdateRestApi operations	String
apigateway:Request/AuthorizerType	Filters access by type of authorizer in the request, for example TOKEN, REQUEST, JWT. Available during CreateAuthorizer and UpdateAuthorizer. Also available during import and reimport as an ArrayOfString	ArrayOfString
apigateway:Request/DisableExecuteApiEndpoint	Filters access by status of the default execute-api endpoint. Available during the CreateRestApi and DeleteRestApi operations	Bool
apigateway:Request/DomainNameArn	Filters access by domain name ARN. Available during the CreateDomainNameAccessAssociation operation	ARN

Condition keys	Description	Type
apigateway:Request/EndpointType	Filters access by endpoint type. Available during the CreateDomainName, UpdateDomainName, CreateRestApi, and UpdateRestApi operations	ArrayOfString
apigateway:Request/MtlsTrustStoreUri	Filters access by URI of the truststore used for mutual TLS authentication. Available during the CreateDomainName and UpdateDomainName operations	String
apigateway:Request/MtlsTrustStoreVersion	Filters access by version of the truststore used for mutual TLS authentication. Available during the CreateDomainName and UpdateDomainName operations	String
apigateway:Request/RouteAuthorizationType	Filters access by authorization type, for example NONE, AWS_IAM, CUSTOM, JWT, COGNITO_USER_POOLS. Available during the CreateMethod and PutMethod operations Also available as a collection during import	ArrayOfString
apigateway:Request/RoutingMode	Filters access by routing mode of the domain name. Available during the CreateDomainName and UpdateDomainName operations	String
apigateway:Request/SecurityPolicy	Filters access by TLS version. Available during the CreateDomain and UpdateDomain operations	ArrayOfString
apigateway:Request/StageName	Filters access by stage name of the deployment that you attempt to create. Available during the CreateDeployment operation	String
apigateway:Resource/AccessLoggingDestination	Filters access by access log destination of the current Stage resource. Available during the UpdateStage and DeleteStage operations	String

Condition keys	Description	Type
apigateway:Resource/AccessLoggingFormat	Filters access by access log format of the current Stage resource. Available during the UpdateStage and DeleteStage operations	String
apigateway:Resource/ApiKeyRequired	Filters access by whether an API key is required or not for the existing Method resource. Available during the PutMethod and DeleteMethod operations. Also available as a collection during reimport	ArrayOfBool
apigateway:Resource/ApiName	Filters access by API name of the existing RestApi resource. Available during UpdateRestApi and DeleteRestApi operations	String
apigateway:Resource/AuthorizerType	Filters access by the current type of authorizer, for example TOKEN, REQUEST, JWT. Available during UpdateAuthorizer and DeleteAuthorizer operations. Also available during reimport as an ArrayOfString	ArrayOfString
apigateway:Resource/DisableExecuteApiEndpoint	Filters access by status of the default execute-api endpoint of the current RestApi resource. Available during UpdateRestApi and DeleteRestApi operations	Bool
apigateway:Resource/EndpointType	Filters access by endpoint type. Available during the UpdateDomainName, DeleteDomainName, UpdateRestApi, and DeleteRestApi operations	ArrayOfString
apigateway:Resource/MtlsTrustStoreUri	Filters access by URI of the truststore used for mutual TLS authentication. Available during UpdateDomainName and DeleteDomainName operations	String

Condition keys	Description	Type
apigateway:Resource/MtlsTrustStoreVersion	Filters access by version of the truststore used for mutual TLS authentication. Available during UpdateDomainName and DeleteDomainName operations	String
apigateway:Resource/RouteAuthorizationType	Filters access by authorization type of the existing Method resource, for example NONE, AWS_IAM, CUSTOM, JWT, COGNITO_USER_POOLS. Available during the PutMethod and DeleteMethod operations. Also available as a collection during reimport	ArrayOfString
apigateway:Resource/RoutingMode	Filters access by routing mode of the domain name. Available during the UpdateDomainName and DeleteDomainName operations	String
apigateway:Resource/SecurityPolicy	Filters access by TLS version. Available during UpdateDomain and DeleteDomain operations	ArrayOfString
aws:RequestTag/${TagKey}	Filters access by the tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags attached to the resource	String
aws:TagKeys	Filters access by the tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon API Gateway Management V2

Amazon API Gateway Management V2 (service prefix: `apigateway`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon API Gateway Management V2

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreatePortal	Grants permission to create a Portal	Write	Portal*		
				apigateway:Request/PortalDisplayName apigateway:Request/PortalDomainName apigateway:Request/CognitoU	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				serPoolArn aws:RequestTag/${TagKey} aws:TagKeys	
CreatePortalProduct	Grants permission to create a Portal Product	Write	PortalProduct*		
				apigateway:Request/PortalProductDisplayName aws:RequestTag/${TagKey} aws:TagKeys	
CreateProductPage	Grants permission to create a Product Page	Write	ProductPage*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				apigateway:Request/ProductPageTitle	
CreateProductRestEndpointPage	Grants permission to create a Product REST Endpoint Page	Write	ProductRestEndpointPage*		
				apigateway:Request/RestApiId apigateway:Request/Stage apigateway:Request/Method apigateway:Request/ProductRestEndpointPageEndpointPrefix	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateRoutingRule	Grants permission to create a routing rule	Write	RoutingRule*	apigateway:Request/Priority apigateway:Request/ConditionBasePaths

Resource types defined by Amazon API Gateway Management V2

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys

Condition keys for Amazon API Gateway Management V2

Amazon API Gateway Management V2 defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
apigateway:Request/AccessLoggingDestination	Filters access by access log destination. Available during the CreateStage and UpdateStage operations	String
apigateway:Request/AccessLoggingFormat	Filters access by access log format. Available during the CreateStage and UpdateStage operations	String
apigateway:Request/ApiKeyRequired	Filters access by the requirement of API. Available during the CreateRoute and UpdateRoute operations. Also available as a collection during import and reimport	ArrayOfBool
apigateway:Request/ApiName	Filters access by API name. Available during the CreateApi and UpdateApi operations	String
apigateway:Request/AuthorizerType	Filters access by type of authorizer in the request, for example REQUEST or JWT. Available during CreateAuthorizer and UpdateAuthorizer. Also available during import and reimport as an ArrayOfString	ArrayOfString
apigateway:Request/AuthorizerUri	Filters access by URI of a Lambda authorizer function. Available during CreateAuthorizer and UpdateAuthorizer. Also available during import and reimport as an ArrayOfString	ArrayOfString
apigateway:Request/CognitoUserPoolArn	Filters access by a Portal's CognitoUserPoolArn that is passed in the request	ARN

Condition keys	Description	Type
apigateway:Request/ConditionBasePaths	Filters access by base paths defined on the condition of a routing rule. Available during the CreateRoutingRule and UpdateRoutingRule operations	ArrayOfString
apigateway:Request/DisableExecuteApiEndpoint	Filters access by status of the default execute-api endpoint. Available during the CreateApi and UpdateApi operations	Bool
apigateway:Request/EndpointType	Filters access by endpoint type. Available during the CreateDomainName, UpdateDomainName, CreateApi, and UpdateApi operations	ArrayOfString
apigateway:Request/Method	Filters access by a ProductRestEndpointPage's HTTP Method that is passed in the request	String
apigateway:Request/MtlsTrustStoreUri	Filters access by URI of the truststore used for mutual TLS authentication. Available during the CreateDomainName and UpdateDomainName operations	String
apigateway:Request/MtlsTrustStoreVersion	Filters access by version of the truststore used for mutual TLS authentication. Available during the CreateDomainName and UpdateDomainName operations	String
apigateway:Request/PortalDisplayName	Filters access by a Portal's Display Name that is passed in the request	String

Condition keys	Description	Type
apigateway:Request/PortalDomainName	Filters access by a Portal's vanity domain name that is passed in the request	String
apigateway:Request/PortalProductDisplayName	Filters access by a PortalProduct's Display Name that is passed in the request	String
apigateway:Request/Priority	Filters access by priority of the routing rule. Available during the CreateRoutingRule and UpdateRoutingRule operations	Numeric
apigateway:Request/ProductPageTitle	Filters access by a ProductPage's Title that is passed in the request	String
apigateway:Request/ProductRestEndpointPageEndpointPrefix	Filters access by a ProductRestEndpointPage's EndpointPrefix that is passed in the request	String
apigateway:Request/RestApiId	Filters access by a ProductRestEndpointPage's Amazon API Gateway API ID that is passed in the request	String
apigateway:Request/RouteAuthorizationType	Filters access by authorization type, for example NONE, AWS_IAM, CUSTOM, JWT. Available during the CreateRoute and UpdateRoute operations. Also available as a collection during import	ArrayOfString

Condition keys	Description	Type
apigatewa y:Request/ RoutingMode	Filters access by routing mode of the domain name. Available during the CreateDomainName and UpdateDomainName operations	String
apigatewa y:Request/ SecurityPolicy	Filters access by TLS version. Available during the CreateDomain and UpdateDomain operations	ArrayOfString
apigatewa y:Request/Stage	Filters access by a ProductRestEndpointPage's Amazon API Gateway Stage Name that is passed in the request	String
apigatewa y:Request/ StageName	Filters access by stage name of the deployment that you attempt to create. Available during the CreateDep loyment operation	String
apigatewa y:Resourc e/AccessL oggingDes tination	Filters access by access log destination of the current Stage resource. Available during the UpdateStage and DeleteStage operations	String
apigatewa y:Resourc e/AccessL oggingFormat	Filters access by access log format of the current Stage resource. Available during the UpdateStage and DeleteStage operations	String
apigatewa y:Resource/ ApiKeyRequired	Filters access by the requirement of API key for the existing Route resource. Available during the UpdateRou te and DeleteRoute operations. Also available as a collection during reimport	ArrayOfBool
apigatewa y:Resource/ ApiName	Filters access by API name. Available during the UpdateApi and DeleteApi operations	String

Condition keys	Description	Type
apigateway:Resource/AuthorizerType	Filters access by the current type of authorizer, for example REQUEST or JWT. Available during UpdateAuthorizer and DeleteAuthorizer operations. Also available during import and reimport as an ArrayOfString	ArrayOfString
apigateway:Resource/AuthorizerUri	Filters access by the URI of the current Lambda authorizer associated with the current API. Available during UpdateAuthorizer and DeleteAuthorizer. Also available as a collection during reimport	ArrayOfString
apigateway:Resource/CognitoUserPoolArn	Filters access by a Portal's CognitoUserPoolArn associated with the resource	ARN
apigateway:Resource/ConditionBasePaths	Filters access by base paths defined on the condition of the existing routing rule. Available during the UpdateRoutingRule and DeleteRoutingRule operations	ArrayOfString
apigateway:Resource/DisableExecuteApiEndpoint	Filters access by status of the default execute-api endpoint. Available during the UpdateApi and DeleteApi operations	Bool
apigateway:Resource/EndpointType	Filters access by endpoint type. Available during the UpdateDomainName, DeleteDomainName, UpdateApi, and DeleteApi operations	ArrayOfString
apigateway:Resource/Method	Filters access by a ProductRestEndpointPage's HTTP Method associated with the resource	String

Condition keys	Description	Type
apigateway:Resource/MtlsTrustStoreUri	Filters access by URI of the truststore used for mutual TLS authentication. Available during the UpdateDomainName and DeleteDomainName operations	String
apigateway:Resource/MtlsTrustStoreVersion	Filters access by version of the truststore used for mutual TLS authentication. Available during the UpdateDomainName and DeleteDomainName operations	String
apigateway:Resource/PortalDisplayName	Filters access by a Portal's Display Name associated with the resource	String
apigateway:Resource/PortalDomainName	Filters access by a Portal's vanity domain name associated with the resource	String
apigateway:Resource/PortalProductDisplayName	Filters access by a PortalProduct's Display Name associated with the resource	String
apigateway:Resource/PortalPublishStatus	Filters access by a Portal's published status associated with the resource	String
apigateway:Resource/Priority	Filters access by priority of the existing routing rule. Available during the UpdateRoutingRule and DeleteRoutingRule operations	Numeric

Condition keys	Description	Type
apigateway:Resource/ProductPageTitle	Filters access by a ProductPage's Title associated with the resource	String
apigateway:Resource/ProductRestEndpointPageEndpointPrefix	Filters access by a ProductRestEndpointPage's EndpointPrefix associated with the resource	String
apigateway:Resource/RestApiId	Filters access by a ProductRestEndpointPage's Amazon API Gateway API ID associated with the resource	String
apigateway:Resource/RouteAuthorizationType	Filters access by authorization type of the existing Route resource, for example NONE, AWS_IAM, CUSTOM. Available during the UpdateRoute and DeleteRoute operations. Also available as a collection during reimport	ArrayOfString
apigateway:Resource/RoutingMode	Filters access by routing mode of the existing domain name. Available during the UpdateDomainName and DeleteDomainName operations	String
apigateway:Resource/SecurityPolicy	Filters access by TLS version. Available during the UpdateDomainName and DeleteDomainName operations	ArrayOfString
apigateway:Resource/Stage	Filters access by a ProductRestEndpointPage's Amazon API Gateway Stage Name associated with the resource	String
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS App Mesh

AWS App Mesh (service prefix: `appmesh`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS App Mesh

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateGatewayRoute	Grants permission to create a gateway route that is	Write	gatewayRoute*	aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	associated with a virtual gateway			aws:RequestTag/${TagKey}	
			virtualService		
CreateMesh	Grants permission to create a service mesh	Write	mesh*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateRoute	Grants permission to create a route that is associated with a virtual router	Write	route*	aws:TagKeys aws:RequestTag/${TagKey}	
			virtualNode		
CreateVirtualGateway	Grants permission to create a virtual gateway within a service mesh	Write	virtualGateway*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateVirtualNode	Grants permission to create a virtual node within a service mesh	Write	virtualNode*	aws:TagKeys aws:RequestTag/${TagKey}	
			virtualService		
CreateVirtualRouter	Grants permission to create a virtual router within a service mesh	Write	virtualRouter*		
				aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateVirtualService	Grants permission to create a virtual service within a service mesh	Write	virtualService*	aws:TagKeys aws:RequestTag/${TagKey}	
			virtualNode		
			virtualRouter		
DeleteGatewayRoute	Grants permission to delete an existing gateway route	Write	gatewayRoute*		
DeleteMesh	Grants permission to delete an existing service mesh	Write	mesh*		
DeleteMeshPolicy [permission only]	Grants permission to delete the RAM access control policy for a mesh	Write	mesh*		
DeleteRoute	Grants permission to delete an existing route	Write	route*		
DeleteVirtualGateway	Grants permission to delete an existing virtual gateway	Write	virtualGateway*		
DeleteVirtualNode	Grants permission to delete an existing virtual node	Write	virtualNode*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteVirtualRouter	Grants permission to delete an existing virtual router	Write	virtualRouter*

			virtualNode		
UpdateVirtualGateway	Grants permission to update an existing virtual gateway in a specified service mesh	Write	virtualGateway*		
UpdateVirtualNode	Grants permission to update an existing virtual node in a specified service mesh	Write	virtualNode*		
UpdateVirtualRouter	Grants permission to update an existing virtual router in a specified service mesh	Write	virtualRouter*		
UpdateVirtualService	Grants permission to update an existing virtual service in a specified service mesh	Write	virtualService*		
			virtualNode		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			virtualRouter		

Resource types defined by AWS App Mesh

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
mesh	`arn:${Partition}:appmesh:${Region}:${Account}:mesh/${MeshName}`	aws:ResourceTag/${TagKey}
virtualService	`arn:${Partition}:appmesh:${Region}:${Account}:mesh/${MeshName}/virtualService/${VirtualServiceName}`	aws:ResourceTag/${TagKey}
virtualNode	`arn:${Partition}:appmesh:${Region}:${Account}:mesh/${MeshName}/virtualNode/${VirtualNodeName}`	aws:ResourceTag/${TagKey}
virtualRouter	`arn:${Partition}:appmesh:${Region}:${Account}:mesh/${MeshName}/virtualRouter/${VirtualRouterName}`	aws:ResourceTag/${TagKey}
route	`arn:${Partition}:appmesh:${Region}:${Account}:mesh/${MeshName}/virtualRo`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
	`uter/${VirtualRouterName}/route/${RouteName}`	
virtualGateway	`arn:${Partition}:appmesh:${Region}:${Account}:mesh/${MeshName}/virtualGateway/${VirtualGatewayName}`	aws:ResourceTag/${TagKey}
gatewayRoute	`arn:${Partition}:appmesh:${Region}:${Account}:mesh/${MeshName}/virtualGateway/${VirtualGatewayName}/gatewayRoute/${GatewayRouteName}`	aws:ResourceTag/${TagKey}

Condition keys for AWS App Mesh

AWS App Mesh defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters actions by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters actions by the tag key-value pairs attached to the resource	String
aws:TagKeys	Filters actions by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS App Mesh Preview

AWS App Mesh Preview (service prefix: `appmesh-preview`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS App Mesh Preview

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateGatewayRoute	Grants permission to create a gateway route that is associated with a virtual gateway	Write	gatewayRoute*		
			virtualService		
CreateMesh	Grants permission to create a service mesh	Write	mesh*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateRoute	Grants permission to create a route that is associated with a virtual router	Write	route*		
			virtualNode		
CreateVirtualGateway	Grants permission to create a virtual gateway within a service mesh	Write	virtualGateway*		
CreateVirtualNode	Grants permission to create a virtual node within a service mesh	Write	virtualNode*

ListVirtualRouters	Grants permission to list existing virtual routers in a service mesh	List	mesh*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListVirtualServices	Grants permission to list existing virtual services in a service mesh	List	mesh*		
PutMeshPolicy [permission only]	Grants permission to define the RAM access control policy for a mesh	Write	mesh*		
StreamAggregatedResources	Grants permission to receive streamed resources for an App Mesh endpoint (VirtualNode/VirtualGateway)	Read	virtualGateway		
			virtualNode		
UpdateGatewayRoute	Grants permission to update an existing gateway route for a specified service mesh and virtual gateway	Write	gatewayRoute*		
			virtualService		
UpdateMesh	Grants permission to update an existing service mesh	Write	mesh*		
UpdateRoute	Grants permission to update an existing route for a specified service mesh and virtual router	Write	route*		
			virtualNode		
UpdateVirtualGateway	Grants permission to update an existing virtual gateway in a specified service mesh	Write	virtualGateway*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateVirtualNode	Grants permission to update an existing virtual node in a specified service mesh	Write	virtualNode*		
UpdateVirtualRouter	Grants permission to update an existing virtual router in a specified service mesh	Write	virtualRouter*		
UpdateVirtualService	Grants permission to update an existing virtual service in a specified service mesh	Write	virtualService*		
			virtualNode		
			virtualRouter		

Resource types defined by AWS App Mesh Preview

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
mesh	`arn:${Partition}:appmesh-preview:${Region}:${Account}:mesh/${MeshName}`	

Resource types	ARN	Condition keys
virtualService	arn:${Partition}:appmesh-preview:${Region}:${Account}:mesh/${MeshName}/virtualService/${VirtualServiceName}	
virtualNode	arn:${Partition}:appmesh-preview:${Region}:${Account}:mesh/${MeshName}/virtualNode/${VirtualNodeName}	
virtualRouter	arn:${Partition}:appmesh-preview:${Region}:${Account}:mesh/${MeshName}/virtualRouter/${VirtualRouterName}	
route	arn:${Partition}:appmesh-preview:${Region}:${Account}:mesh/${MeshName}/virtualRouter/${VirtualRouterName}/route/${RouteName}	
virtualGateway	arn:${Partition}:appmesh-preview:${Region}:${Account}:mesh/${MeshName}/virtualGateway/${VirtualGatewayName}	
gatewayRoute	arn:${Partition}:appmesh-preview:${Region}:${Account}:mesh/${MeshName}/virtualGateway/${VirtualGatewayName}/gatewayRoute/${GatewayRouteName}	

Condition keys for AWS App Mesh Preview

App Mesh Preview has no service-specific context keys that can be used in the Condition element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS App Runner

AWS App Runner (service prefix: `apprunner`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS App Runner

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateCustomDomain	Grants permission to associate your own domain name with the AWS App Runner subdomain URL of your App Runner service	Write	service*		
AssociateWebAcl [permission only]	Grants permission to associate the service with an AWS WAF web ACL	Write	service* webacl*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAutoScalingConfiguration	Grants permission to create an AWS App Runner automatic scaling configuration resource	Write	autoscalingconfiguration*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateConnection	Grants permission to create an AWS App Runner connection resource	Write	connection*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateObservabilityConfiguration	Grants permission to create an AWS App Runner observability configuration resource	Write	observabilityconfiguration*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateService	Grants permission to create an AWS App Runner service resource	Write	service*

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				apprunner:ConnectionArn apprunner:AutoScalingConfigurationArn apprunner:ObservabilityConfigurationArn apprunner:VpcConnectorArn	
UpdateVpcIngressConnection	Grants permission to update an AWS App Runner VpcIngressConnection resource	Write	vpcingressconnection*		
				apprunner:VpcId apprunner:VpcEndpointId	

Resource types defined by AWS App Runner

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
service	`arn:${Partition}:apprunner:${Region}:${Account}:service/${ServiceName}/${ServiceId}`	aws:ResourceTag/${TagKey}
connection	`arn:${Partition}:apprunner:${Region}:${Account}:connection/${ConnectionName}/${ConnectionId}`	aws:ResourceTag/${TagKey}
autoscalingconfiguration	`arn:${Partition}:apprunner:${Region}:${Account}:autoscalingconfiguration/${AutoscalingConfigurationName}/${AutoscalingConfigurationVersion}/${AutoscalingConfigurationId}`	aws:ResourceTag/${TagKey}
observabilityconfiguration	`arn:${Partition}:apprunner:${Region}:${Account}:observabilityconfiguration/${ObservabilityConfigurationName}/${ObservabilityConfigurationVersion}/${ObservabilityConfigurationId}`	aws:ResourceTag/${TagKey}
vpcconnector	`arn:${Partition}:apprunner:${Region}:${Account}:vpcconnector/${VpcConnectorName}/${VpcConnectorVersion}/${VpcConnectorId}`	aws:ResourceTag/${TagKey}
vpcingressconnection	`arn:${Partition}:apprunner:${Region}:${Account}:vpcingressconnection/${V`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
	pcIngressConnectionName}/${VpcIngressConnectionId}	
webacl	arn:${Partition}:wafv2:${Region}:${Account}:${Scope}/webacl/${Name}/${Id}	

Condition keys for AWS App Runner

AWS App Runner defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
apprunner:AutoScalingConfigurationArn	Filters access by the CreateService and UpdateService actions based on the ARN of an associated AutoScalingConfiguration resource	ARN
apprunner:ConnectionArn	Filters access by the CreateService and UpdateService actions based on the ARN of an associated Connection resource	ARN
apprunner:ObservabilityConfigurationArn	Filters access by the CreateService and UpdateService actions based on the ARN of an associated ObservabilityConfiguration resource	ARN
apprunner:ServiceArn	Filters access by the CreateVpcIngressConnection action based on the ARN of an associated Service resource	ARN

Condition keys	Description	Type
apprunner:VpcConnectorArn	Filters access by the CreateService and UpdateService actions based on the ARN of an associated VpcConnector resource	ARN
apprunner:VpcEndpointId	Filters access by the CreateVpcIngressConnection and UpdateVpcIngressConnection actions based on the VPC Endpoint in the request	String
apprunner:VpcId	Filters access by the CreateVpcIngressConnection and UpdateVpcIngressConnection actions based on the VPC in the request	String
aws:RequestTag/${TagKey}	Filters access by actions based on the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by actions based on tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by actions based on the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS App Studio

AWS App Studio (service prefix: `appstudio`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Resource types defined by AWS App Studio
- Condition keys for AWS App Studio

Actions defined by AWS App Studio

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAccountStatus [permission only]	Grants permission to describe the account's current status	Read			
GetEnablementJobStatus [permission only]	Grants permission to fetch status of a enablement job	Read			
StartEnablementJob [permission only]	Grants permission to submit a enablement job	Write			
StartRollbackEnablementJob [permission only]	Grants permission to rollback an enablement job	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartTeam Deployment [permission only]	Grants permission to start a team deployment	Write			

Resource types defined by AWS App Studio

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
instance	`arn:${Partition}:appstudio:${Region}:${Account}:instance/${InstanceId}`	
application	`arn:${Partition}:appstudio:${Region}:${Account}:application/${ApplicationId}`	
connector	`arn:${Partition}:appstudio:${Region}:${Account}:connector/${ConnectionId}`	

Condition keys for AWS App Studio

App Studio has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS App2Container

AWS App2Container (service prefix: `a2c`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Topics

Actions defined by AWS App2Container

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetContainerizationJobDetails	Grants permission to get the details of all Containerization jobs	Read			
GetDeploymentJobDetails	Grants permission to get the details of all Deployment jobs	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartContainerizationJob	Grants permission to start a Containerization job	Write			
StartDeploymentJob	Grants permission to start a Deploymnet job	Write			

Resource types defined by AWS App2Container

AWS App2Container does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS App2Container, specify `"Resource": "*"` in your policy.

Condition keys for AWS App2Container

App2Container has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS AppConfig

AWS AppConfig (service prefix: `appconfig`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

ValidateConfiguration	Grants permission to validate a configuration	Write	application*		
			configurationprofile*		

Resource types defined by AWS AppConfig

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
application	arn:${Partition}:appconfig:${Region}:${Account}:application/${ApplicationId}	aws:ResourceTag/${TagKey}
environment	arn:${Partition}:appconfig:${Region}:${Account}:application/${ApplicationId}/environment/${EnvironmentId}	aws:ResourceTag/${TagKey}
configurationprofile	arn:${Partition}:appconfig:${Region}:${Account}:application/${ApplicationId}/configurationprofile/${ConfigurationProfileId}	aws:ResourceTag/${TagKey}
deploymentstrategy	arn:${Partition}:appconfig:${Region}:${Account}:deploymentstrategy/${DeploymentStrategyId}	aws:ResourceTag/${TagKey}
deployment	arn:${Partition}:appconfig:${Region}:${Account}:application/${ApplicationId}/environment/${EnvironmentId}/deployment/${DeploymentNumber}	aws:ResourceTag/${TagKey}
hostedconfigurationversion	arn:${Partition}:appconfig:${Region}:${Account}:application/${ApplicationId}/configurationprofile/${ConfigurationProfileId}	
configuration	arn:${Partition}:appconfig:${Region}:${Account}:application/${ApplicationId}/environment/${EnvironmentId}/configuration/${ConfigurationProfileId}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
extension	arn:${Partition}:appconfig:${Region}:${Account}:extension/${ExtensionId}/${ExtensionVersionNumber}	aws:ResourceTag/${TagKey}
extension association	arn:${Partition}:appconfig:${Region}:${Account}:extensionassociation/${ExtensionAssociationId}	aws:ResourceTag/${TagKey}

Condition keys for AWS AppConfig

AWS AppConfig defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the allowed set of values for a specified tag	String
aws:ResourceTag/${TagKey}	Filters access by a tag key-value pair assigned to the AWS resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString

Actions, resources, and condition keys for AWS AppFabric

AWS AppFabric (service prefix: appfabric) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS AppFabric

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetUserAccessTasks	Grants permission to start user access tasks for multiple users	Write	appbundle*		
ConnectAppAuthorization	Grants permission to connect app authorizations	Write	appauthorization*		
			appbundle*		
CreateAppAuthorization	Grants permission to create app authorizations for app bundles	Write	appbundle*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys

			ingestion*		
			ingestiondestination*		
				aws:ResourceTag/${TagKey}	

Resource types defined by AWS AppFabric

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
appbundle	arn:${Partition}:appfabric:${Region}:${Account}:appbundle/${AppBundleIdentifier}	aws:ResourceTag/${TagKey}
appauthorization	arn:${Partition}:appfabric:${Region}:${Account}:appbundle/${AppbundleId}/appauthorization/${AppAuthorizationIdentifier}	aws:ResourceTag/${TagKey}
ingestion	arn:${Partition}:appfabric:${Region}:${Account}:appbundle/${AppbundleId}/ingestion/${IngestionIdentifier}	aws:ResourceTag/${TagKey}
ingestion destination	arn:${Partition}:appfabric:${Region}:${Account}:appbundle/${AppbundleId}/ingestion/${IngestionIdentifier}/ingestiondestination/${IngestionDestinationIdentifier}	aws:ResourceTag/${TagKey}

Condition keys for AWS AppFabric

AWS AppFabric defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon AppFlow

Amazon AppFlow (service prefix: `appflow`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon AppFlow

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of

access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelFlowExecutions	Grants permission to cancel in-progress executions of an Amazon AppFlow flow	Write	flow*		
CreateConnectorProfile	Grants permission to create a login profile to be used with Amazon AppFlow flows	Write			
CreateFlow	Grants permission to create an Amazon AppFlow flow	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteConnectorProfile	Grants permission to delete a login profile configured in Amazon AppFlow	Write	connectorprofile*		
DeleteFlow	Grants permission to delete an Amazon AppFlow flow	Write	flow*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DescribeConnector	Grants permission to describe a connector registered in Amazon AppFlow	Read	connector*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeConnectorEntity	Grants permission to describe all fields for an object in a login profile configured in Amazon AppFlow	Read	connectorprofile*		
DescribeConnectorFields [permission only]	Grants permission to describe all fields for an object in a login profile configured in Amazon AppFlow (Console Only)	Read	connectorprofile*		
DescribeConnectorProfiles	Grants permission to describe all login profiles configured in Amazon AppFlow	Read			
DescribeConnectors	Grants permission to describe all connectors supported by Amazon AppFlow	Read			
DescribeFlow	Grants permission to describe a specific flow configured in Amazon AppFlow	Read	flow*		
DescribeFlowExecution [permission only]	Grants permission to describe all flow executions for a flow configured in Amazon AppFlow (Console Only)	Read	flow*		
DescribeFlowExecutionRecords	Grants permission to describe all flow executions for a flow configured in Amazon AppFlow	Read	flow*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeFlows [permission only]	Grants permission to describe all flows configured in Amazon AppFlow (Console Only)	Read			
ListConnectorEntities	Grants permission to list all objects for a login profile configured in Amazon AppFlow	List	connectorprofile*		
ListConnectorFields [permission only]	Grants permission to list all objects for a login profile configured in Amazon AppFlow (Console Only)	Read	connectorprofile*		
ListConnectors	Grants permission to list all connectors supported in Amazon AppFlow	List	connector*		
ListFlows	Grants permission to list all flows configured in Amazon AppFlow	List	flow*		
ListTagsForResource	Grants permission to list tags for a flow	Read	flow*		
RegisterConnector	Grants permission to register an Amazon AppFlow connector	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ResetConnectorMetadataCache	Grants permission to resets metadata of connector entities that Amazon AppFlow stored in its cache	Write	connectorprofile*		
RunFlow [permission only]	Grants permission to run a flow configured in Amazon AppFlow (Console Only)	Write	flow*		
StartFlow	Grants permission to activate (for scheduled and event-triggered flows) or run (for on-demand flows) a flow configured in Amazon AppFlow	Write	flow*		
StopFlow	Grants permission to deactivate a scheduled or event-triggered flow configured in Amazon AppFlow	Write	flow*		
TagResource	Grants permission to tag a flow or a connector	Tagging	connector		
			flow		
				aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UnRegisterConnector	Grants permission to un-register a connector in Amazon AppFlow	Write	connector*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag a flow or a connector	Tagging	connector		
			flow		
				aws:TagKeys	
UpdateConnectorProfile	Grants permission to update a login profile configured in Amazon AppFlow	Write	connectorprofile*		
UpdateConnectorRegistration	Grants permission to update a registered connector configured in Amazon AppFlow	Write	connector*		
UpdateFlow	Grants permission to update a flow configured in Amazon AppFlow	Write	flow*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UseConnectorProfile [permission only]	Grants permission to use a connector profile while creating a flow in Amazon AppFlow	Write	connector profile*		

Resource types defined by Amazon AppFlow

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
connector profile	`arn:${Partition}:appflow:${Region}:${Account}:connectorprofile/${ProfileName}`	
flow	`arn:${Partition}:appflow:${Region}:${Account}:flow/${FlowName}`	aws:ResourceTag/${TagKey}
connector	`arn:${Partition}:appflow:${Region}:${Account}:connector/${ConnectorLabel}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon AppFlow

Amazon AppFlow defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters access by tag-value associated with the resource	String
aws:TagKeys	Filters access by presence of mandatory tags in the request	ArrayOfString

Actions, resources, and condition keys for Amazon AppIntegrations

Amazon AppIntegrations (service prefix: `app-integrations`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Application Auto Scaling

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy,

you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteScalingPolicy	Grants permission to delete a scaling policy	Write	ScalableTarget*		
				application-autoscaling:service-namespace application-autoscaling:scalable-dimension	
DeleteScheduledAction	Grants permission to delete a scheduled action	Write	ScalableTarget*		
				application-autoscaling:service-namespace application-autosc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aling:scalable-dimension	
DeregisterScalableTarget	Grants permission to deregister a scalable target	Write	ScalableTarget*		
				application-autoscaling:service-namespace application-autoscaling:scalable-dimension	
DescribeScalableTargets	Grants permission to describe one or more scalable targets in the specified namespace	Read			
DescribeScalingActivities	Grants permission to describe a set of scaling activities or all scaling activities in the specified namespace	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeScalingPolicies	Grants permission to describe a set of scaling policies or all scaling policies in the specified namespace	Read			
DescribeScheduledActions	Grants permission to describe a set of scheduled actions or all scheduled actions in the specified namespace	Read			
GetPredictiveScalingForecast	Grants permission to retrieve the forecast data for a predictive scaling policy	List			
ListTagsForResource	Grants permission to list tags for a scalable target	Read	ScalableTarget*		
PutScalingPolicy	Grants permission to create and update a scaling policy for a scalable target	Write	ScalableTarget*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				application-autoscaling:service-namespace application-autoscaling:scalable-dimension	
PutScheduledAction	Grants permission to create and update a scheduled action for a scalable target	Write	ScalableTarget*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				application-autoscaling:service-namespace application-autoscaling:scalable-dimension	
RegisterScalableTarget	Grants permission to register AWS or custom resources as scalable targets with Application Auto Scaling and to update configuration parameters used to manage a scalable target	Write	ScalableTarget*		application-autoscaling:TagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys application-autoscaling:service-namespace application-autoscaling:scalable-dimension	
TagResource	Grants permission to tag a scalable target	Tagging	ScalableTarget*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from a scalable target	Tagging	ScalableTarget*		
				aws:TagKeys	

Resource types defined by AWS Application Auto Scaling

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
ScalableTarget	`arn:${Partition}:application-autoscaling:${Region}:${Account}:scalable-target/${ResourceId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Application Auto Scaling

AWS Application Auto Scaling defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
application-autoscaling:scalable-dimension	Filters access by the scalable dimension that is passed in the request	String
application-autoscaling:service-namespace	Filters access by the service namespace that is passed in the request	String
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Application Discovery Arsenal

Topics

Actions defined by Application Discovery Arsenal

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RegisterOnPremisesAgent [permission only]	Grants permission to register AWS provided data collectors to the Application Discovery Service	Write			

Resource types defined by Application Discovery Arsenal

Application Discovery Arsenal does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Application Discovery Arsenal, specify `"Resource": "*"` in your policy.

Condition keys for Application Discovery Arsenal

Application Discovery Arsenal has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Application Discovery Service

AWS Application Discovery Service (service prefix: `discovery`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Application Discovery Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit

resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateConfigurationItemsToApplication	Grants permission to AssociateConfigurationItemsToApplication API. AssociateConfigurationItemsToApplication associates one or more configuration items with an application	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchDeleteAgents	Grants permission to BatchDeleteAgents API. BatchDeleteAgents deletes one or more agents/data collectors associated with your account, each identified by its agent ID. Deleting a data collector does not delete the previous data collected	Write			
BatchDeleteImportData	Grants permission to BatchDeleteImportData API. BatchDeleteImportData deletes one or more Migration Hub import tasks, each identified by their import ID. Each import task has a number of records, which can identify servers or applications	Write			
CreateApplication	Grants permission to CreateApplication API. CreateApplication creates an application with the given name and description	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTags	Grants permission to CreateTags API. CreateTags creates one or more tags for configuration items. Tags are metadata that help you categorize IT assets. This API accepts a list of multiple configuration items	Tagging			
DeleteApplications	Grants permission to DeleteApplications API. DeleteApplications deletes a list of applications and their associations with configuration items	Write			
DeleteTags	Grants permission to DeleteTags API. DeleteTags deletes the association between configuration items and one or more tags. This API accepts a list of multiple configuration items	Tagging		aws:TagKeys	
DescribeAgents	Grants permission to DescribeAgents API. DescribeAgents lists agents or the Connector by ID or lists all agents/Connectors associated with your user if you did not specify an ID	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeBatchDeleteConfigurationTask	Grants permission to DescribeBatchDeleteConfigurationTask API. DescribeBatchDeleteConfigurationTask returns attributes about a batched deletion task to delete a set of configuration items. The supplied task ID should be the task ID receieved from the output of StartBatchDeleteConfigurationTask	Read			
DescribeConfigurations	Grants permission to DescribeConfigurations API. DescribeConfigurations retrieves attributes for a list of configuration item IDs. All of the supplied IDs must be for the same asset type (server, application, process, or connection). Output fields are specific to the asset type selected. For example, the output for a server configuration item includes a list of attributes about the server, such as host name, operating system, and number of network cards	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeContinuousExports	Grants permission to DescribeContinuousExports API. DescribeContinuous Exports lists exports as specified by ID. All continuous exports associated with your user can be listed if you call DescribeContinuousExports as is without passing any parameters	Read			
DescribeExportConfigurations	Grants permission to DescribeExportConfigurations API. DescribeExportConfigurations retrieves the status of a given export process. You can retrieve status from a maximum of 100 processes	Read			
DescribeExportTasks	Grants permission to DescribeExportTasks API. DescribeExportTasks retrieve status of one or more export tasks. You can retrieve the status of up to 100 export tasks	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeImportTasks	Grants permission to DescribeImportTasks API. DescribeImportTasks returns an array of import tasks for your user, including status information, times, IDs, the Amazon S3 Object URL for the import file, and more	List			
DescribeTags	Grants permission to DescribeTags API. DescribeTags retrieves a list of configuration items that are tagged with a specific tag. Or retrieves a list of all tags assigned to a specific configuration item	Read			
DisassociateConfigurationItemsFromApplication	Grants permission to DisassociateConfigurationItemsFromApplication API. DisassociateConfigurationItemsFromApplication disassociates one or more configuration items from an application	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ExportConfigurations	Grants permission to ExportConfigurations API. ExportConfigurations exports all discovered configuration data to an Amazon S3 bucket or an application that enables you to view and evaluate the data. Data includes tags and tag associations, processes , connections, servers, and system performance	Write			
GetDiscoverySummary	Grants permission to GetDiscoverySummary API. GetDiscoverySummary retrieves a short summary of discovered assets	Read			
GetNetworkConnectionGraph	Grants permission to GetNetworkConnectionGraph API. GetNetworkConnectionGraph accepts input list of one of - Ip Addresses, server ids or node ids. Returns a list of nodes and edges which help customer visualize network connection graph. This API is used for visualize network graph functionality in MigrationHub console	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListConfigurations	Grants permission to ListConfigurations API. ListConfigurations retrieves a list of configuration items according to criteria you specify in a filter. The filter criteria identify relationship requirements	List			
ListServerNeighbors	Grants permission to ListServerNeighbors API. ListServerNeighbors retrieves a list of servers which are one network hop away from a specified server	List			
StartBatchDeleteConfigurationTask	Grants permission to StartBatchDeleteConfigurationTask API. StartBatchDeleteConfigurationTask starts an asynchronous batch deletion of your configuration items. All of the supplied IDs must be for the same asset type (server, application, process, or connection). Output is a unique task ID you can use to check back on the deletions progress	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartContinuousExport	Grants permission to StartContinuousExport API. StartContinuousExport start the continuous flow of agent's discovered data into Amazon Athena	Write			iam:AttachRolePolicy iam:CreatePolicy iam:CreateRole iam:CreateServiceLinkedRole
StartDataCollectionByAgentIds	Grants permission to StartDataCollectionByAgentIds API. StartDataCollectionByAgentIds instructs the specified agents or Connectors to start collecting data	Write			
StartExportTask	Grants permission to StartExportTask API. StartExportTask export the configuration data about discovered configuration items and relationships to an S3 bucket in a specified format	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartImportTask	Grants permission to StartImportTask API. StartImportTask starts an import task. The Migration Hub import feature allows you to import details of your on-premises environment directly into AWS without having to use the Application Discovery Service (ADS) tools such as the Discovery Connector or Discovery Agent. This gives you the option to perform migration assessment and planning directly from your imported data including the ability to group your devices as applications and track their migration status	Write			discovery:AssociateConfigurationItemsToApplication discovery:CreateApplication discovery:CreateTags discovery:GetDiscoverySummary discovery:ListConfigurations s3:GetObject

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StopContinuousExport	Grants permission to StopContinuousExport API. StopContinuousExport stops the continuous flow of agent's discovered data into Amazon Athena	Write			
StopDataCollectionByAgentIds	Grants permission to StopDataCollectionByAgentIds API. StopDataCollectionByAgentIds instructs the specified agents or Connectors to stop collecting data	Write			
UpdateApplication	Grants permission to UpdateApplication API. UpdateApplication updates metadata about an application	Write			

Resource types defined by AWS Application Discovery Service

AWS Application Discovery Service does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Application Discovery Service, specify `"Resource": "*"` in your policy.

> **Note**
>
> To separate access, create and use separate AWS accounts.

Condition keys for AWS Application Discovery Service

AWS Application Discovery Service defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Application Migration Service

AWS Application Migration Service (service prefix: `mgn`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

- Condition keys for AWS Application Migration Service

Actions defined by AWS Application Migration Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy,

you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ArchiveApplication	Grants permission to archive an application	Write	ApplicationResource*		
ArchiveWave	Grants permission to archive a wave	Write	WaveResource*		
AssociateApplications	Grants permission to associate applications to a wave	Write	ApplicationResource*		
			WaveResource*		
AssociateSourceServers	Grants permission to associate source servers to an application	Write	ApplicationResource*		
			SourceServerResource*		
BatchCreateVolumeSnapshotGroupForMgn [permission only]	Grants permission to create volume snapshot group	Write	SourceServerResource*		
BatchDeleteSnapshotRequestForMgn	Grants permission to batch delete snapshot request	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
[permission only]					
ChangeServerLifeCycleState	Grants permission to change source server life cycle state	Write	SourceServerResource*		
CreateApplication	Grants permission to create an application	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateConnector	Grants permission to create connector	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateLaunchConfigurationTemplate	Grants permission to create launch configuration template	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateNetworkMigrationDefinition	Grants permission to create a network migration definition	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateReplicationConfigurationTemplate	Grants permission to create replication configuration template	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateVcenterClientForMgn [permission only]	Grants permission to create vcenter client	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateWave	Grants permission to create a wave	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteApplication	Grants permission to delete an application	Write	ApplicationResource*		
DeleteConnector	Grants permission to delete connector	Write	ConnectorResource*		
DeleteJob	Grants permission to delete job	Write	JobResource*		
DeleteLaunchConfigurationTemplate	Grants permission to delete launch configuration template	Write	LaunchConfigurationTemplateResource*		
DeleteNetworkMigrationDefinition	Grants permission to delete a network migration definition	Write	NetworkMigrationDefinitionResource*		
DeleteReplicationConfigurationTemplate	Grants permission to delete replication configuration template	Write	ReplicationConfigurationTemplateResource*		
DeleteSourceServer	Grants permission to delete source server	Write	SourceServerResource*		
DeleteVcenterClient	Grants permission to delete vcenter client	Write	VcenterClientResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteWave	Grants permission to delete a wave	Write	WaveResource*		
DescribeJobLogItems	Grants permission to describe job log items	Read	JobResource*		
DescribeJobs	Grants permission to describe jobs	List			
DescribeLaunchConfigurationTemplates	Grants permission to describe launch configuration template	List			
DescribeReplicationConfigurationTemplates	Grants permission to describe replication configuration template	List			
DescribeReplicationServerAssociationsForMgn [permission only]	Grants permission to describe replication server associations	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeSnapshotRequestsForMgn [permission only]	Grants permission to describe snapshots requests	Read			
DescribeSourceServers	Grants permission to describe source servers	List			
DescribeVcenterClients	Grants permission to describe vcenter clients	List			
DisassociateApplications	Grants permission to disassociate applications from a wave	Write	ApplicationResource*		
			WaveResource*		
DisassociateSourceServers	Grants permission to disassociate source servers from an application	Write	ApplicationResource*		
			SourceServerResource*		
DisconnectFromService	Grants permission to disconnect source server from service	Write	SourceServerResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
FinalizeCutover	Grants permission to finalize cutover	Write	SourceServerResource*		
GetAccountSettings	Grants permission to get account settings	Read			
GetAgentCommandForMgn [permission only]	Grants permission to get agent command	Read	SourceServerResource*		
GetAgentConfirmedResumeInfoForMgn [permission only]	Grants permission to get agent confirmed resume info	Read	SourceServerResource*		
GetAgentInstallationAssetsForMgn [permission only]	Grants permission to get agent installation assets	Read			
GetAgentReplicationInfoForMgn [permission only]	Grants permission to get agent replication info	Read	SourceServerResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAgentRuntimeConfigurationForMgn [permission only]	Grants permission to get agent runtime configuration	Read	SourceServerResource*		
GetAgentSnapshotCreditsForMgn [permission only]	Grants permission to get agent snapshots credits	Read	SourceServerResource*		
GetChannelCommandsForMgn [permission only]	Grants permission to get channel commands	Read			
GetLaunchConfiguration	Grants permission to get launch configuration	Read	SourceServerResource*		
GetNetworkMigrationDefinition	Grants permission to get a network migration definition	Read	NetworkMigrationDefinitionResource*		
GetNetworkMigrationMapperSegmentConstruct	Grants permission to get a network migration mapper segment construct	Read	NetworkMigrationDefinitionResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetReplicationConfiguration	Grants permission to get replication configuration	Read	SourceServerResource*		
GetVcenterClientCommandsForMgn [permission only]	Grants permission to get vcenter client commands	Read	VcenterClientResource*		
InitializeService	Grants permission to initialize service	Write			iam:AddRoleToInstanceProfile iam:CreateInstanceProfile iam:CreateServiceLinkedRole iam:GetInstanceProfile
IssueClientCertificateForMgn [permission only]	Grants permission to issue a client certificate	Write	SourceServerResource		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListApplications	Grants permission to list application summaries	List			
ListConnectors	Grants permission to list connectors	Read			
ListExportErrors	Grants permission to list the errors of an export task	List	ExportResource*		
ListExports	Grants permission to list export tasks	List			
ListImportErrors	Grants permission to list the errors of an import task	List	ImportResource*		
ListImportFileEnrichments	Grants permission to list the import file enrichment tasks	List			
ListImports	Grants permission to list the import tasks	List			
ListManagedAccounts	Grants permission to list managed accounts	List			
ListNetworkMigrationAnalyses	Grants permission to list network migration analyses	List	NetworkMigrationDefinitionResource*		
ListNetworkMigrationAnalysisResults	Grants permission to list network migration analysis results	List	NetworkMigrationDefinitionResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListNetworkMigrationCodeGenerationSegments	Grants permission to list network migration code generation segments	List	NetworkMigrationDefinitionResource*		
ListNetworkMigrationCodeGenerations	Grants permission to list network migration code generations	List	NetworkMigrationDefinitionResource*		
ListNetworkMigrationDefinitions	Grants permission to list network migration definitions	List			
ListNetworkMigrationDeployedStacks	Grants permission to list network migration deployed stacks	List	NetworkMigrationDefinitionResource*		
ListNetworkMigrationDeployedStacksDeletions	Grants permission to list network migration deployed stacks deletions	List	NetworkMigrationDefinitionResource*		
ListNetworkMigrationDeployments	Grants permission to list network migration deployments	List	NetworkMigrationDefinitionResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListNetworkMigrationExecutions	Grants permission to list network migration executions	List	NetworkMigrationDefinitionResource*		
ListNetworkMigrationMapperSegmentConstructs	Grants permission to list network migration mapper segment constructs	List	NetworkMigrationDefinitionResource*		
ListNetworkMigrationMapperSegments	Grants permission to list network migration mapper segments	List	NetworkMigrationDefinitionResource*		
ListNetworkMigrationMappingUpdates	Grants permission to list network migration mapping updates	List	NetworkMigrationDefinitionResource*		
ListNetworkMigrationMappings	Grants permission to list network migration mappings	List	NetworkMigrationDefinitionResource*		
ListSourceServerActions	Grants permission to list source server action documents	List	SourceServerResource*		
ListTagsForResource	Grants permission to list tags for a resource	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTemplateActions	Grants permission to list launch configuration template action documents	List	LaunchConfigurationTemplateResource*		
ListWaves	Grants permission to list wave summaries	List			
MarkAsArchived	Grants permission to mark source server as archived	Write	SourceServerResource*		
NotifyAgentAuthenticationForMgn [permission only]	Grants permission to notify agent authentication	Write	SourceServerResource*		
NotifyAgentConnectedForMgn [permission only]	Grants permission to notify agent is connected	Write	SourceServerResource*		
NotifyAgentDisconnectedForMgn [permission only]	Grants permission to notify agent is disconnected	Write	SourceServerResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
NotifyAgentReplicationProgressForMgn [permission only]	Grants permission to notify agent replication progress	Write	SourceServerResource*		
NotifyVcenterClientStartedForMgn [permission only]	Grants permission to notify vcenter client started	Write	VcenterClientResource*		
PauseReplication	Grants permission to pause replication	Write	SourceServerResource*		
PutSourceServerAction	Grants permission to put source server action document	Write	SourceServerResource*		
PutTemplateAction	Grants permission to put launch configuration template action document	Write	LaunchConfigurationTemplateResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RegisterAgentForMgn [permission only]	Grants permission to register agent	Write		aws:RequestTag/${TagKey} aws:TagKeys	
RemoveSourceServerAction	Grants permission to remove source server action document	Write	SourceServerResource*		
RemoveTemplateAction	Grants permission to remove launch configuration template action document	Write	LaunchConfigurationTemplateResource*		
ResumeReplication	Grants permission to resume replication	Write	SourceServerResource*		
RetryDataReplication	Grants permission to retry replication	Write	SourceServerResource*		
SendAgentLogsForMgn [permission only]	Grants permission to send agent logs	Write	SourceServerResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SendAgentMetricsForMgn [permission only]	Grants permission to send agent metrics	Write	SourceServerResource*		
SendChannelCommandResultForMgn [permission only]	Grants permission to send channel command result	Write			
SendClientLogsForMgn [permission only]	Grants permission to send client logs	Write			
SendClientMetricsForMgn [permission only]	Grants permission to send client metrics	Write			
SendVcenterClientCommandResultForMgn [permission only]	Grants permission to send vcenter client command result	Write	VcenterClientResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SendVcenterClientLogsForMgn [permission only]	Grants permission to send vcenter client logs	Write	VcenterClientResource*		
SendVcenterClientMetricsForMgn [permission only]	Grants permission to send vcenter client metrics	Write	VcenterClientResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

Resource types defined by AWS Application Migration Service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
JobResource	`arn:${Partition}:mgn:${Region}:${Account}:job/${JobID}`	aws:ResourceTag/${TagKey}
ReplicationConfigurationTemplateResource	`arn:${Partition}:mgn:${Region}:${Account}:replication-configuration-template/${ReplicationConfigurationTemplateID}`	aws:ResourceTag/${TagKey}
LaunchConfigurationTemplateResource	`arn:${Partition}:mgn:${Region}:${Account}:launch-configuration-template/${LaunchConfigurationTemplateID}`	aws:ResourceTag/${TagKey}
VcenterClientResource	`arn:${Partition}:mgn:${Region}:${Account}:vcenter-client/${VcenterClientID}`	aws:ResourceTag/${TagKey}
SourceServerResource	`arn:${Partition}:mgn:${Region}:${Account}:source-server/${SourceServerID}`	aws:ResourceTag/${TagKey}
ApplicationResource	`arn:${Partition}:mgn:${Region}:${Account}:application/${ApplicationID}`	aws:ResourceTag/${TagKey}
WaveResource	`arn:${Partition}:mgn:${Region}:${Account}:wave/${WaveID}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
ImportResource	arn:${Partition}:mgn:${Region}:${Account}:import/${ImportID}	aws:ResourceTag/${TagKey}
ExportResource	arn:${Partition}:mgn:${Region}:${Account}:export/${ExportID}	aws:ResourceTag/${TagKey}
ConnectorResource	arn:${Partition}:mgn:${Region}:${Account}:connector/${ConnectorID}	aws:ResourceTag/${TagKey}
NetworkMigrationDefinitionResource	arn:${Partition}:mgn:${Region}:${Account}:network-migration-definition/${NetworkMigrationDefinitionID}	aws:ResourceTag/${TagKey}

Condition keys for AWS Application Migration Service

AWS Application Migration Service defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by presence of tag keys in the request	ArrayOfString

Condition keys	Description	Type
mgn:CreateAction	Filters access by the name of a resource-creating API action	String

Actions, resources, and condition keys for Amazon Application Recovery Controller - Zonal Shift

Amazon Application Recovery Controller - Zonal Shift (service prefix: `arc-zonal-shift`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon Application Recovery Controller - Zonal Shift

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

Actions defined by AWS Application Transformation Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetContainerization	Grants permission to get the details of all Containerization jobs	Read			
GetDeployment	Grants permission to get the details of all Deployment jobs	Read			
GetGroupingAssessment	Grants permission to Get the details of a Grouping Assessment Operation	Read			
GetPortingCompatibilityAssessment	Grants permission to Get Porting Compatibility Operation	Read			
GetPortingRecommendationAssessment	Grants permission to Get the details of a Porting Recommendation Assessment Operation	Read			
GetRuntimeAssessment	Grants permission to Get the details of a Runtime Assessment Operation	Read			
PutLogData	Grants permission to Push Logs (Intended for Clients Only)	Write			
PutMetricData	Grants permission to Push Metrics Data (Intended for Clients Only)	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartContainerization	Grants permission to start a Containerization job	Write			
StartDeployment	Grants permission to start a Deployment job	Write			
StartGroupingAssessment	Grants permission to Start a Grouping Assessment Operation	Write			
StartPortingCompatibilityAssessment	Grants permission to Start Porting Compatibility Operation	Write			
StartPortingRecommendationAssessment	Grants permission to Start the Porting Recommendation Assessment Operation	Write			
StartRuntimeAssessment	Grants permission to Start a Runtime Assessment Operation	Write			

Resource types defined by AWS Application Transformation Service

AWS Application Transformation Service does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Application Transformation Service, specify `"Resource": "*"` in your policy.

Condition keys for AWS Application Transformation Service

Application Transformation Service has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon AppStream 2.0

Amazon AppStream 2.0 (service prefix: `appstream`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon AppStream 2.0

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a

resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateAppBlockBuilderAppBlock	Grants permission to associate the specified app block builder with the app block	Write	app-block*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			app-block-builder*		
				aws:ResourceTag/${TagKey}	
Associate ApplicationFleet	Grants permission to associate the specified application with the fleet	Write	application*		
			fleet*		
				aws:ResourceTag/${TagKey}	
Associate ApplicationToEntitlement	Grants permission to associate the specified application to the specified entitlement	Write	stack*		
Associate Fleet	Grants permission to associate the specified fleet with the specified stack	Write	fleet*		
			stack*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateSoftwareToImageBuilder	Grants permission to associate license included application(s) with an existing image builder instance	Write	image-builder*		
				aws:ResourceTag/${TagKey}	
BatchAssociateUserStack	Grants permission to associate the specified users with the specified stacks. Users in a user pool cannot be assigned to stacks with fleets that are joined to an Active Directory domain	Write	stack*		
				aws:ResourceTag/${TagKey}	
BatchDisassociateUserStack	Grants permission to disassociate the specified users from the specified stacks	Write	stack*		
				aws:ResourceTag/${TagKey}	
CopyImage	Grants permission to copy the specified image within the same Region or to a new Region within the same AWS account	Write	image*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAppBlock	Grants permission to create an app block. App blocks store details about the virtual hard disk that contains the files for the application in an S3 bucket. It also stores the setup script with details about how to mount the virtual hard disk. App blocks are only supported for Elastic fleets	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
CreateAppBlockBuilder	Grants permission to create an app block builder. An app block builder is a virtual machine that is used to create an app block	Write	app-block-builder*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateAppBlockBuilderStreamingURL	Grants permission to create a URL to start an app block builder streaming session	Write	app-block-builder*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateApplication	Grants permission to create an application within customer account. Applications store the details about how to launch applications on streaming instances. This is only supported for Elastic fleets	Write	app-block*		
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
CreateDirectoryConfig	Grants permission to create a Directory Config object in AppStream 2.0. This object includes the configuration information required to join fleets and image builders to Microsoft Active Directory domains	Write			
CreateEntitlement	Grants permission to create an entitlement to control access to applications based on user attributes	Write	stack*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateExportImageTask	Grants permission to create an export task for an AppStream 2.0 image	Write		aws:ResourceTag/${TagKey}	
CreateFleet	Grants permission to create a fleet. A fleet is a group of streaming instances from which applications are launched and streamed to users	Write	fleet*		
			image		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateImageBuilder	Grants permission to create an image builder. An image builder is a virtual machine that is used to create an image	Write	image*		
			image-builder*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateImageBuilderStreamingURL	Grants permission to create a URL to start an image builder streaming session	Write	image-builder*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
CreateImportedImage	Grants permission to create an AppStream 2.0 image from an imported AMI	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateStack	Grants permission to create a stack to start streaming applications to users. A stack consists of an associated fleet, user access policies, and storage configurations	Write	stack*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateStreamingURL	Grants permission to create a temporary URL to start an AppStream 2.0 streaming session for the specified user. A streaming URL enables application streaming to be tested without user setup	Write	fleet*		
			stack*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateThemeForStack	Grants permission to create a custom branding theme, which might includes a custom logo, website links, and other branding to display to your users	Write	stack*		
CreateUpdatedImage	Grants permission to update an existing image within customer account	Write	image*		
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
CreateUsageReportSubscription	Grants permission to create a usage report subscription. Usage reports are generated daily	Write			
CreateUser	Grants permission to create a new user in the user pool	Write			
DeleteAppBlock	Grants permission to delete the specified app block	Write	app-block*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
DeleteAppBlockBuilder	Grants permission to delete the specified app block builder and release capacity	Write	app-block-builder*		
				aws:ResourceTag/${TagKey}	
DeleteApplication	Grants permission to delete the specified application	Write	application*		
				aws:ResourceTag/${TagKey}	
DeleteDirectoryConfig	Grants permission to delete the specified Directory Config object from AppStream 2.0. This object includes the configuration information required to join fleets and image builders to Microsoft Active Directory domains	Write			
DeleteEntitlement	Grants permission to delete the specified entitlement	Write	stack*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteFleet	Grants permission to delete the specified fleet	Write	fleet*		
				aws:ResourceTag/${TagKey}	
DeleteImage	Grants permission to delete the specified image. An image cannot be deleted when it is in use	Write	image*		
				aws:ResourceTag/${TagKey}	
DeleteImageBuilder	Grants permission to delete the specified image builder and release capacity	Write	image-builder*		
				aws:ResourceTag/${TagKey}	
DeleteImagePermissions	Grants permission to delete permissions for the specified private image	Write	image*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteStack	Grants permission to delete the specified stack. After the stack is deleted, the application streaming environment provided by the stack is no longer available to users. Also, any reservations made for application streaming sessions for the stack are released	Write	stack*		
				aws:ResourceTag/${TagKey}	
DeleteThemeForStack	Grants permission to delete a custom branding theme, which might includes a custom logo, website links, and other branding to display to your users	Write	stack*		
DeleteUsageReportSubscription	Grants permission to disable usage report generation	Write			
DeleteUser	Grants permission to delete a user from the user pool	Write			
DescribeAppBlockBuilderAppBlockAssociations	Grants permission to retrieve the associations that are associated with the specified app block builder or app block	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeAppBlockBuilders	Grants permission to retrieve a list that describes one or more specified app block builders, if the app block builder names are provided. Otherwise, all app block builders in the account are described	List			
DescribeAppBlocks	Grants permission to retrieve a list that describes one or more specified app blocks, if the app block arns are provided. Otherwise, all app blocks in the account are described	List			
DescribeAppLicenseUsage	Grants permission to retrieve license included application usage information	List			
DescribeApplicationFleetAssociations	Grants permission to retrieve the associations that are associated with the specified application or fleet	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeApplications	Grants permission to retrieve a list that describes one or more specified applications, if the application arns are provided. Otherwise, all applications in the account are described	List			
DescribeDirectoryConfigs	Grants permission to retrieve a list that describes one or more specified Directory Config objects for AppStream 2.0, if the names for these objects are provided. Otherwise, all Directory Config objects in the account are described. This object includes the configuration information required to join fleets and image builders to Microsoft Active Directory domains	List			
DescribeEntitlements	Grants permission to retrieve one or all entitlements for the specified stack	List	stack*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeFleets	Grants permission to retrieve a list that describes one or more specified fleets, if the fleet names are provided. Otherwise, all fleets in the account are described	List			
DescribeImageBuilders	Grants permission to retrieve a list that describes one or more specified image builders, if the image builder names are provided. Otherwise, all image builders in the account are described	List			
DescribeImagePermissions	Grants permission to retrieve a list that describes the permissions for shared AWS account IDs on a private image that you own	Read	image*		
DescribeImages	Grants permission to retrieve a list that describes one or more specified images, if the image names or image ARNs are provided. Otherwise, all images in the account are described	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeSessions	Grants permission to retrieve a list that describes the streaming sessions for the specified stack and fleet. If a user ID is provided for the stack and fleet, only the streaming sessions for that user are described	List	fleet*		
			stack*		
DescribeSoftwareAssociations	Grants permission to retrieve license included application associations for a specified resource	List	image		
			image-builder		
DescribeStacks	Grants permission to retrieve a list that describes one or more specified stacks, if the stack names are provided. Otherwise, all stacks in the account are described	List			
DescribeThemeForStack	Grants permission to get the custom branding theme information, which might includes a custom logo, website links, and other branding to display to your users	Read	stack*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeUsageReportSubscriptions	Grants permission to retrieve a list that describes one or more usage report subscriptions	List			
DescribeUserStackAssociations	Grants permission to retrieve a list that describes the UserStackAssociation objects	List			
DescribeUsers	Grants permission to retrieve a list that describes users in the user pool	List			
DisableUser	Grants permission to disable the specified user in the user pool. This action does not delete the user	Write			
DisassociateAppBlockBuilderAppBlock	Grants permission to disassociate the specified app block builder with the app block	Write	app-block*		
			app-block-builder*		
				aws:ResourceTag/${TagKey}	
DisassociateApplicationFleet	Grants permission to disassociate the specified application from the specified fleet	Write	application*		
			fleet*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
DisassociateApplicationFromEntitlement	Grants permission to disassociate the specified application from the specified entitlement	Write	stack*		
DisassociateFleet	Grants permission to disassociate the specified fleet from the specified stack	Write	fleet*		
			stack*		
				aws:ResourceTag/${TagKey}	
DisassociateSoftwareFromImageBuilder	Grants permission to remove license included application(s) association(s) from an image builder instance	Write	image-builder*		
				aws:ResourceTag/${TagKey}	
EnableUser	Grants permission to enable a user in the user pool	Write			
ExpireSession	Grants permission to immediately stop the specified streaming session	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetExportImageTask	Grants permission to retrieve details of a specific export image task	Read			
ListAssociatedFleets	Grants permission to retrieve the name of the fleet that is associated with the specified stack	Read	stack*		
ListAssociatedStacks	Grants permission to retrieve the name of the stack with which the specified fleet is associated	Read	fleet*		
ListEntitledApplications	Grants permission to retrieve the applications that are associated with the specified entitlement	List	stack*		
ListExportImageTasks	Grants permission to list export image tasks	List			
ListTagsForResource	Grants permission to retrieve a list of all tags for the specified AppStream 2.0 resource. The following resources can be tagged: Image builders, images, fleets, and stacks	Read			
StartAppBlockBuilder	Grants permission to start the specified app block builder	Write	app-block-builder*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
StartFleet	Grants permission to start the specified fleet	Write	fleet*		
				aws:ResourceTag/${TagKey}	
StartImageBuilder	Grants permission to start the specified image builder	Write	image-builder*		
				aws:ResourceTag/${TagKey}	
StartSoftwareDeploymentToImageBuilder	Grants permission to initiate license included applications deployment to an image builder instance	Write	image-builder*		
				aws:ResourceTag/${TagKey}	
StopAppBlockBuilder	Grants permission to stop the specified app block builder	Write	app-block-builder*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
StopFleet	Grants permission to stop the specified fleet	Write	fleet*		
				aws:ResourceTag/${TagKey}	
StopImageBuilder	Grants permission to stop the specified image builder	Write	image-builder*		
				aws:ResourceTag/${TagKey}	
Stream	Grants permission to federated users to sign in by using their existing credentials and stream applications from the specified stack	Write	stack*		
				appstream:userId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to add or overwrite one or more tags for the specified AppStream 2.0 resource. The following resources can be tagged: Image builders, images, fleets, stacks, app blocks and applications	Tagging	app-block		
			app-block-builder		
			application		
			fleet		
			image		
			image-builder		
			stack		
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UntagResource	Grants permission to disassociate one or more tags from the specified AppStream 2.0 resource	Tagging	app-block		
			app-block-builder		
			application		
			fleet		
			image		
			image-builder		
			stack		
				aws:TagKeys	
UpdateAppBlockBuilder	Grants permission to update a specific app block builder. An app block builder is a virtual machine that is used to create an app block	Write	app-block-builder*		
				aws:ResourceTag/${TagKey}	
UpdateApplication	Grants permission to update the specified fields for the specified application	Write	application*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			app-block		
				aws:ResourceTag/${TagKey}	
UpdateDirectoryConfig	Grants permission to update the specified Directory Config object in AppStream 2.0. This object includes the configuration information required to join fleets and image builders to Microsoft Active Directory domains	Write			
UpdateEntitlement	Grants permission to update the specified fields for the specified entitlement	Write	stack*		
UpdateFleet	Grants permission to update the specified fleet. All attributes except the fleet name can be updated when the fleet is in the STOPPED state	Write	fleet*		
			image		
				aws:ResourceTag/${TagKey}	
UpdateImagePermissions	Grants permission to add or update permissions for the specified private image	Write	image*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
UpdateStack	Grants permission to update the specified fields for the specified stack	Write	stack*		
				aws:ResourceTag/${TagKey}	
UpdateThemeForStack	Grants permission to update the custom branding theme information, which might includes a custom logo, website links, and other branding to display to your users	Write	stack*		

Resource types defined by Amazon AppStream 2.0

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
fleet	arn:${Partition}:appstream:${Region}:${Account}:fleet/${FleetName}	aws:ResourceTag/${TagKey}
image	arn:${Partition}:appstream:${Region}:${Account}:image/${ImageName}	aws:ResourceTag/${TagKey}
image-builder	arn:${Partition}:appstream:${Region}:${Account}:image-builder/${ImageBuilderName}	aws:ResourceTag/${TagKey}
stack	arn:${Partition}:appstream:${Region}:${Account}:stack/${StackName}	aws:ResourceTag/${TagKey}
app-block	arn:${Partition}:appstream:${Region}:${Account}:app-block/${AppBlockName}	aws:ResourceTag/${TagKey}
application	arn:${Partition}:appstream:${Region}:${Account}:application/${ApplicationName}	aws:ResourceTag/${TagKey}
app-block-builder	arn:${Partition}:appstream:${Region}:${Account}:app-block-builder/${AppBlockBuilderName}	aws:ResourceTag/${TagKey}

Condition keys for Amazon AppStream 2.0

Amazon AppStream 2.0 defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
appstream:userId	Filters access by the ID of the AppStream 2.0 user	String
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS AppSync

AWS AppSync (service prefix: `appsync`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- Condition keys for AWS AppSync

Actions defined by AWS AppSync

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateApi	Grants permission to attach a GraphQL API to a custom domain name in AppSync	Write	domain*		
AssociateMergedGraphqlApi	Grants permission to associate a merged API to a source API	Write	graphqlapi*		
AssociateSourceGraphqlApi	Grants permission to associate a source API to a merged API	Write	graphqlapi*		
AssociateWebACL [permission only]	Grants permission to associate a web ACL and a resource	Write	api graphqlapi		
CreateApi	Grants permission to create an API	Write		aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys	iam:CreateServiceLinkedRole
CreateApiCache	Grants permission to create an API cache in AppSync	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateApiKey	Grants permission to create a unique key that you can distribute to clients who are executing your API	Write			
CreateChannelNamespace	Grants permission to create a channel namespace	Write	channelNamespace*		
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys	
CreateDataSource	Grants permission to create a data source	Write			
CreateDomainName	Grants permission to create a custom domain name in AppSync	Write	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys	
CreateFunction	Grants permission to create a new function	Write			
CreateGraphqlApi	Grants permission to create a GraphQL API, which is the top level AppSync resource	Write		aws:RequestTag/${TagKey} aws:TagKeys appsync:Visibility	iam:CreateServiceLinkedRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateResolver	Grants permission to create a resolver. A resolver converts incoming requests into a format that a data source can understand, and converts the data source's responses into GraphQL	Write			
CreateType	Grants permission to create a type	Write			
DeleteApi	Grants permission to delete a API. This will also clean up every AppSync resource below that API	Write	api*		
				aws:ResourceTag/${TagKey}	
DeleteApiCache	Grants permission to delete an API cache in AppSync	Write			
DeleteApiKey	Grants permission to delete an API key	Write			
DeleteChannelNamespace	Grants permission to delete a channel namespace	Write	channelNamespace*		
				aws:ResourceTag/${TagKey}	
DeleteDataSource	Grants permission to delete a data source	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteDomainName	Grants permission to delete a custom domain name in AppSync	Write	domain*		
				aws:ResourceTag/${TagKey}	
DeleteFunction	Grants permission to delete a function	Write			
DeleteGraphqlApi	Grants permission to delete a GraphQL Api. This will also clean up every AppSync resource below that API	Write	graphqlapi*		
				aws:ResourceTag/${TagKey}	
DeleteResolver	Grants permission to delete a resolver	Write			
DeleteResourcePolicy [permission only]	Grants permission to remove a resource policy	Write			
DeleteType	Grants permission to delete a type	Write			
DisassociateApi	Grants permission to detach a GraphQL API to a custom domain name in AppSync	Write	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateMergedGraphqlApi	Grants permission to remove an associated source API from a merged API identified by the source API	Write	mergedApiAssociation*		
DisassociateSourceGraphqlApi	Grants permission to remove an associated source API from a merged API identified by the merged API	Write	sourceApiAssociation*		
DisassociateWebACL [permission only]	Grants permission to disassociate a web ACL and a resource	Write	api		
			graphqlapi		
EvaluateCode	Grants permission to evaluate code with a runtime and context	Read			
EvaluateMappingTemplate	Grants permission to evaluate template mapping	Read			
EventConnect	Grants permission to connect to an Event API	Write	api*		
EventPublish	Grants permission to publish events to a channel namespace	Write	channelNamespace*		
EventSubscribe	Grants permission to subscribe to a channel namespace	Write	channelNamespace*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
FlushApiCache	Grants permission to flush an API cache in AppSync	Write			
GetApi	Grants permission to retrieve an API	Read	api*		
				aws:ResourceTag/${TagKey}	
GetApiAssociation	Grants permission to read custom domain name - GraphQL API association details in AppSync	Read	domain*		
GetApiCache	Grants permission to read information about an API cache in AppSync	Read			
GetChannelNamespace	Grants permission to retrieve a channel namespace	Read	channelNamespace*		
				aws:ResourceTag/${TagKey}	
GetDataSource	Grants permission to retrieve a data source	Read			
GetDataSourceIntrospection	Grants permission to retrieve a data source introspection	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDomainName	Grants permission to read information about a custom domain name in AppSync	Read	domain*		
				aws:ResourceTag/${TagKey}	
GetFunction	Grants permission to retrieve a function	Read			
GetGraphqlApi	Grants permission to retrieve a GraphQL API	Read	graphqlapi*		
				aws:ResourceTag/${TagKey}	
GetGraphqlApiEnvironmentVariables	Grants permission to retrieve the environment variables for a GraphQL API	Read			
GetIntrospectionSchema	Grants permission to retrieve the introspection schema for a GraphQL API	Read			
GetResolver	Grants permission to retrieve a resolver	Read			
GetResourcePolicy [permission only]	Grants permission to read a resource policy	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSchemaCreationStatus	Grants permission to retrieve the current status of a schema creation operation	Read			
GetSourceApiAssociation	Grants permission to read information about a merged API associated source API	Read	sourceApiAssociation*		
GetType	Grants permission to retrieve a type	Read			
GetWebACLForResource [permission only]	Grants permission to get associated web ACLs for a resource	Read	api graphqlapi		
GraphQL [permission only]	Grants permission to send a GraphQL query to a GraphQL API	Write	field* graphqlapi*		
ListApiKeys	Grants permission to list the API keys for a given API	List			
ListApis	Grants permission to list APIs	List		aws:ResourceTag/${TagKey}	
ListChannelNamespaces	Grants permission to list channel namespace	List	api*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
ListDataSources	Grants permission to list the data sources for a given API	List			
ListDomainNames	Grants permission to enumerate custom domain names in AppSync	List		aws:ResourceTag/${TagKey}	
ListFunctions	Grants permission to list the functions for a given API	List			
ListGraphqlApis	Grants permission to list GraphQL APIs	List			
ListResolvers	Grants permission to list the resolvers for a given API and type	List			
ListResolversByFunction	Grants permission to list the resolvers that are associated with a specific function	List			
ListResourcesForWebACL [permission only]	Grants permission to get associated resources for a web ACL	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListSourceApiAssociations	Grants permission to list source APIs associated to a given merged API	List			
ListTagsForResource	Grants permission to list the tags for a resource	Read	api		
			channelNamespace		
			domain		
			graphqlapi		
				aws:ResourceTag/${TagKey}	
ListTypes	Grants permission to list the types for a given API	List			
ListTypesByAssociation	Grants permission to list the types for a given merged API and source API association	List			
PutGraphqlApiEnvironmentVariables	Grants permission to update the environment variables for a GraphQL API	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutResourcePolicy [permission only]	Grants permission to set a resource policy	Write			
SetWebACL	Grants permission to set a web ACL	Permissions management			
SourceGraphQL [permission only]	Grants permission to send a GraphQL query to a source API of a merged API	Write	field* graphqlapi*		
StartDataSourceIntrospection	Grants permission to introspect a data source	Write			
StartSchemaCreation	Grants permission to add a new schema to your GraphQL API. This operation is asynchronous - GetSchemaCreationStatus can show when it has completed	Write			
StartSchemaMerge	Grants permission to initiate a schema merge for a given merged API and associated source API	Write	sourceApiAssociation*		
TagResource	Grants permission to tag a resource	Tagging	api		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			channelNamespace		
			domain		
			graphqlapi		
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag a resource	Tagging	api		
			channelNamespace		
			domain		
			graphqlapi		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:ResourceTag/${TagKey}	
UpdateApi	Grants permission to update an API	Write	api*		iam:CreateServiceLinkedRole
				aws:ResourceTag/${TagKey}	
UpdateApiCache	Grants permission to update an API cache in AppSync	Write			
UpdateApiKey	Grants permission to update an API key for a given API	Write			
UpdateChannelNamespace	Grants permission to update a channel namespace	Write	channelNamespace*		
				aws:ResourceTag/${TagKey}	
UpdateDataSource	Grants permission to update a data source	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateDomainName	Grants permission to update a custom domain name in AppSync	Write	domain*		
				aws:ResourceTag/${TagKey}	
UpdateFunction	Grants permission to update an existing function	Write			
UpdateGraphqlApi	Grants permission to update a GraphQL API	Write	graphqlapi*		iam:CreateServiceLinkedRole
				aws:ResourceTag/${TagKey}	
UpdateResolver	Grants permission to update a resolver	Write			
UpdateSourceApiAssociation	Grants permission to update a merged API source API association	Write	sourceApiAssociation*		
UpdateType	Grants permission to update a type	Write			

Resource types defined by AWS AppSync

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types

that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
datasource	arn:${Partition}:appsync:${Region}:${Account}:apis/${GraphQLAPIId}/datasources/${DatasourceName}	
domain	arn:${Partition}:appsync:${Region}:${Account}:domainnames/${DomainName}	aws:ResourceTag/${TagKey}
graphqlapi	arn:${Partition}:appsync:${Region}:${Account}:apis/${GraphQLAPIId}	aws:ResourceTag/${TagKey}
field	arn:${Partition}:appsync:${Region}:${Account}:apis/${GraphQLAPIId}/types/${TypeName}/fields/${FieldName}	
type	arn:${Partition}:appsync:${Region}:${Account}:apis/${GraphQLAPIId}/types/${TypeName}	
function	arn:${Partition}:appsync:${Region}:${Account}:apis/${GraphQLAPIId}/functions/${FunctionId}	
sourceApiAssociation	arn:${Partition}:appsync:${Region}:${Account}:apis/${MergedGraphQLAPIId}/sourceApiAssociations/${Associationid}	
mergedApiAssociation	arn:${Partition}:appsync:${Region}:${Account}:apis/${SourceGraphQLAPIId}/mergedApiAssociations/${Associationid}	

Resource types	ARN	Condition keys
api	arn:${Partition}:appsync:${Region}:${Account}:apis/${ApiId}	aws:ResourceTag/${TagKey}
channelNamespace	arn:${Partition}:appsync:${Region}:${Account}:apis/${ApiId}/channelNamespace/${ChannelNamespaceName}	aws:ResourceTag/${TagKey}

Condition keys for AWS AppSync

AWS AppSync defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
appsync:Visibility	Filters access by the visibility of an API	String
aws:RequestTag/${TagKey}	Filters access by the tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon ARC Region switch

Amazon ARC Region switch (service prefix: arc-region-switch) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Topics

Actions defined by Amazon ARC Region switch

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ApprovePlanExecutionStep	Grants permission to approve a plan execution step	Write	plan*		
CancelPlanExecution	Grants permission to cancel a plan execution	Write	plan*		
CreatePlan	Grants permission to create a plan	Write	plan*		
				aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
DeletePlan	Grants permission to delete a plan	Write	plan*		
DeleteResourcePolicy [permission only]	Grants permission to delete the RAM access control policy for a plan	Permissions management			
GetPlan	Grants permission to get information about plans in all AWS Regions using a control plane	Read	plan*		
GetPlanEvaluationStatus	Grants permission to get a plan's evaluation status	Read	plan*		
GetPlanExecution	Grants permission to get plan execution details and setup information	Read	plan*		
GetPlanInRegion	Grants permission to get information about a plan in a specific AWS Region using the Region switch Regional data plane	Read	plan*		
GetResourcePolicy [permission only]	Grants permission to get the resource policy of a plan	Permissions management	plan*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListPlanExecutionEvents	Grants permission to list plan execution events	List	plan*		
ListPlanExecutions	Grants permission to list plan executions	List	plan*		
ListPlans	Grants permission to list plans in all AWS Regions using a control plane	List			
ListPlansInRegion	Grants permission to list plans in a specific AWS Region using the Region switch Regional data plane	List			
ListRoute53HealthChecks	Grants permission to list Route 53 health checks	List	plan*		
ListRoute53HealthChecksInRegion	Grants permission to list Route 53 health checks in a specific AWS Region using the Region switch Regional data plane	List	plan*		
ListTagsForResource	Grants permission to list tags for a resource	Read	plan*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutResourcePolicy [permission only]	Grants permission to define the RAM access control policy for a plan	Permissions management			
StartPlanExecution	Grants permission to start a plan execution	Write	plan*		
TagResource	Grants permission to tag a resource	Tagging	plan*	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from a resource	Tagging	plan*	aws:ResourceTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdatePlan	Grants permission to update a plan	Write	plan*		
UpdatePlanExecution	Grants permission to update a plan execution	Write	plan*		
UpdatePlanExecutionStep	Grants permission to update a plan execution step	Write	plan*		

Resource types defined by Amazon ARC Region switch

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
plan	`arn:${Partition}:arc-region-switch::${Account}:plan/${ResourceId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon ARC Region switch

Amazon ARC Region switch defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:ResourceTag/${TagKey}	Filters access by a tag's key and value in a request	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS Artifact

AWS Artifact (service prefix: `artifact`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.

Actions defined by AWS Artifact

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptAgreement	Grants permission to accept an AWS agreement that has not yet been accepted by the customer account	Write	agreement*		
AcceptNdaForAgreement	Grants permission to accept the terms of an NDA Document for a given agreement resource	Write	agreement*		
GetAccountSettings	Grants permission to get the account settings for Artifact	Read			
GetAgreement	Grants permission to get an AWS agreement that has not yet been accepted by the customer account	Read	agreement*		
GetCustomerAgreement	Grants permission to get an AWS agreement that has been accepted by the customer account	Read	customer-agreement*		
GetNdaForAgreement	Grants permission to retrieve the NDA Document for a given agreement resource	Read	agreement*		
GetReport	Grants permission to download a report	Read	report*		
GetReportMetadata	Grants permission to download metadata associated with a report	Read	report*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTermForReport	Grants permission to download a term associated with a report	Read	report*		
ListAgreements	Grants permission to list AWS agreements	List			
ListCustomerAgreements	Grants permission to list customer-agreement resources that have been accepted by the customer account	List			
ListReportVersions	Grants permission to list report versions in your account	List			
ListReports	Grants permission to list reports in your account	List			
PutAccountSettings	Grants permission to put account settings for Artifact	Write			
TerminateAgreement	Grants permission to terminate a customer agreement that was previously accepted by the customer account	Write	customer-agreement*		

Resource types defined by AWS Artifact

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types

that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
customer-agreement	`arn:${Partition}:artifact::${Account}:customer-agreement/*`	
agreement	`arn:${Partition}:artifact:::agreement/*`	
report	`arn:${Partition}:artifact:${Region}::report/${ReportId}:${Version}`	artifact:ReportCategory artifact:ReportSeries

Condition keys for AWS Artifact

AWS Artifact defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
artifact:ReportCategory	Filters access by which category reports are associated with	String
artifact:ReportSeries	Filters access by which series reports are associated with	String

Actions, resources, and condition keys for Amazon Athena

Amazon Athena (service prefix: `athena`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Athena

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetNamedQuery	Grants permission to get information about one or more named queries	Read	workgroup *		
BatchGetPreparedStatement	Grants permission to get information about one or more prepared statements	Read	workgroup *		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetQueryExecution	Grants permission to get information about one or more query executions	Read	workgroup*		
CancelCapacityReservation	Grants permission to cancel a capacity reservation	Write	capacity-reservation*		
CancelQueryExecution	Grants permission to cancel query execution. Deprecated. Applies only to AWS services and principals that use Athena JDBC driver earlier than 1.1.0. Use StopQuery Execution otherwise	Write	workgroup*		
CreateCapacityReservation	Grants permission to create a capacity reservation	Write	capacity-reservation*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDataCatalog	Grants permission to create a datacatalog	Write	datacatalog*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateNamedQuery	Grants permission to create a named query	Write	workgroup*		
CreateNotebook	Grants permission to create a notebook	Write	workgroup*		
CreatePreparedStatement	Grants permission to create a prepared statement	Write	workgroup*		
CreatePresignedNotebookUrl	Grants permission to create a presigned notebook url	Write	workgroup*		
CreateWorkGroup	Grants permission to create a workgroup	Write	workgroup*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteCapacityReservation	Grants permission to delete a capacity reservation	Write	capacity-reservation*		
DeleteDataCatalog	Grants permission to delete a datacatalog	Write	datacatalog*		
DeleteNamedQuery	Grants permission to delete a named query specified	Write	workgroup*		
DeleteNotebook	Grants permission to delete a notebook	Write	workgroup*		
DeletePreparedStatement	Grants permission to delete a prepared statement specified	Write	workgroup*		
DeleteWorkGroup	Grants permission to delete a workgroup	Write	workgroup*		
ExportNotebook	Grants permission to export a notebook	Write	workgroup*		
GetCalculationExecution	Grants permission to get a calculation execution	Read	workgroup*		
GetCalculationExecutionCode	Grants permission to get a calculation execution code	Read	workgroup*		
GetCalculationExecutionStatus	Grants permission to get a calculation execution status	Read	workgroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCapacityAssignmentConfiguration	Grants permission to get capacity assignment information for a capacity reservation	Read	capacity-reservation*		
GetCapacityReservation	Grants permission to get a capacity reservation	Read	capacity-reservation*		
GetCatalogs	Grants permission to enable access to databases and tables. Applies only to AWS services managed policy and principals that use an Athena JDBC driver version 1.1.0	Read			
GetDataCatalog	Grants permission to get a datacatalog	Read	datacatalog*		
GetDatabase	Grants permission to get a database for a given datacatalog	Read	datacatalog*		
GetExecutionEngine	Grants permission to enable access to the specified database and table. Applies only to AWS services managed policy and principals that use an Athena JDBC driver version 1.1.0	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetExecutionEngines	Grants permission to enable access to databases and tables. Applies only to AWS services managed policy and principals that use an Athena JDBC driver version 1.1.0	Read			
GetNamedQuery	Grants permission to get information about the specified named query	Read	workgroup*		
GetNamespace	Grants permission to enable access to the specified database and table. Applies only to AWS services managed policy and principals that use an Athena JDBC driver version 1.1.0	Read			
GetNamespaces	Grants permission to enable access to databases and tables. Applies only to AWS services managed policy and principals that use an Athena JDBC driver version 1.1.0	Read			
GetNotebookMetadata	Grants permission to get notebook metadata	Read	workgroup*		
GetPreparedStatement	Grants permission to get information about the specified prepared statement	Read	workgroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetQueryExecution	Grants permission to get information about the specified query execution	Read	workgroup *		
GetQueryExecutions	Grants permission to get query executions. Deprecated. Applies only to AWS services and principals that use Athena JDBC driver earlier than 1.1.0. Use ListQueryExecutions otherwise	Read			
GetQueryResults	Grants permission to get the query results	Read	workgroup *		
GetQueryResultsStream	Grants permission to get the query results stream	Read	workgroup *		
GetQueryRuntimeStatistics	Grants permission to get runtime statistics for the specified query execution	Read	workgroup *		
GetResourceDashboard	Grants permission to get a Live UI/Persistence UI for a session	Read	workgroup *		
			session		
GetSession	Grants permission to get a session	Read	workgroup *		
			session		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSessionEndpoint	Grants permission to get a connection endpoint and authentication token for a given session Id	Write	workgroup*		
			session		
GetSessionStatus	Grants permission to get a session status	Read	workgroup*		
			session		
GetTable	Grants permission to enable access to the specified table. Applies only to AWS services managed policy and principals that use an Athena JDBC driver version 1.1.0	Read			
GetTableMetadata	Grants permission to get a metadata about a table for a given datacatalog	Read	datacatalog*		
GetTables	Grants permission to enable access to tables. Applies only to AWS services managed policy and principals that use an Athena JDBC driver version 1.1.0	Read			
GetWorkGroup	Grants permission to get a workgroup	Read	workgroup*		
ImportNotebook	Grants permission to import a notebook	Write	workgroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListApplicationDPUSizes	Grants permission to return a list of ApplicationRuntimeIds	List			
ListCalculationExecutions	Grants permission to return a list of calculation executions	List	workgroup*		
ListCapacityReservations	Grants permission to return a list of capacity reservations for the specified AWS account	List			
ListDataCatalogs	Grants permission to return a list of datacatalogs for the specified AWS account	List			
ListDatabases	Grants permission to return a list of databases for a given datacatalog	List	datacatalog*		
ListEngineVersions	Grants permission to return a list of athena engine versions for the specified AWS account	Read			
ListExecutors	Grants permission to return a list of executors	List			
ListNamedQueries	Grants permission to return a list of named queries in Amazon Athena for the specified AWS account	List	workgroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListNotebookMetadata	Grants permission to return a list of notebooks for a given workgroup	List	workgroup*		
ListNotebookSessions	Grants permission to return a list of sessions for a given notebook	List	workgroup*		
ListPreparedStatements	Grants permission to return a list of prepared statements for the specified workgroup	List	workgroup*		
ListQueryExecutions	Grants permission to return a list of query executions for the specified AWS account	Read	workgroup*		
ListSessions	Grants permission to return a list of sessions for a given workgroup	List	workgroup*		
ListTableMetadata	Grants permission to return a list of table metadata in a database for a given datacatalog	Read	datacatalog*		
ListTagsForResource	Grants permission to return a list of tags for a resource	Read	capacity-reservation*		
			datacatalog*		
			session*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			workgroup*		
ListWorkGroups	Grants permission to return a list of workgroups for the specified AWS account	List			
PutCapacityAssignmentConfiguration	Grants permission to assign capacity from a capacity reservation to queries	Write	capacity-reservation*		
			workgroup*		
RunQuery	Grants permission to run a query. Deprecated. Applies only to AWS services and principals that use Athena JDBC driver earlier than 1.1.0. Use StartQueryExecution otherwise	Write			
StartCalculationExecution	Grants permission to start a calculation execution	Write	workgroup*		
StartQueryExecution	Grants permission to start a query execution using an SQL query provided as a string	Write	workgroup*		
StartSession	Grants permission to start a session	Write	workgroup*		
			session		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
StopCalculationExecution	Grants permission to stop a calculation execution	Write	workgroup*		
StopQueryExecution	Grants permission to stop the specified query execution	Write	workgroup*		
TagResource	Grants permission to add a tag to a resource	Tagging	capacity-reservation*		
			datacatalog*		
			session*		
			workgroup*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TerminateSession	Grants permission to terminate a session	Write	workgroup*		
			session		
UntagResource	Grants permission to remove a tag from a resource	Tagging	capacity-reservation*		
			datacatalog*		
			session*		
			workgroup*		
				aws:TagKeys	
UpdateCapacityReservation	Grants permission to update a capacity reservation	Write	capacity-reservation*		
UpdateDataCatalog	Grants permission to update a datacatalog	Write	datacatalog*		
UpdateNamedQuery	Grants permission to update a named query specified	Write	workgroup*		
UpdateNotebook	Grants permission to update a notebook	Write	workgroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateNotebookMetadata	Grants permission to update notebook metadata	Write	workgroup *		
UpdatePreparedStatement	Grants permission to update a prepared statement	Write	workgroup *		
UpdateWorkGroup	Grants permission to update a workgroup	Write	workgroup *		

Resource types defined by Amazon Athena

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
datacatalog	`arn:${Partition}:athena:${Region}:${Account}:datacatalog/${DataCatalogName}`	aws:ResourceTag/${TagKey}
workgroup	`arn:${Partition}:athena:${Region}:${Account}:workgroup/${WorkGroupName}`	aws:ResourceTag/${TagKey}
capacity-reservation	`arn:${Partition}:athena:${Region}:${Account}:capacity-reservation/${CapacityReservationName}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
session	arn:${Partition}:athena:${Region}:${Account}:workgroup/${WorkGroupName}/session/${SessionId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Athena

Amazon Athena defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS Audit Manager

AWS Audit Manager (service prefix: auditmanager) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS Audit Manager

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateAssessmentReportEvidenceFolder	Grants permission to associate an evidence folder with an assessment report in AWS Audit Manager	Write	assessment*		
BatchAssociateAssessmentReportEvidence	Grants permission to associate a list of evidence to an assessment report in AWS Audit Manager	Write	assessment*		
BatchCreateDelegationByAssessment	Grants permission to create delegations for an assessment in AWS Audit Manager	Write	assessment* assessmentControlSet*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchDeleteDelegationByAssessment	Grants permission to delete delegations for an assessment in AWS Audit Manager	Write	assessment*		
			assessmentControlSet*		
BatchDisassociateAssessmentReportEvidence	Grants permission to disassociate a list of evidence from an assessment report in AWS Audit Manager	Write	assessment*		
BatchImportEvidenceToAssessmentControl	Grants permission to import a list of evidence to an assessment control in AWS Audit Manager	Write	assessmentControlSet*		
CreateAssessment	Grants permission to create an assessment to be used with AWS Audit Manager	Write		aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAssessmentFramework	Grants permission to create a framework for use in AWS Audit Manager	Write	assessmentFramework*

Actions defined by Amazon Aurora DSQL

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddPeerCluster [permission only]	Grants permission to add a peer cluster to a multi-Region cluster	Write	Cluster*		dsql:PutMultiRegionProperties
CreateCluster	Grants permission to create new clusters	Write	Cluster*		iam:CreateServiceLinkedRole
				aws:RequestTag/${TagKey} aws:TagKeys dsql:WitnessRegion	
DbConnect	Grants permission to connect to the database	Write	Cluster*		
DbConnectAdmin	Grants permission to connect to the database with admin role. Connecting with any	Write	Cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	other role requires DbConnect permission				
DeleteCluster	Grants permission to delete a cluster and all of its data	Write	Cluster*		
DeleteClusterPolicy	Grants permission to remove the inline resource-based policy attached to a cluster	Write	Cluster*		
GetBackupJob	Grants permission to get the status of an Aurora DSQL cluster backup job	Read	Cluster*		
GetCluster	Grants permission to get information about a cluster	Read	Cluster*		
GetClusterPolicy	Grants permission to retrieve the inline resource-based policy attached to a cluster	Read	Cluster*		
GetRestoreJob	Grants permission to get the status of an Aurora DSQL cluster restore job	Read	Cluster*		
GetVpcEndpointServiceName	Grants permission to retrieve the VPC endpoint service name for a cluster	Read	Cluster*		
InjectError [permission only]	Grants permission to inject errors in targeted clusters	Write		dsql:FisActionId dsql:FisTargetArns	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListClusters	Grants permission to retrieve a list of clusters	List			
ListTagsForResource	Grants permission to list all tags on an Aurora DSQL resource	Read	Cluster*		
PutClusterPolicy	Grants permission to attach or update the inline resource-based policy attached to a cluster	Write	Cluster*		
PutMultiRegionProperties [permission only]	Grants permission to update multi-Region properties of a cluster	Write	Cluster*		
PutWitnessRegion [permission only]	Grants permission to configure and update the witness Region of a multi-Region cluster	Write	Cluster*		dsql:PutMultiRegionProperties
				dsql:WitnessRegion	
RemovePeerCluster [permission only]	Grants permission to remove a peer cluster from a multi-Region cluster	Write	Cluster*		dsql:PutMultiRegionProperties

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartBackupJob	Grants permission to start a backup job for an Aurora DSQL cluster	Write	Cluster*		
StartRestoreJob	Grants permission to start a restore job for an Aurora DSQL cluster	Write	Cluster*		dsql:CreateCluster iam:CreateServiceLinkedRole
StopBackupJob	Grants permission to stop a backup job for an Aurora DSQL cluster	Write	Cluster*		
StopRestoreJob	Grants permission to stop a restore job for an Aurora DSQL Cluster	Write	Cluster*		
TagResource	Grants permission to add tags to Aurora DSQL resources	Tagging	Cluster*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from Aurora DSQL resources	Tagging	Cluster*		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateCluster	Grants permission to modify cluster attributes	Write	Cluster*		
				dsql:WitnessRegion	

Resource types defined by Amazon Aurora DSQL

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Cluster	`arn:${Partition}:dsql:${Region}:${Account}:cluster/${Identifier}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Aurora DSQL

Amazon Aurora DSQL defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString
dsql:FisActionId	Filters access by the ID of an AWS FIS action	String
dsql:FisTargetArns	Filters access by the ARN of an AWS FIS target	ArrayOfARN
dsql:WitnessRegion	Filters access by the witness region of multi-Region clusters	String

Actions, resources, and condition keys for AWS Auto Scaling

AWS Auto Scaling (service prefix: `autoscaling-plans`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Auto Scaling

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateScalingPlan	Creates a scaling plan.	Write			
DeleteScalingPlan	Deletes the specified scaling plan.	Write			
DescribeScalingPlanResources	Describes the scalable resources in the specified scaling plan.	Read			
DescribeScalingPlans	Describes the specified scaling plans or all of your scaling plans.	Read			
GetScalingPlanResourceForecastData	Retrieves the forecast data for a scalable resource.	Read			
UpdateScalingPlan	Updates a scaling plan.	Write			

Resource types defined by AWS Auto Scaling

AWS Auto Scaling does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Auto Scaling, specify `"Resource": "*"` in your policy.

Condition keys for AWS Auto Scaling

Auto Scaling has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS B2B Data Interchange

AWS B2B Data Interchange (service prefix: `b2bi`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Backup

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateBackupVaultMpaApprovalTeam	Grants permission to associate an MPA approval team with a backup vault	Write	backupVault*		
				backup:MpaApprovalTeamArn	
CancelLegalHold	Grants permission to cancel a legal hold	Write	legalHold*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CopyFromBackupVault [permission only]	Grants permission to copy from a backup vault	Write	recoveryPoint*		
				backup:CopyTargets backup:CopyTargetOrgPaths	
CopyIntoBackupVault [permission only]	Grants permission to copy into a backup vault	Write	backupVault*		
				aws:RequestTag/${TagKey}	
CreateBackupAccessPoint [permission only]	Grants permission to create a new access point for backup instant access	Write	recoveryPoint*		
CreateBackupPlan	Grants permission to create a new backup plan	Write	backupPlan*		iam:PassRole
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateBackupSelection	Grants permission to create a new resource assignment in a backup plan	Write	backupPlan*		iam:PassRole
CreateBackupVault	Grants permission to create a new backup vault	Write	backupVault*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateFramework	Grants permission to create a new framework	Write	framework*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateLegalHold	Grants permission to create a new legal hold	Write	legalHold*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateLogicallyAirGappedBackupVault	Grants permission to create a new logically air-gapped backup vault, a logical container where backups are stored	Write	backupVault*		
				aws:RequestTag/${TagKey} aws:TagKeys backup:MinRetentionDays backup:MaxRetentionDays	
CreateReportPlan	Grants permission to create a new report plan	Write	reportPlan*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys backup:FrameworkArns	
CreateRestoreAccessBackupVault	Grants permission to create a restore access backup vault	Write	backupVault*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateRestoreTestingPlan	Grants permission to create a new restore testing plan	Write	restoreTestingPlan*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateRestoreTestingSelection	Grants permission to create a new resource assignment in a restore testing plan	Write	restoreTestingPlan*		iam:PassRole
CreateTieringConfiguration	Grants permission to create a new tiering configuration	Write	tieringConfiguration*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteBackupAccessPoint [permission only]	Grants permission to delete the access point	Write			
DeleteBackupPlan	Grants permission to delete a backup plan	Write	backupPlan*		
DeleteBackupSelection	Grants permission to delete a resource assignment from a backup plan	Write	backupPlan*		
DeleteBackupVault	Grants permission to delete a backup vault	Write	backupVault*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteBackupVaultAccessPolicy	Grants permission to delete backup vault access policy	Permissions management	backupVault*		
DeleteBackupVaultLockConfiguration	Grants permission to remove the lock configuration from a backup vault	Write	backupVault*		
DeleteBackupVaultNotifications	Grants permission to remove the notifications from a backup vault	Write	backupVault*		
DeleteBackupVaultSharingPolicy [permission only]	Grants permission to delete backup vault sharing policy	Permissions management	backupVault*		
DeleteFramework	Grants permission to delete a framework	Write	framework*		
DeleteRecoveryPoint	Grants permission to delete a recovery point from a backup vault	Write	recoveryPoint*		
DeleteReportPlan	Grants permission to delete a report plan	Write	reportPlan*		
DeleteRestoreTestingPlan	Grants permission to delete a restore testing plan	Write	restoreTestingPlan*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteRestoreTestingSelection	Grants permission to delete a resource assignment from a restore testing plan	Write	restoreTestingPlan*

PutBackupVaultLockConfiguration	Grants permission to add a lock configuration to the backup vault	Write	backupVault*		
				backup:ChangeableForDays backup:MinRetentionDays backup:MaxRetentionDays	
PutBackupVaultNotifications	Grants permission to add an SNS topic to the backup vault	Write	backupVault*		
PutBackupVaultSharingPolicy [permission only]	Grants permission to add a sharing policy to the backup vault	Permissions management	backupVault*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutRestoreValidationResult	Grants permission to put a restore validation result	Write			
RevokeRestoreAccessBackupVault	Grants permission to revoke a restore access backup vault	Write	backupVault*		
SearchRecoveryPoint [permission only]	Grants permission to search a recovery point	Permissions management	recoveryPoint*		
StartBackupJob	Grants permission to start a new backup job	Write	backupVault*		iam:PassRole
StartCopyJob	Grants permission to copy a backup from a source backup vault to a destination backup vault	Write	recoveryPoint*		iam:PassRole
StartReportJob	Grants permission to start a new report job	Write	reportPlan*		
StartRestoreJob	Grants permission to start a new restore job	Write	recoveryPoint*		iam:PassRole
StartScanJob	Grants permission to start a new scan job	Write	recoveryPoint*		iam:PassRole
StopBackupJob	Grants permission to stop a backup job	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to tag a resource	Tagging	backupPlan		
			backupVault		
			framework		
			legalHold		
			recoveryPoint		
			reportPlan		
			restoreTestingPlan		
			tieringConfiguration		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag a resource	Tagging	backupPlan		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			backupVault		
			framework		
			legalHold		
			recoveryPoint		
			reportPlan		
			restoreTestingPlan		
			tieringConfiguration		
				aws:TagKeys	
UpdateBackupPlan	Grants permission to update a backup plan	Write	backupPlan*		iam:PassRole
UpdateFramework	Grants permission to update a framework	Write	framework*		
UpdateGlobalSettings	Grants permission to update the current global settings for the AWS Account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateRecoveryPointIndexSettings	Grants permission to update recovery point index settings	Write	recoveryPoint*		
				backup:Index	
UpdateRecoveryPointLifecycle	Grants permission to update the lifecycle of the recovery point	Write	recoveryPoint*		
UpdateRegionSettings	Grants permission to update the current service opt-in settings for the Region	Write			
UpdateReportPlan	Grants permission to update a report plan	Write	reportPlan*		
				backup:FrameworkArns	
UpdateRestoreTestingPlan	Grants permission to update a restore testing plan	Write	restoreTestingPlan*		
UpdateRestoreTestingSelection	Grants permission to update a resource assignment in a restore testing plan	Write	restoreTestingPlan*		iam:PassRole
UpdateTieringConfiguration	Grants permission to update a tiering configuration	Write	tieringConfiguration*		

Resource types defined by AWS Backup

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
backupVault	`arn:${Partition}:backup:${Region}:${Account}:backup-vault:${BackupVaultName}`	aws:ResourceTag/${TagKey}
backupPlan	`arn:${Partition}:backup:${Region}:${Account}:backup-plan:${BackupPlanId}`	aws:ResourceTag/${TagKey}
recoveryPoint	`arn:${Partition}:${Vendor}:${Region}:*:${ResourceType}:${RecoveryPointId}`	aws:ResourceTag/${TagKey}
framework	`arn:${Partition}:backup:${Region}:${Account}:framework:${FrameworkName}-${FrameworkId}`	aws:ResourceTag/${TagKey}
reportPlan	`arn:${Partition}:backup:${Region}:${Account}:report-plan:${ReportPlanName}-${ReportPlanId}`	aws:ResourceTag/${TagKey}
legalHold	`arn:${Partition}:backup:${Region}:${Account}:legal-hold:${LegalHoldId}`	aws:ResourceTag/${TagKey}
restoreTestingPlan	`arn:${Partition}:backup:${Region}:${Account}:restore-testing-plan:${RestoreTestingPlanName}-${RestoreTestingPlanId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
tieringConfiguration	`arn:${Partition}:backup:${Region}:${Account}:tiering-configuration:${TieringConfigurationName}-${TieringConfigurationId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Backup

AWS Backup defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the presence of mandatory tags in the request	ArrayOfString
backup:ChangeableForDays	Filters access by the value of the ChangeableForDays parameter	Numeric
backup:CopyTargetOrgPaths	Filters access by the organization unit	ArrayOfString

Condition keys	Description	Type
backup:CopyTargets	Filters access by the ARN of a backup vault	ArrayOfARN
backup:FrameworkArns	Filters access by the Framework ARNs	ArrayOfARN
backup:Index	Filters access by the value of Index parameter	String
backup:MaxRetentionDays	Filters access by the value of the MaxRetentionDays parameter	Numeric
backup:MinRetentionDays	Filters access by the value of the MinRetentionDays parameter	Numeric
backup:MpaApprovalTeamArn	Filters access by the MPA Approval Team ARN of a backup vault	ARN

Actions, resources, and condition keys for AWS Backup Gateway

AWS Backup Gateway (service prefix: `backup-gateway`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Backup Gateway

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateGatewayToServer	Grants permission to AssociateGatewayToServer	Write	gateway*		
			hypervisor*		
Backup	Grants permission to Backup	Write	virtualmachine*		
CreateGateway	Grants permission to to CreateGateway	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteGateway	Grants permission to DeleteGateway	Write	gateway*		
DeleteHypervisor	Grants permission to DeleteHypervisor	Write	hypervisor*		
DisassociateGatewayFromServer	Grants permission to DisassociateGatewayFromServer	Write	gateway*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetBandwidthRateLimitSchedule	Grants permission to GetBandwidthRateLimitSchedule	Read	gateway*		
GetGateway	Grants permission to GetGateway	Read	gateway*		
GetHypervisor	Grants permission to GetHypervisor	Read	hypervisor*		
GetHypervisorPropertyMappings	Grants permission to GetHypervisorPropertyMappings	Read	hypervisor*		
GetVirtualMachine	Grants permission to GetVirtualMachine	Read	virtualmachine*		
ImportHypervisorConfiguration	Grants permission to ImportHypervisorConfiguration	Write		aws:RequestTag/${TagKey} aws:TagKeys	
ListGateways	Grants permission to ListGateways	Read			
ListHypervisors	Grants permission to ListHypervisors	Read			
ListTagsForResource	Grants permission to ListTagsForResource	Read	gateway		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			hypervisor		
			virtualmachine		
ListVirtualMachines	Grants permission to ListVirtualMachines	Read			
PutBandwidthRateLimitSchedule	Grants permission to PutBandwidthRateLimitSchedule	Write	gateway*

PutMaintenanceStartTime	Grants permission to PutMaintenanceStartTime	Write	gateway*		
Restore	Grants permission to Restore	Write	hypervisor*		
StartVirtualMachinesMetadataSync	Grants permission to StartVirtualMachinesMetadataSync	Write	hypervisor*		iam:PassRole
TagResource	Grants permission to TagResource	Tagging	gateway		
			hypervisor		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			virtualmachine		
				aws:RequestTag/${TagKey} aws:TagKeys	
TestHypervisorConfiguration	Grants permission to TestHypervisorConfiguration	Write	gateway*		
UntagResource	Grants permission to UntagResource	Tagging	gateway		
			hypervisor		
			virtualmachine		
				aws:TagKeys	
UpdateGatewayInformation	Grants permission to UpdateGatewayInformation	Write	gateway*		
UpdateGatewaySoftwareNow	Grants permission to UpdateGatewaySoftwareNow	Write	gateway*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateHypervisor	Grants permission to UpdateHypervisor	Write	gateway*		

Resource types defined by AWS Backup Gateway

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
gateway	`arn:${Partition}:backup-gateway:${Region}:${Account}:gateway/${GatewayId}`	aws:ResourceTag/${TagKey}
hypervisor	`arn:${Partition}:backup-gateway:${Region}:${Account}:hypervisor/${HypervisorId}`	aws:ResourceTag/${TagKey}
virtualmachine	`arn:${Partition}:backup-gateway:${Region}:${Account}:vm/${VirtualmachineId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Backup Gateway

AWS Backup Gateway defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the

policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters access by tag-value associated with the resource	String
aws:TagKeys	Filters access by the presence of mandatory tags in the request	ArrayOfString

Actions, resources, and condition keys for AWS Backup Search

AWS Backup Search (service prefix: `backup-search`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Backup Search

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSearchJob	Grants permission to get details of a search job	Read	searchJob*		
GetSearchResultExportJob	Grants permission to get details of a search result export job	Read	searchExportJob*		
ListSearchJobBackups	Grants permission to list backups in scope of a search job	Read	searchJob*		
ListSearchJobResults	Grants permission to list results of a search job	Read	searchJob*		
ListSearchJobs	Grants permission to list search jobs	List			
ListSearchResultExportJobs	Grants permission to list search result export jobs	List			
ListTagsForResource	Grants permission to list tags for a resource	Read	searchExportJob		
			searchJob		
StartSearchJob	Grants permission to create a search job	Write		aws:RequestTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
StartSearchResultExportJob	Grants permission to start an export job for an existing search job	Write	searchJob*		iam:PassRole
				aws:RequestTag/${TagKey} aws:TagKeys	
StopSearchJob	Grants permission to stop an in-progress search job	Write	searchJob*		
TagResource	Grants permission to tag a resource	Tagging	searchExportJob		
			searchJob		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag a resource	Tagging	searchExportJob		
			searchJob		
				aws:TagKeys	

Resource types defined by AWS Backup Search

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
searchJob	`arn:${Partition}:backup-search:${Region}:${Account}:search-job/${ResourceId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
searchExportJob	arn:${Partition}:backup-search:${Region}:${Account}:search-export-job/${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Backup Search

AWS Backup Search defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the presence of mandatory tags in the request	ArrayOfString

Actions, resources, and condition keys for AWS Backup storage

AWS Backup storage (service prefix: backup-storage) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Backup storage

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CommitBackupJob [permission only]	Grants permission to commit backup job	Write			
DeleteObjects [permission only]	Grants permission to delete objects	Write			
DescribeBackupJob [permission only]	Grants permission to describe backup job	Write			
GetBaseBackup	Grants permission to get base backup	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
[permission only]					
GetChunk [permission only]	Grants permission to get data from a recovery point for a restore job	Write			
GetIncrementalBaseBackup [permission only]	Grants permission to get incremental base backup	Write			
GetObjectMetadata [permission only]	Grants permission to get metadata from a recovery point for a restore job	Write			
ListChunks [permission only]	Grants permission to list data from a recovery point for a restore job	Write			
ListObjects [permission only]	Grants permission to list data from a recovery point for a restore job	Write			
MountCapsule [permission only]	Associates a KMS key to a backup vault	Write			
NotifyObjectComplete [permission only]	Grants permission to mark an uploaded data as completed for a backup job	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutChunk [permission only]	Grants permission to upload data to an AWS Backup-managed recovery point for a backup job	Write			
PutObject [permission only]	Grants permission to put object	Write			
StartObject [permission only]	Grants permission to upload data to an AWS Backup-managed recovery point for a backup job	Write			
UpdateObjectComplete [permission only]	Grants permission to update object complete	Write			

Resource types defined by AWS Backup storage

AWS Backup storage does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Backup storage, specify `"Resource": "*"` in your policy.

Condition keys for AWS Backup storage

Backup Storage has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Batch

AWS Batch (service prefix: `batch`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.

Actions defined by AWS Batch

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelJob	Grants permission to cancel a job in an AWS Batch job queue in your account	Write	job*		
CreateComputeEnvironment	Grants permission to create an AWS Batch compute environment in your account	Write	compute-environment*		
				aws:RequestTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} aws:TagKeys	
CreateConsumableResource	Grants permission to create an AWS Batch consumable resource in your account	Write	consumable-resource*		
				aws:RequestTag/${TagKey} aws:TagKeys

UpdateComputeEnvironment	Grants permission to update an AWS Batch compute environment in your account	Write	compute-environment*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateConsumableResource	Grants permission to update an AWS Batch consumable resource in your account	Write	consumable-resource*		
UpdateJobQueue	Grants permission to update an AWS Batch job queue in your account	Write	job-queue*		
			compute-environment		
			scheduling-policy		
UpdateQuotaShare	Grants permission to update an AWS Batch quota share in your account	Write	quota-share*		
UpdateSchedulingPolicy	Grants permission to update an AWS Batch scheduling policy in your account	Write	scheduling-policy*		
UpdateServiceEnvironment	Grants permission to update an AWS Batch service environment in your account	Write	service-environment*		
UpdateServiceJob	Grants permission to update a service job in an AWS Batch job queue in your account	Write	service-job*		
				batch:SchedulingPriority	

Resource types defined by AWS Batch

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
compute-environment	`arn:${Partition}:batch:${Region}:${Account}:compute-environment/${ComputeEnvironmentName}`	aws:ResourceTag/${TagKey}
job-queue	`arn:${Partition}:batch:${Region}:${Account}:job-queue/${JobQueueName}`	aws:ResourceTag/${TagKey}
job-definition	`arn:${Partition}:batch:${Region}:${Account}:job-definition/${JobDefinitionName}`	
job-definition-revision	`arn:${Partition}:batch:${Region}:${Account}:job-definition/${JobDefinitionName}:${Revision}`	aws:ResourceTag/${TagKey}
job	`arn:${Partition}:batch:${Region}:${Account}:job/${JobId}`	aws:ResourceTag/${TagKey}
scheduling-policy	`arn:${Partition}:batch:${Region}:${Account}:scheduling-policy/${SchedulingPolicyName}`	aws:ResourceTag/${TagKey}
service-environment	`arn:${Partition}:batch:${Region}:${Account}:service-environment/${ServiceEnvironmentName}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
service-job	arn:${Partition}:batch:${Region}:${Account}:service-job/${JobId}	aws:ResourceTag/${TagKey}
consumable-resource	arn:${Partition}:batch:${Region}:${Account}:consumable-resource/${ConsumableResourceName}	aws:ResourceTag/${TagKey}
quota-share	arn:${Partition}:batch:${Region}:${Account}:job-queue/${JobQueueName}/quota-share/${QuotaShareName}	aws:ResourceTag/${TagKey}

Condition keys for AWS Batch

AWS Batch defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
batch:AWSLogsCreateGroup	Filters access by the specified logging driver to determine whether awslogs group will be created for the logs	Bool

Condition keys	Description	Type
batch:AWSLogsGroup	Filters access by the awslogs group where the logs are located	String
batch:AWSLogsRegion	Filters access by the region where the logs are sent to	String
batch:AWSLogsStreamPrefix	Filters access by the awslogs log stream prefix	String
batch:EKSImage	Filters access by the image used to start a container for an Amazon EKS job	String
batch:EKSNamespace	Filters access by the namespace of a cluster used to run the pod for an Amazon EKS job	String
batch:EKSPrivileged	Filters access by the specified privileged parameter value that determines whether the container is given elevated privileges on the host container instance (similar to the root user) for an Amazon EKS job	Bool
batch:EKSRunAsGroup	Filters access by the specified group numeric ID (gid) used to start a container in an Amazon EKS job	Numeric
batch:EKSRunAsUser	Filters access by the specified user numeric ID (uid) used to start a a container in an Amazon EKS job	Numeric
batch:EKSServiceAccountName	Filters access by the name of the service account used to run the pod for an Amazon EKS job	String
batch:Image	Filters access by the image used to start a container	String
batch:LogDriver	Filters access by the log driver used for the container	String

Condition keys	Description	Type
batch:Privileged	Filters access by the specified privileged parameter value that determines whether the container is given elevated privileges on the host container instance (similar to the root user)	Bool
batch:SchedulingPriority	Filters access by the scheduling priority for jobs in the job queue	Numeric
batch:ShareIdentifier	Filters access by the shareIdentifier used inside submit job	String
batch:User	Filters access by user name or numeric uid used inside the container	String

Actions, resources, and condition keys for Amazon Bedrock

Amazon Bedrock (service prefix: `bedrock`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon Bedrock

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy,

you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AllowVendedLogDeliveryForResource [permission only]	Grants permission to configure vended log delivery for a knowledge base	Permissions management	knowledge-base		
ApplyGuardrail	Grants permission to apply a guardrail	Read	guardrail*		
			guardrail-profile		
AssociateAgentCollaborator	Grants permission to associate another existing agent as a collaborator to an existing agent	Write	agent*		
AssociateAgentKnowledgeBase	Grants permission to associate a knowledge base with an agent	Write	agent*		
			knowledge-base*		
AssociateThirdPartyKnowledgeBase [permission only]	Grants permission to use 3rd party platform to store knowledge data	Write		bedrock:ThirdPartyKnowledgeBaseCredentialsSecretArn	
BatchDeleteEvaluationJob	Grants permission to batch delete list of bedrock evaluation jobs	Write	evaluation-job*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CallWithBearerToken	Grants permission to use bearer token	Read		bedrock:BearerTokenType	
CancelAutomatedReasoningPolicyBuildWorkflow	Grants permission to cancel a build workflow for an automated reasoning policy	Write	automated-reasoning-policy*		
CopyBlueprintStage	Grants permission to copy a blueprint from one stage to another	Write	blueprint*		
CountTokens	Grants permission to count the number of tokens in an input prompt	Read	foundation-model*		
CreateAgent	Grants permission to create a new agent and a test agent alias pointing to the DRAFT agent version	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateAgentActionGroup	Grants permission to create a new action group in an existing agent	Write	agent*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateAgentAlias	Grants permission to create a new alias for an agent	Write	agent*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateAutomatedReasoningPolicy	Grants permission to create a new automated reasoning policy	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateAutomatedReasoningPolicyTestCase	Grants permission to create a test case for an automated reasoning policy	Write	automated-reasoning-policy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAutomatedReasoningPolicyVersion	Grants permission to create a new automated reasoning policy version	Write	automated-reasoning-policy*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateBlueprint	Grants permission to create a blueprint for custom output from data automation	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateBlueprintVersion	Grants permission to create a new version for an existing blueprint	Write	blueprint*		
CreateCustomModel	Grants permission to create a custom model into Bedrock	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCustomModelDeployment	Grants permission to create a custom model deployment for custom model	Write	custom-model*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDataAutomationProject	Grants permission to create a data automation project	Write	blueprint		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDataSource	Grants permission to create a data source	Write	knowledge-base*		
CreateEvaluationJob	Grants permission to create a job for evaluation foundation models or custom models	Write	custom-model*		
			default-prompt-router*		
			foundation-model*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			prompt-router*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateFlow	Grants permission to create a prompt flow	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateFlowAlias	Grants permission to create an alias of a prompt flow	Write	flow*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateFlowVersion	Grants permission to create an immutable version of a prompt flow	Write	flow*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateFoundationModelAgreement	Grants permission to create a new foundation model agreement	Write			
CreateGuardrail	Grants permission to create a new guardrail	Write	automated-reasoning-policy		
			automated-reasoning-policy-version		
			guardrail-profile		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateGuardrailVersion	Grants permission to create a new guardrail version	Write	guardrail*		
CreateInferenceProfile	Grants permission to create inference profiles	Write	application-inference-profile*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			foundation-model*		
			inference-profile*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateInvocation	Grants permission to create a new invocation in an existing session	Write	session*		
CreateKnowledgeBase	Grants permission to create a knowledge base	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateMarketplaceModelEndpoint	Grants permission to create a marketplace model endpoint	Write			
CreateModelCopyJob	Grants permission to create a job for copying a custom model across region or across account	Write	custom-model*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateModelCustomizationJob	Grants permission to create a job for customizing the model with your custom training data	Write	custom-model*		
			foundation-model*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateModelEvaluationJob	Grants permission to create a job for evaluation foundation models or custom models	Write	custom-model*		
			foundation-model*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateModelImportJob	Grants permission to create a job for importing model into Bedrock	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateModelInvocationJob	Grants permission to create a new model invocation job	Write	custom-model*		
			foundation-model*		
			model-invocation-job*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreatePrompt	Grants permission to create a prompt	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreatePromptRouter	Grants permission to create a custom prompt router	Write	application-inference-profile*		
			foundation-model*		
			inference-profile*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreatePromptVersion	Grants permission to create a version of a prompt	Write	prompt*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateProvisionedModelThroughput	Grants permission to create a new provisioned model throughput	Write	custom-model*		
			foundation-model*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSession	Grants permission to create a new session	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAgent	Grants permission to delete an Agent that you created earlier	Write	agent*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAgentActionGroup	Grants permission to delete an actionGroup that you created earlier	Write	agent*		
DeleteAgentAlias	Grants permission to delete an AgentAlias that you created earlier	Write	agent-alias*		
DeleteAgentMemory	Grants permission to delete existing memory for an alias	Write	agent-alias*		
DeleteAgentVersion	Grants permission to delete an Agent Version that you created earlier	Write	agent*		
DeleteAutomatedReasoningPolicy	Grants permission to delete an automated reasoning policy or its version	Write	automated-reasoning-policy*		
			automated-reasoning-policy-version*		
DeleteAutomatedReasoningPolicyBuildWorkflow	Grants permission to delete a build workflow for an automated reasoning policy	Write	automated-reasoning-policy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAutomatedReasoningPolicyTestCase	Grants permission to delete a test case for an automated reasoning policy	Write	automated-reasoning-policy*		
DeleteBlueprint	Grants permission to delete a blueprint for data automation	Write	blueprint*		
DeleteCustomModel	Grants permission to delete a custom model that you created earlier	Write	custom-model*		
DeleteCustomModelDeployment	Grants permission to delete a custom model deployment that you created earlier	Write	custom-model-deployment*		
DeleteDataAutomationProject	Grants permission to delete a data automation project	Write	data-automation-project*		
DeleteDataSource	Grants permission to delete a data source	Write	knowledge-base*		
DeleteEnforcedGuardrailConfiguration	Grants permission to delete account-level enforced guardrail configuration	Write			
DeleteFlow	Grants permission to delete a prompt flow	Write	flow*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteFlowAlias	Grants permission to delete an alias of a prompt flow	Write	flow-alias*		
DeleteFlowVersion	Grants permission to delete a version of a prompt flow	Write	flow*		
DeleteFoundationModelAgreement	Grants permission to delete a foundation model agreement that you created earlier	Write			
DeleteGuardrail	Grants permission to delete a guardrail or its version	Write	guardrail*		
DeleteImportedModel	Grants permission to delete previously created Bedrock imported model	Write	imported-model*		
DeleteInferenceProfile	Grants permission to delete inference profiles	Write	application-inference-profile*		
DeleteKnowledgeBase	Grants permission to delete a knowledge base	Write	knowledge-base*		
DeleteKnowledgeBaseDocuments	Grants permission to delete documents from a knowledge base	Write	knowledge-base*		
DeleteMarketplaceModelAgreement	Grants permission to unsubscribe from a bedrock marketplace enabled AWS marketplace model	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteMarketplaceModelEndpoint	Grants permission to delete a marketplace model endpoint	Write	bedrock-marketplace-model-endpoint*		
DeleteModelInvocationLoggingConfiguration	Grants permission to delete an existing Invocation logging configuration	Write			
DeletePrompt	Grants permission to delete a prompt or its version	Write	prompt*		
			prompt-version*		
DeletePromptRouter	Grants permission to delete a custom prompt router	Write	prompt-router*		
DeleteProvisionedModelThroughput	Grants permission to delete a provisioned model throughput that you created earlier	Write	provisioned-model*		
DeleteResourcePolicy [permission only]	Deletes a previously created Bedrock resource policy	Write	custom-model		
			guardrail		
			guardrail-profile		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteSession	Grants permission to delete a Session that you created earlier	Write	session*		
DeregisterMarketplaceModelEndpoint	Grants permission to deregister a marketplace model endpoint to make it unusable in Bedrock Marketplace	Write	bedrock-marketplace-model-endpoint*		
DetectGeneratedContent	Grants permission to detect if the provided content is generated using Amazon Bedrock	Read	foundation-model*		
DisassociateAgentCollaborator	Grants permission to diassociate a collaborator that you associated earlier	Write	agent*		
DisassociateAgentKnowledgeBase	Grants permission to disassociate a knowledge base from the agent	Write	agent* knowledge-base*		
EndSession	Grants permission to end a Session that you created earlier	Write	session*		
ExportAutomatedReasoningPolicyVersion	Grants permission to retrieve an automated reasoning policy version artifact	Read	automated-reasoning-policy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			automated-reasoning-policy-version*		
GenerateQuery	Grants permission to generate queries associated with user input	Read			
GetAgent	Grants permission to retrieve an existing agent	Read	agent*		
GetAgentActionGroup	Grants permission to retrieve an existing action group	Read	agent*		
GetAgentAlias	Grants permission to retrieve an existing alias	Read	agent-alias*		
GetAgentCollaborator	Grants permission to retrieve an existing collaborator	Read	agent*		
GetAgentKnowledgeBase	Grants permission to describe a knowledge base associated with an agent	Read	agent*		
			knowledge-base*		
GetAgentMemory	Grants permission to retrieve existing memory for an alias	Read	agent-alias*		
GetAgentVersion	Grants permission to retrieve an existing version of an agent	Read	agent*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAsyncInvoke	Grants permission to get the properties associated with an asynchronous invocation that you have submitted	Read	async-invoke*		
GetAutomatedReasoningPolicy	Grants permission to retrieve an automated reasoning policy or its version	Read	automated-reasoning-policy*		
			automated-reasoning-policy-version*		
GetAutomatedReasoningPolicyAnnotations	Grants permission to retrieve annotations for a build workflow for an automated reasoning policy	Read	automated-reasoning-policy*		
GetAutomatedReasoningPolicyBuildWorkflow	Grants permission to retrieve a build workflow for an automated reasoning policy	Read	automated-reasoning-policy*		
GetAutomatedReasoningPolicyBuildWorkflowResultAssets	Grants permission to retrieve assets for a build workflow for an automated reasoning policy	Read	automated-reasoning-policy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAutomatedReasoningPolicyNextScenario	Grants permission to retrieve the next unreviewed generated scenario for a build workflow for an automated reasoning policy	Read	automated-reasoning-policy*		
GetAutomatedReasoningPolicyTestCase	Grants permission to retrieve a test case for an automated reasoning policy	Read	automated-reasoning-policy*		
GetAutomatedReasoningPolicyTestResult	Grants permission to retrieve result for a test case for an automated reasoning policy	Read	automated-reasoning-policy*		
GetBlueprint	Grants permission to retrieve an existing blueprint for data automation	Read	blueprint*		
GetBlueprintOptimizationStatus	Grants permission to get the status of a blueprint optimization job	Read	blueprint-optimization-invocation*		
GetBlueprintRecommendation [permission only]	Grants permission to retrieve blueprint recommendation	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCustomModel	Grants permission to get the properties associated with a Bedrock custom model that you have created	Read	custom-model*		
GetCustomModelDeployment	Grants permission to get the properties associated with a custom model deployment. Use this operation to get the status of a custom model deployment	Read	custom-model-deployment*		
GetDataAutomationProject	Grants permission to retrieve an existing data automation project	Read	data-automation-project*		
GetDataAutomationStatus	Grants permission to retrieve the status of a data automation invocation job	Read	data-automation-invocation-job*		
GetDataSource	Grants permission to retrieve an existing data source	Read	knowledge-base*		
GetEvaluationJob	Grants permission to get the properties associated with a evaluation job. Use this operation to get the status of a evaluation job	Read	evaluation-job*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetExecutionFlowSnapshot	Grants permission to retrieve the flow definition for a flow execution	Read	flow*		
			flow-alias*		
			flow-execution*		
GetFlow	Grants permission to retrieve an existing prompt flow	Read	flow*		
GetFlowAlias	Grants permission to retrieve an existing alias of a prompt flow	Read	flow-alias*		
GetFlowExecution	Grants permission to retrieve an existing execution of a flow alias	Read	flow*		
			flow-alias*		
			flow-execution*		
GetFlowVersion	Grants permission to retrieve an existing version of a prompt flow	Read	flow*		
GetFoundationModel	Grants permission to get the properties associated with a Bedrock foundation model	Read	foundation-model*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetFoundationModelAvailability	Grants permission to get the availability of a foundation model	Read			
GetGuardrail	Grants permission to retrieve a guardrail or its version	Read	guardrail*		
GetImportedModel	Grants permission to get the properties associated with Bedrock imported model	Read	imported-model*		
GetInferenceProfile	Grants permission to get the properties associated with an inference profile	Read	application-inference-profile*		
			inference-profile*		
GetIngestionJob	Grants permission to retrieve an existing ingestion job	Read	knowledge-base*		
GetInvocationStep	Grants permission to get an invocation step from a session	Read	session*		
GetKnowledgeBase	Grants permission to retrieve an existing knowledge base	Read	knowledge-base*		
GetKnowledgeBaseDocuments	Grants permission to get details for documents in a knowledge base	Read	knowledge-base*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetMarketplaceModelEndpoint	Grants permission to get the properties of a marketplace model endpoint	Read	bedrock-marketplace-model-endpoint*		
GetModelCopyJob	Grants permission to get the properties associated with a model-copy job. Use this operation to get the status of a model-copy job	Read	model-copy-job*		
GetModelCustomizationJob	Grants permission to get the properties associated with a model-customization job. Use this operation to get the status of a model-customization job	Read	model-customization-job*		
GetModelEvaluationJob	Grants permission to get the properties associated with a model-evaluation job. Use this operation to get the status of a model-evaluation job	Read	model-evaluation-job*		
GetModelImportJob	Grants permission to get the properties associated with a model import job and is used to get the status of a model import job	Read	model-import-job*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetModelInvocationJob	Grants permission to retrieve a model invocation job	Read	model-invocation-job*		
GetModelInvocationLoggingConfiguration	Grants permission to retrieve an existing Invocation logging configuration	Read			
GetPrompt	Grants permission to retrieve an existing prompt or its version	Read	prompt*		
			prompt-version*		
GetPromptRouter	Grants permission to get the properties associated with a prompt router	Read	default-prompt-router*		
			prompt-router*		
GetProvisionedModelThroughput	Grants permission to retrieve a provisioned model throughput	Read	provisioned-model*		
GetResourcePolicy [permission only]	Gets the resource policy document for a Bedrock resource	Read	custom-model		
			guardrail		
			guardrail-profile		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSession	Grants permission to retrieve an existing session	Read	session*		
GetUseCaseForModelAccess	Grants permission to retrieve a use case for model access	Read			
IngestKnowledgeBaseDocuments	Grants permission to directly ingest documents into a knowledge base	Write	knowledge-base*		
InvokeAgent	Grants permission to send user input (text-only) to the alias of an agent for Bedrock	Read	agent-alias*		
InvokeAutomatedReasoningPolicy [permission only]	Grants permission to invoke an Automated Reasoning policy	Read	automated-reasoning-policy*		
			automated-reasoning-policy-version*		
InvokeBlueprintOptimizationAsync	Grants permission to invoke an async job to perform blueprint optimization	Write	blueprint*		
			data-automation-profile*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
InvokeBlueprintRecommendationAsync [permission only]	Grants permission to invoke blueprint recommendations asynchronously	Write	data-automation-profile*		
InvokeBuilder [permission only]	Grants permission to use the conversational builder which aids in building supported bedrock resources	Write			
InvokeDataAutomation	Grants permission to invoke a call to Sync API of Bedrock data automation	Write	blueprint*		
			data-automation-profile*		
			data-automation-project*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
InvokeDataAutomationAsync	Grants permission to invoke a Bedrock data automation job	Write	blueprint*		
			data-automation-profile*		
			data-automation-project*		
				aws:RequestTag/${TagKey} aws:TagKeys	
InvokeFlow	Grants permission to invoke a prompt flow with user input	Read	flow-alias*		
InvokeInlineAgent	Grants permission to send user input (text-only) to the inline agent for Bedrock	Read		bedrock:InlineAgentName	
InvokeModel	Grants permission to invoke the specified Bedrock model to run inference using the input provided in the request body	Read	application-inference-profile*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			async-invoke*		
			bedrock-marketplace-model-endpoint*		
			custom-model-deployment*		
			default-prompt-router*		
			foundation-model*		
			imported-model*		
			inference-profile*		
			prompt-router*		
			provisioned-model*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				bedrock:InferenceProfileArn bedrock:PromptRouterArn aws:RequestTag/${TagKey} aws:TagKeys bedrock:GuardrailIdentifier bedrock:ServiceTier	
InvokeModelWithResponseStream	Grants permission to invoke the specified Bedrock model to run inference using the input provided in the request body with streaming response	Read	application-inference-profile*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			bedrock-marketplace-model-endpoint*		
			custom-model-deployment*		
			default-prompt-router*		
			foundation-model*		
			imported-model*		
			inference-profile*		
			prompt-router*		
			provisioned-model*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				bedrock:InferenceProfileArn bedrock:PromptRouterArn bedrock:GuardrailIdentifier bedrock:ServiceTier	
InvokeTool	Grants permission to invoke the specified Bedrock tool to run inference	Read	system-tool*		
ListAgentActionGroups	Grants permission to list action groups in an agent	List	agent*		
ListAgentAliases	Grants permission to list aliases for an agent	List	agent*		
ListAgentCollaborators	Grants permission to list collaborators for an agent	List	agent*		
ListAgentKnowledgeBases	Grants permission to list knowledge bases associated with an agent	List	agent*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAgentVersions	Grants permission to list existing versions of an agent	List	agent*		
ListAgents	Grants permission to list existing agents	List			
ListAsyncInvokes	Grants permission to get a list of asynchronous invocations that you have submitted	List			
ListAutomatedReasoningPolicies	Grants permission to list automated reasoning policies or its versions	List	automated-reasoning-policy		
ListAutomatedReasoningPolicyBuildWorkflows	Grants permission to list build workflows for an automated reasoning policy	List	automated-reasoning-policy*		
ListAutomatedReasoningPolicyTestCases	Grants permission to list test cases for an automated reasoning policy	List	automated-reasoning-policy*		
ListAutomatedReasoningPolicyTestResults	Grants permission to list test result for an automated reasoning policy	List	automated-reasoning-policy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListBlueprints	Grants permission to list existing blueprints for data automation	List	data-automation-project		
ListCustomModelDeployments	Grants permission to get the list of custom model deployments that you have submitted	List			
ListCustomModels	Grants permission to get a list of Bedrock custom models that you have created	List			
ListDataAutomationProjects	Grants permission to list existing data automation projects	List	blueprint		
ListDataSources	Grants permission to list existing data sources in an knowledge base	List	knowledge-base*		
ListEnforcedGuardrailsConfiguration	Grants permission to list account-level enforced guardrail configurations	List			
ListEvaluationJobs	Grants permission to get the list of evaluation jobs that you have submitted	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListFlowAliases	Grants permission to list existing aliases of a prompt flow	List	flow*		
ListFlowExecutionEvents	Grants permission to retrieve events for a flow execution	List	flow*		
			flow-alias*		
			flow-execution*		
ListFlowExecutions	Grants permission to list executions of a flow or a flow alias	List	flow*		
			flow-alias		
ListFlowVersions	Grants permission to list existing versions of a prompt flow	List	flow*		
ListFlows	Grants permission to list existing prompt flows	List			
ListFoundationModelAgreementOffers	Grants permission to get a list of foundation model agreement offers	List			
ListFoundationModels	Grants permission to list Bedrock foundation models that you can use	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListGuardrails	Grants permission to list guardrails or its versions	List	guardrail		
ListImportedModels	Grants permission to get list of Bedrock imported models	List			
ListInferenceProfiles	Grants permission to list inference profiles that you can use	List			
ListIngestionJobs	Grants permission to list ingestion jobs in a data source	List	knowledge-base*		
ListInvocationSteps	Grants permission to get list of invocation step from a session	List	session*		
ListInvocations	Grants permission to list invocations in a session	List	session*		
ListKnowledgeBaseDocuments	Grants permission to list documents in a knowledge base	List	knowledge-base*		
ListKnowledgeBases	Grants permission to list existing knowledge bases	List			
ListMarketplaceModelEndpoints	Grants permission to list marketplace model endpoints that you can use	Read			
ListModelCopyJobs	Grants permission to get the list of model copy jobs that you have submitted	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListModelCustomizationJobs	Grants permission to get the list of model customization jobs that you have submitted	List			
ListModelEvaluationJobs	Grants permission to get the list of model evaluation jobs that you have submitted	List			
ListModelImportJobs	Grants permission to get list of model import jobs	List			
ListModelInvocationJobs	Grants permission to list model invocation jobs that you created earlier	List			
ListPromptRouters	Grants permission to list prompt routers that you can use	List			
ListPrompts	Grants permission to list existing prompts	List	prompt		
ListProvisionedModelThroughputs	Grants permission to list provisioned model throughputs that you created earlier	List			
ListSessions	Grants permission to list existing sessions	List			
ListTagsForResource	Grants permission to list tags for a Bedrock resource	Read	agent*		
			agent-alias*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

UpdateAgent	Grants permission to update an existing agent	Write	agent*		
UpdateAgentActionGroup	Grants permission to update an existing action group	Write	agent*		
UpdateAgentAlias	Grants permission to update an existing alias	Write	agent-alias*		
UpdateAgentCollaborator	Grants permission to update an existing collaborator	Write	agent*		
UpdateAgentKnowledgeBase	Grants permission to update a knowledge base associated with an agent	Write	agent*		
			knowledge-base*		
UpdateAutomatedReasoningPolicy	Grants permission to update an automated reasoning policy	Write	automated-reasoning-policy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAutomatedReasoningPolicyAnnotations	Grants permission to update annotations for a build workflow for an automated reasoning policy	Write	automated-reasoning-policy*		
UpdateAutomatedReasoningPolicyTestCase	Grants permission to update a test case for automated reasoning policy	Write	automated-reasoning-policy*		
UpdateBlueprint	Grants permission to update a blueprint for data automation	Write	blueprint*		
UpdateCustomModelDeployment	Grants permission to update an existing custom model deployment with a new custom model	Write	custom-model*		
			custom-model-deployment*		
UpdateDataAutomationProject	Grants permission to update a data automation project	Write	data-automation-project*		
			blueprint		
UpdateDataSource	Grants permission to update a data source	Write	knowledge-base*		
UpdateFlow	Grants permission to update a prompt flow	Write	flow*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateFlowAlias	Grants permission to update the configuration of an alias of a prompt flow	Write	flow-alias*		
UpdateGuardrail	Grants permission to update a guardrail	Write	guardrail*		
			automated-reasoning-policy		
			automated-reasoning-policy-version		
			guardrail-profile		
UpdateKnowledgeBase	Grants permission to update a knowledge base	Write	knowledge-base*		
UpdateMarketplaceModelEndpoint	Grants permission to update a marketplace model endpoint	Write	bedrock-marketplace-model-endpoint*		
UpdatePrompt	Grants permission to update a prompt	Write	prompt*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateProvisionedModelThroughput	Grants permission to update a provisioned model throughput that you created earlier	Write	custom-model*		
			foundation-model*		
			provisioned-model*		
UpdateSession	Grants permission to update an existing session	Write	session*		
ValidateFlowDefinition	Grants permission to validate prompt flow definitions	Read			

Resource types defined by Amazon Bedrock

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
foundation-model	`arn:${Partition}:bedrock:${Region}::foundation-model/${ResourceId}`	
system-tool	`arn:${Partition}:bedrock::${Account}:system-tool/${ResourceId}`	

Resource types	ARN	Condition keys
async-invoke	arn:${Partition}:bedrock:${Region}:${Account}:async-invoke/${ResourceId}	aws:ResourceTag/${TagKey}
inference-profile	arn:${Partition}:bedrock:${Region}:${Account}:inference-profile/${ResourceId}	
default-prompt-router	arn:${Partition}:bedrock:${Region}:${Account}:default-prompt-router/${ResourceId}	
prompt-router	arn:${Partition}:bedrock:${Region}:${Account}:prompt-router/${ResourceId}	aws:ResourceTag/${TagKey}
application-inference-profile	arn:${Partition}:bedrock:${Region}:${Account}:application-inference-profile/${ResourceId}	aws:ResourceTag/${TagKey}
custom-model	arn:${Partition}:bedrock:${Region}:${Account}:custom-model/${ResourceId}	aws:ResourceTag/${TagKey}
provisioned-model	arn:${Partition}:bedrock:${Region}:${Account}:provisioned-model/${ResourceId}	aws:ResourceTag/${TagKey}
model-customization-job	arn:${Partition}:bedrock:${Region}:${Account}:model-customization-job/${ResourceId}	aws:ResourceTag/${TagKey}
agent	arn:${Partition}:bedrock:${Region}:${Account}:agent/${AgentId}	aws:ResourceTag/${TagKey}
agent-alias	arn:${Partition}:bedrock:${Region}:${Account}:agent-alias/${AgentId}/${AgentAliasId}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
knowledge-base	arn:${Partition}:bedrock:${Region}:${Account}:knowledge-base/${KnowledgeBaseId}	aws:ResourceTag/${TagKey}
model-evaluation-job	arn:${Partition}:bedrock:${Region}:${Account}:model-evaluation-job/${ResourceId}	aws:ResourceTag/${TagKey}
evaluation-job	arn:${Partition}:bedrock:${Region}:${Account}:evaluation-job/${ResourceId}	aws:ResourceTag/${TagKey}
model-invocation-job	arn:${Partition}:bedrock:${Region}:${Account}:model-invocation-job/${JobIdentifier}	aws:ResourceTag/${TagKey}
guardrail	arn:${Partition}:bedrock:${Region}:${Account}:guardrail/${GuardrailId}	aws:ResourceTag/${TagKey}
guardrail-profile	arn:${Partition}:bedrock:${Region}:${Account}:guardrail-profile/${ResourceId}	
automated-reasoning-policy	arn:${Partition}:bedrock:${Region}:${Account}:automated-reasoning-policy/${AutomatedReasoningPolicyId}	aws:ResourceTag/${TagKey}
automated-reasoning-policy-version	arn:${Partition}:bedrock:${Region}:${Account}:automated-reasoning-policy/${AutomatedReasoningPolicyId}:${AutomatedReasoningPolicyVersion}	aws:ResourceTag/${TagKey}
flow	arn:${Partition}:bedrock:${Region}:${Account}:flow/${FlowId}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
flow-alias	arn:${Partition}:bedrock:${Region}:${Account}:flow/${FlowId}/alias/${FlowAliasId}	aws:ResourceTag/${TagKey}
flow-execution	arn:${Partition}:bedrock:${Region}:${Account}:flow/${FlowId}/alias/${FlowAliasId}/execution/${FlowExecutionId}	
model-copy-job	arn:${Partition}:bedrock:${Region}:${Account}:model-copy-job/${ResourceId}	aws:ResourceTag/${TagKey}
prompt	arn:${Partition}:bedrock:${Region}:${Account}:prompt/${PromptId}	aws:ResourceTag/${TagKey}
prompt-version	arn:${Partition}:bedrock:${Region}:${Account}:prompt/${PromptId}:${PromptVersion}	aws:ResourceTag/${TagKey}
model-import-job	arn:${Partition}:bedrock:${Region}:${Account}:model-import-job/${ResourceId}	aws:ResourceTag/${TagKey}
imported-model	arn:${Partition}:bedrock:${Region}:${Account}:imported-model/${ResourceId}	aws:ResourceTag/${TagKey}
bedrock-marketplace-model-endpoint	arn:${Partition}:bedrock:${Region}:${Account}:marketplace/model-endpoint/all-access	

Resource types	ARN	Condition keys
data-automation-project	arn:${Partition}:bedrock:${Region}:${Account}:data-automation-project/${ProjectId}	aws:ResourceTag/${TagKey}
blueprint	arn:${Partition}:bedrock:${Region}:${Account}:blueprint/${BlueprintId}	aws:ResourceTag/${TagKey}
blueprint-optimization-invocation	arn:${Partition}:bedrock:${Region}:${Account}:blueprint-optimization-invocation/${ResourceId}	aws:ResourceTag/${TagKey}
data-automation-invocation-job	arn:${Partition}:bedrock:${Region}:${Account}:data-automation-invocation/${JobId}	aws:ResourceTag/${TagKey}
data-automation-profile	arn:${Partition}:bedrock:${Region}:${Account}:data-automation-profile/${ProfileId}	
session	arn:${Partition}:bedrock:${Region}:${Account}:session/${SessionId}	aws:ResourceTag/${TagKey}
custom-model-deployment	arn:${Partition}:bedrock:${Region}:${Account}:custom-model-deployment/${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Bedrock

Amazon Bedrock defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by creating requests based on the allowed set of values for each of the mandatory tags	String
aws:ResourceTag/${TagKey}	Filters access by having actions based on the tag value associated with the resource	String
aws:TagKeys	Filters access by creating requests based on the presence of mandatory tags in the request	ArrayOfString
bedrock:BearerTokenType	Filters access by the Short-term or Long-term bearer tokens	String
bedrock:GuardrailIdentifier	Filters access by the GuardrailIdentifier containing the GuardrailArn or the GuardrailArn:NumericVersion	ARN
bedrock:InferenceProfileArn	Filters access by the specified inference profile	ARN
bedrock:InlineAgentName	Filters access by the Inline Agent Names, this will be used in InvokeInlineAgent API names	String
bedrock:PromptRouterArn	Filters access by the specified prompt router	ARN
bedrock:ServiceTier	Filters access by the specified ServiceTier	String
bedrock:ThirdPartyKnowledgeBaseCredentialsSecretArn	Filters access by the secretArn containing the credentials of the third party platform	ARN

Actions, resources, and condition keys for Amazon Bedrock Agentcore

Amazon Bedrock Agentcore (service prefix: `bedrock-agentcore`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon Bedrock Agentcore

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AllowVendedLogDeliveryForResource [permission only]	Grants permission to configure vended telemetry for a resource	Permissions management	memory*		
AuthorizeAction	Grants permission to evaluate Cedar policies for authorization requests	Permissions	gateway*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
[permission only]		management	policy-engine*		
BatchCreateMemoryRecords	Grants permission to create one or more memory records	Write	memory*		
				bedrock-agentcore:namespace	
BatchDeleteMemoryRecords	Grants permission to delete one or more memory records	Write	memory*		
BatchUpdateMemoryRecords	Grants permission to update one or more memory records	Write	memory*		
				bedrock-agentcore:namespace	
CompleteResourceTokenAuth	Grants permission to retrieve access token with OAuth2 for 3LO flow to access external resource	Read	oauth2credentialprovider*		
			token-vault*		
			workload-identity*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			workload-identity-directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				bedrock-agentcore:InboundJwtClaim/iss bedrock-agentcore:InboundJwtClaim/sub bedrock-agentcore:InboundJwtClaim/aud bedrock-agentcore:InboundJwtClaim/scope bedrock-agentcore:InboundJw	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				tClaim/client_id bedrock-agentcore:userid	
ConnectBrowserAutomationStream	Grants permission to connect to a browser automation stream	Read			
ConnectBrowserLiveViewStream	Grants permission to connect to a browser live view stream	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAgentRuntime	Grants permission to create a new agent runtime	Write		aws:RequestTag/${TagKey} aws:TagKeys bedrock-agentcore:subnets bedrock-agentcore:securityGroups	iam:PassRole
CreateAgentRuntimeEndpoint	Grants permission to create a new agent runtime endpoint	Write	runtime*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateApiKeyCredentialProvider	Grants permission to create a new API Key Credential Provider	Write	apikeycredentialprovider*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			token-vault*

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCodeInterpreterSession	Grants permission to get details of a code interpreter session	Read	code-interpreter*		
			code-interpreter-custom*		
GetEvaluator	Grants permission to get details of an evaluator	Read	evaluator*		
GetEvent	Grants permission to fetch an Event	Read	memory*		
				bedrock-agentcore:sessionId bedrock-agentcore:actorId	
GetGateway	Grants permission to retrieve an existing gateway	Read	gateway*		
GetGatewayTarget	Grants permission to retrieve an existing gateway target	Read	gateway*		
GetMemory	Grants permission to fetch details for a Memory resource	Read	memory*		
GetMemoryRecord	Grants permission to fetch a Memory Record	Read	memory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetOauth2CredentialProvider	Grants permission to fetch a registered OAuth2 Credential Provider by its name	Read	oauth2credentialprovider*		
			token-vault*		
GetOnlineEvaluationConfig	Grants permission to get details of an online evaluation configuration	Read	online-evaluation-config*		
GetPolicy	Grants permission to retrieve a policy	Read	policy*		
			policy-engine*		
GetPolicyEngine	Grants permission to retrieve a policy engine	Read	policy-engine*		
GetPolicyGeneration	Grants permission to retrieve status and results of a policy generation request	Read	policy-engine*		
			policy-generation*		
GetResourceApiKey	Grants permission to retrieve an API Key associated with an Api Key Credential Provider	Read	apikeycredentialprovider*		
			token-vault*		
			workload-identity*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			workload-identity-directory*		
GetResourceOauth2Token	Grants permission to retrieve access token with OAuth2 2LO or 3LO flow to access external resource	Read	oauth2credentialprovider*		
			token-vault*		
			workload-identity*		
			workload-identity-directory*		
GetResourcePolicy	Grants permission to retrieve the resource-based policy for a Bedrock resource	Read	gateway		
			runtime		
			runtime-endpoint		
GetTokenVault	Grants permission to fetch the current configuration of the TokenVault, including encryption settings	Read	token-vault*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetWorkloadAccessToken	Grants permission to retrieve an Workload access token for agentic workloads not acting on behalf of a user	Write	workload-identity*		
			workload-identity-directory*		
GetWorkloadAccessTokenForJWT	Grants permission to retrieve an Workload access token for agentic workloads acting on behalf of user with JWT token	Write	workload-identity*		
			workload-identity-directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				bedrock-agentcore:InboundJwtClaim/iss bedrock-agentcore:InboundJwtClaim/sub bedrock-agentcore:InboundJwtClaim/aud bedrock-agentcore:InboundJwtClaim/scope bedrock-agentcore:InboundJw	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				tClaim/client_id	
GetWorkloadAccessTokenForUserId	Grants permission to retrieve an Workload access token for agentic workloads acting on behalf of user with User Id	Write	workload-identity*		
			workload-identity-directory*		
				bedrock-agentcore:userid	
GetWorkloadIdentity	Grants permission to fetch details for a specific Workload identity, including its name and allowed OAuth2 return URLs	Read	workload-identity*		
			workload-identity-directory*		
InvokeAgentRuntime	Grants permission to invoke an agent runtime endpoint	Write	runtime*		
			runtime-endpoint*		
InvokeAgentRuntimeCommand	Grants permission to invoke commands on an agent runtime endpoint	Write	runtime*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			runtime-endpoint*		
InvokeAgentRuntimeForUser	Grants permission to invoke an agent runtime endpoint with X-Amzn-Bedrock-AgentCore-Runtime-User-Id header	Write	runtime*		
			runtime-endpoint*		
InvokeAgentRuntimeWithWebSocketStream	Grants permission to invoke an agent runtime endpoint with WebSocket stream	Write	runtime*		
			runtime-endpoint*		
InvokeAgentRuntimeWithWebSocketStreamForUser	Grants permission to invoke an agent runtime endpoint with WebSocket stream and with X-Amzn-Bedrock-AgentCore-Runtime-User-Id header	Write	runtime*		
			runtime-endpoint*		
InvokeCodeInterpreter	Grants permission to invoke a code interpreter session	Write	code-interpreter*		
			code-interpreter-custom*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
InvokeGateway [permission only]	Grants permission to invoke a gateway	Permissions management	gateway*

Resource types defined by Amazon Bedrock Agentcore

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
evaluator	`arn:${Partition}:bedrock-agentcore:${Region}:${Account}:evaluator/${EvaluatorId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
online-evaluation-config	arn:${Partition}:bedrock-agentcore:${Region}:${Account}:online-evaluation-config/${OnlineEvaluationConfigId}	aws:ResourceTag/${TagKey}
memory	arn:${Partition}:bedrock-agentcore:${Region}:${Account}:memory/${MemoryId}	aws:ResourceTag/${TagKey}
gateway	arn:${Partition}:bedrock-agentcore:${Region}:${Account}:gateway/${GatewayId}	aws:ResourceTag/${TagKey}
workload-identity	arn:${Partition}:bedrock-agentcore:${Region}:${Account}:workload-identity-directory/${DirectoryId}/workload-identity/${WorkloadIdentityName}	aws:ResourceTag/${TagKey}
oauth2credentialprovider	arn:${Partition}:bedrock-agentcore:${Region}:${Account}:token-vault/${TokenVaultId}/oauth2credentialprovider/${Name}	aws:ResourceTag/${TagKey}
apikeycredentialprovider	arn:${Partition}:bedrock-agentcore:${Region}:${Account}:token-vault/${TokenVaultId}/apikeycredentialprovider/${Name}	aws:ResourceTag/${TagKey}
runtime	arn:${Partition}:bedrock-agentcore:${Region}:${Account}:runtime/${RuntimeId}	aws:ResourceTag/${TagKey}
runtime-endpoint	arn:${Partition}:bedrock-agentcore:${Region}:${Account}:runtime/${RuntimeId}/runtime-endpoint/${Name}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
code-interpreter-custom	arn:${Partition}:bedrock-agentcore:${Region}:${Account}:code-interpreter-custom/${CodeInterpreterId}	aws:ResourceTag/${TagKey}
code-interpreter	arn:${Partition}:bedrock-agentcore:${Region}:aws:code-interpreter/${CodeInterpreterId}	
browser-custom	arn:${Partition}:bedrock-agentcore:${Region}:${Account}:browser-custom/${BrowserId}	aws:ResourceTag/${TagKey}
browser	arn:${Partition}:bedrock-agentcore:${Region}:aws:browser/${BrowserId}	
browser-profile	arn:${Partition}:bedrock-agentcore:${Region}:${Account}:browser-profile/${BrowserProfileId}	aws:ResourceTag/${TagKey}
workload-identity-directory	arn:${Partition}:bedrock-agentcore:${Region}:${Account}:workload-identity-directory/${DirectoryId}	aws:ResourceTag/${TagKey}
token-vault	arn:${Partition}:bedrock-agentcore:${Region}:${Account}:token-vault/${TokenVaultId}	aws:ResourceTag/${TagKey}
policy-engine	arn:${Partition}:bedrock-agentcore:${Region}:${Account}:policy-engine/${PolicyEngineId}	
policy	arn:${Partition}:bedrock-agentcore:${Region}:${Account}:policy-engine/${PolicyEngineId}/policy/${PolicyId}	

Resource types	ARN	Condition keys
policy-generation	arn:${Partition}:bedrock-agentcore:${Region}:${Account}:policy-engine/${PolicyEngineId}/policy-generation/${PolicyGenerationId}	

Condition keys for Amazon Bedrock Agentcore

Amazon Bedrock Agentcore defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by creating requests based on the allowed set of values for each of the mandatory tags	String
aws:ResourceTag/${TagKey}	Filters access by having actions based on the tag value associated with the resource	String
aws:TagKeys	Filters access by creating requests based on the presence of mandatory tags in the request	ArrayOfString
bedrock-agentcore:GatewayAuthorizerType	Filters access by the authorizerType attribute on a Gateway	String
bedrock-agentcore:	Filters access by the audience claim (aud) in the JWT passed in the request	ArrayOfString

Condition keys	Description	Type
InboundJwtClaim/aud		
bedrock-agentcore:InboundJwtClaim/client_id	Filters access by the client_id claim in the JWT passed in the request	String
bedrock-agentcore:InboundJwtClaim/iss	Filters access by the issuer (iss) claim present in the JWT passed in the request	String
bedrock-agentcore:InboundJwtClaim/scope	Filters access by the scope claim in the JWT passed in the request	ArrayOfString
bedrock-agentcore:InboundJwtClaim/sub	Filters access by the subject claim (sub) in the JWT passed in the request	String
bedrock-agentcore:KmsKeyArn	Filters access by KMS Key arn provided	String
bedrock-agentcore:actorId	Filters access by Actor Id	String
bedrock-agentcore:namespace	Filters access by namespace	String
bedrock-agentcore:securityGroups	Filters access by the ID of security groups configured for the AgentCore runtime	ArrayOfString

Condition keys	Description	Type
bedrock-agentcore:sessionId	Filters access by Session Id	String
bedrock-agentcore:strategyId	Filters access by Memory Strategy Id	String
bedrock-agentcore:subnets	Filters access by the ID of subnets configured for the AgentCore runtime	ArrayOfString
bedrock-agentcore:userid	Filters access by the static user ID value passed in the request	String

Actions, resources, and condition keys for Amazon Bedrock Powered by AWS Mantle

Amazon Bedrock Powered by AWS Mantle (service prefix: `bedrock-mantle`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon Bedrock Powered by AWS Mantle

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ArchiveProject	Grants permission to archive a specific project	Write	project*	aws:ResourceTag/${TagKey}	
CallWithBearerToken [permission only]	Grants permission to make API calls using bearer token authentication	List		bedrock-mantle:BearerTokenType	
CancelFineTuningJob	Grants permission to cancel an in-progress fine tuning job	Write	project*	aws:ResourceTag/${TagKey}	
				bedrock-mantle:FineTuningJob	
CancelInference	Grants permission to cancel an in-progress inference request	Write	project*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateFile	Grants permission to create a file in a project	Write	project*	aws:ResourceTag/${TagKey}	
CreateFineTuningJob	Grants permission to create a fine tuning job	Write	project*	aws:ResourceTag/${TagKey}	
				bedrock-mantle:Model bedrock-mantle:Files	
CreateInference	Grants permission to create a chat completion inference request	Write	project*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				bedrock-mantle:ServiceTier bedrock-mantle:Model

Actions defined by AWS Billing

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateSourceViews	Grants permission to associate source views to a billing view	Write	billingview*		billing:UseSourceView iam:CreateServiceLinkedRole
				aws:ResourceTag/${TagKey}	
CreateBillingView	Grants permission to create a billing view	Write	billingview*		billing:UseSourceView iam:CreateServiceLinkedRole
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteBillingView	Grants permission to delete a billing view	Write	billingview*		
				aws:ResourceTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey}	
DeleteResourcePolicy [permission only]	Grants permission to delete a billing view resource policy	Permissions management	billingview*		
				aws:ResourceTag/${TagKey}	
DisassociateSourceViews	Grants permission to disassociate source views from a billing view	Write	billingview*		
				aws:ResourceTag/${TagKey}	
GetBillingData [permission only]	Grants permission to perform queries on billing information	Read	billingview		
				aws:ResourceTag/${TagKey}	
GetBillingDetails [permission only]	Grants permission to view detailed line item billing information	Read	billingview		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetBillingNotifications [permission only]	Grants permission to view notifications sent by AWS related to your accounts billing information	Read			
GetBillingPreferences [permission only]	Grants permission to view billing preferences such as reserved instance, savings plans and credits sharing	Read			
GetBillingView	Grants permission to get the metadata for a specified billing view	Read	billingview*		
				aws:ResourceTag/${TagKey}	
GetBillingViewData [permission only]	Grants permission to get cost and usage data for a specified billng view	Read	billingview*		
GetContractInformation [permission only]	Grants permission to view the account's contract information including the contract number, end-user organization names, PO numbers and if the account is used to service public-sector customers	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCredits [permission only]	Grants permission to view credits that have been redeemed	Read			
GetIAMAccessPreference [permission only]	Grants permission to retrieve the state of the Allow IAM Access billing preference	Read			
GetResourcePolicy	Grants permission to get the resource policy specified billing view	Permissions management	billingview*		
				aws:ResourceTag/${TagKey}	
GetSellerOfRecord [permission only]	Grants permission to retrieve the account's default Seller of Record	Read			
ListBillingViews	Grants permission to get a list of all your available billing views	Read			
ListSourceViewsForBillingView	Grants permission to get the list of source views for a specified billing view	List	billingview*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
ListTagsForResource	Grants permission to get the list of tags for a specified billing view	Read	billingview*		
				aws:ResourceTag/${TagKey}	
PutContractInformation [permission only]	Grants permission to set the account's contract information end-user organization names and if the account is used to service public-sector customers	Write			
PutResourcePolicy [permission only]	Grants permission to put a billing view resource policy	Permissions management	billingview*		
				aws:ResourceTag/${TagKey}	
RedeemCredits [permission only]	Grants permission to redeem an AWS credit	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to add tags to a specified billing view	Tagging	billingview*		
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
UntagResource	Grants permission to remove a tag from a specified billing view	Tagging	billingview*		
				aws:TagKeys aws:ResourceTag/${TagKey}	
UpdateBillingPreferences [permission only]	Grants permission to update billing preferences such as reserved instance, savings plans and credits sharing	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateBillingView	Grants permission to update a billing view	Write	billingview*		
				aws:ResourceTag/${TagKey}	
UpdateIAMAccessPreference [permission only]	Grants permission to update the Allow IAM Access billing preference	Write			
UseSourceView [permission only]	Grants permission to use a billing view as a data source for other billing views	Read			

Resource types defined by AWS Billing

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
billingview	`arn:${Partition}:billing::${Account}:billingview/${ResourceId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Billing

AWS Billing defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Billing and Cost Management Dashboards

AWS Billing and Cost Management Dashboards (service prefix: `bcm-dashboards`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Billing and Cost Management Dashboards

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateDashboard	Grants permission to create a dashboard	Write			
DeleteDashboard	Grants permission to delete a dashboard	Write			
GetDashboard	Grants permission to get dashboard information	Read			
GetResourcePolicy	Grants permission to get the resource policy for a dashboard	Read			
ListDashboards	Grants permission to list information about all of the dashboards for a user	Read			
ListTagsForResource	Grants permission to list all of the tags for a resource	Read			
TagResource	Grants permission to create a tag for a resource	Tagging		aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove a tag for a resource	Tagging		aws:TagKeys	
UpdateDashboard	Grants permission to update an existing dashboard	Write			

Resource types defined by AWS Billing and Cost Management Dashboards

AWS Billing and Cost Management Dashboards does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Billing and Cost Management Dashboards, specify `"Resource": "*"` in your policy.

Condition keys for AWS Billing and Cost Management Dashboards

AWS Billing and Cost Management Dashboards defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String

Condition keys	Description	Type
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Billing And Cost Management Data Exports

AWS Billing And Cost Management Data Exports (service prefix: `bcm-data-exports`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS Billing And Cost Management Data Exports

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateExport	Grants permission to create an export	Write	table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			billingview		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteExport	Grants permission to delete an export	Write	export*		
				aws:ResourceTag/${TagKey}	
GetExecution	Grants permission to get the execution of an export	Read	export*		
				aws:ResourceTag/${TagKey}	
GetExport	Grants permission to get an export	Read	export*		
				aws:ResourceTag/${TagKey}	
GetTable	Grants permission to get the details of a table	Read	table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListExecutions	Grants permission to list all executions of an export	List	export*		
				aws:ResourceTag/${TagKey}	
ListExports	Grants permission to list all exports	List			
ListTables	Grants permission to list all available tables	List			
ListTagsForResource	Grants permission to list tags for a resource	Read	export*		
				aws:ResourceTag/${TagKey}	
TagResource	Grants permission to tag a resource	Tagging	export*		
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UntagResource	Grants permission to untag a resource	Tagging	export*		
				aws:TagKeys aws:ResourceTag/${TagKey}	
UpdateExport	Grants permission to update an export	Write	export*		
			table*		
			billingview		
				aws:ResourceTag/${TagKey}	

Resource types defined by AWS Billing And Cost Management Data Exports

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
export	arn:${Partition}:bcm-data-exports:${Region}:${Account}:export/${Identifier}	aws:ResourceTag/${TagKey}
table	arn:${Partition}:bcm-data-exports:${Region}:${Account}:table/${Identifier}	
billingview	arn:${Partition}:billing::${Account}:billingview/${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Billing And Cost Management Data Exports

AWS Billing And Cost Management Data Exports defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Billing And Cost Management Pricing Calculator

AWS Billing And Cost Management Pricing Calculator (service prefix: `bcm-pricing-calculator`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Billing And Cost Management Pricing Calculator

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action

with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateBillEstimate	Grants permission to create a new bill estimate. Charge is incurred for successful bill estimates	Write	bill-scenario		
CreateBillScenario	Grants permission to create a new bill scenario	Write		aws:RequestTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} aws:TagKeys	
CreateBillScenarioCommitmentModification	Grants permission to create new commitments or remove existing commitment from a specified bill scenario	Write	bill-scenario*		
CreateBillScenarioUsageModification	Grants permission to create usage in the specified bill scenario	Write	bill-scenario*		
CreateWorkloadEstimate	Grants permission to create a new Workload estimate	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateWorkloadEstimateUsage	Grants permission to create usage in the specified workload estimate	Write	workload-estimate*		
DeleteBillEstimate	Grants permission to delete bill estimate	Write	bill-estimate*		
DeleteBillScenario	Grants permission to delete a bill scenario	Write	bill-scenario*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteBillScenarioCommitmentModification	Grants permission to delete newly added commitments from the specified bill scenario	Write	bill-scenario*		
DeleteBillScenarioUsageModification	Grants permission to delete newly added usage from the specified bill scenario	Write	bill-scenario*		
DeleteWorkloadEstimate	Grants permission to delete the specified workload estimate	Write	workload-estimate*		
DeleteWorkloadEstimateUsage	Grants permission to delete newly added usage from the specified workload estimate	Write	workload-estimate*		
GetBillEstimate	Grants permission to retrieve details of a bill estimate including estimated cost	Read	bill-estimate*		
GetBillScenario	Grants permission to retrieve information associated with a bill scenario	Read	bill-scenario*		
GetPreferences	Grants permission to retrieve applicable rate type preferences for the account	Read			
GetWorkloadEstimate	Grants permission to retrieve information associated with a workload estimate	Read	workload-estimate*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListBillEstimateCommitments	Grants permission to list commitments associated with the specified bill estimate	List	bill-estimate*		
ListBillEstimateInputCommitmentModifications	Grants permission to list added or removed commitments for a specified bill estimate	List	bill-estimate*		
ListBillEstimateInputUsageModifications	Grants permission to list added or modified usage for a specified bill estimate	List	bill-estimate*		
ListBillEstimateLineItems	Grants permission to list result line items for a specified bill estimate	List	bill-estimate*		
ListBillEstimates	Grants permission to list bill estimates	List			
ListBillScenarioCommitmentModifications	Grants permission to list commitments included in a bill scenario	List	bill-scenario*		
ListBillScenarioUsageModifications	Grants permission to list usage lines of a specified bill scenario	List	bill-scenario*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListBillScenarios	Grants permission to list bill scenarios	List			
ListTagsForResource	Grants permission to return a list of tags for a resource	Tagging			
ListWorkloadEstimateUsage	Grants permission to list usage lines for the specified workload estimate	List	workload-estimate*		
ListWorkloadEstimates	Grants permission to list workload estimates	List			
TagResource	Grants permission to add a tag to a resource	Tagging	bill-scenario	aws:ResourceTag/${TagKey}	
			workload-estimate	aws:ResourceTag/${TagKey}	
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UntagResource	Grants permission to remove a tag from a resource	Tagging	bill-scenario	aws:ResourceTag/${TagKey}	
			workload-estimate	aws:ResourceTag/${TagKey}	
				aws:TagKeys	
UpdateBillEstimate	Grants permission to update bill estimate name and expiration date time	Write	bill-estimate*		
UpdateBillScenario	Grants permission to update name and expiration date time of the specified bill scenario	Write	bill-scenario*		
UpdateBillScenarioCommitmentModification	Grants permission to update commitment group of commitments in the specified bill scenario	Write	bill-scenario*		
UpdateBillScenarioUsageModification	Grants permission to update usage amount, usage hour, and usage group in the specified bill scenario	Write	bill-scenario*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdatePreferences	Grants permission to update rate type preferences for the account	Write			
UpdateWorkloadEstimate	Grants permission to update name and expiration date time of the specified workload estimate	Write	workload-estimate*		
UpdateWorkloadEstimateUsage	Grants permission to update usage amount and usage group in the specified workload estimate based on the usage id	Write	workload-estimate*		

Resource types defined by AWS Billing And Cost Management Pricing Calculator

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
bill-estimate	`arn:${Partition}:bcm-pricing-calculator::${Account}:bill-estimate/${BillEstimateId}`	

Resource types	ARN	Condition keys
bill-scenario	arn:${Partition}:bcm-pricing-calculator::${Account}:bill-scenario/${BillScenarioId}	aws:ResourceTag/${TagKey}
workload-estimate	arn:${Partition}:bcm-pricing-calculator::${Account}:workload-estimate/${WorkloadEstimateId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Billing And Cost Management Pricing Calculator

AWS Billing And Cost Management Pricing Calculator defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Billing And Cost Management Recommended Actions

AWS Billing And Cost Management Recommended Actions (service prefix: `bcm-recommended-actions`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Billing Console

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetConsoleActionSetEnforced [permission only]	Grants permission to view whether existing or fine-grained IAM actions are being used to control authorization to Billing, Cost Management, and Account consoles	Read			
ModifyAccount [permission only]	Allow or deny IAM users permission to modify Account Settings	Write			
ModifyBilling [permission only]	Allow or deny IAM users permission to modify billing settings	Write			
ModifyPaymentMethods [permission only]	Allow or deny IAM users permission to modify payment methods	Write			
UpdateConsoleActionSetEnforced [permission only]	Grants permission to change whether existing or fine-grained IAM actions will be used to control authorization to Billing, Cost Management, and Account consoles	Write			
ViewAccount [permission only]	Allow or deny IAM users permission to view account settings	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ViewBilling [permission only]	Allow or deny IAM users permission to view billing pages in the console	Read			
ViewPaymentMethods [permission only]	Allow or deny IAM users permission to view payment methods	Read			
ViewUsage [permission only]	Allow or deny IAM users permission to view AWS usage reports	Read			

Resource types defined by AWS Billing Console

AWS Billing Console does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Billing Console, specify `"Resource": "*"` in your policy.

Condition keys for AWS Billing Console

Billing Console has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Braket

Amazon Braket (service prefix: `braket`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon Braket

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptUserAgreement [permission only]	Grants permission to accept the Amazon Braket user agreement	Write			
CancelJob	Grants permission to cancel a job	Write	job*		
CancelQuantumTask	Grants permission to cancel a quantum task	Write	quantum-task*		
CreateJob	Grants permission to create a job	Write		aws:RequestTag/${TagKey} aws:ResourceTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} aws:TagKeys	
CreateQuantumTask	Grants permission to create a quantum task	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
CreateSpendingLimit	Grants permission to create a spending limit	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteSpendingLimit	Grants permission to delete a spending limit	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
GetDevice	Grants permission to retrieve information about the devices available in Amazon Braket	Read			
GetJob	Grants permission to retrieve jobs	Read	job*		
GetQuantumTask	Grants permission to retrieve quantum tasks	Read	quantum-task*		
GetServiceLinkedRoleStatus [permission only]	Grants permission to check if the Amazon Braket service linked role has been created	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetUserAgreementStatus [permission only]	Grants permission to check if the account has accepted the Amazon Braket user agreement	Read			
ListTagsForResource	Grants permission to listing the tags that have been applied to the quantum task resource or the job	Read	job		
			quantum-task		
			spending-limit		
SearchDevices	Grants permission to search for devices available in Amazon Braket	Read			
SearchJobs	Grants permission to search for jobs	Read			
SearchQuantumTasks	Grants permission to search for quantum tasks	Read			
SearchSpendingLimits	Grants permission to search for spending limit	Read			
TagResource	Grants permission to add one or more tags to a quantum task or a hybrid job	Tagging	job		
			quantum-task		
			spending-limit		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove one or more tags from a quantum task resource or a job. A tag consists of a key-value pair	Tagging	job		
			quantum-task		
			spending-limit		
				aws:TagKeys	
UpdateSpendingLimit	Grants permission to update a spending limit	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	

Resource types defined by Amazon Braket

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
quantum-task	`arn:${Partition}:braket:${Region}:${Account}:quantum-task/${RandomId}`	aws:ResourceTag/${TagKey}
job	`arn:${Partition}:braket:${Region}:${Account}:job/${JobName}`	aws:ResourceTag/${TagKey}
spending-limit	`arn:${Partition}:braket:${Region}:${Account}:spending-limit/${RandomId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Braket

Amazon Braket defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String

Condition keys	Description	Type
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS Budget Service

AWS Budget Service (service prefix: `budgets`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Topics

Actions defined by AWS Budget Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a

resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

> **Note**
>
> The actions in this table are not APIs, but are instead permissions that grant access to the AWS Billing and Cost Management APIs that access budgets.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateBudgetAction	Grants permission to configure a response that executes once your budget exceeds a specific budget threshold. Creating a budget action with tags also requires the 'budgets:TagResource' permission	Write	budgetAction*		iam:PassRole
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
DeleteBudgetAction	Grants permission to delete an action that is associated with a specific budget	Write	budgetAction*		
DescribeBudgetAction	Grants permission to retrieve the details of a specific budget action associated with a budget	Read	budgetAction*		
DescribeBudgetActionHistories	Grants permission to retrieve a historical view of the budget actions statuses associated with a particular budget action. These status include statues such as 'Standby', 'Pending' and 'Executed'	Read	budgetAction*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeBudgetActionsForAccount	Grants permission to retrieve the details of all of the budget actions associated with your account	Read			
DescribeBudgetActionsForBudget	Grants permission to retrieve the details of all of the budget actions associated with a budget	Read	budget*		
ExecuteBudgetAction	Grants permission to initiate a pending budget action as well as reverse a previously executed budget action	Write	budgetAction*		
ListTagsForResource	Grants permission to view resource tags for a budget or budget action	Read	budget		
			budgetAction		
ModifyBudget	Grants permission to create and modify budgets, and edit budget details. Creating a budget with tags also requires the 'budgets:TagResource' permission	Write	budget*		iam:CreateServiceLinkedRole
TagResource	Grants permission to apply resource tags to a budget or budget action. Also needed to create a budget or budget action with tags	Tagging	budget		
			budgetAction		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove resource tags from a budget or budget action	Tagging	budget		
			budgetAction		
				aws:TagKeys	
UpdateBudgetAction	Grants permission to update the details of a specific budget action associated with a budget	Write	budgetAction*		iam:PassRole
ViewBudget	Grants permission to view budgets and budget details	Read	budget*		billing:GetBillingViewData

Resource types defined by AWS Budget Service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
budget	arn:${Partition}:budgets::${Account}:budget/${BudgetName}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys
budgetAction	arn:${Partition}:budgets::${Account}:budget/${BudgetName}/action/${ActionId}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys

Condition keys for AWS Budget Service

AWS Budget Service defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access based on the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access based on the tags associated with the resource	String

Condition keys	Description	Type
aws:TagKeys	Filters access based on the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS BugBust

AWS BugBust (service prefix: `bugbust`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS BugBust

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which

the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateEvent [permission only]	Grants permission to create a BugBust event	Write		aws:TagKeys	iam:CreateServiceLinkedRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey}	
EvaluateProfilingGroups [permission only]	Grants permission to evaluate checked-in profiling groups	Write	Event*		
				aws:ResourceTag/${TagKey}	
GetEvent [permission only]	Grants permission to view customer details about an event	Read	Event*		
				aws:ResourceTag/${TagKey}	
GetJoinEventStatus [permission only]	Grants permission to view the status of a BugBust player's attempt to join a BugBust event	Read	Event*		
				aws:ResourceTag/${TagKey}	
JoinEvent [permission only]	Grants permission to join an event	Write	Event*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListBugs [permission only]	Grants permission to view the bugs that were imported into an event for players to work on	Read	Event*		codeguru-reviewer: DescribeCodeReview codeguru-reviewer: ListRecommendations
				aws:ResourceTag/${TagKey}	
ListEventParticipants [permission only]	Grants permission to view the participants of an event	Read	Event*		
				aws:ResourceTag/${TagKey}	
ListEventScores [permission only]	Grants permission to view the scores of an event's players	Read	Event*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListEvents [permission only]	Grants permission to List BugBust events	List		aws:ResourceTag/${TagKey}	
ListProfilingGroups [permission only]	Grants permission to view the profiling groups that were imported into an event for players to work on	Read	Event*		
				aws:ResourceTag/${TagKey}	
ListPullRequests [permission only]	Grants permission to view the pull requests used by players to submit fixes to their claimed bugs in an event	Read	Event*		
				aws:ResourceTag/${TagKey}	
ListTagsForResource [permission only]	Grants permission to lists tag for a Bugbust resource	Read	Event*		
				aws:ResourceTag/${TagKey}	
TagResource [permission only]	Grants permission to tag a Bugbust resource	Tagging	Event*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource [permission only]	Grants permission to untag a Bugbust resource	Tagging	Event*		
				aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateEvent [permission only]	Grants permission to update a BugBust event	Write	Event*		codeguru-profiler:DescribeProfilingGroup codeguru-profiler:ListProfilingGroups codeguru-reviewer:DescribeCodeReview codeguru-reviewer:ListCodeReviews codeguru-reviewer:ListRecommendations codeguru-reviewer:TagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					codeguru-reviewer:UnTagResource
				aws:ResourceTag/${TagKey}	
UpdateWorkItem [permission only]	Grants permission to update a work item as claimed or unclaimed (bug or profiling group)	Write	Event*		codeguru-reviewer:ListRecommendations
				aws:ResourceTag/${TagKey}	
UpdateWorkItemAdmin [permission only]	Grants permission to update an event's work item (bug or profiling group)	Write	Event*		codeguru-reviewer:ListRecommendations
				aws:ResourceTag/${TagKey}	

Resource types defined by AWS BugBust

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Event	`arn:${Partition}:bugbust:${Region}:${Account}:events/${EventId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS BugBust

AWS BugBust defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access based on the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access based on the tags associated with the resource	String
aws:TagKeys	Filters access based on the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Certificate Manager

AWS Certificate Manager (service prefix: `acm`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Certificate Manager

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddTagsToCertificate	Grants permission to add one or more tags to a certificate	Tagging	certificate*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteCertificate	Grants permission to delete a certificate and its associated private key	Write	certificate*		
DescribeCertificate	Grants permission to retreive a certificates and its metadata	Read	certificate*		
ExportCertificate	Grants permission to export an exportable certificate for use anywhere	Read	certificate*		
				acm:DomainNames	
GetAccountConfiguration	Grants permission to retrieve account level configuration from AWS Certificate Manager	Read			
GetCertificate	Grants permission to retrieve a certificate and certificate chain for a certificate ARN	Read	certificate*		
ImportCertificate	Grants permission to import a 3rd party certificate into AWS Certificate Manager (ACM)	Write	certificate*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListCertificates	Grants permission to retrieve a list of the certificate ARNs and the domain name for each ARN	List			
ListTagsForCertificate	Grants permission to lists the tags that have been associated with a certificate	Read	certificate*		
PutAccountConfiguration	Grants permission to update account level configuration in AWS Certificate Manager	Write			
RemoveTagsFromCertificate	Grants permission to remove one or more tags from a certificate	Tagging	certificate*		
				aws:RequestTag/${TagKey} aws:TagKeys	
RenewCertificate	Grants permission to renew an eligible private certificate	Write	certificate*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RequestCertificate	Grants permission to requests a public or private certificate	Write		aws:RequestTag/${TagKey} aws:TagKeys acm:DomainNames acm:CertificateTransparencyLogging acm:ValidationMethod acm:KeyAlgorithm acm:CertificateAuthority acm:Export	
ResendValidationEmail	Grants permission to resend an email to request domain ownership validation	Write	certificate*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RevokeCertificate	Grants permission to revoke an exportable certificate	Write	certificate*		
				acm:DomainNames	
UpdateCertificateOptions	Grants permission to update a certificate configuration. Use this to specify whether to opt in to or out of certificate transparency logging	Write	certificate*		

Resource types defined by AWS Certificate Manager

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
certificate	`arn:${Partition}:acm:${Region}:${Account}:certificate/${CertificateId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Certificate Manager

AWS Certificate Manager defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the

policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
acm:CertificateAuthority	Filters access by certificateAuthority in the request. Can be used to restrict which Certificate Authorites certificates can be issued from	String
acm:CertificateTransparencyLogging	Filters access by certificateTransparencyLogging option in the request. Default 'ENABLED' if no key is present in the request	String
acm:DomainNames	Filters access by domainNames in the request. This key can be used to restrict which domains can be in certificate requests	ArrayOfString
acm:Export	Filters access by the export option in the request. Can be used to restrict creation of certificates that can be exported	String
acm:KeyAlgorithm	Filters access by keyAlgorithm in the request	String
acm:ValidationMethod	Filters access by validationMethod in the request. Default 'EMAIL' if no key is present in the request	String
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS Chatbot

AWS Chatbot (service prefix: `chatbot`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

				aws:ResourceTag/${TagKey}	
DeleteMicrosoftTeamsConfiguredTeam	Grants permission to delete the Microsoft Teams configured with AWS Chatbot in an AWS account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteMicrosoftTeamsUserIdentity	Grants permission to delete an AWS Chatbot Microsoft Teams User Identity	Write			
DeleteSlackChannelConfiguration	Grants permission to delete an AWS Chatbot Slack Channel Configuration	Write	ChatbotConfiguration*		
				aws:ResourceTag/${TagKey}	
DeleteSlackUserIdentity	Grants permission to delete an AWS Chatbot Slack User Identity	Write			
DeleteSlackWorkspaceAuthorization	Grants permission to delete the Slack workspace authorization with AWS Chatbot, associated with an AWS account	Write			
DescribeChimeWebhookConfigurations	Grants permission to list all AWS Chatbot Chime Webhook Configurations in an AWS Account	Read			
DescribeSlackChannelConfigurations	Grants permission to list all AWS Chatbot Slack Channel Configurations in an AWS account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeSlackChannels	Grants permission to list all public Slack channels in the Slack workspace connected to the AWS Account onboarded with AWS Chatbot service	Read			
DescribeSlackUserIdentities	Grants permission to describe AWS Chatbot Slack User Identities	Read			
DescribeSlackWorkspaces	Grants permission to list all authorized Slack workspaces connected to the AWS Account onboarded with AWS Chatbot service	Read			
DisassociateFromConfiguration	Grants permission to disassociate a resource from a configuration	Write	ChatbotConfiguration*		
			custom-action*		
				aws:ResourceTag/${TagKey}	
GetAccountPreferences	Grants permission to retrieve AWS Chatbot account preferences	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCustomAction	Grants permission to get a custom action	Read	custom-action*		
				aws:ResourceTag/${TagKey}	
GetMicrosoftTeamsChannelConfigurations	Grants permission to get a single AWS Chatbot Microsoft Teams Channel Configurations in an AWS account	Read		aws:ResourceTag/${TagKey}	
GetMicrosoftTeamsOauthParameters	Grants permission to generate OAuth parameters to request Microsoft Teams OAuth code to be used by the AWS Chatbot service	Read			
GetSlackOauthParameters	Grants permission to generate OAuth parameters to request Slack OAuth code to be used by the AWS Chatbot service	Read			
ListAssociations	Grants permission to list resources associated with a configuration	Read	ChatbotConfiguration*		
ListCustomActions	Grants permission to list custom actions	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListMicrosoftTeamsChannelConfigurations	Grants permission to list all AWS Chatbot Microsoft Teams Channel Configurations in an AWS account	Read			
ListMicrosoftTeamsConfiguredTeams	Grants permission to list all Microsoft Teams connected to the AWS Account onboarded with AWS Chatbot service	Read			
ListMicrosoftTeamsUserIdentities	Grants permission to describe AWS Chatbot Microsoft Teams User Identities	Read			
ListTagsForResource	Grants permission to List all tags associated with the AWS Chatbot Channel Configuration	Read			
RedeemMicrosoftTeamsOauthCode	Grants permission to redeem previously generated parameters with Microsoft APIs, to acquire OAuth tokens to be used by the AWS Chatbot service	Write			
RedeemSlackOauthCode	Grants permission to redeem previously generated parameters with Slack API, to acquire OAuth tokens to be used by the AWS Chatbot service	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to create tags on AWS Chatbot Channel Configuration	Tagging	ChatbotConfiguration		
			custom-action		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove tags on AWS Chatbot Channel Configuration	Tagging	ChatbotConfiguration		
			custom-action		
				aws:TagKeys	
UpdateAccountPreferences	Grants permission to update AWS Chatbot account preferences	Write			
UpdateChimeWebhookConfiguration	Grants permission to update an AWS Chatbot Chime Webhook Configuration	Write	ChatbotConfiguration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
UpdateCustomAction	Grants permission to update a custom action	Write	custom-action*		
				aws:ResourceTag/${TagKey}	
UpdateMicrosoftTeamsChannelConfiguration	Grants permission to update an AWS Chatbot Microsoft Teams Channel Configuration	Write	ChatbotConfiguration*		
				aws:ResourceTag/${TagKey}	
UpdateSlackChannelConfiguration	Grants permission to update an AWS Chatbot Slack Channel Configuration	Write	ChatbotConfiguration*		
				aws:ResourceTag/${TagKey}	

Resource types defined by AWS Chatbot

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
ChatbotConfiguration	`arn:${Partition}:chatbot::${Account}:chat-configuration/${ConfigurationType}/${ChatbotConfigurationName}`	aws:ResourceTag/${TagKey}
custom-action	`arn:${Partition}:chatbot::${Account}:custom-action/${ActionName}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Chatbot

AWS Chatbot defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Chime

Amazon Chime (service prefix: `chime`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon Chime

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptDelegate	Grants permission to accept the delegate invitation to share management of an Amazon Chime account with another AWS Account	Write			
ActivateUsers	Grants permission to activate users in an Amazon Chime Enterprise account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddDomain	Grants permission to add a domain to your Amazon Chime account	Write			
AddOrUpdateGroups	Grants permission to add new or update existing Active Directory or Okta user groups associated with your Amazon Chime Enterprise account	Write			
AssociateChannelFlow	Grants permission to associate a flow with a channel	Write	app-instance-bot*		
			app-instance-user*		
			channel*		
			channel-flow*		
AssociatePhoneNumberWithUser	Grants permission to associate a phone number with an Amazon Chime user	Write			
AssociatePhoneNumbersWithVoiceConnector	Grants permission to associate multiple phone numbers with an Amazon Chime Voice Connector	Write	voice-connector*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociatePhoneNumbersWithVoiceConnectorGroup	Grants permission to associate multiple phone numbers with an Amazon Chime Voice Connector Group	Write			
AssociateSigninDelegateGroupsWithAccount	Grants permission to associate the specified sign-in delegate groups with the specified Amazon Chime account	Write			
AssociateVoiceConnectorConnect [permission only]	Grants permission to associate the specified Amazon Connect instance with an Amazon Chime Voice Connector	Write			
AuthorizeDirectory	Grants permission to authorize an Active Directory for your Amazon Chime Enterprise account	Write			
BatchCreateAttendee	Grants permission to create new attendees for an active Amazon Chime SDK meeting	Write	meeting*		
BatchCreateChannelMembership	Grants permission to add multiple users and bots to a channel	Write	app-instance-bot* app-instance-user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			channel*		
BatchCreateRoomMembership	Grants permission to batch add room members	Write			
BatchDeletePhoneNumber	Grants permission to move up to 50 phone numbers to the deletion queue	Write			
BatchSuspendUser	Grants permission to suspend up to 50 users from a Team or EnterpriseLWA Amazon Chime account	Write			
BatchUnsuspendUser	Grants permission to remove the suspension from up to 50 previously suspended users for the specified Amazon Chime EnterpriseLWA account	Write			
BatchUpdateAttendeeCapabilitiesExcept	Grants permission to update AttendeeCapabilities except the capabilities listed in an ExcludedAttendeeIds table	Write	meeting*		
BatchUpdatePhoneNumber	Grants permission to update phone number details within the UpdatePhoneNumberRequestItem object for up to 50 phone numbers	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchUpdateUser	Grants permission to update user details within the UpdateUserRequestItem object for up to 20 users for the specified Amazon Chime account	Write			
ChannelFlowCallback	Grants permission to callback for a message on a channel	Write	channel*		
Connect	Grants permission to establish a web socket connection for app instance user to the messaging session endpoint	Write	app-instance-user*		
ConnectDirectory	Grants permission to connect an Active Directory to your Amazon Chime Enterprise account	Write			ds:ConnectDirectory
CreateAccount	Grants permission to create an Amazon Chime account under the administrator's AWS account	Write			
CreateApiKey	Grants permission to create a new SCIM access key for your Amazon Chime account and Okta configuration	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAppInstance	Grants permission to create an app instance in the AWS account (tag-based access controls are only supported on identity-chime.<region>.amazonaws.com endpoints)	Write		aws:TagKeys aws:RequestTag/${TagKey}	
CreateAppInstanceAdmin	Grants permission to promote a user or bot to an AppInstanceAdmin	Write	app-instance*		
			app-instance-bot*		
			app-instance-user*		
CreateAppInstanceBot	Grants permission to create a bot within an AppInstance (tag-based access controls are only supported on identity-chime.<region>.amazonaws.com endpoints)	Write		aws:TagKeys aws:RequestTag/${TagKey}	
CreateAppInstanceUser	Grants permission to create a user within an AppInstance (tag-based access controls are only supported on identity-chime.<region>.amazonaws.com endpoints)	Write		aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAttendee	Grants permission to create a new attendee for an active Amazon Chime SDK meeting	Write	meeting*		
CreateBot	Grants permission to create a bot for an Amazon Chime Enterprise account	Write			
CreateCDRBucket	Grants permission to create a new Call Detail Record S3 bucket	Write			s3:CreateBucket s3:ListAllMyBuckets
CreateChannel	Grants permission to create a channel for an app instance in the AWS account (tag-based access controls are only supported on messaging-chime.<region>.amazonaws.com endpoints)	Write	app-instance-bot*		
			app-instance-user*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateChannelBan	Grants permission to ban a user or bot from a channel	Write	app-instance-bot*		
			app-instance-user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			channel*		
CreateChannelFlow	Grants permission to create a channel flow for an app instance in the AWS account (tag-based access controls are only supported on messaging-chime.<region>.amazonaws.com endpoints)	Write	app-instance*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateChannelMembership	Grants permission to add a user or bot to a channel	Write	app-instance-bot*		
			app-instance-user*		
			channel*		
CreateChannelModerator	Grants permission to create a channel moderator	Write	app-instance-bot*		
			app-instance-user*		
			channel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateConnectAnalyticsConnector [permission only]	Grants permission to create an Amazon Connect Analytics Connector in the AWS account (tag-based access controls are only supported on voice-chime.<region>.amazonaws.com endpoints)	Write		aws:TagKeys aws:RequestTag/${TagKey}	chime:CreateVoiceConnector
CreateConnectCallTransferConnector [permission only]	Grants permission to create an Amazon Connect Call Transfer Connector in the AWS account (tag-based access controls are only supported on voice-chime.<region>.amazonaws.com endpoints)	Write		aws:TagKeys aws:RequestTag/${TagKey}	chime:CreateVoiceConnector
CreateMediaCapturePipeline	Grants permission to create a media capture pipeline (tag-based access controls are only supported on media-pipelines-chime.<region>.amazonaws.com endpoints)	Write		aws:TagKeys aws:RequestTag/${TagKey}	s3:GetBucketPolicy
CreateMediaConcatenationPipeline	Grants permission to create a media concatenation pipeline (tag-based access controls are only supported on media-pipelines-chime.<region>.amazonaws.com endpoints)	Write		aws:TagKeys aws:RequestTag/${TagKey}	s3:GetBucketPolicy

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateMediaInsightsPipeline	Grants permission to create a media insights pipeline (tag-based access controls are only supported on media-pipelines-chime.<region>.amazonaws.com endpoints)	Write	media-insights-pipeline-configuration*		chime:TagResource kinesisvideo:DescribeStream
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateMediaInsightsPipelineConfiguration	Grants permission to create a media insights pipeline configuration (tag-based access controls are only supported on media-pipelines-chime.<region>.amazonaws.com endpoints)	Write		aws:TagKeys aws:RequestTag/${TagKey}	chime:TagResource iam:PassRole kinesis:DescribeStream s3:ListBucket

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateMediaLiveConnectorPipeline	Grants permission to create a media live connector pipeline (tag-based access controls are only supported on media-pipelines-chime.<region>.amazonaws.com endpoints)	Write		aws:TagKeys aws:RequestTag/${TagKey}	
CreateMediaPipelineKinesisVideoStreamPool	Grants permission to create kinesis video stream pool (tag-based access controls are only supported on media-pipelines-chime.<region>.amazonaws.com endpoints)	Write		aws:TagKeys aws:RequestTag/${TagKey}	kinesis:DescribeStream kinesisvideo:CreateStream kinesisvideo:GetDataEndpoint kinesisvideo:ListStreams

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateMediaStreamPipeline	Grants permission to create a media stream pipeline (tag-based access controls are only supported on media-pipelines-chime.<region>.amazonaws.com endpoints)	Write	media-pipeline-kinesis-video-stream-pool*		kinesisvideo:DescribeStream kinesisvideo:GetDataEndpoint kinesisvideo:PutMedia
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateMeeting	Grants permission to create a new meeting in the specified media Region, with no initial attendees (tag-based access controls are only supported on meetings-chime.<region>.amazonaws.com endpoints)	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateMeetingDialOut	Grants permission to call a phone number to join the specified Amazon Chime SDK meeting	Write	meeting*		
CreateMeetingWithAttendees	Grants permission to create a new meeting in the specified media Region, with a set of attendees (tag-based access controls are only supported on meetings-chime.<region>.amazonaws.com endpoints)	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreatePhoneNumberOrder	Grants permission to create a phone number order with the Carriers	Write			
CreateProxySession	Grants permission to create a proxy session for the specified Amazon Chime Voice Connector	Write	voice-connector*		
CreateRoom	Grants permission to create a room	Write			
CreateRoomMembership	Grants permission to add a room member	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSipMediaApplication	Grants permission to create an Amazon Chime SIP media application in the AWS account (tag-based access controls are only supported on voice-chime.<region>.amazonaws.com endpoints)	Write		aws:TagKeys aws:RequestTag/${TagKey}	
CreateSipMediaApplicationCall	Grants permission to create outbound call for Amazon Chime SIP media application under the administrator's AWS account	Write	sip-media-application*		
CreateSipRule	Grants permission to create an Amazon Chime SIP rule under the administrator's AWS account	Write	sip-media-application		
CreateUser	Grants permission to create a user under the specified Amazon Chime account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateVoiceConnector	Grants permission to create a Voice Connector in the AWS account (tag-based access controls are only supported on voice-chime.<region>.amazonaws.com endpoints)	Write		aws:TagKeys aws:RequestTag/${TagKey}	chime:CreateConnectAnalyticsConnector chime:CreateConnectCallTransferConnector
CreateVoiceConnectorGroup	Grants permission to create a Amazon Chime Voice Connector Group under the administrator's AWS account	Write	voice-connector		
CreateVoiceProfile	Grants permission to create a voice profile	Write			
CreateVoiceProfileDomain	Grants permission to create a voice profile domain (tag-based access controls are only supported on voice-chime.<region>.amazonaws.com endpoints)	Write		aws:TagKeys aws:RequestTag/${TagKey}	chime:TagResource kms:CreateGrant kms:DescribeKey
DeleteAccount	Grants permission to delete the specified Amazon Chime account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAccountOpenIdConfig	Grants permission to delete the OpenIdConfig attributes from your Amazon Chime account	Write			
DeleteApiKey	Grants permission to delete the specified SCIM access key associated with your Amazon Chime account and Okta configuration	Write			
DeleteAppInstance	Grants permission to delete an AppInstance	Write	app-instance*		
DeleteAppInstanceAdmin	Grants permission to demote an AppInstanceAdmin to a user or bot	Write	app-instance*		
			app-instance-bot*		
			app-instance-user*		
DeleteAppInstanceBot	Grants permission to delete an AppInstanceBot	Write	app-instance-bot*		
DeleteAppInstanceStreamingConfigurations	Grants permission to disable data streaming for the app instance	Write	app-instance*		
DeleteAppInstanceUser	Grants permission to delete an AppInstanceUser	Write	app-instance-user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAttendee	Grants permission to delete the specified attendee from an Amazon Chime SDK meeting	Write	meeting*		
DeleteCDRBucket	Grants permission to delete a Call Detail Record S3 bucket from your Amazon Chime account	Write			s3:DeleteBucket
DeleteChannel	Grants permission to delete a channel	Write	app-instance-bot*		
			app-instance-user*		
			channel*		
DeleteChannelBan	Grants permission to remove a user or bot from a channel's ban list	Write	app-instance-bot*		
			app-instance-user*		
			channel*		
DeleteChannelFlow	Grants permission to delete a channel flow	Write	channel*		
DeleteChannelMembership	Grants permission to remove a member from a channel	Write	app-instance-bot*		
			app-instance-user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			channel*		
DeleteChannelMessage	Grants permission to delete a channel message	Write	app-instance-bot*		
			app-instance-user*		
			channel*		
DeleteChannelModerator	Grants permission to delete a channel moderator	Write	app-instance-bot*		
			app-instance-user*		
			channel*		
DeleteDelegate	Grants permission to delete delegated AWS account management from your Amazon Chime account	Write			
DeleteDomain	Grants permission to delete a domain from your Amazon Chime account	Write			
DeleteEventsConfiguration	Grants permission to delete an events configuration for a bot to receive outgoing events	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteGroups	Grants permission to delete Active Directory or Okta user groups from your Amazon Chime Enterprise account	Write			
DeleteMediaCapturePipeline	Grants permission to delete a media capture pipeline	Write	media-pipeline*		
DeleteMediaInsightsPipelineConfiguration	Grants permission to delete a media insights pipeline configuration	Write	media-insights-pipeline-configuration*		chime:ListVoiceConnectors
DeleteMediaPipeline	Grants permission to delete a media pipeline	Write	media-pipeline*		
DeleteMediaPipelineKinesisVideoStreamPool	Grants permission to delete kinesis video stream pool	Write	media-pipeline-kinesis-video-stream-pool*		
DeleteMeeting	Grants permission to delete the specified Amazon Chime SDK meeting	Write	meeting*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteMessagingStreamingConfigurations	Grants permission to delete the data streaming configurations of an AppInstance	Write	app-instance*		
DeletePhoneNumber	Grants permission to move a phone number to the deletion queue	Write			
DeleteProxySession	Grants permission to delete a proxy session for the specified Amazon Chime Voice Connector	Write	voice-connector*		
DeleteRoom	Grants permission to delete a room	Write			
DeleteRoomMembership	Grants permission to remove a room member	Write			
DeleteSipMediaApplication	Grants permission to delete Amazon Chime SIP media application under the administrator's AWS account	Write	sip-media-application*		
DeleteSipRule	Grants permission to delete Amazon Chime SIP rule under the administrator's AWS account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteVoiceConnector	Grants permission to delete the specified Amazon Chime Voice Connector	Write	voice-connector*		logs:CreateLogDelivery logs:DeleteLogDelivery logs:GetLogDelivery logs:ListLogDeliveries
DeleteVoiceConnectorEmergencyCallingConfiguration	Grants permission to delete emergency calling configuration for the specified Amazon Chime Voice Connector	Write	voice-connector*		
DeleteVoiceConnectorExternalSystemsConfiguration	Grants permission to delete the configuration of the external system that is connected with the specified Amazon Chime Voice Connector	Write	voice-connector*		
DeleteVoiceConnectorGroup	Grants permission to delete the specified Amazon Chime Voice Connector Group	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteVoiceConnectorOrigination	Grants permission to delete the origination settings for the specified Amazon Chime Voice Connector	Write	voice-connector*		
DeleteVoiceConnectorProxy	Grants permission to delete proxy configuration for the specified Amazon Chime Voice Connector	Write	voice-connector*		
DeleteVoiceConnectorStreamingConfiguration	Grants permission to delete streaming configuration for the specified Amazon Chime Voice Connector	Write	voice-connector*		
DeleteVoiceConnectorTermination	Grants permission to delete the termination settings for the specified Amazon Chime Voice Connector	Write	voice-connector*		
DeleteVoiceConnectorTerminationCredentials	Grants permission to delete SIP termination credentials for the specified Amazon Chime Voice Connector	Write	voice-connector*		
DeleteVoiceProfile	Grants permission to delete a voice profile	Write	voice-profile*		
DeleteVoiceProfileDomain	Grants permission to delete a voice profile domain	Write	voice-profile-domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeregisterAppInstanceUserEndpoint	Grants permission to deregister an endpoint for an app instance user	Write	app-instance-user*		
DescribeAppInstance	Grants permission to get the full details of an AppInstance	Read	app-instance*		
DescribeAppInstanceAdmin	Grants permission to get the full details of an AppInstanceAdmin	Read	app-instance*		
			app-instance-bot*		
			app-instance-user*		
DescribeAppInstanceBot	Grants permission to get the full details of an AppInstanceBot	Read	app-instance-bot*		
DescribeAppInstanceUser	Grants permission to get the full details of an AppInstanceUser	Read	app-instance-user*		
DescribeAppInstanceUserEndpoint	Grants permission to describe an endpoint registered for an app instance user	Read	app-instance-user*		
DescribeChannel	Grants permission to get the full details of a channel	Read	app-instance-bot*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			app-instance-user*		
			channel*		
DescribeChannelBan	Grants permission to get the full details of a channel ban	Read	app-instance-bot*		
			app-instance-user*		
			channel*		
DescribeChannelFlow	Grants permission to get the full details of a channel flow	Read	channel-flow*		
DescribeChannelMembership	Grants permission to get the full details of a channel membership	Read	app-instance-bot*		
			app-instance-user*		
			channel*		
DescribeChannelMembershipForAppInstanceUser	Grants permission to get the details of a channel based on the membership of the specified user or bot	Read	app-instance-bot*		
			app-instance-user*		
			channel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeChannelModeratedByAppInstanceUser	Grants permission to get the full details of a channel moderated by the specified user or bot	Read	app-instance-bot*		
			app-instance-user*		
			channel*		
DescribeChannelModerator	Grants permission to get the full details of a single ChannelModerator	Read	app-instance-bot*		
			app-instance-user*		
			channel*		
DisassociateChannelFlow	Grants permission to disassociate a flow from a channel	Write	app-instance-bot*		
			app-instance-user*		
			channel*		
			channel-flow*		
DisassociatePhoneNumberFromUser	Grants permission to disassociate the primary provisioned number from the specified Amazon Chime user	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociatePhoneNumbersFromVoiceConnector	Grants permission to disassociate multiple phone numbers from the specified Amazon Chime Voice Connector	Write	voice-connector*		
DisassociatePhoneNumbersFromVoiceConnectorGroup	Grants permission to disassociate multiple phone numbers from the specified Amazon Chime Voice Connector Group	Write			
DisassociateSigninDelegateGroupsFromAccount	Grants permission to disassociate the specified sign-in delegate groups from the specified Amazon Chime account	Write			
DisassociateVoiceConnectorConnect [permission only]	Grants permission to disassociate the Amazon Connect instance from the specified Amazon Chime Voice Connector	Write			
DisconnectDirectory	Grants permission to disconnect the Active Directory from your Amazon Chime Enterprise account	Write			
GetAccount	Grants permission to get details for the specified Amazon Chime account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAccountResource	Grants permission to get details for the account resource associated with your Amazon Chime account	Read			
GetAccountSettings	Grants permission to get account settings for the specified Amazon Chime account ID	Read			
GetAccountWithOpenIdConfig	Grants permission to get the account details and OpenIdConfig attributes for your Amazon Chime account	Read			
GetAppInstanceRetentionSettings	Grants permission to get retention settings for an app instance	Read	app-instance*		
GetAppInstanceStreamingConfigurations	Grants permission to get the streaming configurations for an app instance	Read	app-instance*		
GetAttendee	Grants permission to get attendee details for a specified meeting ID and attendee ID	Read	meeting*		
GetBot	Grants permission to retrieve details for the specified bot	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCDRBucket	Grants permission to get details of a Call Detail Record S3 bucket associated with your Amazon Chime account	Read			s3:GetBucketAcl s3:GetBucketLocation s3:GetBucketLogging s3:GetBucketVersioning s3:GetBucketWebsite
GetChannelMembershipPreferences	Grants permission to get the preferences for a channel membership	Read	app-instance-bot*		
			app-instance-user*		
			channel*		
GetChannelMessage	Grants permission to get the full details of a channel message	Read	app-instance-bot*		
			app-instance-user*		
			channel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetChannelMessageStatus	Grants permission to get the status of a channel message	Read	app-instance-bot*		
			app-instance-user*		
			channel*		
GetDomain	Grants permission to get domain details for a domain associated with your Amazon Chime account	Read			
GetEventsConfiguration	Grants permission to retrieve details for an events configuration for a bot to receive outgoing events	Read			
GetGlobalSettings	Grants permission to get global settings related to Amazon Chime for the AWS account	Read			
GetMediaCapturePipeline	Grants permission to get an existing media capture pipeline	Read	media-pipeline*		
GetMediaInsightsPipelineConfiguration	Grants permission to get a media insights pipeline configuration	Read	media-insights-pipeline-configuration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetMediaPipeline	Grants permission to get an existing media pipeline	Read	media-pipeline*		
GetMediaPipelineKinesisVideoStreamPool	Grants permission to get an existing media pipeline	Read	media-pipeline-kinesis-video-stream-pool*		
GetMeeting	Grants permission to get the meeting record for a specified meeting ID	Read	meeting*		
GetMeetingDetail	Grants permission to get attendee, connection, and other details for a meeting	Read			
GetMessagingSessionEndpoint	Grants permission to get the endpoint for the messaging session	Read			
GetMessagingStreamingConfigurations	Grants permission to get the data streaming configurations of an AppInstance	Read	app-instance*		
GetPhoneNumber	Grants permission to get details for the specified phone number	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetPhoneNumberOrder	Grants permission to get details for the specified phone number order	Read			
GetPhoneNumberSettings	Grants permission to get phone number settings related to Amazon Chime for the AWS account	Read			
GetProxySession	Grants permission to get details of the specified proxy session for the specified Amazon Chime Voice Connector	Read	voice-connector*		
GetRetentionSettings	Grants permission to retrieve the retention settings for the specified Amazon Chime account	Read			
GetRoom	Grants permission to retrieve a room	Read			
GetSipMediaApplication	Grants permission to get details of Amazon Chime SIP media application under the administrator's AWS account	Read	sip-media-application*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSipMediaApplicationAlexaSkillConfiguration	Grants permission to get Alexa Skill configuration settings for Amazon Chime SIP media application under the administrator's AWS account	Read	sip-media-application*		
GetSipMediaApplicationLoggingConfiguration	Grants permission to get logging configuration settings for Amazon Chime SIP media application under the administrator's AWS account	Read	sip-media-application*		
GetSipRule	Grants permission to get details of Amazon Chime SIP rule under the administrator's AWS account	Read			
GetSpeakerSearchTask	Grants permission to get a speaker search task on the specified Amazon Chime resource	Read	media-pipeline voice-connector		
GetTelephonyLimits	Grants permission to get telephony limits for the AWS account	Read			
GetUser	Grants permission to get details for the specified user ID	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetUserActivityReportData	Grants permission to get a summary of user activity on the user details page	Read			
GetUserByEmail	Grants permission to get user details for an Amazon Chime user based on the email address in an Amazon Chime Enterprise or Team account	Read			
GetUserSettings	Grants permission to get user settings related to the specified Amazon Chime user	Read			
GetVoiceConnector	Grants permission to get details for the specified Amazon Chime Voice Connector	Read	voice-connector*		
GetVoiceConnectorEmergencyCallingConfiguration	Grants permission to get details of the emergency calling configuration for the specified Amazon Chime Voice Connector	Read	voice-connector*		
GetVoiceConnectorExternalSystemsConfiguration	Grants permission to get the configuration of the external system that is connected with the specified Amazon Chime Voice Connector	Read	voice-connector*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetVoiceConnectorGroup	Grants permission to get details for the specified Amazon Chime Voice Connector Group	Read			
GetVoiceConnectorLoggingConfiguration	Grants permission to get details of the logging configuration for the specified Amazon Chime Voice Connector	Read	voice-connector*		
GetVoiceConnectorOrigination	Grants permission to get details of the origination settings for the specified Amazon Chime Voice Connector	Read	voice-connector*		
GetVoiceConnectorProxy	Grants permission to get details of the proxy configuration for the specified Amazon Chime Voice Connector	Read	voice-connector*		
GetVoiceConnectorStreamingConfiguration	Grants permission to get details of the streaming configuration for the specified Amazon Chime Voice Connector	Read	voice-connector*		
GetVoiceConnectorTermination	Grants permission to get details of the termination settings for the specified Amazon Chime Voice Connector	Read	voice-connector*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetVoiceConnectorTerminationHealth	Grants permission to get details of the termination health for the specified Amazon Chime Voice Connector	Read	voice-connector*		
GetVoiceProfile	Grants permission to get a voice profile	Read	voice-profile*		
GetVoiceProfileDomain	Grants permission to get a voice profile domain	Read	voice-profile-domain*		
GetVoiceToneAnalysisTask	Grants permission to get a voice tone analysis task on the specified Amazon Chime resource	Read	media-pipeline voice-connector		
InviteDelegate	Grants permission to send an invitation to accept a request for AWS account delegation for an Amazon Chime account	Write			
InviteUsers	Grants permission to invite as many as 50 users to the specified Amazon Chime account	Write			
InviteUsersFromProvider	Grants permission to invite users from a third party provider to your Amazon Chime account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAccountUsageReportData	Grants permission to list Amazon Chime account usage reporting data	List			
ListAccounts	Grants permission to list the Amazon Chime accounts under the administrator's AWS account	List			
ListApiKeys	Grants permission to list the SCIM access keys defined for your Amazon Chime account and Okta configuration	List			
ListAppInstanceAdmins	Grants permission to list administrators in the app instance	List	app-instance*		
			app-instance-bot*		
			app-instance-user*		
ListAppInstanceBots	Grants permission to list all AppInstanceBots created under a single app instance	List	app-instance-bot*		
ListAppInstanceUserEndpoints	Grants permission to list the endpoints registered for an app instance user	List	app-instance-user*		
ListAppInstanceUsers	Grants permission to list all AppInstanceUsers created under a single app instance	List	app-instance-user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAppInstances	Grants permission to list all Amazon Chime app instances created under a single AWS account	List	app-instance*		
ListAttendeeTags	Grants permission to list the tags applied to an Amazon Chime SDK attendee resource	List	meeting*		
ListAttendees	Grants permission to list up to 100 attendees for a specified Amazon Chime SDK meeting	List	meeting*		
ListAvailableVoiceConnectorRegions	Grants permission to list the available AWS Regions in which you can create an Amazon Chime SDK Voice Connector	List			
ListBots	Grants permission to list the bots associated with the administrator's Amazon Chime Enterprise account	List			
ListCDRBucket	Grants permission to list Call Detail Record S3 buckets	List			s3:ListAllMyBuckets s3:ListBucket

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListCallingRegions	Grants permission to list the calling regions available for the administrator's AWS account	List			
ListChannelBans	Grants permission to list all the users and bots banned from a particular channel	List	app-instance-bot*		
			app-instance-user*		
			channel*		
ListChannelFlows	Grants permission to list all the Channel Flows created under a single Chime AppInstance	List	channel-flow*		
ListChannelMemberships	Grants permission to list all channel memberships in a channel	List	app-instance-bot*		
			app-instance-user*		
			channel*		
ListChannelMembershipsForAppInstanceUser	Grants permission to list all channels that a particular user or bot is a part of	List	app-instance-bot*		
			app-instance-user*		
ListChannelMessages	Grants permission to list all the messages in a channel	Read	app-instance-bot*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			app-instance-user*		
			channel*		
ListChannelModerators	Grants permission to list all the moderators for a channel	List	app-instance-bot*		
			app-instance-user*		
			channel*		
ListChannels	Grants permission to list all the Channels created under a single Chime AppInstance	List	app-instance-bot*		
			app-instance-user*		
ListChannelsAssociatedWithChannelFlow	Grants permission to list all the Channels associated with a single Chime Channel Flow	List	channel-flow*		
ListChannelsModeratedByAppInstanceUser	Grants permission to list all channels moderated by a user or bot	List	app-instance-bot*		
			app-instance-user*		
ListDelegates	Grants permission to list account delegate information associated with your Amazon Chime account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDirectories	Grants permission to list active Active Directories hosted in the Directory Service of your AWS account	List			
ListDomains	Grants permission to list domains associated with your Amazon Chime account	List			
ListGroups	Grants permission to list Active Directory or Okta user groups associated with your Amazon Chime Enterprise account	List			
ListMediaCapturePipelines	Grants permission to list media capture pipelines	List			
ListMediaInsightsPipelineConfigurations	Grants permission to list all media insights pipeline configurations	List			
ListMediaPipelineKinesisVideoStreamPools	Grants permission to list media pipelines	List			
ListMediaPipelines	Grants permission to list media pipelines	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListMeetingEvents	Grants permission to list all events that occurred for a specified meeting	List			
ListMeetingTags	Grants permission to list the tags applied to an Amazon Chime SDK meeting resource	List	meeting*		
ListMeetings	Grants permission to list up to 100 active Amazon Chime SDK meetings	List			
ListMeetingsReportData	Grants permission to list meetings ended during the specified date range	List			
ListPhoneNumberOrders	Grants permission to list the phone number orders under the administrator's AWS account	List			
ListPhoneNumbers	Grants permission to list the phone numbers under the administrator's AWS account	List			
ListProxySessions	Grants permission to list proxy sessions for the specified Amazon Chime Voice Connector	List	voice-connector*		
ListRoomMemberships	Grants permission to list all room members	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListRooms	Grants permission to list rooms	List			
ListSipMediaApplications	Grants permission to list all Amazon Chime SIP media applications under the administrator's AWS account	List			
ListSipRules	Grants permission to list all Amazon Chime SIP rules under the administrator's AWS account	List	sip-media-application		
ListSubChannels	Grants permission to list all the SubChannels under a single Channel	List	app-instance-bot*		
			app-instance-user*		
			channel*		
ListSupportedPhoneNumberCountries	Grants permission to list the phone number countries supported by the AWS account	List			
ListTagsForResource	Grants permission to list the tags applied to an Amazon Chime resource	Read	app-instance		
			app-instance-bot		
			app-instance-user		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			channel		
			channel-flow		
			media-insights-pipeline-configuration		
			media-pipeline		
			media-pipeline-kinesis-video-stream-pool		
			meeting		
			sip-media-application		
			voice-connector		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			voice-profile-domain		
ListUsers	Grants permission to list the users that belong to the specified Amazon Chime account	List			
ListVoiceConnectorGroups	Grants permission to list the Amazon Chime Voice Connector Groups under the administrator's AWS account	List			
ListVoiceConnectorTerminationCredentials	Grants permission to list the SIP termination credentials for the specified Amazon Chime Voice Connector	List	voice-connector*		
ListVoiceConnectors	Grants permission to list the Amazon Chime Voice Connectors under the administrator's AWS account	List			
ListVoiceProfileDomains	Grants permission to list voice profile domains	List			
ListVoiceProfiles	Grants permission to list voice profiles	List	voice-profile-domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
LogoutUser	Grants permission to log out the specified user from all of the devices they are currently logged into	Write			
PutAppInstanceRetentionSettings	Grants permission to enable data retention for the app instance	Write	app-instance*		
PutAppInstanceStreamingConfigurations	Grants permission to configure data streaming for the app instance	Write	app-instance*		
PutAppInstanceUserExpirationSettings	Grants permission to put expiration settings for an AppInstanceUser	Write	app-instance-user*		
PutChannelExpirationSettings	Grants permission to put expiration settings for a channel	Write	app-instance-user*		
			channel*		
PutChannelMembershipPreferences	Grants permission to put the preferences for a channel membership	Write	app-instance-bot*		
			app-instance-user*		
			channel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutEventsConfiguration	Grants permission to update details for an events configuration for a bot to receive outgoing events	Write			
PutMessagingStreamingConfigurations	Grants permission to put the data streaming configurations of an AppInstance	Write	app-instance*		
PutRetentionSettings	Grants permission to create or update retention settings for the specified Amazon Chime account	Write			
PutSipMediaApplicationAlexaSkillConfiguration	Grants permission to update Alexa Skill configuration settings for Amazon Chime SIP media application under the administrator's AWS account	Write	sip-media-application*		
PutSipMediaApplicationLoggingConfiguration	Grants permission to update logging configuration settings for Amazon Chime SIP media application under the administrator's AWS account	Write	sip-media-application*		
PutVoiceConnectorEmergencyCallingConfiguration	Grants permission to add emergency calling configuration for the specified Amazon Chime Voice Connector	Write	voice-connector*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutVoiceConnectorExternalSystemsConfiguration	Grants permission to update the configuration of the external system that is connected with the specified Amazon Chime Voice Connector	Write	voice-connector*		
PutVoiceConnectorLoggingConfiguration	Grants permission to add logging configuration for the specified Amazon Chime Voice Connector	Write	voice-connector*		logs:CreateLogDelivery logs:CreateLogGroup logs:DeleteLogDelivery logs:DescribeLogGroups logs:GetLogDelivery logs:ListLogDeliveries

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutVoiceConnectorOrigination	Grants permission to update the origination settings for the specified Amazon Chime Voice Connector	Write	voice-connector*		
PutVoiceConnectorProxy	Grants permission to add proxy configuration for the specified Amazon Chime Voice Connector	Write	voice-connector*		
PutVoiceConnectorStreamingConfiguration	Grants permission to add streaming configuration for the specified Amazon Chime Voice Connector	Write	voice-connector*		chime:GetMediaInsightsPipelineConfiguration
			media-insights-pipeline-configuration		
PutVoiceConnectorTermination	Grants permission to update the termination settings for the specified Amazon Chime Voice Connector	Write	voice-connector*		
PutVoiceConnectorTerminationCredentials	Grants permission to add SIP termination credentials for the specified Amazon Chime Voice Connector	Write	voice-connector*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RedactChannelMessage	Grants permission to redact message content	Write	app-instance-bot*		
			app-instance-user*		
			channel*		
RedactConversationMessage	Grants permission to redact the specified Chime conversation Message	Write			
RedactRoomMessage	Grants permission to redacts the specified Chime room Message	Write			
RegenerateSecurityToken	Grants permission to regenerate the security token for the specified bot	Write			
RegisterAppInstanceUserEndpoint	Grants permission to register an endpoint for an app instance user	Write	app-instance-user*		mobiletargeting:GetApp
RenameAccount	Grants permission to modify the account name for your Amazon Chime Enterprise or Team account	Write			
RenewDelegate	Grants permission to renew the delegation request associated with an Amazon Chime account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ResetAccountResource	Grants permission to reset the account resource in your Amazon Chime account	Write			
ResetPersonalPIN	Grants permission to reset the personal meeting PIN for the specified user on an Amazon Chime account	Write			
RestorePhoneNumber	Grants permission to restore the specified phone number from the deltion queue back to the phone number inventory	Write			
RetrieveDataExports	Grants permission to download the file containing links to all user attachments returned as part of the "Request attachments" action	Read			
SearchAvailablePhoneNumbers	Grants permission to search phone numbers that can be ordered from the carrier	Read			
SearchChannels	Grants permission to search channels that an AppInstanceUser belongs to, or search channels across the AppInstance for an AppInstaceAdmin	List	app-instance-bot* app-instance-user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SendChannelMessage	Grants permission to send a message to a particular channel that the member is a part of	Write	app-instance-bot*		
			app-instance-user*		
			channel*		
StartDataExport	Grants permission to submit the "Request attachments" request	Write			
StartMeetingTranscription	Grants permission to start transcription for a meeting	Write			
StartSpeakerSearchTask	Grants permission to start a speaker search task on the specified Amazon Chime resource	Write	media-pipeline		
			voice-connector		
StartVoiceToneAnalysisTask	Grants permission to start a voice tone analysis task on the specified Amazon Chime resource	Write	media-pipeline		
			voice-connector		
StopMeetingTranscription	Grants permission to stop transcription for a meeting	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StopSpeakerSearchTask	Grants permission to stop a speaker search task on the specified Amazon Chime resource	Write	media-pipeline		
			voice-connector		
StopVoiceToneAnalysisTask	Grants permission to stop a voice tone analysis task on the specified Amazon Chime resource	Write	media-pipeline		
			voice-connector		
SubmitSupportRequest	Grants permission to submit a customer service support request	Write			
SuspendUsers	Grants permission to suspend users from an Amazon Chime Enterprise account	Write			
TagAttendee	Grants permission to apply the specified tags to the specified Amazon Chime SDK attendee	Tagging	meeting*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagMeeting	Grants permission to apply the specified tags to the specified Amazon Chime SDK meeting	Tagging	meeting*		
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
TagResource	Grants permission to apply the specified tags to the specified resource (tag-based access controls are only supported on *-chime.<region>.amazonaws.com endpoints)	Tagging	app-instance		
			app-instance-bot		
			app-instance-user		
			channel		
			channel-flow		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			media-insights-pipeline-configuration		
			media-pipeline		
			media-pipeline-kinesis-video-stream-pool		
			meeting		
			sip-media-application		
			voice-connector		
			voice-profile-domain		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
UnauthorizeDirectory	Grants permission to unauthorize an Active Directory from your Amazon Chime Enterprise account	Write			
UntagAttendee	Grants permission to untag the specified tags from the specified Amazon Chime SDK attendee	Tagging	meeting*		
UntagMeeting	Grants permission to untag the specified tags from the specified Amazon Chime SDK meeting	Tagging	meeting*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UntagResource	Grants permission to untag the specified tags from the specified resource (tag-based access controls are only supported on *-chime.<region>.amazonaws.com endpoints)	Tagging	app-instance		
			app-instance-bot		
			app-instance-user		
			channel		
			channel-flow		
			media-insights-pipeline-configuration		
			media-pipeline		
			media-pipeline-kinesis-video-stream-pool		
			meeting		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			sip-media-application		
			voice-connector		
			voice-profile-domain		
				aws:TagKeys	
UpdateAccount	Grants permission to update account details for the specified Amazon Chime account	Write			
UpdateAccountOpenIdConfig	Grants permission to update the OpenIdConfig attributes for your Amazon Chime account	Write			
UpdateAccountResource	Grants permission to update the account resource in your Amazon Chime account	Write			
UpdateAccountSettings	Grants permission to update the settings for the specified Amazon Chime account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAppInstance	Grants permission to update AppInstance metadata	Write	app-instance*		
UpdateAppInstanceBot	Grants permission to update the details for an AppInstanceBot	Write	app-instance-bot*		
UpdateAppInstanceUser	Grants permission to update the details for an AppInstanceUser	Write	app-instance-user*		
UpdateAppInstanceUserEndpoint	Grants permission to update an endpoint registered for an app instance user	Write	app-instance-user*		
UpdateAttendeeCapabilities	Grants permission to the capabilties that you want to update	Write	meeting*		
UpdateBot	Grants permission to update the status of the specified bot	Write			
UpdateCDRSettings	Grants permission to update your Call Detail Record S3 bucket	Write			s3:CreateBucket s3:DeleteBucket s3:ListAllMyBuckets
UpdateChannel	Grants permission to update a channel's attributes	Write	app-instance-bot*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			app-instance-user*		
			channel*		
UpdateChannelFlow	Grants permission to update a channel flow	Write	channel-flow*		
UpdateChannelMessage	Grants permission to update the content of a message	Write	app-instance-bot*		
			app-instance-user*		
			channel*		
UpdateChannelReadMarker	Grants permission to set the timestamp to the point when a user last read messages in a channel	Write	app-instance-bot*		
			app-instance-user*		
			channel*		
UpdateGlobalSettings	Grants permission to update the global settings related to Amazon Chime for the AWS account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateMediaInsightsPipelineConfiguration	Grants permission to update the status of a media insights pipeline configuration	Write	media-insights-pipeline-configuration*		chime:ListVoiceConnectors iam:PassRole kinesis:DescribeStream s3:ListBucket
UpdateMediaInsightsPipelineStatus	Grants permission to update the status of a media insights pipeline	Write	media-pipeline*		
UpdateMediaPipelineKinesisVideoStreamPool	Grants permission to update kinesis video stream pool	Write	media-pipeline-kinesis-video-stream-pool*		
UpdatePhoneNumber	Grants permission to update phone number details for the specified phone number	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdatePhoneNumberSettings	Grants permission to update phone number settings related to Amazon Chime for the AWS account	Write			
UpdateProxySession	Grants permission to update a proxy session for the specified Amazon Chime Voice Connector	Write	voice-connector*		
UpdateRoom	Grants permission to update a room	Write			
UpdateRoomMembership	Grants permission to update room membership role	Write			
UpdateSipMediaApplication	Grants permission to update properties of Amazon Chime SIP media application under the administrator's AWS account	Write	sip-media-application*		
UpdateSipMediaApplicationCall	Grants permission to update an Amazon Chime SIP media application call under the administrator's AWS account	Write	sip-media-application*		
UpdateSipRule	Grants permission to update properties of Amazon Chime SIP rule under the administrator's AWS account	Write	sip-media-application		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateSupportedLicenses	Grants permission to update the supported license tiers available for users in your Amazon Chime account	Write			
UpdateUser	Grants permission to update user details for a specified user ID	Write			
UpdateUserLicenses	Grants permission to update the licenses for your Amazon Chime users	Write			
UpdateUserSettings	Grants permission to update user settings related to the specified Amazon Chime user	Write			
UpdateVoiceConnector	Grants permission to update Amazon Chime Voice Connector details for the specified Amazon Chime Voice Connector	Write	voice-connector*		
UpdateVoiceConnectorGroup	Grants permission to update Amazon Chime Voice Connector Group details for the specified Amazon Chime Voice Connector Group	Write	voice-connector		
UpdateVoiceProfile	Grants permission to update a voice profile	Write	voice-profile*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateVoiceProfileDomain	Grants permission to update a voice profile domain	Write	voice-profile-domain*		
ValidateAccountResource	Grants permission to validate the account resource in your Amazon Chime account	Read			
ValidateE911Address	Grants permission to validate an address to be used for 911 calls made with Amazon Chime Voice Connectors	Read			

Resource types defined by Amazon Chime

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
meeting	`arn:${Partition}:chime:${Region}:${AccountId}:meeting/${MeetingId}`	aws:ResourceTag/${TagKey}
app-instance	`arn:${Partition}:chime:${Region}:${AccountId}:app-instance/${AppInstanceId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
app-instance-user	arn:${Partition}:chime:${Region}:${AccountId}:app-instance/${AppInstanceId}/user/${AppInstanceUserId}	aws:ResourceTag/${TagKey}
app-instance-bot	arn:${Partition}:chime:${Region}:${AccountId}:app-instance/${AppInstanceId}/bot/${AppInstanceBotId}	aws:ResourceTag/${TagKey}
channel	arn:${Partition}:chime:${Region}:${AccountId}:app-instance/${AppInstanceId}/channel/${ChannelId}	aws:ResourceTag/${TagKey}
channel-flow	arn:${Partition}:chime:${Region}:${AccountId}:app-instance/${AppInstanceId}/channel-flow/${ChannelFlowId}	aws:ResourceTag/${TagKey}
media-pipeline	arn:${Partition}:chime:${Region}:${AccountId}:media-pipeline/${MediaPipelineId}	aws:ResourceTag/${TagKey}
media-insights-pipeline-configuration	arn:${Partition}:chime:${Region}:${AccountId}:media-insights-pipeline-configuration/${ConfigurationName}	aws:ResourceTag/${TagKey}
media-pipeline-kinesis-video-stream-pool	arn:${Partition}:chime:${Region}:${AccountId}:media-pipeline-kinesis-video-stream-pool/${PoolName}	aws:ResourceTag/${TagKey}
voice-profile-domain	arn:${Partition}:chime:${Region}:${AccountId}:voice-profile-domain/${VoiceProfileDomainId}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
voice-profile	arn:${Partition}:chime:${Region}:${AccountId}:voice-profile/${VoiceProfileId}	
voice-connector	arn:${Partition}:chime:${Region}:${AccountId}:vc/${VoiceConnectorId}	aws:ResourceTag/${TagKey}
sip-media-application	arn:${Partition}:chime:${Region}:${AccountId}:sma/${SipMediaApplicationId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Chime

Amazon Chime defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag's key and value in a request	String
aws:ResourceTag/${TagKey}	Filters access by the tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the tag keys in a request	ArrayOfString

Actions, resources, and condition keys for AWS Clean Rooms

AWS Clean Rooms (service prefix: `cleanrooms`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS Clean Rooms

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetCollaborationAnalysisTemplate	Grants permission to view details of analysisTemplates associated to the collaboration	Read	analysistemplate*		cleanrooms:GetCollaborationAnalysisTemplate
			collaboration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetSchema	Grants permission to view details for schemas	Read	collaboration*		cleanrooms:GetSchema
			configuredtableassociation		
			idmappingtable		
BatchGetSchemaAnalysisRule	Grants permission to view analysis rules associated with schemas	Read	collaboration*		cleanrooms:GetSchema
			configuredtableassociation		
			idmappingtable		
CreateAnalysisTemplate	Grants permission to create a new analysis template	Write	analysistemplate*	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			membership*	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
CreateCollaboration	Grants permission to create a new collaboration, a shared data collaboration environment	Write	collaboration*	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCollaborationChangeRequest	Grants permission to create a change request in a collaboration	Write	collaboration*	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateConfiguredAudienceModelAssociation	Grants permission to link a Cleanrooms ML configured audience model with a collaboration by creating a new association	Write	configuredaudiencemodelassociation*	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	cleanrooms-ml:GetConfiguredAudienceModel cleanrooms-ml:GetConfiguredAudienceModelPolicy cleanrooms-ml:PutConfiguredAudienceModelPolicy

UpdateProtectedQuery	Grants permission to update protected queries	Write	membership*		

Resource types defined by AWS Clean Rooms

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
analysistemplate	arn:${Partition}:cleanrooms:${Region}:${Account}:membership/${MembershipId}/analysistemplate/${AnalysisTemplateId}	aws:ResourceTag/${TagKey}
collaboration	arn:${Partition}:cleanrooms:${Region}:${Account}:collaboration/${CollaborationId}	aws:ResourceTag/${TagKey}
configuredaudiencemodelassociation	arn:${Partition}:cleanrooms:${Region}:${Account}:membership/${MembershipId}/configuredaudiencemodelassociation/${ConfiguredAudienceModelAssociationId}	aws:ResourceTag/${TagKey}
configuredtable	arn:${Partition}:cleanrooms:${Region}:${Account}:configuredtable/${ConfiguredTableId}	aws:ResourceTag/${TagKey}
configuredtableassociation	arn:${Partition}:cleanrooms:${Region}:${Account}:membership/${MembershipId}/configuredtableassociation/${ConfiguredTableAssociationId}	aws:ResourceTag/${TagKey}
idmappingtable	arn:${Partition}:cleanrooms:${Region}:${Account}:membership/${MembershipId}/idmappingtable/${IdMappingTableId}	aws:ResourceTag/${TagKey}
idnamespaceassociation	arn:${Partition}:cleanrooms:${Region}:${Account}:membership/${MembershipId}/idnamespaceassociation/${IdNamespaceAssociationId}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
membership	arn:${Partition}:cleanrooms:${Region}:${Account}:membership/${MembershipId}	aws:ResourceTag/${TagKey}
privacybudgettemplate	arn:${Partition}:cleanrooms:${Region}:${Account}:membership/${MembershipId}/privacybudgettemplate/${PrivacyBudgetTemplateId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Clean Rooms

AWS Clean Rooms defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Clean Rooms ML

AWS Clean Rooms ML (service prefix: `cleanrooms-ml`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Topics

Actions defined by AWS Clean Rooms ML

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelTrainedModel	Grants permission to cancel a trained model	Write	TrainedModel*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelTrainedModelInferenceJob	Grants permission to cancel a trained model inference job	Write	TrainedModelInferenceJob*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateAudienceModel	Grants permission to create an audience model	Write	trainingdataset*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateConfiguredAudienceModel	Grants permission to create a configured audience model	Write	audiencemodel*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateConfiguredModelAlgorithm	Grants permission to create a configured model algorithm	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateConfiguredModelAlgorithmAssociation	Grants permission to create a configured model algorithm association	Write	ConfiguredModelAlgorithm*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateMLInputChannel	Grants permission to create an ML input channel	Write	ConfiguredModelAlgorithmAssociation*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTrainedModel	Grants permission to create a trained model	Write	ConfiguredModelAlgorithmAssociation*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateTrainingDataset	Grants permission to create a training dataset, or seed audience. In Clean Rooms ML, the TrainingDataset is metadata that points to a Glue table, which is read only during AudienceModel creation	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAudienceGenerationJob	Grants permission to delete the specified audience generation job, and removes all data associated with the job	Write	audiencegenerationjob*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAudienceModel	Grants permission to delete the specified audience generation job, and removes all data associated with the job	Write	audiencemodel*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteConfiguredAudienceModel	Grants permission to delete the specified configured audience model	Write	configuredaudiencemodel*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteConfiguredAudienceModelPolicy	Grants permission to delete the specified configured audience model policy	Write	configuredaudiencemodel*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteConfiguredModelAlgorithm	Grants permission to delete a configured model algorithm	Write	ConfiguredModelAlgorithm*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteConfiguredModelAlgorithmAssociation	Grants permission to delete a configured model algorithm association	Write	ConfiguredModelAlgorithmAssociation*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteMLConfiguration	Grants permission to delete an ML configuration	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteMLInputChannelData	Grants permission to delete all data associated with the ML input channel	Write	MLInputChannel*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteTrainedModelOutput	Grants permission to delete all output associated with the trained model	Write	TrainedModel*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteTrainingDataset	Grants permission to delete a training dataset	Write	trainingdataset*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAudienceGenerationJob	Grants permission to return information about an audience generation job	Read	audiencegenerationjob*		
				aws:RequestTag/${TagKey} aws:TagKeys	
GetAudienceModel	Grants permission to return information about an audience model	Read	audiencemodel*		
				aws:RequestTag/${TagKey} aws:TagKeys	
GetCollaborationConfiguredModelAlgorithmAssociation	Grants permission to return information about a configured model algorithm association created by any member in the collaboration	Read	ConfiguredModelAlgorithmAssociation*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys cleanrooms-ml:CollaborationId	
GetCollaborationMLInputChannel	Grants permission to return information about an ML input channel created by any member in the collaboration	Read	MLInputChannel*		
				aws:RequestTag/${TagKey} aws:TagKeys cleanrooms-ml:CollaborationId	
GetCollaborationTrainedModel	Grants permission to return information about a trained model created by any member in the collaboration	Read	TrainedModel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys cleanrooms-ml:CollaborationId	
GetConfiguredAudienceModel	Grants permission to return information about a configured audience model	Read	configuredaudiencemodel*		
				aws:RequestTag/${TagKey} aws:TagKeys	
GetConfiguredAudienceModelPolicy	Grants permission to return information about a configured audience model policy	Read	configuredaudiencemodel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
GetConfiguredModelAlgorithm	Grants permission to return information about a configured model algorithm	Read	ConfiguredModelAlgorithm*		
				aws:RequestTag/${TagKey} aws:TagKeys	
GetConfiguredModelAlgorithmAssociation	Grants permission to return information about a configured model algorithm association	Read	ConfiguredModelAlgorithmAssociation*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetMLConfiguration	Grants permission to return information about an ML configuration	Read		aws:RequestTag/${TagKey} aws:TagKeys	
GetMLInputChannel	Grants permission to return information about an ML input channel	Read	MLInputChannel*		
				aws:RequestTag/${TagKey} aws:TagKeys

			trainingdataset		
				aws:TagKeys aws:ResourceTag/${TagKey}	
UpdateConfiguredAudienceModel	Grants permission to update a configured audience model.	Write	configuredaudiencemodel*		
			audiencemodel		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	

Resource types defined by AWS Clean Rooms ML

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
trainingdataset	`arn:${Partition}:cleanrooms-ml:${Region}:${Account}:training-dataset/${ResourceId}`	aws:ResourceTag/${TagKey}
audiencemodel	`arn:${Partition}:cleanrooms-ml:${Region}:${Account}:audience-model/${ResourceId}`	aws:ResourceTag/${TagKey}
configuredaudiencemodel	`arn:${Partition}:cleanrooms-ml:${Region}:${Account}:configured-audience-model/${ResourceId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
audiencegenerationjob	arn:${Partition}:cleanrooms-ml:${Region}:${Account}:audience-generation-job/${ResourceId}	aws:ResourceTag/${TagKey}
ConfiguredModelAlgorithm	arn:${Partition}:cleanrooms-ml:${Region}:${Account}:configured-model-algorithm/${ResourceId}	aws:ResourceTag/${TagKey}
ConfiguredModelAlgorithmAssociation	arn:${Partition}:cleanrooms-ml:${Region}:${Account}:membership/${MembershipId}/configured-model-algorithm-association/${ResourceId}	aws:ResourceTag/${TagKey}
MLInputChannel	arn:${Partition}:cleanrooms-ml:${Region}:${Account}:membership/${MembershipId}/ml-input-channel/${ResourceId}	aws:ResourceTag/${TagKey}
TrainedModel	arn:${Partition}:cleanrooms-ml:${Region}:${Account}:membership/${MembershipId}/trained-model/${ResourceId}	aws:ResourceTag/${TagKey}
TrainedModelInferenceJob	arn:${Partition}:cleanrooms-ml:${Region}:${Account}:membership/${MembershipId}/trained-model-inference-job/${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Clean Rooms ML

AWS Clean Rooms ML defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
cleanrooms-ml:CollaborationId	Filters access by Clean rooms collaboration id	String

Actions, resources, and condition keys for AWS Cloud Control API

AWS Cloud Control API (service prefix: `cloudformation`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- Resource types defined by AWS Cloud Control API
- Condition keys for AWS Cloud Control API

Actions defined by AWS Cloud Control API

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelResourceRequest	Grants permission to cancel resource requests in your account	Write			
CreateResource	Grants permission to create resources in your account	Write			
DeleteResource	Grants permission to delete resources in your account	Write			
GetResource	Grants permission to get resources in your account	Read			
GetResourceRequestStatus	Grants permission to get resource requests in your account	Read			
ListResourceRequests	Grants permission to list resource requests in your account	Read			
ListResources	Grants permission to list resources in your account	Read			
UpdateResource	Grants permission to update resources in your account	Write			

Resource types defined by AWS Cloud Control API

AWS Cloud Control API does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Cloud Control API, specify `"Resource": "*"` in your policy.

Condition keys for AWS Cloud Control API

Cloud Control API has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Cloud Directory

Amazon Cloud Directory (service prefix: `clouddirectory`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Cloud Directory

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of

access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddFacetToObject	Grants permission to add a new Facet to an object	Write	directory*		
ApplySchema	Grants permission to copy input published schema into Directory with same name and version as that of published schema	Write	directory* publishedSchema*		
AttachObject	Grants permission to attach an existing object to another existing object	Write	directory*		
AttachPolicy	Grants permission to attach a policy object to any other object	Write	directory*		
AttachToIndex	Grants permission to attach the specified object to the specified index	Write	directory*		
AttachTypedLink	Grants permission to attach a typed link b/w a source & target object reference	Write	directory*		
BatchRead	Grants permission to perform all the read operations in a batch. Each individual operation inside BatchRead needs to be granted permissions explicitly	Read	directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchWrite	Grants permission to perform all the write operations in a batch. Each individual operation inside BatchWrite needs to be granted permissions explicitly	Write	directory*		
CreateDirectory	Grants permission to create a Directory by copying the published schema into the directory	Write	publishedSchema*		
CreateFacet	Grants permission to create a new Facet in a schema	Write	appliedSchema*		
			developmentSchema*		
CreateIndex	Grants permission to create an index object	Write	directory*		
CreateObject	Grants permission to create an object in a Directory	Write	directory*		
CreateSchema	Grants permission to create a new schema in a development state	Write			
CreateTypedLinkFacet	Grants permission to create a new Typed Link facet in a schema	Write	appliedSchema*		
			developmentSchema*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteDirectory	Grants permission to delete a directory. Only disabled directories can be deleted	Write	directory*		
DeleteFacet	Grants permission to delete a given Facet. All attributes and Rules associated with the facet will be deleted	Write	developmentSchema*		
DeleteObject	Grants permission to delete an object and its associated attributes	Write	directory*		
DeleteSchema	Grants permission to delete a given schema	Write	developmentSchema*		
			publishedSchema*		
DeleteTypedLinkFacet	Grants permission to delete a given TypedLink Facet. All attributes and Rules associated with the facet will be deleted	Write	developmentSchema*		
DetachFromIndex	Grants permission to detach the specified object from the specified index	Write	directory*		
DetachObject	Grants permission to detach a given object from the parent object	Write	directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DetachPolicy	Grants permission to detach a policy from an object	Write	directory*		
DetachTypedLink	Grants permission to detach a given typed link b/w given source and target object reference	Write	directory*		
DisableDirectory	Grants permission to disable the specified directory	Write	directory*		
EnableDirectory	Grants permission to enable the specified directory	Write	directory*		
GetAppliedSchemaVersion	Grants permission to return current applied schema version ARN, including the minor version in use	Read	appliedSchema*		
GetDirectory	Grants permission to retrieve metadata about a directory	Read	directory*		
GetFacet	Grants permission to get details of the Facet, such as Facet Name, Attributes, Rules, or ObjectType	Read	appliedSchema*		
			developmentSchema*		
			publishedSchema*		
GetLinkAttributes	Grants permission to retrieve attributes that are associated with a typed link	Read	directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetObjectAttributes	Grants permission to retrieve attributes within a facet that are associated with an object	Read	directory*		
GetObjectInformation	Grants permission to retrieve metadata about an object	Read	directory*		
GetSchemaAsJson	Grants permission to retrieve a JSON representation of the schema	Read	appliedSchema*		
			developmentSchema*		
			publishedSchema*		
GetTypedLinkFacetInformation	Grants permission to return identity attributes order information associated with a given typed link facet	Read	appliedSchema*		
			developmentSchema*		
			publishedSchema*		
ListAppliedSchemaArns	Grants permission to list schemas applied to a directory	List	directory*		
ListAttachedIndices	Grants permission to list indices attached to an object	Read	directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDevelopmentSchemaArns	Grants permission to retrieve the ARNs of schemas in the development state	List			
ListDirectories	Grants permission to list directories created within an account	List			
ListFacetAttributes	Grants permission to retrieve attributes attached to the facet	Read	appliedSchema*		
			developmentSchema*		
			publishedSchema*		
ListFacetNames	Grants permission to retrieve the names of facets that exist in a schema	Read	appliedSchema*		
			developmentSchema*		
			publishedSchema*		
ListIncomingTypedLinks	Grants permission to return a paginated list of all incoming TypedLinks for a given object	Read	directory*		
ListIndex	Grants permission to list objects attached to the specified index	Read	directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListManagedSchemaArns	Grants permission to list the major version families of each managed schema. If a major version ARN is provided as SchemaArn, the minor version revisions in that family are listed instead	List			
ListObjectAttributes	Grants permission to list all attributes associated with an object	Read	directory*		
ListObjectChildren	Grants permission to return a paginated list of child objects associated with a given object	Read	directory*		
ListObjectParentPaths	Grants permission to retrieve all available parent paths for any object type such as node, leaf node, policy node, and index node objects	Read	directory*		
ListObjectParents	Grants permission to list parent objects associated with a given object in pagination fashion	Read	directory*		
ListObjectPolicies	Grants permission to return policies attached to an object in pagination fashion	Read	directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListOutgoingTypedLinks	Grants permission to return a paginated list of all outgoing TypedLinks for a given object	Read	directory*		
ListPolicyAttachments	Grants permission to return all of the ObjectIdentifiers to which a given policy is attached	Read	directory*		
ListPublishedSchemaArns	Grants permission to retrieve published schema ARNs	List			
ListTagsForResource	Grants permission to return tags for a resource	Read	directory*		
ListTypedLinkFacetAttributes	Grants permission to return a paginated list of attributes associated with typed link facet	Read	appliedSchema*		
			developmentSchema*		
			publishedSchema*		
ListTypedLinkFacetNames	Grants permission to return a paginated list of typed link facet names that exist in a schema	Read	appliedSchema*		
			developmentSchema*		
			publishedSchema*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
LookupPolicy	Grants permission to list all policies from the root of the Directory to the object specified	Read	directory*		
PublishSchema	Grants permission to publish a development schema with a version	Write	developmentSchema*		
PutSchemaFromJson	Grants permission to update a schema using JSON upload. Only available for development schemas	Write			
RemoveFacetFromObject	Grants permission to remove the specified facet from the specified object	Write	directory*		
TagResource	Grants permission to add tags to a resource	Tagging	directory*		
UntagResource	Grants permission to remove tags from a resource	Tagging	directory*		
UpdateFacet	Grants permission to add/update/delete existing Attributes, Rules, or ObjectType of a Facet	Write	appliedSchema*		
			developmentSchema*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateLinkAttributes	Grants permission to update a given typed link's attributes. Attributes to be updated must not contribute to the typed link's identity, as defined by its IdentityAttributeOrder	Write	directory*		
UpdateObjectAttributes	Grants permission to update a given object's attributes	Write	directory*		
UpdateSchema	Grants permission to update the schema name with a new name	Write	developmentSchema*		
UpdateTypedLinkFacet	Grants permission to add/update/delete existing Attributes, Rules, identity attribute order of a TypedLinkFacet	Write	developmentSchema*		
UpgradeAppliedSchema	Grants permission to upgrade a single directory in-place using the PublishedSchemaArn with schema updates found in MinorVersion. Backwards-compatible minor version upgrades are instantaneously available for readers on all objects in the directory	Write	directory* publishedSchema*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpgradePublishedSchema	Grants permission to upgrade a published schema under a new minor version revision using the current contents of DevelopmentSchemaArn	Write	developmentSchema*		
			publishedSchema*		

Resource types defined by Amazon Cloud Directory

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
appliedSchema	`arn:${Partition}:clouddirectory:${Region}:${Account}:directory/${DirectoryId}/schema/${SchemaName}/${Version}`	
developmentSchema	`arn:${Partition}:clouddirectory:${Region}:${Account}:schema/development/${SchemaName}`	
directory	`arn:${Partition}:clouddirectory:${Region}:${Account}:directory/${DirectoryId}`	

Resource types	ARN	Condition keys
published Schema	`arn:${Partition}:clouddirectory:${Region}:${Account}:schema/published/${SchemaName}/${Version}`	

Condition keys for Amazon Cloud Directory

Cloud Directory has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Cloud Map

AWS Cloud Map (service prefix: `servicediscovery`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Cloud Map

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateHttpNamespace	Grants permission to create an HTTP namespace	Write		aws:TagKeys aws:RequestTag/${TagKey}	
CreatePrivateDnsNamespace	Grants permission to create a private namespace based on DNS, which will be visible only inside a specified Amazon VPC	Write		aws:TagKeys aws:RequestTag/${TagKey}	
CreatePublicDnsNamespace	Grants permission to create a public namespace based on DNS, which will be visible on the internet	Write		aws:TagKeys aws:RequestTag/${TagKey}	
CreateService	Grants permission to create a service	Write	namespace*		
			service*		
				servicediscovery:NamespaceArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
DeleteNamespace	Grants permission to delete a specified namespace	Write	namespace*		
DeleteResourcePolicy [permission only]	Grants permission to delete the RAM access control policy for a namespace	Write	namespace*		
DeleteService	Grants permission to delete a specified service	Write	service*		
				servicediscovery:ServiceCreatedByAccount	
DeleteServiceAttributes	Grants permission to delete specified attributes from a service	Write	service*		
				servicediscovery:ServiceCreatedByAccount	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeregisterInstance	Grants permission to delete the records and the health check, if any, that Amazon Route 53 created for the specified instance	Write	service*		
				servicediscovery:ServiceArn servicediscovery:ServiceCreatedByAccount	
DiscoverInstances	Grants permission to discover registered instances for a specified namespace and service	Read	namespace*		
			service*		
				servicediscovery:NamespaceName servicediscovery:ServiceName	
DiscoverInstancesRevision	Grants permission to discover the revision of the instances for a specified namespace and service	Read	namespace*		
			service*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				servicediscovery:NamespaceName servicediscovery:ServiceName	
GetInstance	Grants permission to get information about a specified instance	Read	service*		
				servicediscovery:ServiceArn	
GetInstancesHealthStatus	Grants permission to get the current health status (Healthy, Unhealthy, or Unknown) of one or more instances	Read	service*		
				servicediscovery:ServiceArn	
GetNamespace	Grants permission to get information about a namespace	Read	namespace*		
GetOperation	Grants permission to get information about a specific operation	Read	namespace*		
			service		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetResourcePolicy [permission only]	Grants permission to read the RAM access control policy for a namespace	Read	namespace*		
GetService	Grants permission to get the settings for a specified service	Read	service*		
GetServiceAttributes	Grants permission to get the attributes for a specified service	Read	service*		
ListInstances	Grants permission to get summary information about the instances that were registered with a specified service	Read	service*		
				servicediscovery:ServiceArn	
ListNamespaces	Grants permission to get information about the namespaces	Read			
ListOperations	Grants permission to list operations that match the criteria that you specify	List			
ListServices	Grants permission to get settings for all the services that match specified filters	Read			
ListTagsForResource	Grants permission to lists tags for the specified resource	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutResourcePolicy [permission only]	Grants permission to define the RAM access control policy for a namespace	Write	namespace*		
RegisterInstance	Grants permission to register an instance based on the settings in a specified service	Write	service*		
				servicediscovery:ServiceArn servicediscovery:ServiceCreatedByAccount	
TagResource	Grants permission to add one or more tags to the specified resource	Tagging		aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove one or more tags from the specified resource	Tagging		aws:TagKeys	
UpdateHttpNamespace	Grants permission to update the settings for a HTTP namespace	Write	namespace*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateInstanceCustomHealthStatus	Grants permission to update the current health status for an instance that has a custom health check	Write	service*		
				servicediscovery:ServiceArn servicediscovery:ServiceCreatedByAccount	
UpdatePrivateDnsNamespace	Grants permission to update the settings for a private DNS namespace	Write	namespace*		
UpdatePublicDnsNamespace	Grants permission to update the settings for a public DNS namespace	Write	namespace*		
UpdateService	Grants permission to update the settings in a specified service	Write	service*		
				servicediscovery:ServiceCreatedByAccount	
UpdateServiceAttributes	Grants permission to update the attributes in a specified service	Write	service*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				servicediscovery:ServiceCreatedByAccount	

Resource types defined by AWS Cloud Map

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
namespace	`arn:${Partition}:servicediscovery:${Region}:${Account}:namespace/${NamespaceId}`	aws:ResourceTag/${TagKey}
service	`arn:${Partition}:servicediscovery:${Region}:${Account}:service/${ServiceId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Cloud Map

AWS Cloud Map defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters actions based on the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters actions based on the tags associated with the resource	String
aws:TagKeys	Filters actions based on the tag keys that are passed in the request	ArrayOfString
servicediscovery:NamespaceArn	Filters access by specifying the Amazon Resource Name (ARN) for the related namespace	ARN
servicediscovery:NamespaceName	Filters access by specifying the name of the related namespace	String
servicediscovery:ServiceArn	Filters access by specifying the Amazon Resource Name (ARN) for the related service	ARN
servicediscovery:ServiceCreatedByAccount	Filters access by specifying the account id of the related service creator	String
servicediscovery:ServiceName	Filters access by specifying the name of the related service	String

Actions, resources, and condition keys for AWS Cloud9

AWS Cloud9 (service prefix: `cloud9`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS Cloud9

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ActivateEC2Remote [permission only]	Grants permission to start the Amazon EC2 instance that your AWS Cloud9 IDE connects to	Write	environment*		
CreateEnvironmentEC2	Grants permission to create an AWS Cloud9 development environment, launches an Amazon Elastic Compute Cloud (Amazon EC2) instance,	Write		cloud9:EnvironmentName	ec2:DescribeSubnets

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	and then hosts the environment on the instance			cloud9:InstanceType cloud9:SubnetId cloud9:UserArn cloud9:OwnerArn aws:RequestTag/${TagKey} aws:TagKeys	ec2:DescribeVpcs iam:CreateServiceLinkedRole
CreateEnvironmentMembership	Grants permission to add an environment member to an AWS Cloud9 development environment	Write	environment*		
				cloud9:UserArn cloud9:EnvironmentId cloud9:Permissions	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateEnvironmentSSH [permission only]	Grants permission to create an AWS Cloud9 SSH development environment	Write		cloud9:EnvironmentName cloud9:OwnerArn aws:RequestTag/${TagKey} aws:TagKeys	
CreateEnvironmentToken [permission only]	Grants permission to create an authentication token that allows a connection between the AWS Cloud9 IDE and the user's environment	Read	environment*		
DeleteEnvironment	Grants permission to delete an AWS Cloud9 development environment. If the environment is hosted on an Amazon Elastic Compute Cloud (Amazon EC2) instance, also terminates the instance	Write	environment*		iam:CreateServiceLinkedRole
DeleteEnvironmentMembership	Grants permission to delete an environment member from an AWS Cloud9 development environment	Write	environment*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				cloud9:UserArn cloud9:EnvironmentId	
DescribeEC2Remote [permission only]	Grants permission to get details about the connection to the EC2 development environment, including host, user, and port	Read	environment*		
DescribeEnvironmentMemberships	Grants permission to get information about environment members for an AWS Cloud9 development environment	Read	environment*		
				cloud9:UserArn cloud9:EnvironmentId	
DescribeEnvironmentStatus	Grants permission to get status information for an AWS Cloud9 development environment	Read	environment*		
DescribeEnvironments	Grants permission to get information about AWS Cloud9 development environments	Read	environment*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeSSHRemote [permission only]	Grants permission to get details about the connection to the SSH development environment, including host, user, and port	Read	environment*		
GetEnvironmentConfig [permission only]	Grants permission to get configuration information that's used to initialize the AWS Cloud9 IDE	Read	environment*		
GetEnvironmentSettings [permission only]	Grants permission to get the AWS Cloud9 IDE settings for a specified development environment	Read	environment*		
GetMembershipSettings [permission only]	Grants permission to get the AWS Cloud9 IDE settings for a specified environment member	Read	environment*		
GetMigrationExperiences [permission only]	Grants permission to get the migration experience for a cloud9 user	Read			
GetUserPublicKey [permission only]	Grants permission to get the user's public SSH key, which is used by AWS Cloud9 to connect to SSH development environments	Read		cloud9:UserArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetUserSettings [permission only]	Grants permission to get the AWS Cloud9 IDE settings for a specified user	Read			
ListEnvironments	Grants permission to get a list of AWS Cloud9 development environment identifiers	Read			
ListTagsForResource	Grants permission to list tags for a cloud9 environment	Read	environment*		
ModifyTemporaryCredentialsOnEnvironmentEC2 [permission only]	Grants permission to set AWS managed temporary credentials on the Amazon EC2 instance that's used by the AWS Cloud9 integrated development environment (IDE)	Write	environment*		
TagResource	Grants permission to add tags to a cloud9 environment	Tagging	environment*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from a cloud9 environment	Tagging	environment*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
UpdateEnvironment	Grants permission to change the settings of an existing AWS Cloud9 development environment	Write	environment*		
UpdateEnvironmentMembership	Grants permission to change the settings of an existing environment member for an AWS Cloud9 development environment	Write	environment*		
				cloud9:UserArn cloud9:EnvironmentId cloud9:Permissions	
UpdateEnvironmentSettings [permission only]	Grants permission to update the AWS Cloud9 IDE settings for a specified development environment	Write	environment*		
UpdateMembershipSettings [permission only]	Grants permission to update the AWS Cloud9 IDE settings for a specified environment member	Write	environment*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateSSHRemote [permission only]	Grants permission to update details about the connection to the SSH development environment, including host, user, and port	Write	environment*		
UpdateUserSettings [permission only]	Grants permission to update IDE-specific settings of an AWS Cloud9 user	Write			

Resource types defined by AWS Cloud9

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
environment	`arn:${Partition}:cloud9:${Region}:${Account}:environment:${ResourceId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Cloud9

AWS Cloud9 defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
cloud9:EnvironmentId	Filters access by the AWS Cloud9 environment ID	String
cloud9:EnvironmentName	Filters access by the AWS Cloud9 environment name	String
cloud9:InstanceType	Filters access by the instance type of the AWS Cloud9 environment's Amazon EC2 instance	String
cloud9:OwnerArn	Filters access by the owner ARN specified	ARN
cloud9:Permissions	Filters access by the type of AWS Cloud9 permissions	String
cloud9:SubnetId	Filters access by the subnet ID that the AWS Cloud9 environment will be created in	String
cloud9:UserArn	Filters access by the user ARN specified	ARN

Actions, resources, and condition keys for AWS CloudFormation

AWS CloudFormation (service prefix: `cloudformation`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS CloudFormation

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ActivateOrganizationsAccess	Grants permission to activate trusted access between StackSets and Organizations. With trusted access between StackSets and Organizations activated, the management account has permissions to create and manage StackSets for your organization	Write			
ActivateType	Grants permission to activate a public third-party extension	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	, making it available for use in stack templates				
BatchDescribeTypeConfigurations	Grants permission to return configuration data for the specified CloudFormation extensions	Read			
CancelUpdateStack	Grants permission to cancel an update on the specified stack	Write	stack*		
ContinueUpdateRollback	Grants permission to continue rolling back a stack that is in the UPDATE_ROLLBACK_FAILED state to the UPDATE_ROLLBACK_COMPLETE state	Write	stack*		
				cloudformation:RoleArn	
CreateChangeSet	Grants permission to create a list of changes for a stack	Write	stack*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				cloudformation:ChangeSetName cloudformation:ResourceTypes cloudformation:ImportResourceTypes cloudformation:RoleArn cloudformation:StackPolicyUrl cloudformation:TemplateUrl aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
CreateGeneratedTemplate	Grants permission to create a template from existing resources that are not already managed with CloudFormation	Write			
CreateStack	Grants permission to create a stack as specified in the template	Write	stack*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				cloudformation:ResourceTypes cloudformation:RoleArn cloudformation:StackPolicyUrl cloudformation:TemplateUrl aws:RequestTag/${TagKey} aws:TagKeys	
CreateStackInstances	Grants permission to create stack instances for the specified accounts, within the specified regions	Write	stackset*		
			stackset-target		
			type		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys cloudformation:TargetRegion	
CreateStackRefactor	Grants permission to create a stack refactor	Write	stack*		
CreateStackSet	Grants permission to create a stackset as specified in the template	Write		cloudformation:RoleArn cloudformation:TemplateUrl aws:RequestTag/${TagKey} aws:TagKeys	
CreateUploadBucket [permission only]	Grants permission to upload templates to Amazon S3 buckets. Used only by the AWS CloudFormation console and is not documented in the API reference	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeactivateOrganizationsAccess	Grants permission to deactivate trusted access between StackSets and Organizations. If trusted access is deactivated, the management account does not have permissions to create and manage service-managed StackSets for your organization	Write			
DeactivateType	Grants permission to deactivate a public extension that was previously activated in this account and region	Write			
DeleteChangeSet	Grants permission to delete the specified change set. Deleting change sets ensures that no one executes the wrong change set	Write	stack*		
				cloudformation:ChangeSetName	
DeleteGeneratedTemplate	Grants permission to delete a generated template	Write			
DeleteStack	Grants permission to delete a specified stack	Write	stack*		
				cloudformation:RoleArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteStackInstances	Grants permission to delete stack instances for the specified accounts, in the specified regions	Write	stackset*		
			stackset-target		
			type		
				cloudformation:TargetRegion	
DeleteStackSet	Grants permission to delete a specified stackset	Write	stackset*		
DeregisterType	Grants permission to deregister an existing CloudFormation type or type version	Write			
DescribeAccountLimits	Grants permission to retrieve your account's AWS CloudFormation limits	Read			
DescribeChangeSet	Grants permission to return the description for the specified change set	Read	stack*		
				cloudformation:ChangeSetName	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeChangeSetHooks	Grants permission to return the Hook invocation information for the specified change set	Read	stack*		
				cloudformation:ChangeSetName	
DescribeEvents	Grants permission to return all related events for a specified operation	Read	changeset		
			stack		
DescribeGeneratedTemplate	Grants permission to describe a generated template. The output includes details about the progress of the creation of a generated template	Read			
DescribeOrganizationsAccess	Grants permission to return information about the account's OrganizationAccess status	Read			
DescribePublisher	Grants permission to return information about a CloudFormation extension publisher	Read			
DescribeResourceScan	Grants permission to describe details of a resource scan	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeStackDriftDetectionStatus	Grants permission to return information about a stack drift detection operation	Read			
DescribeStackEvents	Grants permission to return all stack related events for a specified stack	Read	stack*		
DescribeStackInstance	Grants permission to return the stack instance that's associated with the specified stack set, AWS account, and region	Read	stackset*		
DescribeStackRefactor	Grants permission to return the description for the specified stack refactor	Read	stack*		
DescribeStackResource	Grants permission to return a description of the specified resource in the specified stack	Read	stack*		
DescribeStackResourceDrifts	Grants permission to return drift information for the resources that have been checked for drift in the specified stack	Read	stack*		
DescribeStackResources	Grants permission to return AWS resource descriptions for running and deleted stacks	Read	stack*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeStackSet	Grants permission to return the description of the specified stack set	Read	stackset*		
DescribeStackSetOperation	Grants permission to return the description of the specified stack set operation	Read	stackset*		
DescribeStacks	Grants permission to return the description for the specified stack, and to all stacks when used in combination with the ListStacks action	List	stack		cloudformation:ListStacks
DescribeType	Grants permission to return information about the CloudFormation type requested	Read			
DescribeTypeRegistration	Grants permission to return information about the registration process for a CloudFormation type	Read			
DetectStackDrift	Grants permission to detects whether a stack's actual configuration differs, or has drifted, from it's expected configuration, as defined in the stack template and any values specified as template parameters	Read	stack*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DetectStackResourceDrift	Grants permission to return information about whether a resource's actual configuration differs, or has drifted, from it's expected configuration, as defined in the stack template and any values specified as template parameters	Read	stack*		
DetectStackSetDrift	Grants permission to enable users to detect drift on a stack set and the stack instances that belong to that stack set	Read	stackset*		
EstimateTemplateCost	Grants permission to return the estimated monthly cost of a template	Read		cloudformation:TemplateUrl	
ExecuteChangeSet	Grants permission to update a stack using the input information that was provided when the specified change set was created	Write	stack*		
				cloudformation:ChangeSetName	
ExecuteStackRefactor	Grants permission to execute a stack refactor using the input information that was provided when the specified stack refactor was created	Write	stack*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetGeneratedTemplate	Grants permission to retrieve a generated template	Read			
GetHookResult	Grants permission to return detailed information about a specific hook invocation result	Read		cloudformation:TypeArn	kms:Decrypt
GetStackPolicy	Grants permission to return the stack policy for a specified stack	Read	stack*		
GetTemplate	Grants permission to return the template body for a specified stack	Read	stack*		
GetTemplateSummary	Grants permission to return information about a new or existing template	Read	stack		
			stackset		
				cloudformation:TemplateUrl	
ImportStacksToStackSet	Grants permission to enable users to import existing stacks to a new or existing stackset	Write	stackset*		
ListAllHookResults	Grants permission to return Hook invocations result information for a specified Hook, a combination of Hook and status, or all Hooks	List		cloudformation:TypeArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListChangeSets	Grants permission to return the ID and status of each active change set for a stack. For example, AWS CloudFormation lists change sets that are in the CREATE_IN_PROGRESS or CREATE_PENDING state	List	stack*		
ListExports	Grants permission to list all exported output values in the account and region in which you call this action	List			
ListGeneratedTemplates	Grants permission to list your generated templates in this Region	List			
ListHookResults	Grants permission to return Hook invocations result information for the specified target	List	stack		
				cloudformation:ChangeSetName	
ListImports	Grants permission to list all stacks that are importing an exported output value	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListResourceScanRelatedResources	Grants permission to list the related resources for a list of resources from a resource scan. The response indicates whether each returned resource is already managed by CloudFormation	List			
ListResourceScanResources	Grants permission to list the resources from a resource scan. The results can be filtered by resource identifier, resource type prefix, tag key, and tag value	List			
ListResourceScans	Grants permission to list the resource scans from newest to oldest. By default it will return up to 10 resource scans	List			
ListStackInstanceResourceDrifts	Grants permission to return drift information for the resources that have been checked for drift in the specified stack instance	List	stackset*		
ListStackInstances	Grants permission to return summary information about stack instances that are associated with the specified stack set	List	stackset*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListStackRefactorActions	Grants permission to return the list of actions of the specified stack refactor	List	stack*		
ListStackRefactors	Grants permission to return the ID and status of each active stack refactor	List	stack*		
ListStackResources	Grants permission to return descriptions of all resources of the specified stack	List	stack*		
ListStackSetAutoDeploymentTargets	Grants permission to return summary information about StackSet Auto Deployment Targets	List	stackset*		
ListStackSetOperationResults	Grants permission to return summary information about the results of a stack set operation	List	stackset*		
ListStackSetOperations	Grants permission to return summary information about operations performed on a stack set	List	stackset*		
ListStackSets	Grants permission to return summary information about stack sets that are associated with the user	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListStacks	Grants permission to return the summary information for stacks whose status matches the specified StackStatusFilter. In combination with the DescribeStacks action, grants permission to list descriptions for stacks	List			
ListTypeRegistrations	Grants permission to list CloudFormation type registration attempts	List			
ListTypeVersions	Grants permission to list versions of a particular CloudFormation type	List			
ListTypes	Grants permission to list available CloudFormation types	List			
PublishType	Grants permission to publish the specified extension to the CloudFormation registry as a public extension in this region	Write			
RecordHandlerProgress	Grants permission to record the handler progress	Write	stack*		
RegisterPublisher	Grants permission to register account as a publisher of public extensions in the CloudFormation registry	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RegisterType	Grants permission to register a new CloudFormation type	Write			
RollbackStack	Grants permission to rollback the stack to the last stable state	Write	stack*		
				cloudformation:RoleArn	
SetStackPolicy	Grants permission to set a stack policy for a specified stack	Permissions management	stack*		
				cloudformation:StackPolicyUrl	
SetTypeConfiguration	Grants permission to set the configuration data for a registered CloudFormation extension, in the given account and region	Write			
SetTypeDefaultVersion	Grants permission to set which version of a CloudFormation type applies to CloudFormation operations	Write			
SignalResource	Grants permission to send a signal to the specified resource with a success or failure status	Write	stack*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartResourceScan	Grants permission to start a scan of the resources in this account in this Region	Write			
StopStackSetOperation	Grants permission to stop an in-progress operation on a stack set and its associated stack instances	Write	stackset*		
TagResource	Grants permission to tag cloudformation resources	Tagging	changeset		
			stack		
			stackset		
				aws:TagKeys aws:RequestTag/${TagKey} cloudformation:CreateAction	
TestType	Grants permission to test a registered extension to make sure it meets all necessary requirements for being published in the CloudFormation registry	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UntagResource	Grants permission to untag cloudformation resources	Tagging	changeset		
			stack		
			stackset		
				aws:TagKeys cloudformation:CreateAction	
UpdateGeneratedTemplate	Grants permission to update a generated template. This can be used to change the name, add and remove resources, refresh resources, and change the DeletionPolicy and UpdateReplacePolicy settings	Write			
UpdateStack	Grants permission to update a stack as specified in the template	Write	stack*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				cloudformation:ResourceTypes cloudformation:RoleArn cloudformation:StackPolicyUrl cloudformation:TemplateUrl aws:RequestTag/${TagKey} aws:TagKeys	
UpdateStackInstances	Grants permission to update the parameter values for stack instances for the specified accounts, within the specified regions	Write	stackset*		
			stackset-target		
			type		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				cloudformation:TargetRegion	
UpdateStackSet	Grants permission to update a stackset as specified in the template	Write	stackset*		
			stackset-target		
			type		
				cloudformation:RoleArn cloudformation:TemplateUrl cloudformation:TargetRegion aws:RequestTag/${TagKey} aws:TagKeys	
UpdateTerminationProtection	Grants permission to update termination protection for the specified stack	Write	stack*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ValidateTemplate	Grants permission to validate a specified template	Read		cloudformation:TemplateUrl	

Resource types defined by AWS CloudFormation

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
changeset	`arn:${Partition}:cloudformation:${Region}:${Account}:changeSet/${ChangeSetName}/${Id}`	aws:ResourceTag/${TagKey}
stack	`arn:${Partition}:cloudformation:${Region}:${Account}:stack/${StackName}/${Id}`	aws:ResourceTag/${TagKey}
stackset	`arn:${Partition}:cloudformation:${Region}:${Account}:stackset/${StackSetName}:${Id}`	aws:ResourceTag/${TagKey}
stackset-target	`arn:${Partition}:cloudformation:${Region}:${Account}:stackset-target/${StackSetTarget}`	

Resource types	ARN	Condition keys
type	arn:${Partition}:cloudformation:${Region}:${Account}:type/resource/${Type}	
typeHook	arn:${Partition}:cloudformation:${Region}:${Account}:type/hook/${Type}	
generated template	arn:${Partition}:cloudformation:${Region}:${Account}:generatedTemplate/${Id}	
resourcescan	arn:${Partition}:cloudformation:${Region}:${Account}:resourceScan/${Id}	

Condition keys for AWS CloudFormation

AWS CloudFormation defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Condition keys	Description	Type
cloudformation:ChangeSetName	Filters access by an AWS CloudFormation change set name. Use to control which change sets IAM users can execute or delete	String
cloudformation:CreateAction	Filters access by the name of a resource-mutating API action. Use to control which APIs IAM users can use to add or remove tags on a stack or stack set	String
cloudformation:ImportResourceTypes	Filters access by the template resource types, such as AWS::EC2::Instance. Use to control which resource types IAM users can work with when they want to import a resource into a stack	String
cloudformation:ResourceTypes	Filters access by the template resource types, such as AWS::EC2::Instance. Use to control which resource types IAM users can work with when they create or update a stack	ArrayOfString
cloudformation:RoleArn	Filters access by the ARN of an IAM service role. Use to control which service role IAM users can use to work with stacks or change sets	ARN
cloudformation:StackPolicyUrl	Filters access by an Amazon S3 stack policy URL. Use to control which stack policies IAM users can associate with a stack during a create or update stack action	String
cloudformation:TargetRegion	Filters access by stack set target region. Use to control which regions IAM users can use when they create or update stack sets	ArrayOfString
cloudformation:TemplateUrl	Filters access by an Amazon S3 template URL. Use to control which templates IAM users can use when they create or update stacks	String
cloudformation:TypeArn	Filters access by the ARN of a CloudFormation extension	ARN

Actions, resources, and condition keys for Amazon CloudFront

Amazon CloudFront (service prefix: `cloudfront`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon CloudFront

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AllowVendedLogDeliveryForResource [permission only]	Grants permission to configure vended log delivery for a distribution	Permissions management	distribution		
AssociateAlias	Grants permission to associate an alias to a CloudFront distribution	Write	distribution*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateDistributionTenantWebACL	Grants permission to associate a distribution tenant with an AWS WAF web ACL	Write	distribution-tenant*		
AssociateDistributionWebACL	Grants permission to associate a distribution with an AWS WAF web ACL	Write	distribution*		
CopyDistribution	Grants permission to copy an existing distribution and create a new web distribution	Write	distribution*		cloudfront:CopyDistribution cloudfront:CreateDistribution cloudfront:GetDistribution
CreateAnycastIpList	Grants permission to create an Anycast static IP list	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateCachePolicy	Grants permission to add a new cache policy to CloudFront	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCloudFrontOriginAccessIdentity	Grants permission to create a new CloudFront origin access identity	Write			
CreateConnectionFunction	Grants permission to create a connection function	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateConnectionGroup	Grants permission to create a connection group	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateContinuousDeploymentPolicy	Grants permission to add a new continuous-deployment policy to CloudFront	Write			
CreateDistribution	Grants permission to create a new web distribution	Write		aws:RequestTag/${TagKey} aws:TagKeys	cloudfront:CreateConnectionGroup

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateDistributionTenant	Grants permission to create a distribution tenant	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateFieldLevelEncryptionConfig	Grants permission to create a new field-level encryption configuration	Write			
CreateFieldLevelEncryptionProfile	Grants permission to create a field-level encryption profile	Write			
CreateFunction	Grants permission to create a CloudFront function	Write			
CreateInvalidation	Grants permission to create a new invalidation batch request	Write	distribution*		
CreateInvalidationForDistributionTenant	Grants permission to create an invalidation for a distribution tenant	Write	distribution-tenant*		
CreateKeyGroup	Grants permission to add a new key group to CloudFront	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateKeyValueStore	Grants permission to create a CloudFront KeyValueStore	Write			
CreateMonitoringSubscription	Grants permission to enable additional CloudWatch metrics for the specified CloudFront distribution. The additional metrics incur an additional cost	Write			
CreateOriginAccessControl	Grants permission to create a new origin access control	Write			
CreateOriginRequestPolicy	Grants permission to add a new origin request policy to CloudFront	Write			
CreatePublicKey	Grants permission to add a new public key to CloudFront	Write			
CreateRealtimeLogConfig	Grants permission to create a real-time log configuration	Write			
CreateResponseHeadersPolicy	Grants permission to add a new response headers policy to CloudFront	Write			
CreateSavingsPlan [permission only]	Grants permission to create a new savings plan	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateStreamingDistribution	Grants permission to create a new RTMP distribution	Write			
CreateStreamingDistributionWithTags	Grants permission to create a new RTMP distribution with tags	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateTrustStore	Grants permission to create a trust store	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateVpcOrigin	Grants permission to create a VPC origin	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAnycastIpList	Grants permission to delete an Anycast static IP list	Write	anycast-ip-list*		
DeleteCachePolicy	Grants permission to delete a cache policy	Write	cache-policy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteCloudFrontOriginAccessIdentity	Grants permission to delete a CloudFront origin access identity	Write	origin-access-identity*		
DeleteConnectionFunction	Grants permission to delete a connection function	Write	connection-function*		
DeleteConnectionGroup	Grants permission to delete a connection group	Write	connection-group*		
DeleteContinuousDeploymentPolicy	Grants permission to delete a continuous-deployment policy	Write	continuous-deployment-policy*		
DeleteDistribution	Grants permission to delete a web distribution	Write	distribution*		
DeleteDistributionTenant	Grants permission to delete a distribution tenant	Write	distribution-tenant*		
DeleteFieldLevelEncryptionConfig	Grants permission to delete a field-level encryption configuration	Write	field-level-encryption-config*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteFieldLevelEncryptionProfile	Grants permission to delete a field-level encryption profile	Write	field-level-encryption-profile*		
DeleteFunction	Grants permission to delete a CloudFront function	Write	function*		
DeleteKeyGroup	Grants permission to delete a key group	Write			
DeleteKeyValueStore	Grants permission to delete a CloudFront KeyValueStore	Write	key-value-store*		
DeleteMonitoringSubscription	Grants permission to disable additional CloudWatch metrics for the specified CloudFront distribution	Write			
DeleteOriginAccessControl	Grants permission to delete an origin access control	Write	origin-access-control*		
DeleteOriginRequestPolicy	Grants permission to delete an origin request policy	Write	origin-request-policy*		
DeletePublicKey	Grants permission to delete a public key from CloudFront	Write			
DeleteRealtimeLogConfig	Grants permission to delete a real-time log configuration	Write	realtime-log-config*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteResourcePolicy	Grants permission to delete a resource's policy document	Write	vpcorigin		
DeleteResponseHeadersPolicy	Grants permission to delete a response headers policy	Write	response-headers-policy*		
DeleteStreamingDistribution	Grants permission to delete an RTMP distribution	Write	streaming-distribution*		
DeleteTrustStore	Grants permission to delete a trust store	Write	trust-store*		
DeleteVpcOrigin	Grants permission to delete a VPC origin	Write	vpcorigin*		
DescribeConnectionFunction	Grants permission to get a connection function summary	Read	connection-function*		
DescribeFunction	Grants permission to get a CloudFront function summary	Read	function*		
DescribeKeyValueStore	Grants permission to get a CloudFront KeyValueStore summary	Read	key-value-store*		
DisassociateDistributionTenantWebACL	Grants permission to disassociate a distribution tenant from an AWS WAF web ACL	Write	distribution-tenant*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateDistributionWebACL	Grants permission to disassociate a distribution from an AWS WAF web ACL	Write	distribution*		
GetAnycastIpList	Grants permission to get an Anycast static IP list	Read	anycast-ip-list*		
GetCachePolicy	Grants permission to get the cache policy	Read	cache-policy*		
GetCachePolicyConfig	Grants permission to get the cache policy configuration	Read	cache-policy*		
GetCloudFrontOriginAccessIdentity	Grants permission to get the information about a CloudFront origin access identity	Read	origin-access-identity*		
GetCloudFrontOriginAccessIdentityConfig	Grants permission to get the configuration information about a Cloudfront origin access identity	Read	origin-access-identity*		
GetConnectionFunction	Grants permission to get a connection function's code	Read	connection-function*		
GetConnectionGroup	Grants permission to get information about a connection group	Read	connection-group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetConnectionGroupByRoutingEndpoint	Grants permission to get information about a connection group by the specified routing endpoint	Read	connection-group*		
GetContinuousDeploymentPolicy	Grants permission to get the continuous-deployment policy	Read	continuous-deployment-policy*		
GetContinuousDeploymentPolicyConfig	Grants permission to get the continuous-deployment policy configuration	Read	continuous-deployment-policy*		
GetDistribution	Grants permission to get the information about a web distribution	Read	distribution*		
GetDistributionConfig	Grants permission to get the configuration information about a distribution	Read	distribution*		
GetDistributionTenant	Grants permission to get information about a distribution tenant	Read	distribution-tenant*		
GetDistributionTenantByDomain	Grants permission to get information about a distribution tenant by the associated domain	Read	distribution-tenant*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetFieldLevelEncryption	Grants permission to get the field-level encryption configuration information	Read	field-level-encryption-config*		
GetFieldLevelEncryptionConfig	Grants permission to get the field-level encryption configuration information	Read	field-level-encryption-config*		
GetFieldLevelEncryptionProfile	Grants permission to get the field-level encryption configuration information	Read	field-level-encryption-profile*		
GetFieldLevelEncryptionProfileConfig	Grants permission to get the field-level encryption profile configuration information	Read	field-level-encryption-profile*		
GetFunction	Grants permission to get a CloudFront function's code	Read	function*		
GetInvalidation	Grants permission to get the information about an invalidation	Read	distribution*		
GetInvalidationForDistributionTenant	Grants permission to get information about an invalidation for a distribution tenant	Read	distribution-tenant*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetKeyGroup	Grants permission to get a key group	Read			
GetKeyGroupConfig	Grants permission to get a key group configuration	Read			
GetManagedCertificateDetails	Grants permission to get details about a CloudFront managed certificate	Read	distribution-tenant*		
GetMonitoringSubscription	Grants permission to get information about whether additional CloudWatch metrics are enabled for the specified CloudFront distribution	Read			
GetOriginAccessControl	Grants permission to get the origin access control	Read	origin-access-control*		
GetOriginAccessControlConfig	Grants permission to get the origin access control configuration	Read	origin-access-control*		
GetOriginRequestPolicy	Grants permission to get the origin request policy	Read	origin-request-policy*		
GetOriginRequestPolicyConfig	Grants permission to get the origin request policy configuration	Read	origin-request-policy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetPublicKey	Grants permission to get the public key information	Read			
GetPublicKeyConfig	Grants permission to get the public key configuration information	Read			
GetRealtimeLogConfig	Grants permission to get a real-time log configuration	Read	realtime-log-config*		
GetResourcePolicy	Grants permission to get the information about a resource's policy document	Read	vpcorigin		
GetResponseHeadersPolicy	Grants permission to get the response headers policy	Read	response-headers-policy*		
GetResponseHeadersPolicyConfig	Grants permission to get the response headers policy configuration	Read	response-headers-policy*		
GetSavingsPlan [permission only]	Grants permission to get a savings plan	Read			
GetStreamingDistribution	Grants permission to get the information about an RTMP distribution	Read	streaming-distribution*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetStreamingDistributionConfig	Grants permission to get the configuration information about a streaming distribution	Read	streaming-distribution*		
GetTrustStore	Grants permission to get information about a trust store	Read	trust-store*		
GetVpcOrigin	Grants permission to get the information about a VPC origin	Read	vpcorigin*		
ListAnycastIpLists	Grants permission to list your Anycast static IP lists	List			
ListCachePolicies	Grants permission to list all cache policies that have been created in CloudFront for this account	List			
ListCloudFrontOriginAccessIdentities	Grants permission to list your CloudFront origin access identities	List			
ListConflictingAliases	Grants permission to list all aliases that conflict with the given alias in CloudFront	List	distribution*		
ListConnectionFunctions	Grants permission to list the connection functions in your AWS account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListConnectionGroups	Grants permission to list the connection groups in your AWS account	List			
ListContinuousDeploymentPolicies	Grants permission to list all continuous-deployment policies in the account	List			
ListDistributionTenants	Grants permission to list the distribution tenants in your AWS account	List			
ListDistributionTenantsByCustomization	Grants permission to list the distribution tenants by the customization that you specify	List			
ListDistributions	Grants permission to list the distributions associated with your AWS account	List			
ListDistributionsByAnycastIpListId	Grants permission to list the distributions in your account that are associated with the specified AnycastIpListId	List			
ListDistributionsByCachePolicyId	Grants permission to list distribution IDs for distributions that have a cache behavior that's associated with the specified cache policy	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDistributionsByConnectionFunction	Grants permission to list summaries for distributions associated with the specified connection function	List	connection-function*		
ListDistributionsByConnectionMode	Grants permission to list the distributions by the specified connection mode	List			
ListDistributionsByKeyGroup	Grants permission to list distribution IDs for distributions that have a cache behavior that's associated with the specified key group	List			
ListDistributionsByLambdaFunction [permission only]	Grants permission to list the distributions associated a Lambda function	List			
ListDistributionsByOriginRequestPolicyId	Grants permission to list distribution IDs for distributions that have a cache behavior that's associated with the specified origin request policy	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDistributionsByRealtimeLogConfig	Grants permission to get a list of distributions that have a cache behavior that's associated with the specified real-time log configuration	List			
ListDistributionsByResponseHeadersPolicyId	Grants permission to list distribution IDs for distributions that have a cache behavior that's associated with the specified response headers policy	List			
ListDistributionsByTrustStore	Grants permission to list summaries for distributions associated with the specified trust store	List	trust-store*		
ListDistributionsByVpcOriginId	Grants permission to list IDs for distributions associated with the specified VPC origin	List			
ListDistributionsByWebACLId	Grants permission to list the distributions associated with your AWS account with given AWS WAF web ACL	List			
ListDomainConflicts	Grants permission to list domain conflicts for a specified domain	List	distribution		
			distribution-tenant		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListFieldLevelEncryptionConfigs	Grants permission to list all field-level encryption configurations that have been created in CloudFront for this account	List			
ListFieldLevelEncryptionProfiles	Grants permission to list all field-level encryption profiles that have been created in CloudFront for this account	List			
ListFunctions	Grants permission to get a list of CloudFront functions	List			
ListInvalidations	Grants permission to list your invalidation batches	List	distribution*		
ListInvalidationsForDistributionTenant	Grants permission to list the invalidations for a distribution tenant	List	distribution-tenant*		
ListKeyGroups	Grants permission to list all key groups that have been created in CloudFront for this account	List			
ListKeyValueStores	Grants permission to get a list of CloudFront KeyValueStores	List			
ListOriginAccessControls	Grants permission to list all origin access controls in the account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListOriginRequestPolicies	Grants permission to list all origin request policies that have been created in CloudFront for this account	List			
ListPublicKeys	Grants permission to list all public keys that have been added to CloudFront for this account	List			
ListRateCards [permission only]	Grants permission to list CloudFront rate cards for the account	List			
ListRealtimeLogConfigs	Grants permission to get a list of real-time log configurations	List			
ListResponseHeadersPolicies	Grants permission to list all response headers policies that have been created in CloudFront for this account	List			
ListSavingsPlans [permission only]	Grants permission to list savings plans in the account	List			
ListStreamingDistributions	Grants permission to list your RTMP distributions	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTagsForResource	Grants permission to list tags for a CloudFront resource	Read	anycast-ip-list		
			connection-function		
			connection-group		
			distribution		
			distribution-tenant		
			trust-store

UpdateVpcOrigin	Grants permission to update a VPC origin	Write	vpcorigin*		
VerifyDnsConfiguration	Grants permission to verify the DNS configuration for a specified domain	Read	distribution-tenant		

Resource types defined by Amazon CloudFront

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
distribution	`arn:${Partition}:cloudfront::${Account}:distribution/${DistributionId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
streaming-distribution	arn:${Partition}:cloudfront::${Account}:streaming-distribution/${DistributionId}	aws:ResourceTag/${TagKey}
origin-access-identity	arn:${Partition}:cloudfront::${Account}:origin-access-identity/${Id}	
field-level-encryption-config	arn:${Partition}:cloudfront::${Account}:field-level-encryption-config/${Id}	
field-level-encryption-profile	arn:${Partition}:cloudfront::${Account}:field-level-encryption-profile/${Id}	
cache-policy	arn:${Partition}:cloudfront::${Account}:cache-policy/${Id}	
origin-request-policy	arn:${Partition}:cloudfront::${Account}:origin-request-policy/${Id}	
realtime-log-config	arn:${Partition}:cloudfront::${Account}:realtime-log-config/${Name}	
function	arn:${Partition}:cloudfront::${Account}:function/${Name}	
key-value-store	arn:${Partition}:cloudfront::${Account}:key-value-store/${Name}	
response-headers-policy	arn:${Partition}:cloudfront::${Account}:response-headers-policy/${Id}	
origin-access-control	arn:${Partition}:cloudfront::${Account}:origin-access-control/${Id}	

Resource types	ARN	Condition keys
continuous-deployment-policy	arn:${Partition}:cloudfront::${Account}:continuous-deployment-policy/${Id}	
anycast-ip-list	arn:${Partition}:cloudfront::${Account}:anycast-ip-list/${Id}	aws:ResourceTag/${TagKey}
vpcorigin	arn:${Partition}:cloudfront::${Account}:vpcorigin/${Id}	aws:ResourceTag/${TagKey}
distribution-tenant	arn:${Partition}:cloudfront::${Account}:distribution-tenant/${Id}	aws:ResourceTag/${TagKey}
connection-group	arn:${Partition}:cloudfront::${Account}:connection-group/${Id}	aws:ResourceTag/${TagKey}
trust-store	arn:${Partition}:cloudfront::${Account}:trust-store/${Id}	aws:ResourceTag/${TagKey}
connection-function	arn:${Partition}:cloudfront::${Account}:connection-function/${Id}	aws:ResourceTag/${TagKey}

Condition keys for Amazon CloudFront

Amazon CloudFront defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon CloudFront KeyValueStore

Amazon CloudFront KeyValueStore (service prefix: `cloudfront-keyvaluestore`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Condition keys for Amazon CloudFront KeyValueStore

Actions defined by Amazon CloudFront KeyValueStore

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteKey	Grants permission to delete the key value pair specified by the key	Write	key-value-store*		
DescribeKeyValueStore	Grants permission to return metadata information about Key Value Store	Read	key-value-store*		
GetKey	Grants permission to return a key value pair	Read	key-value-store*		
ListKeys	Grants permission to returns a list of key value pairs	List	key-value-store*		
PutKey	Grants permission to create a new key value pair or replace the value of an existing key	Write	key-value-store*		
UpdateKeys	Grants permission to put or delete multiple key value pairs in a single, all-or-nothing operation	Write	key-value-store*		

Resource types defined by Amazon CloudFront KeyValueStore

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
key-value-store	arn:${Partition}:cloudfront::${Account}:key-value-store/${ResourceId}	

Condition keys for Amazon CloudFront KeyValueStore

CloudFront KeyValueStore has no service-specific context keys that can be used in the Condition element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS CloudHSM

AWS CloudHSM (service prefix: cloudhsm) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS CloudHSM

You can specify the following actions in the Action element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CopyBackupToRegion	Grants permission to create a copy of a backup in the specified region	Write	backup*		cloudhsm:CopyBackupToRegion cloudhsm:TagResource cloudhsm:UntagResource
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateCluster	Grants permission to create a new AWS CloudHSM cluster	Write	backup		cloudhsm:TagResource ec2:AuthorizeSecurityGroupEgress ec2:AuthorizeSecurityGroupIngress

			cluster		
				aws:TagKeys	

Resource types defined by AWS CloudHSM

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
backup	`arn:${Partition}:cloudhsm:${Region}:${Account}:backup/${CloudHsmBackupInstanceName}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
cluster	arn:${Partition}:cloudhsm:${Region}:${Account}:cluster/${CloudHsmClusterInstanceName}	aws:ResourceTag/${TagKey}

Condition keys for AWS CloudHSM

AWS CloudHSM defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon CloudSearch

Amazon CloudSearch (service prefix: cloudsearch) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon CloudSearch

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddTags	Attaches resource tags to an Amazon CloudSearch domain	Tagging	domain*		
BuildSuggesters	Indexes the search suggestions	Write	domain*		
CreateDomain	Creates a new search domain	Write	domain*		
DefineAnalysisScheme	Configures an analysis scheme that can be applied to a text or text-array field to define language-specific text processing options	Write	domain*		
DefineExpression	Configures an Expression for the search domain	Write	domain*		
DefineIndexField	Configures an IndexField for the search domain	Write	domain*		
DefineSuggester	Configures a suggester for a domain	Write	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAnalysisScheme	Deletes an analysis scheme	Write	domain*		
DeleteDomain	Permanently deletes a search domain and all of its data	Write	domain*		
DeleteExpression	Removes an Expression from the search domain	Write	domain*		
DeleteIndexField	Removes an IndexField from the search domain	Write	domain*		
DeleteSuggester	Deletes a suggester	Write	domain*		
DescribeAnalysisSchemes	Gets the analysis schemes configured for a domain	Read	domain*		
DescribeAvailabilityOptions	Gets the availability options configured for a domain	Read	domain*		
DescribeDomainEndpointOptions	Gets the domain endpoint options configured for a domain	Read	domain*		
DescribeDomains	Gets information about the search domains owned by this account	List	domain*

DescribeSuggesters	Gets the suggesters configured for a domain	Read	domain*		
IndexDocuments	Tells the search domain to start indexing its documents using the latest indexing options	Write	domain*		
ListDomainNames	Lists all search domains owned by an account	List	domain*		
ListTags	Displays all of the resource tags for an Amazon CloudSearch domain	Read	domain*		
RemoveTags	Removes the specified resource tags from an Amazon ES domain	Tagging	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAvailabilityOptions	Configures the availability options for a domain	Write	domain*		
UpdateDomainEndpointOptions	Configures the domain endpoint options for a domain	Write	domain*		
UpdateScalingParameters	Configures scaling parameters for a domain	Write	domain*		
UpdateServiceAccessPolicies	Configures the access rules that control access to the domain's document and search endpoints	Permissions management	domain*		
document [permission only]	Allows access to the document service operations	Write	domain		
search [permission only]	Allows access to the search operations	Read	domain		
suggest [permission only]	Allows access to the suggest operations	Read	domain		

Resource types defined by Amazon CloudSearch

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types

that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

> **Note**
>
> For information about using Amazon CloudSearch resource ARNs in an IAM policy, see Amazon CloudSearch ARNs in the *Amazon CloudSearch Developer Guide*.

Resource types	ARN	Condition keys
domain	`arn:${Partition}:cloudsearch:${Region}:${Account}:domain/${DomainName}`	

Condition keys for Amazon CloudSearch

CloudSearch has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS CloudShell

AWS CloudShell (service prefix: `cloudshell`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- Condition keys for AWS CloudShell

Actions defined by AWS CloudShell

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ApproveCommand [permission only]	Grants permission to approve a command sent by another AWS service	Read	Environment*		
CreateEnvironment [permission only]	Grants permissions to create a CloudShell environment	Write		cloudshell:SecurityGroupIds cloudshell:SubnetIds cloudshell:VpcIds	
CreateSession [permission only]	Grants permissions to connect to a CloudShell environment from the AWS Management Console	Write	Environment*		
DeleteEnvironment	Grants permission to delete a CloudShell environment	Write	Environment*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
[permission only]					
DescribeEnvironments [permission only]	Grants permission to return descriptions of existing user's environments	List			
GetEnvironmentStatus [permission only]	Grants permission to read a CloudShell environment status	Read	Environment*		
GetFileDownloadUrls [permission only]	Grants permissions to download files from a CloudShell environment	Write	Environment*		
GetFileUploadUrls [permission only]	Grants permissions to upload files to a CloudShell environment	Write	Environment*		
PutCredentials [permission only]	Grants permissions to forward console credentials to the environment	Write	Environment*		
StartEnvironment [permission only]	Grants permission to start a stopped CloudShell environment	Write	Environment*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StopEnvironment [permission only]	Grants permission to stop a running CloudShell environment	Write	Environment*		

Resource types defined by AWS CloudShell

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Environment	`arn:${Partition}:cloudshell:${Region}:${Account}:environment/${EnvironmentId}`	

Condition keys for AWS CloudShell

AWS CloudShell defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
cloudshell:SecurityGroupIds	Filters access by security group ids. Available during CreateEnvironment operation	ArrayOfString
cloudshell:SubnetIds	Filters access by subnet ids. Available during CreateEnvironment operation	ArrayOfString
cloudshell:VpcIds	Filters access by vpc ids. Available during CreateEnvironment operation	ArrayOfString

Actions, resources, and condition keys for AWS CloudTrail

AWS CloudTrail (service prefix: `cloudtrail`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS CloudTrail

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddTags	Grants permission to add one or more tags to a trail, event data store, channel or dashboard, up to a limit of 50	Tagging	channel		
			dashboard		
			eventdatastore		
			trail		
				aws:RequestTag/${TagKey} aws:TagKeys	
CancelQuery	Grants permission to cancel a running query	Write	eventdatastore*		
CreateChannel	Grants permission to create a channel	Write	channel*		cloudtrail:AddTags
			eventdatastore*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateDashboard	Grants permission to create a dashboard	Write	dashboard *		cloudtrail:AddTags cloudtrail:StartDashboardRefresh cloudtrail:StartQuery
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateEventDataStore	Grants permission to create an event data store	Write	eventdatastore*		cloudtrail:AddTags iam:CreateServiceLinkedRole iam:GetRole kms:Decrypt kms:GenerateDataKey organizations:ListAWSServiceAccessForOrganization
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateServiceLinkedChannel [permission only]	Grants permission to create a service-linked channel that specifies the settings for delivery of log data to an AWS service	Write	channel*		
CreateTrail	Grants permission to create a trail that specifies the settings for delivery of log data to an Amazon S3 bucket	Write	trail*		cloudtrail:AddTags iam:CreateServiceLinkedRole iam:GetRole organizations:ListAWSServiceAccessForOrganization
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteChannel	Grants permission to delete a channel	Write	channel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteDashboard	Grants permission to delete a dashboard	Write	dashboard*		
DeleteEventDataStore	Grants permission to delete an event data store	Write	eventdatastore*		
DeleteResourcePolicy	Grants permission to delete a resource policy from the provided resource	Write	channel		
			dashboard		
			eventdatastore		
DeleteServiceLinkedChannel [permission only]	Grants permission to delete a service-linked channel	Write	channel*		
DeleteTrail	Grants permission to delete a trail	Write	trail*		
DeregisterOrganizationDelegatedAdmin	Grants permission to deregister an AWS Organizations member account as a delegated administrator	Write			organizations:DeregisterDelegatedAdministrator organizations:ListAWSServiceAccessForOrganization

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeQuery	Grants permission to list details for the query	Read	eventdatastore*		
DescribeTrails	Grants permission to list settings for the trails associated with the current region for your account	Read			
DisableFederation	Grants permission to disable federation of event data store data by using the AWS Glue Data Catalog	Write	eventdatastore*		glue:DeleteDatabase glue:DeleteTable glue:PassConnection lakeformation:DeregisterResource lakeformation:RegisterResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableFederation	Grants permission to enable federation of event data store data by using the AWS Glue Data Catalog	Write	eventdatastore*		glue:CreateDatabase glue:CreateTable iam:GetRole iam:PassRole lakeformation:DeregisterResource lakeformation:RegisterResource
GenerateQuery	Grants permission to generate a query for a specified event data store using the CloudTrail Lake query generator	Write	eventdatastore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GenerateQueryResultsSummary [permission only]	Grants permission to generate a results summary for specified queries using the CloudTrail natural language generator	Read	eventdatastore*		cloudtrail:GetQueryResults kms:Decrypt kms:GenerateDataKey
GetChannel	Grants permission to return information about a specific channel	Read	channel*		
GetDashboard	Grants permission to list settings for the dashboard	Read	dashboard*		
GetEventConfiguration	Grants permission to list event configurations that are configured for a trail or an event data store	Read	eventdatastore		
			trail		
GetEventDataStore	Grants permission to list settings for the event data store	Read	eventdatastore*		
GetEventDataStoreData	Grants permission to get data from an event data store by using the AWS Glue Data Catalog	Read	eventdatastore*		kms:Decrypt kms:GenerateDataKey

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetEventSelectors	Grants permission to list settings for event selectors configured for a trail	Read	trail*		
GetImport	Grants permission to return information about a specific import	Read			
GetInsightSelectors	Grants permission to list CloudTrail Insights selectors that are configured for a trail or event data store	Read	eventdatastore		
			trail		
GetQueryResults	Grants permission to fetch results of a complete query	Read	eventdatastore*		kms:Decrypt kms:GenerateDataKey
GetResourcePolicy	Grants permission to get the resource policy attached to the provided resource	Read	channel		
			dashboard		
			eventdatastore		
GetServiceLinkedChannel [permission only]	Grants permission to list settings for the service-linked channel	Read	channel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTrail	Grants permission to list settings for the trail	Read	trail*		
GetTrailStatus	Grants permission to retrieve a JSON-formatted list of information about the specified trail	Read	trail*		
ListChannels	Grants permission to list the channels in the current account, and their source names	List			
ListDashboards	Grants permission to list dashboards associated with the current region for your account	List			
ListEventDataStores	Grants permission to list event data stores associated with the current region for your account	List			
ListImportFailures	Grants permission to return a list of failures for the specified import	Read			
ListImports	Grants permission to return information on all imports, or a select set of imports by ImportStatus or Destination	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListInsightsData	Grants permission to retrieve data captured by CloudTrail Insights	List	trail*		
ListPublicKeys	Grants permission to list the public keys whose private keys were used to sign trail digest files within a specified time range	Read			
ListQueries	Grants permission to list queries associated with an event data store	List	eventdatastore*		
ListServiceLinkedChannels [permission only]	Grants permission to list service-linked channels associated with the current region for a specified account	List			
ListTags	Grants permission to list the tags for trails, event data stores, channels or dashboards in the current region	Read	channel		
			dashboard		
			eventdatastore		
			trail		
ListTrails	Grants permission to list trails associated with the current region for your account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
LookupEvents	Grants permission to look up and retrieve metric data for API activity events captured by CloudTrail that create, update, or delete resources in your account	Read			
PutEventConfiguration	Grants permission to create and update event configurations for a trail or an event data store	Write	eventdatastore		iam:CreateServiceLinkedRole iam:GetRole
			trail		
PutEventSelectors	Grants permission to create and update event selectors for a trail	Write	trail*		
PutInsightSelectors	Grants permission to create and update CloudTrail Insights selectors for a trail or event data store	Write	eventdatastore		
			trail		
PutResourcePolicy	Grants permission to attach a resource policy to the provided resource	Write	channel		
			dashboard		
			eventdatastore		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RegisterOrganizationDelegatedAdmin	Grants permission to register an AWS Organizations member account as a delegated administrator	Write			iam:CreateServiceLinkedRole iam:GetRole organizations:ListAWSServiceAccessForOrganization organizations:RegisterDelegatedAdministrator
RemoveTags	Grants permission to remove tags from a trail, event data store, channel or dashboard	Tagging	channel		
			dashboard		
			eventdatastore		
			trail		
				aws:TagKeys	
RestoreEventDataStore	Grants permission to restore an event data store	Write	eventdatastore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SearchSampleQueries	Grants permission to perform semantic search for CloudTrail Lake sample queries	Read			
StartDashboardRefresh	Grants permission to start a refresh on the specified dashboard	Write	dashboard*		cloudtrail:StartQuery
StartEventDataStoreIngestion	Grants permission to start ingestion on an event data store	Write	eventdatastore*		
StartImport	Grants permission to start an import of logged trail events from a source S3 bucket to a destination event data store	Write			
StartLogging	Grants permission to start the recording of AWS API calls and log file delivery for a trail	Write	trail*		
StartQuery	Grants permission to start a new query on a specified event data store	Write	eventdatastore*		kms:Decrypt kms:GenerateDataKey
StopEventDataStoreIngestion	Grants permission to stop ingestion on an event data store	Write	eventdatastore*		
StopImport	Grants permission to stop a specified import	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StopLogging	Grants permission to stop the recording of AWS API calls and log file delivery for a trail	Write	trail*		
UpdateChannel	Grants permission to update a channel	Write	channel*		
UpdateDashboard	Grants permission to update a dashboard	Write	dashboard*		cloudtrail:StartDashboardRefresh cloudtrail:StartQuery

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateEventDataStore	Grants permission to update an event data store	Write	eventdatastore*		iam:CreateServiceLinkedRole iam:GetRole kms:Decrypt kms:GenerateDataKey organizations:ListAWSServiceAccessForOrganization
UpdateServiceLinkedChannel [permission only]	Grants permission to update the service-linked channel settings for delivery of log data to an AWS service	Write	channel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateTrail	Grants permission to update the settings that specify delivery of log files	Write	trail*		iam:CreateServiceLinkedRole iam:GetRole organizations:ListAWSServiceAccessForOrganization

Resource types defined by AWS CloudTrail

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

> **Note**
>
> For policies that control access to CloudTrail actions, the Resource element is always set to "*". For information about using resource ARNs in an IAM policy, see How AWS CloudTrail works with IAM in the *AWS CloudTrail User Guide*.

Resource types	ARN	Condition keys
trail	arn:${Partition}:cloudtrail:${Region}:${Account}:trail/${TrailName}	aws:ResourceTag/${TagKey}
eventdatastore	arn:${Partition}:cloudtrail:${Region}:${Account}:eventdatastore/${EventDataStoreId}	aws:ResourceTag/${TagKey}
channel	arn:${Partition}:cloudtrail:${Region}:${Account}:channel/${ChannelId}	aws:ResourceTag/${TagKey}
dashboard	arn:${Partition}:cloudtrail:${Region}:${Account}:dashboard/${DashboardName}	aws:ResourceTag/${TagKey}

Condition keys for AWS CloudTrail

AWS CloudTrail defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags attached to the resource	String
aws:TagKeys	Filters access by the tag keys in a request	ArrayOfString

Actions, resources, and condition keys for AWS CloudTrail Data

AWS CloudTrail Data (service prefix: `cloudtrail-data`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS CloudTrail Data

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutAuditEvents	Grants permission to ingest your application events into CloudTrail Lake	Write	channel*		

Resource types defined by AWS CloudTrail Data

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types

that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

> **Note**
>
> For policies that control access to CloudTrail actions, the Resource element is always set to "*". For information about using resource ARNs in an IAM policy, see How AWS CloudTrail works with IAM in the *AWS CloudTrail User Guide*.

Resource types	ARN	Condition keys
channel	`arn:${Partition}:cloudtrail:${Region}:${Account}:channel/${ChannelId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS CloudTrail Data

AWS CloudTrail Data defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag's key and value in a request	String
aws:ResourceTag/${TagKey}	Filters actions based on the presence of tag key-value pairs in the request	String
aws:TagKeys	Filters access by the tag keys in a request	ArrayOfString

Actions, resources, and condition keys for Amazon CloudWatch

Amazon CloudWatch (service prefix: `cloudwatch`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon CloudWatch

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetServiceLevelIndicatorReport	Grants permission to batch get service level indicator report	Read			
BatchGetServiceLevelObjectiveBudgetReport	Grants permission to batch retrieve a service level objective budget report	Read	slo*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateServiceLevelObjective	Grants permission to create a service level objective	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAlarmMuteRule	Grants permission to delete an alarm mute rule	Write	alarm-mute-rule*		
DeleteAlarms	Grants permission to delete a collection of alarms	Write	alarm*		
DeleteAnomalyDetector	Grants permission to delete the specified anomaly detection model from your account	Write			
DeleteDashboards	Grants permission to delete all CloudWatch dashboards that you specify	Write	dashboard*		
DeleteInsightRules	Grants permission to delete a collection of insight rules	Write	insight-rule*		
DeleteMetricStream	Grants permission to delete the CloudWatch metric stream that you specify	Write	metric-stream*		
DeleteServiceLevelObjective	Grants permission to delete a service level objective	Write	slo*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeAlarmHistory	Grants permission to retrieve the history for the specified alarm	Read	alarm*		
DescribeAlarms	Grants permission to describe all alarms, currently owned by the user's account	Read	alarm*		
DescribeAlarmsForMetric	Grants permission to describe all alarms configured on the specified metric, currently owned by the user's account	Read			
DescribeAnomalyDetectors	Grants permission to list the anomaly detection models that you have created in your account	Read			
DescribeInsightRules	Grants permission to describe all insight rules, currently owned by the user's account	Read			
DisableAlarmActions	Grants permission to disable actions for a collection of alarms	Write	alarm*		
DisableInsightRules	Grants permission to disable a collection of insight rules	Write	insight-rule*		
EnableAlarmActions	Grants permission to enable actions for a collection of alarms	Write	alarm*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableInsightRules	Grants permission to enable a collection of insight rules	Write	insight-rule*		
EnableTopologyDiscovery	Grants permission to enable a CloudWatch topology discovery	Write			
GenerateQuery	Grants permission to generate a Metrics Insights or Logs Insights query string from a natural language prompt	Read			
GenerateQueryResultsSummary	Grants permission to generate a summary of CloudWatch LogInsights query results in natural language using generative AI	Read			
GetAlarmMuteRule	Grants permission to get an alarm mute rule	Read	alarm-mute-rule*		
GetDashboard	Grants permission to display the details of the CloudWatch dashboard you specify	Read	dashboard*		
GetInsightRuleReport	Grants permission to return the top-N report of unique contributors over a time range for a given insight rule	Read	insight-rule*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetMetricData	Grants permission to retrieve batch amounts of CloudWatch metric data and perform metric math on retrieved data	Read			
GetMetricStatistics	Grants permission to retrieve statistics for the specified metric	Read			
GetMetricStream	Grants permission to return the details of a CloudWatch metric stream	Read	metric-stream*		
GetMetricWidgetImage	Grants permission to retrieve snapshots of metric widgets	Read			
GetService	Grants permission to retrieve information about a service	Read	service*		
GetServiceData [permission only]	Grants permission to retrieve service data	Read	service*		
GetServiceLevelObjective	Grants permission to retrieve information about service level objective	Read	slo*		
GetTopologyDiscoveryStatus [permission only]	Grants permission to retrieve a CloudWatch topology discovery status	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTopologyMap	Grants permission to retrieve a CloudWatch topology map	Read			
Link [permission only]	Grants permission to share CloudWatch resources with a monitoring account	Write			
ListAlarmMuteRules	Grants permission to retrieve a list of alarm mute rules owned by the user's account	List	alarm-mute-rule*		
ListDashboards	Grants permission to return a list of all CloudWatch dashboards in your account	List			
ListEntitiesForMetric [permission only]	Grants permission to retrieve all the entities that are emitting a given metric	List			
ListManagedInsightRules	Grants permission to list available managed Insight Rules for a given Resource ARN	Read		aws:RequestTag/${TagKey} aws:TagKeys cloudwatch:requestManagedResourceARNs	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListMetricStreams	Grants permission to return a list of all CloudWatch metric streams in your account	List			
ListMetrics	Grants permission to retrieve a list of valid metrics stored for the AWS account owner	List

Resource types defined by Amazon CloudWatch

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
alarm	`arn:${Partition}:cloudwatch:${Region}:${Account}:alarm:${AlarmName}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
alarm-mute-rule	arn:${Partition}:cloudwatch:${Region}:${Account}:alarm-mute-rule:${AlarmMuteRuleName}	aws:ResourceTag/${TagKey}
dashboard	arn:${Partition}:cloudwatch::${Account}:dashboard/${DashboardName}	
insight-rule	arn:${Partition}:cloudwatch:${Region}:${Account}:insight-rule/${InsightRuleName}	aws:ResourceTag/${TagKey}
metric-stream	arn:${Partition}:cloudwatch:${Region}:${Account}:metric-stream/${MetricStreamName}	aws:ResourceTag/${TagKey}
slo	arn:${Partition}:cloudwatch:${Region}:${Account}:slo/${SloName}	aws:ResourceTag/${TagKey}
service	arn:${Partition}:cloudwatch:${Region}:${Account}:service/${ServiceName}-${UniqueAttributesHex}	aws:ResourceTag/${TagKey}

Condition keys for Amazon CloudWatch

Amazon CloudWatch defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters actions based on the allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters actions based on tag-value associated with the resource	String
aws:TagKeys	Filters actions based on the presence of mandatory tags in the request	ArrayOfString
cloudwatch:AlarmActions	Filters actions based on defined alarm actions	ArrayOfString
cloudwatch:namespace	Filters actions based on the presence of optional namespace values	String
cloudwatch:requestInsightRuleLogGroups	Filters actions based on the Log Groups specified in an Insight Rule	ArrayOfString
cloudwatch:requestManagedResourceARNs	Filters access by the Resource ARNs specified in a managed Insight Rule	ArrayOfARN

Actions, resources, and condition keys for Amazon CloudWatch Application Insights

Amazon CloudWatch Application Insights (service prefix: `applicationinsights`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon CloudWatch Application Insights

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddWorkload	Grants permission to add a workload	Write			
CreateApplication	Grants permission to create an application from a resource group	Write			
CreateComponent	Grants permission to create a component from a group of resources	Write			
CreateLogPattern	Grants permission to create log a pattern	Write			
DeleteApplication	Grants permission to delete an application	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteComponent	Grants permission to delete a component	Write			
DeleteLogPattern	Grants permission to delete a log pattern	Write			
DescribeApplication	Grants permission to describe an application	Read			
DescribeComponent	Grants permission to describe a component	Read			
DescribeComponentConfiguration	Grants permission to describe a component's configuration	Read			
DescribeComponentConfigurationRecommendation	Grants permission to describe the recommended application component configuration	Read			
DescribeLogPattern	Grants permission to describe a log pattern	Read			
DescribeObservation	Grants permission to describe an observation	Read			
DescribeProblem	Grants permission to describe a problem	Read			
DescribeProblemObservations	Grants permission to describe the observation in a problem	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeWorkload	Grants permission to describe a workload	Read			
Link [permission only]	Grants permission to share Application Insights resources with a monitoring account	Write			
ListApplications	Grants permission to list all applications	List			
ListComponents	Grants permission to list an application's components	List			
ListConfigurationHistory	Grants permission to list configuration history	List			
ListLogPatternSets	Grants permission to list log pattern sets for an application	List			
ListLogPatterns	Grants permission to list log patterns	List			
ListProblems	Grants permission to list the problems in an application	List			
ListTagsForResource	Grants permission to list tags for the resource	Read			
ListWorkloads	Grants permission to list workloads	List			
RemoveWorkload	Grants permission to remove a workload	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to tag a resource	Tagging		aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag a resource	Tagging		aws:TagKeys	
UpdateApplication	Grants permission to update an application	Write			
UpdateComponent	Grants permission to update a component	Write			
UpdateComponentConfiguration	Grants permission to update a component's configuration	Write			
UpdateLogPattern	Grants permission to update a log pattern	Write			
UpdateProblem	Grants permission to update a problem	Write			
UpdateWorkload	Grants permission to update a workload	Write			

Resource types defined by Amazon CloudWatch Application Insights

Amazon CloudWatch Application Insights does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon CloudWatch Application Insights, specify `"Resource": "*"` in your policy.

Condition keys for Amazon CloudWatch Application Insights

Amazon CloudWatch Application Insights defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon CloudWatch Application Signals

Amazon CloudWatch Application Signals (service prefix: `application-signals`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon CloudWatch Application Signals

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetServiceLevelObjectiveBudgetReport	Grants permission to batch retrieve a service level objective budget report	Read	slo*		
BatchUpdateExclusionWindows	Grants permission to add or remove exclusion windows from Amazon CloudWatch SLOs	Write	slo*		
CreateServiceLevelObjective	Grants permission to create a service level objective	Write		aws:RequestTag/${TagKey}

Resource types defined by Amazon CloudWatch Internet Monitor

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
HealthEvent	`arn:${Partition}:internetmonitor:${Region}:${Account}:monitor/${MonitorName}/health-event/${EventId}`	aws:ResourceTag/${TagKey}
Monitor	`arn:${Partition}:internetmonitor:${Region}:${Account}:monitor/${MonitorName}`	aws:ResourceTag/${TagKey}
InternetEvent	`arn:${Partition}:internetmonitor::${Account}:internet-event/${InternetEventId}`	

Condition keys for Amazon CloudWatch Internet Monitor

Amazon CloudWatch Internet Monitor defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon CloudWatch Logs

Amazon CloudWatch Logs (service prefix: `logs`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon CloudWatch Logs

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateKmsKey	Grants permission to associate the specified AWS Key Management Service (AWS KMS) customer master key (CMK) with the specified log group	Write	log-group*		
AssociateSourceToS3TableIntegration	Grants permission to associate a log source to an S3 Tables integration	Write			
CallWithBearerToken [permission only]	Grants permission to authenticate requests using bearer token	Write			
CancelExportTask	Grants permission to cancel an export task if it is in PENDING or RUNNING state	Write			
CancelImportTask	Grants permission to cancel an import from CloudTrail Lake to CloudWatch	Write			
CreateDelivery	Grants permission to create a delivery connecting a delivery	Write	delivery*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	source to a delivery destination		delivery-destination*		
			delivery-source*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateExportTask	Grants permission to create an ExportTask which allows you to efficiently export data from a Log Group to your Amazon S3 bucket	Write	log-group*		
CreateImportTask	Grants permission to start an asynchronous process to import data from a CloudTrail Lake event data store into a managed log group in CloudWatch	Write			
CreateLogAnomalyDetector	Grants permission to create a log anomaly detector	Write	log-group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateLogDelivery [permission only]	Grants permission to create the log delivery	Write			
CreateLogGroup	Grants permission to create a new log group with the specified name	Write	log-group*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateLogStream	Grants permission to create a new log stream with the specified name	Write	log-stream*		
CreateScheduledQuery	Grants permission to create a scheduled query	Write	scheduled-query*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
DeleteAccountPolicy	Grants permission to delete an account policy	Write			
DeleteDataProtectionPolicy	Grants permission to delete a data protection policy attached to a log group	Write	log-group*		
DeleteDelivery	Grants permission to delete a delivery	Write	delivery*		
DeleteDeliveryDestination	Grants permission to delete a delivery destination after all associated deliveries are deleted	Write	delivery-destination*		
DeleteDeliveryDestinationPolicy	Grants permission to delete a delivery destination policy associated with a delivery destination	Write	delivery-destination*		
DeleteDeliverySource	Grants permission to delete a delivery source after all associated deliveries are deleted	Write	delivery-destination*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteDestination	Grants permission to delete the destination with the specified name	Write	destination*		
DeleteIndexPolicy	Grants permission to delete an index policy attached to a log group	Write			
DeleteIntegration	Grants permission to delete the integration	Write			
DeleteLogAnomalyDetector	Grants permission to delete a log anomaly detector	Write	anomaly-detector*		
DeleteLogDelivery [permission only]	Grants permission to delete the log delivery information for specified log delivery	Write			
DeleteLogGroup	Grants permission to delete the log group with the specified name	Write	log-group*		
DeleteLogStream	Grants permission to delete a log stream	Write	log-stream*		
DeleteMetricFilter	Grants permission to delete a metric filter associated with the specified log group	Write	log-group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeletePipelineRule [permission only]	Grants permission to delete telemetry pipeline	Write			
DeleteQueryDefinition	Grants permission to delete a saved CloudWatch Logs Insights query definition	Write			
DeleteResourcePolicy	Grants permission to delete a resource policy from this account	Permissions management			
DeleteRetentionPolicy	Grants permission to delete the retention policy of the specified log group	Write	log-group*		
DeleteScheduledQuery	Grants permission to delete a scheduled query	Write	scheduled-query*		
DeleteSubscriptionFilter	Grants permission to delete a subscription filter associated with the specified log group	Write	log-group*		
DeleteTransformer	Grants permission to delete a transformer associated with the specified log group	Write	log-group*		
DescribeAccountPolicies	Grants permission to retrieve account policies	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeConfigurationTemplates	Grants permission to retrieve a list of configuration templates of available log types	List			
DescribeDeliveries	Grants permission to retrieve a list of deliveries an account	List			
DescribeDeliveryDestinations	Grants permission to retrieve a list of delivery destinations an account	List			
DescribeDeliverySources	Grants permission to retrieve a list of delivery sources in an account	List			
DescribeDestinations	Grants permission to return all the destinations that are associated with the AWS account making the request	List			
DescribeExportTasks	Grants permission to return all the export tasks that are associated with the AWS account making the request	List			
DescribeFieldIndexes	Grants permission to return all the indexing attributes that are attached with the log groups	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeImportTaskBatches	Grants permission to return detailed information about the individual batches within an import task, including status and any error	List			
DescribeImportTasks	Grants permission to return all the import tasks associated with the AWS account making the request	List			
DescribeIndexPolicies	Grants permission to return all the index policies that are attached with the log groups	List			
DescribeLogGroups	Grants permission to return all the log groups that are associated with the AWS account making the request	List			
DescribeLogStreams	Grants permission to return all the log streams that are associated with the specified log group	List	log-group*		
DescribeMetricFilters	Grants permission to return all the metrics filters associated with the specified log group	List	log-group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeQueries	Grants permission to return a list of CloudWatch Logs Insights queries that are scheduled, executing, or have been executed recently in this account	List			
DescribeQueryDefinitions	Grants permission to return a paginated list of your saved CloudWatch Logs Insights query definitions	List			
DescribeResourcePolicies	Grants permission to return all the resource policies in this account	List			
DescribeSubscriptionFilters	Grants permission to return all the subscription filters associated with the specified log group	List	log-group*		
DisassociateKmsKey	Grants permission to disassociate the associated AWS Key Management Service (AWS KMS) customer master key (CMK) from the specified log group	Write	log-group*		
DisassociateSourceFromS3TableIntegration	Grants permission to disassociate a log source from an S3 Tables integration	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
FilterLogEvents	Grants permission to retrieve log events, optionally filtered by a filter pattern from the specified log group	Read	log-group*		
GetDataProtectionPolicy	Grants permission to retrieve a data protection policy attached to a log group	Read	log-group*		
GetDelivery	Grants permission to retrieve a single delivery	Read	delivery*		
GetDeliveryDestination	Grants permission to retrieve a single delivery destination	Read	delivery-destination*		
GetDeliveryDestinationPolicy	Grants permission to retrieve a delivery destination policy attached to a delivery destination	Read	delivery-destination*		
GetDeliverySource	Grants permission to retrieve a single delivery source	Read	delivery-source*		
GetIntegration	Grants permission to retrieve a single integration	Read			
GetLogAnomalyDetector	Grants permission to get a log anomaly detector	Read	anomaly-detector*		
GetLogDelivery [permission only]	Grants permission to get the log delivery information for specified log delivery	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetLogEvents	Grants permission to retrieve log events from the specified log stream	Read	log-stream*		
GetLogFields	Grants permission to retrieve a list of log fields for a data source	Read			
GetLogGroupFields	Grants permission to return a list of the fields that are included in log events in the specified log group, along with the percentage of log events that contain each field	Read	log-group*		
GetLogRecord	Grants permission to retrieve all the fields and values of a single log event	Read	log-group*		
GetQueryResults	Grants permission to return the results from the specified query	Read	log-group*		
GetScheduledQuery	Grants permission to retrieve information about a specified scheduled query	Read	scheduled-query*		
GetScheduledQueryHistory	Grants permission to return the execution history for a specified scheduled query	Read	scheduled-query*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTransformer	Grants permission to return transformer associated with the specified log group	Read	log-group*		
IntegrateWithS3Table [permission only]	Grants permission to deliver log events to S3 Tables	Write	log-group*		
Link [permission only]	Grants permission to share CloudWatch resources with a monitoring account	Write			
ListAggregateLogGroupSummaries	Grants permission to return an aggregate summary of all log groups in the region grouped by specified data-source characteristics	List			
ListAnomalies	Grants permission to list all anomalies detected in the AWS account making the request	List	anomaly-detector		
ListEntitiesForLogGroup [permission only]	Grants permission to retrieve all the entities that are associated with log group	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListIntegrations	Grants permission to list all integrations associated with the AWS account making the request	List			
ListLogAnomalyDetectors	Grants permission to return all the anomaly detectors that are associated with the AWS account making the request	List	anomaly-detector		
ListLogDeliveries [permission only]	Grants permission to list all the log deliveries for specified account and/or log source	List			
ListLogGroups	Grants permission to return all the log groups that are associated with the AWS account making the request	List			
ListLogGroupsForEntity [permission only]	Grants permission to retrieve all the log groups that are associated with entity	List			
ListLogGroupsForQuery	Grants permission to return all the log groups that are associated with the specified query	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListScheduledQueries	Grants permission to return all scheduled queries that are associated with the AWS account making the request	List			
ListSourcesForS3TableIntegration	Grants permission to return all log sources associated with an S3 Tables integration	List			
ListTagsForResource	Grants permission to list the tags for the specified resource	List	anomaly-detector		
			delivery		
			delivery-destination		
			delivery-source		
			destination		
			log-group		
ListTagsLogGroup	Grants permission to list the tags for the specified log group	List	log-group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ProcessWithPipeline [permission only]	Grants permission to process and transform log events through pipeline transformers before storage	Write	log-group*		
PutAccountPolicy	Grants permission to attach an account policy	Write			
PutBearerTokenAuthentication	Grants permission to enable or disable bearer token based authentication for the specified log group	Write	log-group*		
PutDataProtectionPolicy	Grants permission to attach a data protection policy to detect and redact sensitive information from log events	Write	log-group*		
PutDeliveryDestination	Grants permission to create/update a delivery destination	Write	delivery-destination*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey} logs:DeliveryDestinationResourceArn	
PutDeliveryDestinationPolicy	Grants permission to attach a delivery destination policy to a delivery destination	Write	delivery-destination*		
PutDeliverySource	Grants permission to create/update a delivery source	Write	delivery-source*		
				aws:TagKeys aws:RequestTag/${TagKey} logs:LogGeneratingResourceArns	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutDestination	Grants permission to create or update a Destination	Write	destination*		iam:PassRole
				aws:TagKeys aws:RequestTag/${TagKey}	
PutDestinationPolicy	Grants permission to create or update an access policy associated with an existing Destination	Write	destination*		
PutIndexPolicy	Grants permission to attach an index policy at log group level to optimize search and query	Write			
PutIntegration	Grants permission to create integration between cloudwatch logs and opensearch	Write			
PutLogEvents	Grants permission to upload a batch of log events to the specified log stream	Write	log-stream*		
PutLogGroupDeletionProtection	Grants permission to enable or disable deletion protection for the specified log group	Write	log-group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutMetricFilter	Grants permission to create or update a metric filter and associates it with the specified log group	Write	log-group*		
PutPipelineRule [permission only]	Grants permission to create telemetry pipeline	Write			
PutQueryDefinition	Grants permission to create or update a query definition	Write			
PutResourcePolicy	Grants permission to create or update a resource policy allowing other AWS services to put log events to this account	Permissions management			
PutRetentionPolicy	Grants permission to set the retention of the specified log group	Write	log-group*		
PutSubscriptionFilter	Grants permission to create or update a subscription filter and associates it with the specified log group	Write	log-group*		iam:PassRole
			destination		
PutTransformer	Grants permission to create or update a transformer and associates it with the specified log group	Write	log-group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartLiveTail	Grants permission to start a Live Tail session in CloudWatch Logs	Read	log-group*		
StartQuery	Grants permission to schedule a query of a log group using CloudWatch Logs Insights	Read	log-group*		
StopLiveTail [permission only]	Grants permission to stop a Live Tail session that is in progress	Read			
StopQuery	Grants permission to stop a CloudWatch Logs Insights query that is in progress	Read			
TagLogGroup	Grants permission to add or update the specified tags for the specified log group	Tagging	log-group*		
				aws:TagKeys aws:RequestTag/${TagKey}	
TagResource	Grants permission to add or update the specified tags for the specified resource	Tagging	anomaly-detector		
			delivery		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			delivery-destination		
			delivery-source		
			destination		
			log-group		
			scheduled-query		
				aws:TagKeys aws:RequestTag/${TagKey}	
TestMetricFilter	Grants permission to test the filter pattern of a metric filter against a sample of log event messages	Read			
TestTransformer	Grants permission to test the transformer against a sample of log event messages	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Unmask [permission only]	Grants permission to fetch unmasked log events that have been redacted with a data protection policy	Read	log-group*		
UntagLogGroup	Grants permission to remove the specified tags from the specified log group	Tagging	log-group*		
				aws:TagKeys	
UntagResource	Grants permission to remove the specified tags from the specified resource	Tagging	anomaly-detector		
			delivery		
			delivery-destination		
			delivery-source		
			destination		
			log-group		
			scheduled-query		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAnomaly	Grants permission to update an anomaly reported by a log anomaly detector	Write	anomaly-detector*		
UpdateDeliveryConfiguration	Grants permission to update configuration related to a delivery	Write	delivery*		
			delivery-destination*		
			delivery-source*		
				aws:TagKeys aws:RequestTag/${TagKey}	
UpdateLogAnomalyDetector	Grants permission to update a log anomaly detector	Write	anomaly-detector*		
UpdateLogDelivery [permission only]	Grants permission to update the log delivery information for specified log delivery	Write			
UpdateScheduledQuery	Grants permission to update a scheduled query	Write	scheduled-query*		

Resource types defined by Amazon CloudWatch Logs

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
log-group	`arn:${Partition}:logs:${Region}:${Account}:log-group:${LogGroupName}`	aws:ResourceTag/${TagKey}
log-stream	`arn:${Partition}:logs:${Region}:${Account}:log-group:${LogGroupName}:log-stream:${LogStreamName}`	aws:ResourceTag/${TagKey}
destination	`arn:${Partition}:logs:${Region}:${Account}:destination:${DestinationName}`	aws:ResourceTag/${TagKey}
delivery-source	`arn:${Partition}:logs:${Region}:${Account}:delivery-source:${DeliverySourceName}`	aws:ResourceTag/${TagKey}
delivery	`arn:${Partition}:logs:${Region}:${Account}:delivery:${DeliveryName}`	aws:ResourceTag/${TagKey}
delivery-destination	`arn:${Partition}:logs:${Region}:${Account}:delivery-destination:${DeliveryDestinationName}`	aws:ResourceTag/${TagKey}
anomaly-detector	`arn:${Partition}:logs:${Region}:${Account}:anomaly-detector:${DetectorId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
scheduled-query	arn:${Partition}:logs:${Region}:${Account}:scheduled-query:${ScheduledQueryId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon CloudWatch Logs

Amazon CloudWatch Logs defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
logs:DeliveryDestinationResourceArn	Filters access by the Log Destination ARN passed in the request	ARN
logs:LogGeneratingResourceArns	Filters access by the Log Generating Resource ARNs passed in the request	ArrayOfARN

Actions, resources, and condition keys for Amazon CloudWatch Network Synthetic Monitor

Amazon CloudWatch Network Synthetic Monitor (service prefix: `networkmonitor`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon CloudWatch Network Synthetic Monitor

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit

resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateMonitor	Grants permission to create a monitor	Write	monitor*		
CreateProbe	Grants permission to create a probe	Write			
DeleteMonitor	Grants permission to delete a monitor	Write	monitor*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteProbe	Grants permission to delete a probe	Write	probe*		
GetMonitor	Grants permission to get information about a monitor	Read	monitor*		
GetProbe	Grants permission to get information about a probe	Read	probe*		
ListMonitors	Grants permission to list all monitors in an account and their statuses	List			
ListTagsForResource	Grants permission to list the tags for a resource	Read	monitor		
			probe		
TagResource	Grants permission to add tags to a resource	Tagging	monitor		
			probe		
UntagResource	Grants permission to remove tags from a resource	Tagging	monitor		
			probe		
				aws:TagKeys	
UpdateMonitor	Grants permission to update a monitor	Write	monitor*		
UpdateProbe	Grants permission to update a probe	Write	probe*		

Resource types defined by Amazon CloudWatch Network Synthetic Monitor

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
monitor	`arn:${Partition}:networkmonitor:${Region}:${Account}:monitor/${MonitorName}`	aws:ResourceTag/${TagKey}
probe	`arn:${Partition}:networkmonitor:${Region}:${Account}:probe/${ProbeId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon CloudWatch Network Synthetic Monitor

Amazon CloudWatch Network Synthetic Monitor defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon CloudWatch Observability Access Manager

Amazon CloudWatch Observability Access Manager (service prefix: `oam`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon CloudWatch Observability Access Manager

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateLink	Grants permission to create a link between a monitoring account and a source account for cross-account monitoring	Write	Sink*		oam:TagResource
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				oam:ResourceTypes	
CreateSink	Grants permission to create a sink in an account so that it can be used as a monitoring account for cross-account monitoring	Write		aws:RequestTag/${TagKey} aws:TagKeys	oam:TagResource
DeleteLink	Grants permission to delete a link between a monitoring account and a source account for cross-account monitoring	Write	Link*		
				aws:ResourceTag/${TagKey}	
DeleteSink	Grants permission to delete a cross-account monitoring sink in a monitoring account	Write	Sink*		
				aws:ResourceTag/${TagKey}	
GetLink	Grants permission to retrieve complete information about one cross-account monitoring link	Read	Link*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSink	Grants permission to retrieve complete information about one cross-account monitoring sink	Read	Sink*		
				aws:ResourceTag/${TagKey}	
GetSinkPolicy	Grants permission to retrieve information for the IAM policy for a cross-account monitoring sink	Read	Sink*		
				aws:ResourceTag/${TagKey}	
ListAttachedLinks	Grants permission to retrieve a list of links that are linked for a cross-account monitoring sink	Read	Sink*		
				aws:ResourceTag/${TagKey}	
ListLinks	Grants permission to retrieve the ARNs of cross-account monitoring links in this account	Read			
ListSinks	Grants permission to retrieve the ARNs of cross-account monitoring sinks in this account	Read			
ListTagsForResource	Grants permission to list the tags for a resource	Read	Link		
			Sink		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutSinkPolicy	Grants permission to create or update the IAM policy for a cross-account monitoring sink	Write	Sink*		
				aws:ResourceTag/${TagKey}	
TagResource	Grants permission to tag a resource	Tagging	Link		
			Sink		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag a resource	Tagging	Link		
			Sink		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateLink	Grants permission to update an existing link between a monitoring account and a source account	Write	Link*		
				aws:ResourceTag/${TagKey} oam:ResourceTypes	

Resource types defined by Amazon CloudWatch Observability Access Manager

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Link	`arn:${Partition}:oam:${Region}:${Account}:link/${ResourceId}`	aws:ResourceTag/${TagKey}
Sink	`arn:${Partition}:oam:${Region}:${Account}:sink/${ResourceId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon CloudWatch Observability Access Manager

Amazon CloudWatch Observability Access Manager defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine

the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
oam:ResourceTypes	Filters access by the presence of resource types in the request	ArrayOfString

Actions, resources, and condition keys for Amazon CloudWatch Observability Admin Service

Amazon CloudWatch Observability Admin Service (service prefix: `observabilityadmin`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon CloudWatch Observability Admin Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCentralizationRuleForOrganization	Grants permission to create a new organization centralization rule with the specified name for the organization	Write	organization-centralization-rule*		
				aws:TagKeys aws:RequestTag/${TagKey} observabilityadmin:CentralizationSourceRegions observabilityadmin:CentralizationDestinationRegion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				observabilityadmin:CentralizationBackupRegion	
CreateS3TableIntegration	Grants permission to create a new s3 table integration with the specified configuration	Write	s3tableintegration *		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateTelemetryPipeline	Grants permission to create a new telemetry pipeline with the specified name and configuration	Write	telemetry-pipeline *		
				aws:TagKeys aws:RequestTag/${TagKey} observabilityadmin:SourceType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTelemetryRule	Grants permission to create a new telemetry rule with the specified name for the account	Write	telemetry-rule*

ValidateTelemetryPipelineConfiguration	Grants permission to Validate a telemetry pipeline configuration	Read			

Resource types defined by Amazon CloudWatch Observability Admin Service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
telemetry-rule	`arn:${Partition}:observabilityadmin:${Region}:${Account}:telemetry-rule/${TelemetryRuleName}`	aws:ResourceTag/${TagKey}
organization-telemetry-rule	`arn:${Partition}:observabilityadmin:${Region}:${Account}:organization-telemetry-rule/${TelemetryRuleName}`	aws:ResourceTag/${TagKey}
organization-centralization-rule	`arn:${Partition}:observabilityadmin:${Region}:${Account}:organization-centralization-rule/${CentralizationRuleName}`	aws:ResourceTag/${TagKey}
telemetry-pipeline	`arn:${Partition}:observabilityadmin:${Region}:${Account}:telemetry-pipeline/${TelemetryPipelineIdentifier}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
s3tableintegration	arn:${Partition}:observabilityadmin:${Region}:${Account}:s3tableintegration/${S3TableIntegrationIdentifier}	aws:ResourceTag/${TagKey}

Condition keys for Amazon CloudWatch Observability Admin Service

Amazon CloudWatch Observability Admin Service defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
observabilityadmin:CentralizationBackupRegion	Filters access by the backup region that is passed in the request	String
observabilityadmin:Centrali	Filters access by the destination region that is passed in the request	String

Condition keys	Description	Type
zationDestinationRegion		
observabilityadmin:CentralizationSourceRegions	Filters access by the source regions that are passed in the request	ArrayOfString
observabilityadmin:SourceType	Filters access by the source type that is passed in the request	String

Actions, resources, and condition keys for AWS CloudWatch RUM

AWS CloudWatch RUM (service prefix: `rum`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS CloudWatch RUM

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchCreateRumMetricDefinitions	Grants permission to create rum metric definitions	Write	AppMonitorResource*		
BatchDeleteRumMetricDefinitions	Grants permission to remove rum metric definitions	Write	AppMonitorResource*		
BatchGetRumMetricDefinitions	Grants permission to get rum metric definitions	Read	AppMonitorResource*		
CreateAppMonitor	Grants permission to create appMonitor metadata	Write	AppMonitorResource*		iam:CreateServiceLinkedRole iam:GetRole
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAppMonitor	Grants permission to delete appMonitor metadata	Write	AppMonitorResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

Actions defined by Amazon CloudWatch Synthetics

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateResource	Grants permission to associate a resource with a group	Write	group*		
				aws:ResourceTag/${TagKey} aws:TagKeys	
CreateCanary	Grants permission to create a canary	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateGroup	Grants permission to create a group	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteCanary	Grants permission to delete a canary. Amazon Synthetics deletes all the resources except for the Lambda function and the CloudWatch Alarms if you created one	Write	canary*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
DeleteGroup	Grants permission to delete a group	Write	group*		
				aws:ResourceTag/${TagKey} aws:TagKeys	
DescribeCanaries	Grants permission to list information of all canaries	Read		synthetics:Names	
DescribeCanariesLastRun	Grants permission to list information about the last test run associated with all canaries	Read		synthetics:Names	
DescribeRuntimeVersions	Grants permission to list information about Synthetics canary runtime versions	Read			
DisassociateResource	Grants permission to disassociate a resource from a group	Write	group*		
				aws:ResourceTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCanary	Grants permission to view the details of a canary	Read	canary*		
				aws:ResourceTag/${TagKey} aws:TagKeys	
GetCanaryRuns	Grants permission to list information about all the test runs associated with a canary	Read	canary*		
				aws:ResourceTag/${TagKey} aws:TagKeys	
GetGroup	Grants permission to view the details of a group	Read	group*		
				aws:ResourceTag/${TagKey} aws:TagKeys

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:TagKeys	
ListGroupResources	Grants permission to list information about canaries in a group	List	group*		
				aws:ResourceTag/${TagKey} aws:TagKeys	
ListGroups	Grants permission to list information of all groups	List			
ListTagsForResource	Grants permission to list all tags and values associated with a resource	Read	canary		
			group		
StartCanary	Grants permission to start a canary, so that Amazon CloudWatch Synthetics starts monitoring a website	Write	canary*		
				aws:ResourceTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartCanaryDryRun	Grants permission to start a canary dry run, so that Amazon CloudWatch Synthetics can execute a test execution of a canary with provided parameters	Write	canary*		
				aws:ResourceTag/${TagKey} aws:TagKeys	
StopCanary	Grants permission to stop a canary	Write	canary*		
				aws:ResourceTag/${TagKey} aws:TagKeys	
TagResource	Grants permission to add one or more tags to a resource	Tagging	canary		
			group		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove one or more tags from a resource	Tagging	canary		
			group		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:TagKeys	
UpdateCanary	Grants permission to update a canary	Write	canary*		
				aws:ResourceTag/${TagKey} aws:TagKeys	

Resource types defined by Amazon CloudWatch Synthetics

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
canary	`arn:${Partition}:synthetics:${Region}:${Account}:canary:${CanaryName}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
group	arn:${Partition}:synthetics:${Region}:${Account}:group:${GroupId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon CloudWatch Synthetics

Amazon CloudWatch Synthetics defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access based on the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access based on the tags associated with the resource	String
aws:TagKeys	Filters access based on the tag keys that are passed in the request	ArrayOfString
synthetics:Names	Filters access based on the name of the canary	ArrayOfString

Actions, resources, and condition keys for AWS CodeArtifact

AWS CodeArtifact (service prefix: codeartifact) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS CodeArtifact

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateExternalConnection	Grants permission to add an external connection to a repository	Write	repository*		
AssociateWithDownstreamRepository	Grants permission to associate an existing repository as an upstream repository to another repository	Write	repository*		
CopyPackageVersions	Grants permission to copy package versions from one repository to another repository in the same domain	Write	package* repository*		
CreateDomain	Grants permission to create a new domain	Write		aws:RequestTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} aws:TagKeys	
CreatePackageGroup	Grants permission to create a package group	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateRepository	Grants permission to create a new repository	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteDomain	Grants permission to delete a domain	Write	domain*

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateExternalConnection	Grants permission to disassociate an external connection from a repository	Write	repository*		
DisposePackageVersions	Grants permission to set the status of package versions to Disposed and delete their assets	Write	package*		
GetAssociatedPackageGroup	Grants permission to return a package's associated package group	Read	package-group*		
GetAuthorizationToken	Grants permission to generate a temporary authentication token for accessing repositories in a domain	Read	domain*		
GetDomainPermissionsPolicy	Grants permission to return a domain's resource policy	Read	domain*		
GetPackageVersionAsset	Grants permission to return an asset (or file) that is part of a package version	Read	package*		
GetPackageVersionReadme	Grants permission to return a package version's readme file	Read	package*		
GetRepositoryEndpoint	Grants permission to return an endpoint for a repository	Read	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetRepositoryPermissionsPolicy	Grants permission to return a repository's resource policy	Read	repository*		
ListAllowedRepositoriesForGroup	Grants permission to list the allowed repositories for a package group	List	package-group*		
ListAssociatedPackages	Grants permission to list the packages associated to a package group	List	package-group*		
ListDomains	Grants permission to list the domains in the current user's AWS account	List			
ListPackageGroups	Grants permission to list the package groups in a domain	List	domain*		
ListPackageVersionAssets	Grants permission to list a package version's assets	List	package*		
ListPackageVersionDependencies	Grants permission to list the direct dependencies of a package version	List	package*		
ListPackageVersions	Grants permission to list a package's versions	List	package*		
ListPackages	Grants permission to list the packages in a repository	List	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListRepositories	Grants permission to list the repositories administered by the calling account	List			
ListRepositoriesInDomain	Grants permission to list the repositories in a domain	List	domain*		
ListSubPackageGroups	Grants permission to list the sub package groups for a parent package group	List	package-group*		
ListTagsForResource	Grants permission to list tags for a CodeArtifact resource	List	domain		
			package-group		
			repository		
PublishPackageVersion	Grants permission to publish assets and metadata to a repository endpoint	Write	package*		
PutDomainPermissionsPolicy	Grants permission to attach a resource policy to a domain	Write	domain*		
PutPackageMetadata	Grants permission to add, modify or remove package metadata using a repository endpoint	Write	package*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutPackageOriginConfiguration	Grants permission to set origin configuration for a package	Write	package*		
PutRepositoryPermissionsPolicy	Grants permission to attach a resource policy to a repository	Write	repository*		
ReadFromRepository	Grants permission to return package assets and metadata from a repository endpoint	Read	repository*		
TagResource	Grants permission to tag a CodeArtifact resource	Tagging	domain		
			package-group		
			repository		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove a tag from a CodeArtifact resource	Tagging	domain		
			package-group		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			repository		
				aws:TagKeys	
UpdatePackageGroup	Grants permission to modify the properties of a package group	Write	package-group*		
UpdatePackageGroupOriginConfiguration	Grants permission to modify the package origin configuration of a package group	Write	package-group*		
UpdatePackageVersionsStatus	Grants permission to modify the status of one or more versions of a package	Write	package*		
UpdateRepository	Grants permission to modify the properties of a repository	Write	repository*		

Resource types defined by AWS CodeArtifact

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Note

The ARN of the package groups resource must use an encoded package group pattern.

Resource types	ARN	Condition keys
domain	arn:${Partition}:codeartifact:${Region}:${Account}:domain/${DomainName}	aws:ResourceTag/${TagKey}
repository	arn:${Partition}:codeartifact:${Region}:${Account}:repository/${DomainName}/${RepositoryName}	aws:ResourceTag/${TagKey}
package-group	arn:${Partition}:codeartifact:${Region}:${Account}:package-group/${DomainName}${EncodedPackageGroupPattern}	aws:ResourceTag/${TagKey}
package	arn:${Partition}:codeartifact:${Region}:${Account}:package/${DomainName}/${RepositoryName}/${PackageFormat}/${PackageNamespace}/${PackageName}	

Condition keys for AWS CodeArtifact

AWS CodeArtifact defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS CodeBuild

AWS CodeBuild (service prefix: `codebuild`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS CodeBuild

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchDeleteBuilds	Grants permission to delete one or more builds	Write	project*		
BatchGetBuildBatches	Grants permission to get information about one or more build batches	Read	project*		
BatchGetBuilds	Grants permission to get information about one or more builds	Read	project*		
BatchGetCommandExecutions	Grants permission to get information about one or more command executions	Read	sandbox*		
BatchGetFleets	Grants permission to return an array of the Fleet objects specified by the input parameter	Read	fleet*		
BatchGetProjects	Grants permission to get information about one or more build projects	Read	project*		
BatchGetReportGroups	Grants permission to return an array of ReportGroup objects that are specified by the input reportGroupArns parameter	Read	report-group*		
BatchGetReports	Grants permission to return an array of the Report	Read	report-group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	objects specified by the input reportArns parameter				
BatchGetSandboxes	Grants permission to get information about one or more sandboxes	Read	project*		
BatchPutCodeCoverages [permission only]	Grants permission to add or update information about a report	Write	report-group*		
BatchPutTestCases [permission only]	Grants permission to add or update information about a report	Write	report-group*		
CreateFleet	Grants permission to create a compute fleet	Write	fleet*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys codebuild:imageId codebuild:computeType codebuild:vpcConfig codebuild:vpcConfig.vpcId codebuild:vpcConfig.securityGroupIds codebuild:vpcConfig.subnets codebuild:computeC

				codebuild:serviceRole	
CreateReport [permission only]	Grants permission to create a report. A report is created when tests specified in the buildspec file for a report groups run during the build of a project	Write	report-group*		
CreateReportGroup	Grants permission to create a report group	Write	report-group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys codebuild:exportConfig.s3Destination.bucket codebuild:exportConfig.s3Destination.bucketOwner codebuild:exportConfig.s3Destination.encryptionKey codebuild:exportConfig.s3Destination.encrypti	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				onDisabled codebuild:exportConfig.s3Destination.path	
CreateWebhook	Grants permission to create webhook. For an existing AWS CodeBuild build project that has its source code stored in a GitHub or Bitbucket repository, enables AWS CodeBuild to start rebuilding the source code every time a code change is pushed to the repository	Write	project*		
				codebuild:buildType codebuild:manualCreation codebuild:scopeConfiguration.domain codebuild:scopeConfiguration.name codebuild:scopeConfiguration.scope	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteBuildBatch	Grants permission to delete a build batch	Write	project*		
DeleteFleet	Grants permission to delete a compute fleet	Write	fleet*		
DeleteOAuthToken [permission only]	Grants permission to delete an OAuth token from a connected third-party OAuth provider. Only used in the AWS CodeBuild console	Write			
DeleteProject	Grants permission to delete a build project	Write	project*		
DeleteReport	Grants permission to delete a report	Write	report-group*		
DeleteReportGroup	Grants permission to delete a report group	Write	report-group*		
DeleteResourcePolicy	Grants permission to delete a resource policy for the associated project or report group	Permissions management	project report-group		
DeleteSourceCredentials	Grants permission to delete a set of GitHub, GitHub Enterprise, or Bitbucket source credentials	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteWebhook	Grants permission to delete webhook. For an existing AWS CodeBuild build project that has its source code stored in a GitHub or Bitbucket repository, stops AWS CodeBuild from rebuilding the source code every time a code change is pushed to the repository	Write	project*		
DescribeCodeCoverages	Grants permission to return an array of CodeCoverage objects	Read	report-group*		
DescribeTestCases	Grants permission to return an array of TestCase objects	Read	report-group*		
GetReportGroupTrend	Grants permission to analyze and accumulate test report values for the test reports in the specified report group	Read	report-group*		
GetResourcePolicy	Grants permission to return a resource policy for the specified project or report group	Read	project report-group		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ImportSourceCredentials	Grants permission to import the source repository credentials for an AWS CodeBuild project that has its source code stored in a GitHub, GitHub Enterprise, or Bitbucket repository	Write		codebuild:authType codebuild:serverType codebuild:shouldOverwrite codebuild:token codebuild:username	
InvalidateProjectCache	Grants permission to reset the cache for a project	Write	project*		
ListBuildBatches	Grants permission to get a list of build batch IDs, with each build batch ID representing a single build batch	List			
ListBuildBatchesForProject	Grants permission to get a list of build batch IDs for the specified build project, with each build batch ID representing a single build batch	List	project*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListBuilds	Grants permission to get a list of build IDs, with each build ID representing a single build	List			
ListBuildsForProject	Grants permission to get a list of build IDs for the specified build project, with each build ID representing a single build	List	project*		
ListCommandExecutionsForSandbox	Grants permission to get a list of command execution IDs for the specified sandbox, with each command execution ID representing a single command execution	List	sandbox*		
ListConnectedOAuthAccounts [permission only]	Grants permission to list connected third-party OAuth providers. Only used in the AWS CodeBuild console	List			
ListCuratedEnvironmentImages	Grants permission to get information about Docker images that are managed by AWS CodeBuild	List			
ListFleets	Grants permission to get a list of compute fleet ARNs, with each compute fleet ARN representing a single fleet	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListProjects	Grants permission to get a list of build project names, with each build project name representing a single build project	List			
ListReportGroups	Grants permission to return a list of report group ARNs. Each report group ARN represents one report group	List			
ListReports	Grants permission to return a list of report ARNs. Each report ARN representing one report	List			
ListReportsForReportGroup	Grants permission to return a list of report ARNs that belong to the specified report group. Each report ARN represents one report	List	report-group*		
ListRepositories [permission only]	Grants permission to list source code repositories from a connected third-party OAuth provider. Only used in the AWS CodeBuild console	List			
ListSandboxes	Grants permission to get a list of sandbox IDs, with each sandbox ID representing a single sandbox	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListSandboxesForProject	Grants permission to get a list of sandbox IDs for the specified sandbox project, with each sandbox ID representing a single sandbox	List	project*		
ListSharedProjects	Grants permission to return a list of project ARNs that have been shared with the requester. Each project ARN represents one project	List			
ListSharedReportGroups	Grants permission to return a list of report group ARNs that have been shared with the requester. Each report group ARN represents one report group	List			
ListSourceCredentials	Grants permission to return a list of SourceCredentialsInfo objects	List			
PersistOAuthToken [permission only]	Grants permission to save an OAuth token from a connected third-party OAuth provider. Only used in the AWS CodeBuild console	Write			
PutResourcePolicy	Grants permission to create a resource policy for the associated project or report group	Permissions management	project report-group		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RetryBuild	Grants permission to retry a build	Write	project*		
RetryBuildBatch	Grants permission to retry a build batch	Write	project*		
StartBuild	Grants permission to start running a build	Write	project*

Resource types defined by AWS CodeBuild

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
build	`arn:${Partition}:codebuild:${Region}:${Account}:build/${BuildId}`	
build-batch	`arn:${Partition}:codebuild:${Region}:${Account}:build-batch/${BuildBatchId}`	
project	`arn:${Partition}:codebuild:${Region}:${Account}:project/${ProjectName}`	aws:ResourceTag/${TagKey}
report-group	`arn:${Partition}:codebuild:${Region}:${Account}:report-group/${ReportGroupName}`	aws:ResourceTag/${TagKey}
report	`arn:${Partition}:codebuild:${Region}:${Account}:report/${ReportGroupName}:${ReportId}`	
fleet	`arn:${Partition}:codebuild:${Region}:${Account}:fleet/${FleetName}:${FleetId}`	
sandbox	`arn:${Partition}:codebuild:${Region}:${Account}:sandbox/${SandboxId}`	

Condition keys for AWS CodeBuild

AWS CodeBuild defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by actions based on the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by actions based on tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by actions based on the presence of tag keys in the request	ArrayOfString
codebuild:artifacts	Filters access by the API corresponding argument value	Bool
codebuild:artifacts.bucketOwnerAccess	Filters access by the API corresponding argument value	String
codebuild:artifacts.encryptionDisabled	Filters access by the API corresponding argument value	Bool
codebuild:artifacts.location	Filters access by the API corresponding argument value	String

Condition keys	Description	Type
codebuild:authType	Filters access by the API corresponding argument value	String
codebuild:autoRetryLimit	Filters access by the API corresponding argument value	Numeric
codebuild:buildArn	Filters access by the ARN of the AWS CodeBuild build from which the request originated	ARN
codebuild:buildBatchConfig	Filters access by the API corresponding argument value	Bool
codebuild:buildBatchConfig.restrictions.computeTypesAllowed	Filters access by the API corresponding argument value	ArrayOfString
codebuild:buildBatchConfig.restrictions.fleetsAllowed	Filters access by the API corresponding argument value	ArrayOfString
codebuild:buildBatchConfig.serviceRole	Filters access by the API corresponding argument value	String
codebuild:buildType	Filters access by the API corresponding argument value	String
codebuild:cache	Filters access by the API corresponding argument value	Bool

Condition keys	Description	Type
codebuild:cache.location	Filters access by the API corresponding argument value	String
codebuild:cache.modes	Filters access by the API corresponding argument value	ArrayOfString
codebuild:cache.type	Filters access by the API corresponding argument value	String
codebuild:computeConfiguration	Filters access by the API corresponding argument value	Bool
codebuild:computeConfiguration.disk	Filters access by the API corresponding argument value	Numeric
codebuild:computeConfiguration.instanceType	Filters access by the API corresponding argument value	String
codebuild:computeConfiguration.machineType	Filters access by the API corresponding argument value	String
codebuild:computeConfiguration.memory	Filters access by the API corresponding argument value	Numeric
codebuild:computeConfiguration.vCpu	Filters access by the API corresponding argument value	Numeric

Condition keys	Description	Type
codebuild:computeType	Filters access by the API corresponding argument value	String
codebuild:concurrentBuildLimit	Filters access by the API corresponding argument value	Numeric
codebuild:encryptionKey	Filters access by the API corresponding argument value	String
codebuild:environment	Filters access by the API corresponding argument value	Bool
codebuild:environment.certificate	Filters access by the API corresponding argument value	String
codebuild:environment.computeConfiguration	Filters access by the API corresponding argument value	Bool
codebuild:environment.computeConfiguration.disk	Filters access by the API corresponding argument value	Numeric
codebuild:environment.computeConfiguration.instanceType	Filters access by the API corresponding argument value	String

Condition keys	Description	Type
codebuild:environment.computeConfiguration.machineType	Filters access by the API corresponding argument value	String
codebuild:environment.computeConfiguration.memory	Filters access by the API corresponding argument value	Numeric
codebuild:environment.computeConfiguration.vCpu	Filters access by the API corresponding argument value	Numeric
codebuild:environment.computeType	Filters access by the API corresponding argument value	String
codebuild:environment.environmentVariables	Filters access by the API corresponding argument value	Bool
codebuild:environment.environmentVariables.name	Filters access by the API corresponding argument value	ArrayOfString

Condition keys	Description	Type
codebuild:environment.environmentVariables.value	Filters access by the API corresponding argument value	ArrayOfString
codebuild:environment.environmentVariables/${name}.value	Filters access by the API corresponding argument value	String
codebuild:environment.fleet.fleetArn	Filters access by the API corresponding argument value	ARN
codebuild:environment.image	Filters access by the API corresponding argument value	String
codebuild:environment.imagePullCredentialsType	Filters access by the API corresponding argument value	String
codebuild:environment.privilegedMode	Filters access by the API corresponding argument value	Bool

Condition keys	Description	Type
codebuild:environment.registryCredential	Filters access by the API corresponding argument value	Bool
codebuild:environment.registryCredential.credential	Filters access by the API corresponding argument value	String
codebuild:environment.registryCredential.credentialProvider	Filters access by the API corresponding argument value	String
codebuild:environment.type	Filters access by the API corresponding argument value	String
codebuild:environmentType	Filters access by the API corresponding argument value	String
codebuild:exportConfig.s3Destination.bucket	Filters access by the API corresponding argument value	String
codebuild:exportConfig.s3Destination.bucketOwner	Filters access by the API corresponding argument value	String

Condition keys	Description	Type
codebuild:exportConfig.s3Destination.encryptionDisabled	Filters access by the API corresponding argument value	Bool
codebuild:exportConfig.s3Destination.encryptionKey	Filters access by the API corresponding argument value	String
codebuild:exportConfig.s3Destination.path	Filters access by the API corresponding argument value	String
codebuild:fileSystemLocations.identifier	Filters access by the API corresponding argument value	ArrayOfString
codebuild:fileSystemLocations.location	Filters access by the API corresponding argument value	ArrayOfString
codebuild:fileSystemLocations.type	Filters access by the API corresponding argument value	ArrayOfString

Condition keys	Description	Type
codebuild:fileSystemLocations/${identifier}.location	Filters access by the API corresponding argument value	String
codebuild:fileSystemLocations/${identifier}.type	Filters access by the API corresponding argument value	String
codebuild:fleetServiceRole	Filters access by the API corresponding argument value	String
codebuild:imageId	Filters access by the API corresponding argument value	String
codebuild:logsConfig	Filters access by the API corresponding argument value	Bool
codebuild:logsConfig.s3Logs	Filters access by the API corresponding argument value	Bool
codebuild:logsConfig.s3Logs.bucketOwnerAccess	Filters access by the API corresponding argument value	String
codebuild:logsConfig.s3Logs.encryptionDisabled	Filters access by the API corresponding argument value	Bool

Condition keys	Description	Type
codebuild:logsConfig.s3Logs.location	Filters access by the API corresponding argument value	String
codebuild:logsConfig.s3Logs.status	Filters access by the API corresponding argument value	String
codebuild:manualCreation	Filters access by the API corresponding argument value	Bool
codebuild:projectArn	Filters access by the ARN of the AWS CodeBuild project from which the request originated	ARN
codebuild:projectVisibility	Filters access by the API corresponding argument value	String
codebuild:scopeConfiguration.domain	Filters access by the API corresponding argument value	String
codebuild:scopeConfiguration.name	Filters access by the API corresponding argument value	String
codebuild:scopeConfiguration.scope	Filters access by the API corresponding argument value	String
codebuild:secondaryArtifacts	Filters access by the API corresponding argument value	Bool

Condition keys	Description	Type
codebuild:secondaryArtifacts.artifactIdentifier	Filters access by the API corresponding argument value	ArrayOfString
codebuild:secondaryArtifacts.bucketOwnerAccess	Filters access by the API corresponding argument value	ArrayOfString
codebuild:secondaryArtifacts.encryptionDisabled	Filters access by the API corresponding argument value	ArrayOfBool
codebuild:secondaryArtifacts.location	Filters access by the API corresponding argument value	ArrayOfString
codebuild:secondaryArtifacts/${artifactIdentifier}.bucketOwnerAccess	Filters access by the API corresponding argument value	String
codebuild:secondaryArtifacts/${artifactIdentifier}.encryptionDisabled	Filters access by the API corresponding argument value	Bool

Condition keys	Description	Type
codebuild:secondaryArtifacts/${artifactIdentifier}.location	Filters access by the API corresponding argument value	String
codebuild:secondarySources	Filters access by the API corresponding argument value	Bool
codebuild:secondarySources.auth.resource	Filters access by the API corresponding argument value	ArrayOfString
codebuild:secondarySources.auth.type	Filters access by the API corresponding argument value	ArrayOfString
codebuild:secondarySources.buildStatusConfig.context	Filters access by the API corresponding argument value	ArrayOfString
codebuild:secondarySources.buildStatusConfig.targetUrl	Filters access by the API corresponding argument value	ArrayOfString

Condition keys	Description	Type
codebuild:secondarySources.buildspec	Filters access by the API corresponding argument value	Bool
codebuild:secondarySources.insecureSsl	Filters access by the API corresponding argument value	ArrayOfBool
codebuild:secondarySources.location	Filters access by the API corresponding argument value	ArrayOfString
codebuild:secondarySources.sourceIdentifier	Filters access by the API corresponding argument value	ArrayOfString
codebuild:secondarySources/${sourceIdentifier}.auth.resource	Filters access by the API corresponding argument value	String
codebuild:secondarySources/${sourceIdentifier}.auth.type	Filters access by the API corresponding argument value	String

Condition keys	Description	Type
codebuild:secondarySources/${sourceIdentifier}.buildStatusConfig.context	Filters access by the API corresponding argument value	String
codebuild:secondarySources/${sourceIdentifier}.buildStatusConfig.targetUrl	Filters access by the API corresponding argument value	String
codebuild:secondarySources/${sourceIdentifier}.buildspec	Filters access by the API corresponding argument value	Bool
codebuild:secondarySources/${sourceIdentifier}.insecureSsl	Filters access by the API corresponding argument value	Bool

Condition keys	Description	Type
codebuild:secondarySources/${sourceIdentifier}.location	Filters access by the API corresponding argument value	String
codebuild:serverType	Filters access by the API corresponding argument value	String
codebuild:serviceRole	Filters access by the API corresponding argument value	String
codebuild:shouldOverwrite	Filters access by the API corresponding argument value	Bool
codebuild:source	Filters access by the API corresponding argument value	Bool
codebuild:source.auth.resource	Filters access by the API corresponding argument value	String
codebuild:source.auth.type	Filters access by the API corresponding argument value	String
codebuild:source.buildStatusConfig.context	Filters access by the API corresponding argument value	String

Condition keys	Description	Type
codebuild:source.buildStatusConfig.targetUrl	Filters access by the API corresponding argument value	String
codebuild:source.buildspec	Filters access by the API corresponding argument value	Bool
codebuild:source.insecureSsl	Filters access by the API corresponding argument value	Bool
codebuild:source.location	Filters access by the API corresponding argument value	String
codebuild:token	Filters access by the API corresponding argument value	String
codebuild:username	Filters access by the API corresponding argument value	String
codebuild:vpcConfig	Filters access by the API corresponding argument value	Bool
codebuild:vpcConfig.securityGroupIds	Filters access by the API corresponding argument value	ArrayOfString
codebuild:vpcConfig.subnets	Filters access by the API corresponding argument value	ArrayOfString
codebuild:vpcConfig.vpcId	Filters access by the API corresponding argument value	String

Actions, resources, and condition keys for Amazon CodeCatalyst

Amazon CodeCatalyst (service prefix: `codecatalyst`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon CodeCatalyst

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptConnection [permission only]	Grants permission to accept a request to connect this account to an Amazon CodeCatalyst space	Write		aws:RequestTag/${TagKey} aws:TagKeys	
AssociateIamRoleToConnection	Grants permission to associate an IAM role to a connection	Write	connections*		iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
[permission only]				aws:ResourceTag/${TagKey}	
AssociateIdentityCenterApplicationToSpace [permission only]	Grants permission to associate an IAM Identity Center application with an Amazon CodeCatalyst space	Write	identity-center-application*		
				aws:ResourceTag/${TagKey}	
AssociateIdentityToIdentityCenterApplication [permission only]	Grants permission to associate an identity with an IAM Identity Center application for an Amazon CodeCatalyst space	Write	identity-center-application*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchAssociateIdentitiesToIdentityCenterApplication [permission only]	Grants permission to associate multiple identities with an IAM Identity Center application for an Amazon CodeCatalyst space	Write	identity-center-application*		
				aws:ResourceTag/${TagKey}	
BatchDisassociateIdentitiesFromIdentityCenterApplication [permission only]	Grants permission to disassociate multiple identities from an IAM Identity Center application for an Amazon CodeCatalyst space	Write	identity-center-application*		
				aws:ResourceTag/${TagKey}	
CreateIdentityCenterApplication [permission only]	Grants permission to create an IAM Identity Center application	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSpace [permission only]	Grants permission to create an Amazon CodeCatalyst space	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateSpaceAdminRoleAssignment [permission only]	Grants permission to create an administrator role assignment for a given Amazon CodeCatalyst space and IAM Identity Center application	Write	identity-center-applications*		
				aws:ResourceTag/${TagKey}	
DeleteConnection [permission only]	Grants permission to delete a connection	Write	connections*		
				aws:ResourceTag/${TagKey}	
DeleteIdentityCenterApplication [permission only]	Grants permission to delete an IAM Identity Center application	Write	identity-center-applications*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
DisassociateIamRoleFromConnection [permission only]	Grants permission to disassociate an IAM role from a connection	Write	connections*		
				aws:ResourceTag/${TagKey}	
DisassociateIdentityCenterApplicationFromSpace [permission only]	Grants permission to disassociate an IAM Identity Center application from an Amazon CodeCatalyst space	Write	identity-center-applications*		
				aws:ResourceTag/${TagKey}	
DisassociateIdentityFromIdentityCenterApplication [permission only]	Grants permission to disassociate an identity from an IAM Identity Center application for an Amazon CodeCatalyst space	Write	identity-center-applications*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
GetBillingAuthorization [permission only]	Grants permission to describe the billing authorization for a connection	Read	connections*		
				aws:ResourceTag/${TagKey}	
GetConnection [permission only]	Grants permission to get a connection	Read	connections*		
				aws:ResourceTag/${TagKey}	
GetIdentityCenterApplication [permission only]	Grants permission to get information about an IAM Identity Center application	Read	identity-center-applications*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetPendingConnection [permission only]	Grants permission to get a pending request to connect this account to an Amazon CodeCatalyst space	Read			
ListConnections [permission only]	Grants permission to list connections that are not pending	List			
ListIamRolesForConnection [permission only]	Grants permission to list IAM roles associated with a connection	List	connections*		
				aws:ResourceTag/${TagKey}	
ListIdentityCenterApplications [permission only]	Grants permission to view a list of all IAM Identity Center applications in the account	List			
ListIdentityCenterApplicationsForSpace [permission only]	Grants permission to view a list of IAM Identity Center applications by Amazon CodeCatalyst space	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListSpacesForIdentityCenterApplication [permission only]	Grants permission to view a list of Amazon CodeCatalyst spaces by IAM Identity Center application	List	identity-center-applications*		
				aws:ResourceTag/${TagKey}	
ListTagsForResource [permission only]	Grants permission to list tags for an Amazon CodeCatalyst resource	Read	connections		
			identity-center-applications		
				aws:ResourceTag/${TagKey}	
PutBillingAuthorization [permission only]	Grants permission to create or update the billing authorization for a connection	Write	connections*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RejectConnection [permission only]	Grants permission to reject a request to connect this account to an Amazon CodeCatalyst space	Write			
SynchronizeIdentityCenterApplication [permission only]	Grants permission to synchronize an IAM Identity Center application with the backing identity store	Write	identity-center-applications*		
				aws:ResourceTag/${TagKey}	
TagResource [permission only]	Grants permission to tag an Amazon CodeCatalyst resource	Tagging	connections		
			identity-center-applications		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
UntagResource [permission only]	Grants permission to untag an Amazon CodeCatalyst resource	Tagging	connections		
			identity-center-applications		
				aws:TagKeys aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateIdentityCenterApplication [permission only]	Grants permission to update an IAM Identity Center application	Write	identity-center-applications*		
				aws:ResourceTag/${TagKey}	

Resource types defined by Amazon CodeCatalyst

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
connections	`arn:${Partition}:codecatalyst:${Region}:${Account}:/connections/${ConnectionId}`	aws:ResourceTag/${TagKey}
identity-center-applications	`arn:${Partition}:codecatalyst:${Region}:${Account}:/identity-center-applications/${IdentityCenterApplicationId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
space	arn:${Partition}:codecatalyst:::space/${SpaceId}	
project	arn:${Partition}:codecatalyst:::space/${SpaceId}/project/${ProjectId}	

Condition keys for Amazon CodeCatalyst

Amazon CodeCatalyst defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag's key and value in a request	String
aws:ResourceTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:TagKeys	Filters access by the tag keys in a request	ArrayOfString

Actions, resources, and condition keys for AWS CodeCommit

AWS CodeCommit (service prefix: codecommit) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS CodeCommit

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateApprovalRuleTemplateWithRepository	Grants permission to associate an approval rule template with a repository	Write	repository*		
BatchAssociateApprovalRuleTemplateWithRepositories	Grants permission to associate an approval rule template with multiple repositories in a single operation	Write	repository*		
BatchDescribeMergeConflicts	Grants permission to get information about multiple merge conflicts when attempting to merge two	Read	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	commits using either the three-way merge or the squash merge option				
BatchDisassociateApprovalRuleTemplateFromRepositories	Grants permission to remove the association between an approval rule template and multiple repositories in a single operation	Write	repository*		
BatchGetCommits	Grants permission to return information about one or more commits in an AWS CodeCommit repository	Read	repository*		
BatchGetPullRequests [permission only]	Grants permission to return information about one or more pull requests in an AWS CodeCommit repository	Read	repository*		
BatchGetRepositories	Grants permission to get information about multiple repositories	Read	repository*		
CancelUploadArchive [permission only]	Grants permission to cancel the uploading of an archive to a pipeline in AWS CodePipeline	Read	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateApprovalRuleTemplate	Grants permission to create an approval rule template that will automatically create approval rules in pull requests that match the conditions defined in the template; does not grant permission to create approval rules for individual pull requests	Write			
CreateBranch	Grants permission to create a branch in an AWS CodeCommit repository with this API; does not control Git create branch actions	Write	repository*		
				codecommit:References	
CreateCommit	Grants permission to add, copy, move or update single or multiple files in a branch in an AWS CodeCommit repository, and generate a commit for the changes in the specified branch	Write	repository*		
				codecommit:References	
CreatePullRequest	Grants permission to create a pull request in the specified repository	Write	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreatePullRequestApprovalRule	Grants permission to create an approval rule specific to an individual pull request; does not grant permission to create approval rule templates	Write	repository*		
CreateRepository	Grants permission to create an AWS CodeCommit repository	Write	repository*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateUnreferencedMergeCommit	Grants permission to create an unreferenced commit that contains the result of merging two commits using either the three-way or the squash merge option; does not control Git merge actions	Write	repository*		
				codecommit:References	
DeleteApprovalRuleTemplate	Grants permission to delete an approval rule template	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteBranch	Grants permission to delete a branch in an AWS CodeCommit repository with this API; does not control Git delete branch actions	Write	repository*		
				codecommit:References	
DeleteCommentContent	Grants permission to delete the content of a comment made on a change, file, or commit in a repository	Write	repository*		
DeleteFile	Grants permission to delete a specified file from a specified branch	Write	repository*		
				codecommit:References	
DeletePullRequestApprovalRule	Grants permission to delete approval rule created for a pull request if the rule was not created by an approval rule template	Write	repository*		
DeleteRepository	Grants permission to delete an AWS CodeCommit repository	Write	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeMergeConflicts	Grants permission to get information about specific merge conflicts when attempting to merge two commits using either the three-way or the squash merge option	Read	repository*		
DescribePullRequestEvents	Grants permission to return information about one or more pull request events	Read	repository*		
DisassociateApprovalRuleTemplateFromRepository	Grants permission to remove the association between an approval rule template and a repository	Write	repository*		
EvaluatePullRequestApprovalRules	Grants permission to evaluate whether a pull request is mergable based on its current approval state and approval rule requirements	Read	repository*		
GetApprovalRuleTemplate	Grants permission to return information about an approval rule template	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetBlob	Grants permission to view the encoded content of an individual file in an AWS CodeCommit repository from the AWS CodeCommit console	Read	repository*		
GetBranch	Grants permission to get details about a branch in an AWS CodeCommit repository with this API; does not control Git branch actions	Read	repository*		
GetComment	Grants permission to get the content of a comment made on a change, file, or commit in a repository	Read	repository*		
GetCommentReactions	Grants permission to get the reactions on a comment	Read	repository*		
GetCommentsForComparedCommit	Grants permission to get information about comments made on the comparison between two commits	Read	repository*		
GetCommentsForPullRequest	Grants permission to get comments made on a pull request	Read	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCommit	Grants permission to return information about a commit, including commit message and committer information, with this API; does not control Git log actions	Read	repository*		
GetCommitHistory [permission only]	Grants permission to get information about the history of commits in a repository	Read	repository*		
GetCommitsFromMergeBase [permission only]	Grants permission to get information about the difference between commits in the context of a potential merge	Read	repository*		
GetDifferences	Grants permission to view information about the differences between valid commit specifiers such as a branch, tag, HEAD, commit ID, or other fully qualified reference	Read	repository*		
GetFile	Grants permission to return the base-64 encoded contents of a specified file and its metadata	Read	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetFolder	Grants permission to return the contents of a specified folder in a repository	Read	repository*		
GetMergeCommit	Grants permission to get information about a merge commit created by one of the merge options for pull requests that creates merge commits. Not all merge options create merge commits. This permission does not control Git merge actions	Read	repository*		
				codecommit:References	
GetMergeConflicts	Grants permission to get information about merge conflicts between the before and after commit IDs for a pull request in a repository	Read	repository*		
GetMergeOptions	Grants permission to get information about merge options for pull requests that can be used to merge two commits; does not control Git merge actions	Read	repository*		
GetObjectIdentifier [permission only]	Grants permission to resolve blobs, trees, and commits to their identifier	Read	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetPullRequest	Grants permission to get information about a pull request in a specified repository	Read	repository*		
GetPullRequestApprovalStates	Grants permission to retrieve the current approvals on an inputted pull request	Read	repository*		
GetPullRequestOverrideState	Grants permission to retrieve the current override state of a given pull request	Read	repository*		
GetReferences [permission only]	Grants permission to get details about references in an AWS CodeCommit repository; does not control Git reference actions	Read	repository*		
GetRepository	Grants permission to get information about an AWS CodeCommit repository	Read	repository*		
GetRepositoryTriggers	Grants permission to get information about triggers configured for a repository	Read	repository*		
GetTree [permission only]	Grants permission to view the contents of a specified tree in an AWS CodeCommit repository from the AWS CodeCommit console	Read	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetUploadArchiveStatus [permission only]	Grants permission to get status information about an archive upload to a pipeline in AWS CodePipeline	Read	repository*		
GitPull [permission only]	Grants permission to pull information from an AWS CodeCommit repository to a local repo	Read	repository*		
GitPush [permission only]	Grants permission to push information from a local repo to an AWS CodeCommit repository	Write	repository*		
				codecommit:References	
ListApprovalRuleTemplates	Grants permission to list all approval rule templates in an AWS Region for the AWS account	List			
ListAssociatedApprovalRuleTemplatesForRepository	Grants permission to list approval rule templates that are associated with a repository	List	repository*		
ListBranches	Grants permission to list branches for an AWS CodeCommit repository with this API; does not control Git branch actions	List	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListFileCommitHistory	Grants permission to list commits and changes to a specified file	List	repository*		
ListPullRequests	Grants permission to list pull requests for a specified repository	List	repository*		
ListRepositories	Grants permission to list information about AWS CodeCommit repositories in the current Region for your AWS account	List			
ListRepositoriesForApprovalRuleTemplate	Grants permission to list repositories that are associated with an approval rule template	List			
ListTagsForResource	Grants permission to list the resource attached to a CodeCommit resource ARN	List	repository		
MergeBranchesByFastForward	Grants permission to merge two commits into the specified destination branch using the fast-forward merge option	Write	repository*		
				codecommit:References	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
MergeBranchesBySquash	Grants permission to merge two commits into the specified destination branch using the squash merge option	Write	repository*		
				codecommit:References	
MergeBranchesByThreeWay	Grants permission to merge two commits into the specified destination branch using the three-way merge option	Write	repository*		
				codecommit:References	
MergePullRequestByFastForward	Grants permission to close a pull request and attempt to merge it into the specified destination branch for that pull request at the specified commit using the fast-forward merge option	Write	repository*		
				codecommit:References	
MergePullRequestBySquash	Grants permission to close a pull request and attempt to merge it into the specified destination branch for that pull request at the specified commit using the squash merge option	Write	repository*		
				codecommit:References	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
MergePullRequestByThreeWay	Grants permission to close a pull request and attempt to merge it into the specified destination branch for that pull request at the specified commit using the three-way merge option	Write	repository*		
				codecommit:References	
OverridePullRequestApprovalRules	Grants permission to override all approval rules for a pull request, including approval rules created by a template	Write	repository*		
PostCommentForComparedCommit	Grants permission to post a comment on the comparison between two commits	Write	repository*		
PostCommentForPullRequest	Grants permission to post a comment on a pull request	Write	repository*		
PostCommentReply	Grants permission to post a comment in reply to a comment on a comparison between commits or a pull request	Write	repository*		
PutCommentReaction	Grants permission to post a reaction on a comment	Write	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutFile	Grants permission to add or update a file in a branch in an AWS CodeCommit repository, and generate a commit for the addition in the specified branch	Write	repository*		
				codecommit:References	
PutRepositoryTriggers	Grants permission to create, update, or delete triggers for a repository	Write	repository*		
TagResource	Grants permission to attach resource tags to a CodeCommit resource ARN	Tagging	repository		
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys	
TestRepositoryTriggers	Grants permission to test the functionality of repository triggers by sending information to the trigger target	Write	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UntagResource	Grants permission to disassociate resource tags from a CodeCommit resource ARN	Tagging	repository		
				aws:TagKeys aws:ResourceTag/${TagKey}	
UpdateApprovalRuleTemplateContent	Grants permission to update the content of approval rule templates; does not grant permission to update content of approval rules created specifically for pull requests	Write			
UpdateApprovalRuleTemplateDescription	Grants permission to update the description of approval rule templates	Write			
UpdateApprovalRuleTemplateName	Grants permission to update the name of approval rule templates	Write			
UpdateComment	Grants permission to update the contents of a comment if the identity matches the identity used to create the comment	Write	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateDefaultBranch	Grants permission to change the default branch in an AWS CodeCommit repository	Write	repository*		
UpdatePullRequestApprovalRuleContent	Grants permission to update the content for approval rules created for a specific pull requests; does not grant permission to update approval rule content for rules created with an approval rule template	Write	repository*		
UpdatePullRequestApprovalState	Grants permission to update the approval state for pull requests	Write	repository*		
UpdatePullRequestDescription	Grants permission to update the description of a pull request	Write	repository*		
UpdatePullRequestStatus	Grants permission to update the status of a pull request	Write	repository*		
UpdatePullRequestTitle	Grants permission to update the title of a pull request	Write	repository*		
UpdateRepositoryDescription	Grants permission to change the description of an AWS CodeCommit repository	Write	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateRepositoryEncryptionKey	Grants permission to change the AWS KMS encryption key used to encrypt and decrypt an AWS CodeCommit repository	Write	repository*		
UpdateRepositoryName	Grants permission to change the name of an AWS CodeCommit repository	Write	repository*		
UploadArchive [permission only]	Grants permission to the service role for AWS CodePipeline to upload repository changes into a pipeline	Write	repository*		

Resource types defined by AWS CodeCommit

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
repository	`arn:${Partition}:codecommit:${Region}:${Account}:${RepositoryName}`	aws:ResourceTag/${TagKey}

Condition keys for AWS CodeCommit

AWS CodeCommit defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
codecommit:References	Filters access by Git reference to specified AWS CodeCommit actions	String

Actions, resources, and condition keys for AWS CodeConnections

AWS CodeConnections (service prefix: `codeconnections`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Resource types defined by AWS CodeConnections
- Condition keys for AWS CodeConnections

Actions defined by AWS CodeConnections

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateConnection	Grants permission to create a Connection resource	Write		aws:RequestTag/${TagKey} aws:TagKeys codeconnections:ProviderType	
CreateHost	Grants permission to create a host resource	Write		aws:RequestTag/${TagKey} aws:TagKeys codeconnections:Pr	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				oviderType codeconnections:VpcId	
CreateRepositoryLink	Grants permission to create a repository link	Write	Connection*		codeconnections:PassConnection codeconnections:UseConnection
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSyncConfiguration	Grants permission to create a template sync config	Write	RepositoryLink*		codeconnections:PassRepository iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				codeconnections:Branch	
DeleteConnection	Grants permission to delete a Connection resource	Write	Connection*		
DeleteHost	Grants permission to delete a host resource	Write	Host*		
DeleteRepositoryLink	Grants permission to delete a repository link	Write	RepositoryLink*		
DeleteSyncConfiguration	Grants permission to delete a sync configuration	Write			
GetConnection	Grants permission to get details about a Connection resource	Read	Connection*		
GetConnectionToken [permission only]	Grants permission to get a Connection token to call provider actions	Read	Connection*		
GetHost	Grants permission to get details about a host resource	Read	Host*		
GetIndividualAccessToken [permission only]	Grants permission to associate a third party, such as a Bitbucket App installation, with a Connection	Read		codeconnections:ProviderType	codeconnections:StartOAuthHandshake

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetInstallationUrl [permission only]	Grants permission to associate a third party, such as a Bitbucket App installation, with a Connection	Read		codeconnections:ProviderType	
GetRepositoryLink	Grants permission to describe a repository link	Read	RepositoryLink*		
GetRepositorySyncStatus	Grants permission to get the latest sync status for a repository	Read	RepositoryLink*		
				codeconnections:Branch	
GetResourceSyncStatus	Grants permission to get the latest sync status for a resource (cfn stack or other resources)	Read			
GetSyncBlockerSummary	Grants permission to describe service sync blockers on a resource (cfn stack or other resources)	Read			
GetSyncConfiguration	Grants permission to describe a sync configuration	Read			
ListConnections	Grants permission to list Connection resources	List	Connection*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				codeconnections:ProviderTypeFilter	
ListHosts	Grants permission to list host resources	List		codeconnections:ProviderTypeFilter	
ListInstallationTargets [permission only]	Grants permission to associate a third party, such as a Bitbucket App installation, with a Connection	List			codeconnections:GetIndividualAccessToken codeconnections:StartOAuthHandshake
ListRepositoryLinks	Grants permission to list repository links	List			
ListRepositorySyncDefinitions	Grants permission to list repository sync definitions	List			
ListSyncConfigurations	Grants permission to list sync configurations for a repository link	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTagsForResource	Grants permission to the set of key-value pairs that are used to manage the resource	List	Connection		
			Host		
			RepositoryLink		
PassConnection [permission only]	Grants permission to pass a Connection resource to an AWS service that accepts a Connection ARN as input, such as codepipeline:CreatePipeline	Read	Connection*		
				codeconnections:PassedToService	
PassRepository [permission only]	Grants permission to pass a repository link resource to an AWS service that accepts a RepositoryLinkId as input, such as codeconnections:CreateSyncConfiguration	Read	RepositoryLink*		
				codeconnections:PassedToService	
RegisterAppCode [permission only]	Grants permission to associate a third party server, such as a GitHub Enterprise Server instance, with a Host	Read		codeconnections:HostArn	
StartAppRegistrationHandshake [permission only]	Grants permission to associate a third party server, such as a GitHub Enterprise Server instance, with a Host	Read		codeconnections:HostArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartOAuthHandshake [permission only]	Grants permission to associate a third party, such as a Bitbucket App installation, with a Connection	Read		codeconnections:ProviderType	
TagResource	Grants permission to add or modify the tags of the given resource	Tagging	Connection		
			Host		
			RepositoryLink		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove tags from an AWS resource	Tagging	Connection		
			Host		
			RepositoryLink		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateConnectionInstallation	Grants permission to update a Connection resource with an installation of the CodeStar Connections App	Write	Connection*		codeconnections:GetIndividualAccessToken codeconnections:GetInstallationUrl codeconnections:ListInstallationTargets codeconnections:StartOAuthHandshake
				codeconnections:InstallationId	
UpdateHost	Grants permission to update a host resource	Write	Host*		
				codeconnections:VpcId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateRepositoryLink	Grants permission to update a repository link	Write	RepositoryLink*		
UpdateSyncBlocker	Grants permission to update a sync blocker for a resource (cfn stack or other resources)	Write			
UpdateSyncConfiguration	Grants permission to update a sync configuration	Write		codeconnections:Branch	
UseConnection [permission only]	Grants permission to use a Connection resource to call provider actions	Read	Connection*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				codeconnections:BranchName codeconnections:FullRepositoryId codeconnections:OwnerId codeconnections:ProviderAction codeconnections:ProviderPermissionsRequired codeconnections:RepositoryName	

Resource types defined by AWS CodeConnections

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types

that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Connection	`arn:${Partition}:codeconnections:${Region}:${Account}:connection/${ConnectionId}`	aws:ResourceTag/${TagKey}
Host	`arn:${Partition}:codeconnections:${Region}:${Account}:host/${HostId}`	aws:ResourceTag/${TagKey}
RepositoryLink	`arn:${Partition}:codeconnections:${Region}:${Account}:repository-link/${RepositoryLinkId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS CodeConnections

AWS CodeConnections defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String

Condition keys	Description	Type
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
codeconnections:Branch	Filters access by the branch name that is passed in the request	String
codeconnections:BranchName	Filters access by the branch name that is passed in the request. Applies only to UseConnection requests for access to a specific repository branch	String
codeconnections:FullRepositoryId	Filters access by the repository that is passed in the request. Applies only to UseConnection requests for access to a specific repository	String
codeconnections:HostArn	Filters access by the host resource associated with the connection used in the request	ARN
codeconnections:InstallationId	Filters access by the third-party ID (such as the Bitbucket App installation ID for CodeConnections) that is used to update a Connection. Allows you to restrict which third-party App installations can be used to make a Connection	String
codeconnections:OwnerId	Filters access by the owner of the third-party repository. Applies only to UseConnection requests for access to repositories owned by a specific user	String
codeconnections:PassedToService	Filters access by the service to which the principal is allowed to pass a Connection or RepositoryLink	String
codeconnections:ProviderAction	Filters access by the provider action in a UseConnection request such as ListRepositories. See documentation for all valid values	String

Condition keys	Description	Type
codeconnections:ProviderPermissionsRequired	Filters access by the write permissions of a provider action in a UseConnection request. Valid types include read_only and read_write	String
codeconnections:ProviderType	Filters access by the type of third-party provider passed in the request	String
codeconnections:ProviderTypeFilter	Filters access by the type of third-party provider used to filter results	String
codeconnections:RepositoryName	Filters access by the repository name that is passed in the request. Applies only to UseConnection requests for access to repositories owned by a specific user	String
codeconnections:VpcId	Filters access by the VpcId passed in the request	String

Actions, resources, and condition keys for AWS CodeDeploy

AWS CodeDeploy (service prefix: `codedeploy`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS CodeDeploy

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddTagsToOnPremisesInstances	Grants permission to add tags to one or more on-premises instances	Tagging	instance*		
BatchGetApplicationRevisions	Grants permission to get information about one or more application revisions	Read	application*		
BatchGetApplications	Grants permission to get information about multiple applications associated with the IAM user	Read	application*		
BatchGetDeploymentGroups	Grants permission to get information about one or more deployment groups	Read	deploymentgroup*		
BatchGetDeploymentInstances	Grants permission to get information about one or more instance that are part of a deployment group	Read	deploymentgroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetDeploymentTargets	Grants permission to return an array of one or more targets associated with a deployment. This method works with all compute types and should be used instead of the deprecated BatchGetDeploymentInstances. The maximum number of targets that can be returned is 25	Read			
BatchGetDeployments	Grants permission to get information about multiple deployments associated with the IAM user	Read	deploymentgroup*		
BatchGetOnPremisesInstances	Grants permission to get information about one or more on-premises instances	Read	instance*		
ContinueDeployment	Grants permission to start the process of rerouting traffic from instances in the original environment to instances in thereplacement environment without waiting for a specified wait time to elapse	Write			
CreateApplication	Grants permission to create an application associated with the IAM user	Write	application*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateCloudFormationDeployment [permission only]	Grants permission to create CloudFormation deployment to cooperate ochestration for a CloudFormation stack update	Write			
CreateDeployment	Grants permission to create a deployment for an application associated with the IAM user	Write	deploymentgroup*		
CreateDeploymentConfig	Grants permission to create a custom deployment configuration associated with the IAM user	Write	deploymentconfig*		
CreateDeploymentGroup	Grants permission to create a deployment group for an application associated with the IAM user	Write	deploymentgroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteApplication	Grants permission to delete an application associated with the IAM user	Write	application*		
DeleteDeploymentConfig	Grants permission to delete a custom deployment configuration associated with the IAM user	Write	deploymentconfig*		
DeleteDeploymentGroup	Grants permission to delete a deployment group for an application associated with the IAM user	Write	deploymentgroup*		
DeleteGitHubAccountToken	Grants permission to delete a GitHub account connection	Write			
DeleteResourcesByExternalId	Grants permission to delete resources associated with the given external Id	Write			
DeregisterOnPremisesInstance	Grants permission to deregister an on-premises instance	Write	instance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetApplication	Grants permission to get information about a single application associated with the IAM user	List	application*		
GetApplicationRevision	Grants permission to get information about a single application revision for an application associated with the IAM user	List	application*		
GetDeployment	Grants permission to get information about a single deployment to a deployment group for an application associated with the IAM user	List	deploymentgroup*		
GetDeploymentConfig	Grants permission to get information about a single deployment configuration associated with the IAM user	List	deploymentconfig*		
GetDeploymentGroup	Grants permission to get information about a single deployment group for an application associated with the IAM user	List	deploymentgroup*		
GetDeploymentInstance	Grants permission to get information about a single instance in a deployment associated with the IAM user	List	deploymentgroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDeploymentTarget	Grants permission to return information about a deployment target	Read			
GetOnPremisesInstance	Grants permission to get information about a single on-premises instance	List	instance*		
ListApplicationRevisions	Grants permission to get information about all application revisions for an application associated with the IAM user	List	application*		
ListApplications	Grants permission to get information about all applications associated with the IAM user	List			
ListDeploymentConfigs	Grants permission to get information about all deployment configurations associated with the IAM user	List			
ListDeploymentGroups	Grants permission to get information about all deployment groups for an application associated with the IAM user	List	application*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDeploymentInstances	Grants permission to get information about all instances in a deployment associated with the IAM user	List	deploymentgroup*		
ListDeploymentTargets	Grants permission to return an array of target IDs that are associated a deployment	List			
ListDeployments	Grants permission to get information about all deployments to a deployment group associated with the IAM user, or to get all deployments associated with the IAM user	List	deploymentgroup*		
ListGitHubAccountTokenNames	Grants permission to list the names of stored connections to GitHub accounts	List			
ListOnPremisesInstances	Grants permission to get a list of one or more on-premises instance names	List			
ListTagsForResource	Grants permission to return a list of tags for the resource identified by a specified ARN. Tags are used to organize and categorize your CodeDeploy resources	List	application		
			deploymentgroup		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutLifecycleEventHookExecutionStatus	Grants permission to notify a lifecycle event hook execution status for associated deployment with the IAM user	Write			
RegisterApplicationRevision	Grants permission to register information about an application revision for an application associated with the IAM user	Write	application*		
RegisterOnPremisesInstance	Grants permission to register an on-premises instance	Write	instance*		
RemoveTagsFromOnPremisesInstances	Grants permission to remove tags from one or more on-premises instances	Tagging	instance*		
SkipWaitTimeForInstanceTermination	Grants permission to override any specified wait time and starts terminating instances immediately after the traffic routing is complete. This action applies to blue-green deployments only	Write			
StopDeployment	Grants permission to stop a deployment	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to associate the list of tags in the input Tags parameter with the resource identified by the ResourceArn input parameter	Tagging	application		
			deploymentgroup		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to disassociate a resource from a list of tags. The resource is identified by the ResourceArn input parameter. The tags are identfied by the list of keys in the TagKeys input parameter	Tagging	application		
			deploymentgroup		
				aws:TagKeys	
UpdateApplication	Grants permission to update an application	Write	application*		
UpdateDeploymentGroup	Grants permission to change information about a single deployment group for an application associated with the IAM user	Write	deploymentgroup*		

Resource types defined by AWS CodeDeploy

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
application	`arn:${Partition}:codedeploy:${Region}:${Account}:application:${ApplicationName}`	aws:ResourceTag/${TagKey}
deploymentconfig	`arn:${Partition}:codedeploy:${Region}:${Account}:deploymentconfig:${DeploymentConfigurationName}`	
deploymentgroup	`arn:${Partition}:codedeploy:${Region}:${Account}:deploymentgroup:${ApplicationName}/${DeploymentGroupName}`	aws:ResourceTag/${TagKey}
instance	`arn:${Partition}:codedeploy:${Region}:${Account}:instance:${InstanceName}`	

Condition keys for AWS CodeDeploy

AWS CodeDeploy defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters actions based on the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters actions based on tag key-value pairs attached to the resource	String
aws:TagKeys	Filters actions based on the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS CodeDeploy secure host commands service

AWS CodeDeploy secure host commands service (service prefix: `codedeploy-commands-secure`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- Condition keys for AWS CodeDeploy secure host commands service

Actions defined by AWS CodeDeploy secure host commands service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDeploymentSpecification	Grants permission to get deployment specification	Read			
PollHostCommand	Grants permission to request host agent commands	Read			
PutHostCommandAcknowledgement	Grants permission to mark host agent commands acknowledged	Write			
PutHostCommandComplete	Grants permission to mark host agent commands completed	Write			

Resource types defined by AWS CodeDeploy secure host commands service

AWS CodeDeploy secure host commands service does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS CodeDeploy secure host commands service, specify `"Resource": "*"` in your policy.

Condition keys for AWS CodeDeploy secure host commands service

CodeDeploy Commands Secure has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon CodeGuru

Amazon CodeGuru (service prefix: `codeguru`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon CodeGuru

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCodeGuruFreeTrialSummary [permission only]	Grants permission to get free trial summary for the CodeGuru service which includes expiration date	Read			

Resource types defined by Amazon CodeGuru

Amazon CodeGuru does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon CodeGuru, specify `"Resource": "*"` in your policy.

Condition keys for Amazon CodeGuru

CodeGuru has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon CodeGuru Profiler

Amazon CodeGuru Profiler (service prefix: `codeguru-profiler`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon CodeGuru Profiler

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which

the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddNotificationChannels	Grants permission to add up to 2 topic ARNs of existing AWS SNS topics to publish notifications	Write	Profiling Group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetFrameMetricData	Grants permission to get the frame metric data for a Profiling Group	List	Profiling Group*		
ConfigureAgent	Grants permission to register with the orchestration service and retrieve profiling configuration information, used by agents	Write	Profiling Group*		
CreateProfilingGroup	Grants permission to create a profiling group	Write		aws:TagKeys aws:RequestTag/${TagKey}	
DeleteProfilingGroup	Grants permission to delete a profiling group	Write	Profiling Group*		
DescribeProfilingGroup	Grants permission to describe a profiling group	Read	Profiling Group*		
GetFindingsReportAccountSummary	Grants permission to get a summary of recent recommendations for each profiling group in the account	Read			
GetNotificationConfiguration	Grants permission to get the notification configuration	Read	Profiling Group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetPolicy	Grants permission to get the resource policy associated with the specified Profiling Group	Read	Profiling Group*		
GetProfile	Grants permission to get aggregated profiles for a specific profiling group	Read	Profiling Group*		
GetRecommendations	Grants permission to get recommendations	Read	Profiling Group*		
ListFindingsReports	Grants permission to list the available recommendations reports for a specific profiling group	List	Profiling Group*		
ListProfileTimes	Grants permission to list the start times of the available aggregated profiles for a specific profiling group	List	Profiling Group*		
ListProfilingGroups	Grants permission to list profiling groups in the account	List			
ListTagsForResource	Grants permission to list tags for a Profiling Group	List	Profiling Group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PostAgentProfile	Grants permission to submit a profile collected by an agent belonging to a specific profiling group for aggregation	Write	Profiling Group*		
PutPermission	Grants permission to update the list of principals allowed for an action group in the resource policy associated with the specified Profiling Group	Permissions management	Profiling Group*		
RemoveNotificationChannel	Grants permission to delete an already configured SNStopic arn from the notification configuration	Write	Profiling Group*		
RemovePermission	Grants permission to remove the permission of specified Action Group from the resource policy associated with the specified Profiling Group	Permissions management	Profiling Group*		
SubmitFeedback	Grants permission to submit user feedback for useful or non useful anomaly	Write	Profiling Group*		
TagResource	Grants permission to add or overwrite tags to a Profiling Group	Tagging	Profiling Group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove tags from a Profiling Group	Tagging	Profiling Group*		
				aws:TagKeys	
UpdateProfilingGroup	Grants permission to update a specific profiling group	Write	Profiling Group*		

Resource types defined by Amazon CodeGuru Profiler

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Profiling Group	`arn:${Partition}:codeguru-profiler:${Region}:${Account}:profilingGroup/${ProfilingGroupName}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon CodeGuru Profiler

Amazon CodeGuru Profiler defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon CodeGuru Reviewer

Amazon CodeGuru Reviewer (service prefix: `codeguru-reviewer`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon CodeGuru Reviewer

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Associate Repository	Grants permission to associates a repository with Amazon CodeGuru Reviewer	Write		aws:RequestTag/${TagKey} aws:TagKeys	codecommit:GetRepository codecommit:ListRepositories codecommit:TagResource codestar-connections:PassConnection events:PutRule events:PutTargets iam:CreateServiceLinkedRole

Actions defined by AWS CodePipeline

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcknowledgeJob	Grants permission to view information about a specified job and whether that job has been received by the job worker	Write			
AcknowledgeThirdPartyJob	Grants permission to confirm that a job worker has received the specified job (partner actions only)	Write			
CreateCustomActionType	Grants permission to create a custom action that you can use in the pipelines associated with your AWS account	Write	actiontype*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreatePipeline	Grants permission to create a uniquely named pipeline	Write	pipeline*		
				aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
DeleteCustomActionType	Grants permission to delete a custom action	Write	actiontype*		
DeletePipeline	Grants permission to delete a specified pipeline	Write	pipeline*		
DeleteWebhook	Grants permission to delete a specified webhook	Write	webhook*		
DeregisterWebhookWithThirdParty	Grants permission to remove the registration of a webhook with the third party specified in its configuration	Write	webhook*		
DisableStageTransition	Grants permission to prevent revisions from transitioning to the next stage in a pipeline	Write	stage*		
EnableStageTransition	Grants permission to allow revisions to transition to the next stage in a pipeline	Write	stage*		
GetActionType	Grants permission to view information about an action type	Read			
GetJobDetails	Grants permission to view information about a job (custom actions only)	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetPipeline	Grants permission to retrieve information about a pipeline structure	Read	pipeline*		
GetPipelineExecution	Grants permission to view information about an execution of a pipeline, including details about artifacts, the pipeline execution ID, and the name, version, and status of the pipeline	Read	pipeline*		
GetPipelineState	Grants permission to view information about the current state of the stages and actions of a pipeline	Read	pipeline*		
GetThirdPartyJobDetails	Grants permission to view the details of a job for a third-party action (partner actions only)	Read			
ListActionExecutions	Grants permission to list the action executions that have occurred in a pipeline	Read	pipeline*		
ListActionTypes	Grants permission to list a summary of all the action types available for pipelines in your account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDeployActionExecutionTargets	Grants permission to list the deployment details for deploy action executions that have occurred in a pipeline	Read	pipeline*		
ListPipelineExecutions	Grants permission to list a summary of the most recent executions for a pipeline	List	pipeline*		
ListPipelines	Grants permission to list a summary of all the pipelines associated with your AWS account	List			
ListRuleExecutions	Grants permission to list the rule executions that have occurred in a pipeline	Read	pipeline*		
ListRuleTypes	Grants permission to list a summary of all the rule types available for pipelines in your account	Read			
ListTagsForResource	Grants permission to list tags for a CodePipeline resource	Read	actiontype		
			pipeline		
			webhook		
ListWebhooks	Grants permission to list all of the webhooks associated with your AWS account	List	webhook*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
OverrideStageCondition	Grants permission to resume the pipeline execution by overriding a condition in a stage	Write	stage*		
PollForJobs	Grants permission to view information about any jobs for CodePipeline to act on	Write	actiontype*		
PollForThirdPartyJobs	Grants permission to determine whether there are any third-party jobs for a job worker to act on (partner actions only)	Write			
PutActionRevision	Grants permission to edit actions in a pipeline	Write	action*		
PutApprovalResult	Grants permission to provide a response (Approved or Rejected) to a manual approval request in CodePipeline	Write	action*		
PutJobFailureResult	Grants permission to represent the failure of a job as returned to the pipeline by a job worker (custom actions only)	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutJobSuccessResult	Grants permission to represent the success of a job as returned to the pipeline by a job worker (custom actions only)	Write			
PutThirdPartyJobFailureResult	Grants permission to represent the failure of a third-party job as returned to the pipeline by a job worker (partner actions only)	Write			
PutThirdPartyJobSuccessResult	Grants permission to represent the success of a third-party job as returned to the pipeline by a job worker (partner actions only)	Write

RetryStageExecution	Grants permission to resume the pipeline execution by retrying the last failed actions in a stage	Write	stage*		
RollbackStage	Grants permission to rollback the stage to a previous successful execution	Write	stage*		
StartPipelineExecution	Grants permission to run the most recent revision through the pipeline	Write	pipeline*		
StopPipelineExecution	Grants permission to stop an in-progress pipeline execution	Write	pipeline*		
TagResource	Grants permission to tag a CodePipeline resource	Tagging	actiontype		
			pipeline		
			webhook		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove a tag from a CodePipeline resource	Tagging	actiontype		
			pipeline		
			webhook		
				aws:TagKeys	
UpdateActionType	Grants permission to update an action type	Write	actiontype*		
UpdatePipeline	Grants permission to update a pipeline with changes to the structure of the pipeline	Write	pipeline*		

Resource types defined by AWS CodePipeline

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
action	arn:${Partition}:codepipeline:${Region}:${Account}:${PipelineName}/${StageName}/${ActionName}	aws:ResourceTag/${TagKey}
actiontype	arn:${Partition}:codepipeline:${Region}:${Account}:actiontype:${Owner}/${Category}/${Provider}/${Version}	aws:ResourceTag/${TagKey}
pipeline	arn:${Partition}:codepipeline:${Region}:${Account}:${PipelineName}	aws:ResourceTag/${TagKey}
stage	arn:${Partition}:codepipeline:${Region}:${Account}:${PipelineName}/${StageName}	aws:ResourceTag/${TagKey}
webhook	arn:${Partition}:codepipeline:${Region}:${Account}:webhook:${WebhookName}	aws:ResourceTag/${TagKey}

Condition keys for AWS CodePipeline

AWS CodePipeline defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters actions based on the presence of tag key-value pairs in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters actions based on tag key-value pairs attached to the resource	String
aws:TagKeys	Filters actions based on the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS CodeStar

AWS CodeStar (service prefix: `codestar`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS CodeStar

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of

access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateTeamMember	Grants permission to add a user to the team for an AWS CodeStar project	Permissions management	project*		
CreateProject	Grants permission to create a project with minimal structure, customer policies, and no resources	Permissions management		aws:RequestTag/${TagKey} aws:TagKeys	
CreateUserProfile	Grants permission to create a profile for a user that includes user preferences, display name, and email	Write	user*		
DeleteExtendedAccess [permission only]	Grants permission to extended delete APIs	Write	project*		
DeleteProject	Grants permission to delete a project, including project resources. Does not delete users associated with the project, but does delete the IAM roles that allowed access to the project	Permissions management	project*		
DeleteUserProfile	Grants permission to delete a user profile in AWS CodeStar,	Write	user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	including all personal preference data associated with that profile, such as display name and email address. It does not delete the history of that user, for example the history of commits made by that user				
DescribeProject	Grants permission to describe a project and its resources	Read	project*		
DescribeUserProfile	Grants permission to describe a user in AWS CodeStar and the user attributes across all projects	Read			
DisassociateTeamMember	Grants permission to remove a user from a project. Removing a user from a project also removes the IAM policies from that user that allowed access to the project and its resources	Permissions management	project*		
GetExtendedAccess [permission only]	Grants permission to extended read APIs	Read	project*		
ListProjects	Grants permission to list all projects in CodeStar associated with your AWS account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListResources	Grants permission to list all resources associated with a project in CodeStar	List	project*		
ListTagsForProject	Grants permission to list the tags associated with a project in CodeStar	List	project*		
ListTeamMembers	Grants permission to list all team members associated with a project	List	project*		
ListUserProfiles	Grants permission to list user profiles in AWS CodeStar	List			
PutExtendedAccess [permission only]	Grants permission to extended write APIs	Write	project*		
TagProject	Grants permission to add tags to a project in CodeStar	Tagging	project*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagProject	Grants permission to remove tags from a project in CodeStar	Tagging	project*		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateProject	Grants permission to update a project in CodeStar	Write	project*		
UpdateTeamMember	Grants permission to update team member attributes within a CodeStar project	Permissions management	project*		
UpdateUserProfile	Grants permission to update a profile for a user that includes user preferences, display name, and email	Write	user*		
VerifyServiceRole	Grants permission to verify whether the AWS CodeStar service role exists in the customer's account	List			

Resource types defined by AWS CodeStar

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
project	`arn:${Partition}:codestar:${Region}:${Account}:project/${ProjectId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
user	arn:${Partition}:iam::${Account}:user/${AwsUserName}	iam:ResourceTag/${TagKey}

Condition keys for AWS CodeStar

AWS CodeStar defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by requests based on the allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters access by actions based on tag-value associated with the resource	String
aws:TagKeys	Filters access by requests based on the presence of mandatory tags in the request	ArrayOfString
iam:ResourceTag/${TagKey}	Filters access by actions based on tag-value associated with the resource	String

Actions, resources, and condition keys for AWS CodeStar Connections

AWS CodeStar Connections (service prefix: codestar-connections) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS CodeStar Connections

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateConnection	Grants permission to create a Connection resource	Write		aws:RequestTag/${TagKey} aws:TagKeys codestar-connections:ProviderType	
CreateHost	Grants permission to create a host resource	Write		aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys codestar-connections:ProviderType codestar-connections:VpcId	
CreateRepositoryLink	Grants permission to create a repository link	Write	Connection*		codestar-connections:PassConnection codestar-connections:UseConnection
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSyncConfiguration	Grants permission to create a template sync config	Write	RepositoryLink*		codestar-connections:PassRepository iam:PassRole
				codestar-connections:Branch	
DeleteConnection	Grants permission to delete a Connection resource	Write	Connection*		
DeleteHost	Grants permission to delete a host resource	Write	Host*		
DeleteRepositoryLink	Grants permission to delete a repository link	Write	RepositoryLink*		
DeleteSyncConfiguration	Grants permission to delete a sync configuration	Write			
GetConnection	Grants permission to get details about a Connection resource	Read	Connection*		
GetConnectionToken [permission only]	Grants permission to get a Connection token to call provider actions	Read	Connection*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetHost	Grants permission to get details about a host resource	Read	Host*		
GetIndividualAccessToken [permission only]	Grants permission to associate a third party, such as a Bitbucket App installation, with a Connection	Read		codestar-connections:ProviderType	codestar-connections:StartOAuthHandshake
GetInstallationUrl [permission only]	Grants permission to associate a third party, such as a Bitbucket App installation, with a Connection	Read		codestar-connections:ProviderType	
GetRepositoryLink	Grants permission to describe a repository link	Read	RepositoryLink*		
GetRepositorySyncStatus	Grants permission to get the latest sync status for a repository	Read	RepositoryLink*		
				codestar-connections:Branch	
GetResourceSyncStatus	Grants permission to get the latest sync status for a resource (cfn stack or other resources)	Read			
GetSyncBlockerSummary	Grants permission to describe service sync blockers on a resource (cfn stack or other resources)	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSyncConfiguration	Grants permission to describe a sync configuration	Read			
ListConnections	Grants permission to list Connection resources	List	Connection*		
				codestar-connections:ProviderTypeFilter	
ListHosts	Grants permission to list host resources	List		codestar-connections:ProviderTypeFilter	
ListInstallationTargets [permission only]	Grants permission to associate a third party, such as a Bitbucket App installation, with a Connection	List			codestar-connections:GetIndividualAccessToken codestar-connections:StartOAuthHandshake
ListRepositoryLinks	Grants permission to list repository links	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListRepositorySyncDefinitions	Grants permission to list repository sync definitions	List			
ListSyncConfigurations	Grants permission to list sync configurations for a repository link	List			
ListTagsForResource	Grants permission to the set of key-value pairs that are used to manage the resource	List	Connection		
			Host		
			RepositoryLink		
PassConnection [permission only]	Grants permission to pass a Connection resource to an AWS service that accepts a Connection ARN as input, such as codepipeline:CreatePipeline	Read	Connection*		
				codestar-connections:PassedToService	
PassRepository [permission only]	Grants permission to pass a repository link resource to an AWS service that accepts a RepositoryLinkId as input, such as codestar-connections:CreateSyncConfiguration	Read	RepositoryLink*		
				codestar-connections:PassedToService	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RegisterAppCode [permission only]	Grants permission to associate a third party server, such as a GitHub Enterprise Server instance, with a Host	Read		codestar-connections:HostArn	
StartAppRegistrationHandshake [permission only]	Grants permission to associate a third party server, such as a GitHub Enterprise Server instance, with a Host	Read		codestar-connections:HostArn	
StartOAuthHandshake [permission only]	Grants permission to associate a third party, such as a Bitbucket App installation, with a Connection	Read		codestar-connections:ProviderType	
TagResource	Grants permission to add or modify the tags of the given resource	Tagging	Connection		
			Host		
			RepositoryLink		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove tags from an AWS resource	Tagging	Connection		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			Host		
			RepositoryLink		
				aws:TagKeys	
UpdateConnectionInstallation	Grants permission to update a Connection resource with an installation of the CodeStar Connections App	Write	Connection*		codestar-connections:GetIndividualAccessToken codestar-connections:GetInstallationUrl codestar-connections:ListInstallationTargets codestar-connections:StartOAuthHandshake

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

UseConnection [permission only]	Grants permission to use a Connection resource to call provider actions	Read	Connection*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				codestar-connections:BranchName codestar-connections:FullRepositoryId codestar-connections:OwnerId codestar-connections:ProviderAction codestar-connections:ProviderPermissionsRequired codestar-connections:RepositoryName	

Resource types defined by AWS CodeStar Connections

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Connection	`arn:${Partition}:codestar-connections:${Region}:${Account}:connection/${ConnectionId}`	aws:ResourceTag/${TagKey}
Host	`arn:${Partition}:codestar-connections:${Region}:${Account}:host/${HostId}`	aws:ResourceTag/${TagKey}
RepositoryLink	`arn:${Partition}:codestar-connections:${Region}:${Account}:repository-link/${RepositoryLinkId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS CodeStar Connections

AWS CodeStar Connections defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
codestar-connections:Branch	Filters access by the branch name that is passed in the request	String
codestar-connections:BranchName	Filters access by the branch name that is passed in the request. Applies only to UseConnection requests for access to a specific repository branch	String
codestar-connections:FullRepositoryId	Filters access by the repository that is passed in the request. Applies only to UseConnection requests for access to a specific repository	String
codestar-connections:HostArn	Filters access by the host resource associated with the connection used in the request	ARN
codestar-connections:InstallationId	Filters access by the third-party ID (such as the Bitbucket App installation ID for CodeStar Connections) that is used to update a Connection. Allows you to restrict which third-party App installations can be used to make a Connection	String
codestar-connections:OwnerId	Filters access by the owner of the third-party repository. Applies only to UseConnection requests for access to repositories owned by a specific user	String

Condition keys	Description	Type
codestar-connections:PassedToService	Filters access by the service to which the principal is allowed to pass a Connection or RepositoryLink	String
codestar-connections:ProviderAction	Filters access by the provider action in a UseConnection request such as ListRepositories. See documentation for all valid values	String
codestar-connections:ProviderPermissionsRequired	Filters access by the write permissions of a provider action in a UseConnection request. Valid types include read_only and read_write	String
codestar-connections:ProviderType	Filters access by the type of third-party provider passed in the request	String
codestar-connections:ProviderTypeFilter	Filters access by the type of third-party provider used to filter results	String
codestar-connections:RepositoryName	Filters access by the repository name that is passed in the request. Applies only to UseConnection requests for access to repositories owned by a specific user	String
codestar-connections:VpcId	Filters access by the VpcId passed in the request	String

Actions, resources, and condition keys for AWS CodeStar Notifications

AWS CodeStar Notifications (service prefix: `codestar-notifications`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS CodeStar Notifications

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateNotificationRule	Grants permission to create a notification rule for a resource	Write	notificationrule*		
				aws:RequestTag/${TagKey} aws:ResourceTag/

Actions defined by Amazon CodeWhisperer

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AllowVendedLogDeliveryForResource [permission only]	Grants permission to configure vended log delivery for CodeWhisperer customization resource	Permissions management	customization*		
				aws:ResourceTag/${TagKey}	
AssociateCustomizationPermi	Grants permission to invoke AssociateCustomizationPermission on CodeWhisperer	Write	customization*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ssion [permission only]				aws:ResourceTag/${TagKey}	
CreateCustomization [permission only]	Grants permission to invoke CreateCustomization on CodeWhisperer	Write	customization*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateProfile [permission only]	Grants permission to invoke CreateProfile on CodeWhisperer	Write	profile*		
				aws:TagKeys aws:RequestTag/${TagKey}	
DeleteCustomization [permission only]	Grants permission to invoke DeleteCustomization on CodeWhisperer	Write	customization*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteProfile [permission only]	Grants permission to invoke DeleteProfile on CodeWhisperer	Write	profile*		
				aws:ResourceTag/${TagKey}	
DisassociateCustomizationPermission [permission only]	Grants permission to invoke DisassociateCustomizationPermission on CodeWhisperer	Write	customization*		
				aws:ResourceTag/${TagKey}	
GenerateRecommendations [permission only]	Grants permission to invoke GenerateRecommendations on CodeWhisperer	Read			
GetCustomization [permission only]	Grants permission to invoke GetCustomization on CodeWhisperer	Read	customization*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListCustomizationPermissions [permission only]	Grants permission to invoke ListCustomizationPermissions on CodeWhisperer	List	customization*		
				aws:ResourceTag/${TagKey}	
ListCustomizationVersions [permission only]	Grants permission to invoke ListCustomizationVersions on CodeWhisperer	List	customization*		
				aws:ResourceTag/${TagKey}	
ListCustomizations [permission only]	Grants permission to invoke ListCustomizations on CodeWhisperer	List	customization*		
ListProfiles [permission only]	Grants permission to invoke ListProfiles on CodeWhisperer	List			
ListTagsForResource [permission only]	Grants permission to invoke ListTagsForResource on CodeWhisperer	List	customization		
			profile		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource [permission only]	Grants permission to invoke TagResource on CodeWhisperer	Tagging	customization		
			profile		
				aws:ResourceTag/${TagKey} aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource [permission only]	Grants permission to invoke UntagResource on CodeWhisperer	Tagging	customization		
			profile		
				aws:ResourceTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateCustomization [permission only]	Grants permission to invoke UpdateCustomization on CodeWhisperer	Write	customization*		
				aws:ResourceTag/${TagKey}	
UpdateProfile [permission only]	Grants permission to invoke UpdateProfile on CodeWhisperer	Write	profile*		
				aws:ResourceTag/${TagKey}	

Resource types defined by Amazon CodeWhisperer

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
profile	`arn:${Partition}:codewhisperer:${Region}:${Account}:profile/${Identifier}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
customization	arn:${Partition}:codewhisperer:${Region}:${Account}:customization/${Identifier}	aws:ResourceTag/${TagKey}

Condition keys for Amazon CodeWhisperer

Amazon CodeWhisperer defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with CodeWhisperer resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Cognito Identity

Amazon Cognito Identity (service prefix: cognito-identity) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon Cognito Identity

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateIdentityPool	Grants permission to create a new identity pool	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteIdentities	Grants permission to delete identities from an identity pool. You can specify a list of 1-60 identities that you want to delete	Write		cognito-identity:IdentityPoolArn	
DeleteIdentityPool	Grants permission to delete a user pool. Once a pool is	Write	identitypool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	deleted, users will not be able to authenticate with the pool				
DescribeIdentity	Grants permission to return metadata related to the given identity, including when the identity was created and any associated linked logins	Read		cognito-identity:IdentityPoolArn	
DescribeIdentityPool	Grants permission to get details about a particular identity pool, including the pool name, ID description, creation date, and current number of users	Read	identitypool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCredentialsForIdentity	Grants permission to return credentials for the provided identity ID	Read		cognito-identity-unauth:IdentityPoolArn cognito-identity-unauth:AccountId cognito-identity-auth:IdentityPoolArn cognito-identity-auth:AccountId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetId	Grants permission to generate (or retrieve) a Cognito ID. Supplying multiple logins will create an implicit linked account	Write		cognito-identity-unauth:IdentityPoolArn cognito-identity-unauth:AccountId cognito-identity-auth:IdentityPoolArn cognito-identity-auth:AccountId	
GetIdentityPoolAnalytics	Grants permission to get analytics data about the total current identity count for all identity pool identity provider (IdPs)	Read	identitypool*		
GetIdentityPoolDailyAnalytics	Grants permission to get analytics data about the number of new identities and total identities for all identity pool identity providers (IdPs)	Read	identitypool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetIdentityPoolRoles	Grants permission to get the roles for an identity pool	Read	identitypool*		
GetIdentityProviderDailyAnalytics	Grants permission to get analytics data about the number of new identities and total identities for one identity pool identity provider (IdPs)	Read	identitypool*		
GetOpenIdToken	Grants permission to get an OpenID token, using a known Cognito ID	Read		cognito-identity-unauth:IdentityPoolArn cognito-identity-unauth:AccountId cognito-identity-auth:IdentityPoolArn cognito-identity-auth:AccountId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetOpenIdTokenForDeveloperIdentity	Grants permission to register (or retrieve) a Cognito IdentityId and an OpenID Connect token for a user authenticated by your backend authentication process	Read	identitypool*		
GetPrincipalTagAttributeMap	Grants permission to get the principal tags for an identity pool and provider	Read	identitypool*		
ListIdentities	Grants permission to list the identities in an identity pool	List	identitypool*		
ListIdentityPools	Grants permission to list all of the Cognito identity pools registered for your account	List			
ListTagsForResource	Grants permission to list the tags that are assigned to an Amazon Cognito identity pool	Read	identitypool		
LookupDeveloperIdentity	Grants permission to retrieve the IdentityId associated with a DeveloperUserIdentifier or the list of DeveloperUserIdentifiers associated with an IdentityId for an existing identity	Read	identitypool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
MergeDeveloperIdentities	Grants permission to merge two users having different IdentityIds, existing in the same identity pool, and identified by the same developer provider	Write	identitypool*		
SetIdentityPoolRoles	Grants permission to set the roles for an identity pool. These roles are used when making calls to GetCredentialsForIdentity action	Write			
SetPrincipalTagAttributeMap	Grants permission to set the principal tags for an identity pool and provider. These tags are used when making calls to GetOpenIdToken action	Write			
TagResource	Grants permission to assign a set of tags to an Amazon Cognito identity pool	Tagging	identitypool*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UnlinkDeveloperIdentity	Grants permission to unlink a DeveloperUserIdentifier from an existing identity	Write	identitypool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UnlinkIdentity	Grants permission to unlink a federated identity from an existing account	Write		cognito-identity-auth:IdentityPoolArn cognito-identity-auth:AccountId	
UntagResource	Grants permission to remove the specified tags from an Amazon Cognito identity pool	Tagging	identitypool*		
				aws:TagKeys	
UpdateIdentityPool	Grants permission to update an identity pool	Write	identitypool*		

Resource types defined by Amazon Cognito Identity

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
identitypool	`arn:${Partition}:cognito-identity:${Region}:${Account}:identitypool/${IdentityPoolId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Cognito Identity

Amazon Cognito Identity defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by a key that is present in the request	ArrayOfString
cognito-identity-auth:AccountId	Filters access by the owning AWS account ID for identity pool authenticated users. Applies to unauthenticated (public) API operations	String
cognito-identity-auth:IdentityPoolArn	Filters access by the identity pool ID for a given authenticated-user identity ID. Applies to unauthenticated (public) API operations	ARN

Condition keys	Description	Type
cognito-identity-unauth:AccountId	Filters access by the owning AWS account ID of an identity pool for identity pool guest users. Applies to unauthenticated (public) API operations	String
cognito-identity-unauth:IdentityPoolArn	Filters access by the identity pool ID for a given guest-user identity ID. Applies to unauthenticated (public) API operations	ARN
cognito-identity:IdentityPoolArn	Filters access by the identity pool ID for a given identity ID for DeleteIdentities and DescribeIdentity	ARN

Actions, resources, and condition keys for Amazon Cognito Sync

Amazon Cognito Sync (service prefix: `cognito-sync`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon Cognito Sync

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BulkPublish	Grants permission to initiate a bulk publish of all existing datasets for an Identity Pool to the configured stream	Write	identitypool*		
DeleteDataset	Grants permission to delete a specific dataset	Write	dataset*		
DescribeDataset	Grants permission to get metadata about a dataset by identity and dataset name	Read	dataset*		
DescribeIdentityPoolUsage	Grants permission to get usage details (for example, data storage) about a particular identity pool	Read	identitypool*		
DescribeIdentityUsage	Grants permission to get usage information for an identity, including number of datasets and data usage	Read	identity*		
GetBulkPublishDetails	Grants permission to get the status of the last BulkPublish operation for an identity pool	Read	identitypool*		
GetCognitoEvents	Grants permission to get the events and the corresponding Lambda functions associated with an identity pool	Read	identitypool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetIdentityPoolConfiguration	Grants permission to get the configuration settings of an identity pool	Read	identitypool*		
ListDatasets	Grants permission to list datasets for an identity	List	dataset*		
ListIdentityPoolUsage	Grants permission to get a list of identity pools registered with Cognito	Read	identitypool*		
ListRecords	Grants permission to get paginated records, optionally changed after a particular sync count for a dataset and identity	Read	dataset*		
QueryRecords [permission only]	Grants permission to query records	Read			
RegisterDevice	Grants permission to register a device to receive push sync notifications	Write	identity*		
SetCognitoEvents	Grants permission to set the AWS Lambda function for a given event type for an identity pool	Write	identitypool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SetDatasetConfiguration [permission only]	Grants permission to configure datasets	Write	dataset*		
SetIdentityPoolConfiguration	Grants permission to set the necessary configuration for push sync	Write	identitypool*		
SubscribeToDataset	Grants permission to subscribe to receive notifications when a dataset is modified by another device	Write	dataset*		
UnsubscribeFromDataset	Grants permission to unsubscribe from receiving notifications when a dataset is modified by another device	Write	dataset*		
UpdateRecords	Grants permission to post updates to records and add and delete records for a dataset and user	Write	dataset*		

Resource types defined by Amazon Cognito Sync

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
dataset	`arn:${Partition}:cognito-sync:${Region}:${Account}:identitypool/${IdentityPoolId}/identity/${IdentityId}/dataset/${DatasetName}`	
identity	`arn:${Partition}:cognito-sync:${Region}:${Account}:identitypool/${IdentityPoolId}/identity/${IdentityId}`	
identitypool	`arn:${Partition}:cognito-sync:${Region}:${Account}:identitypool/${IdentityPoolId}`	

Condition keys for Amazon Cognito Sync

Cognito Sync has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Cognito User Pools

Amazon Cognito User Pools (service prefix: `cognito-idp`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.

Actions defined by Amazon Cognito User Pools

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddCustomAttributes	Grants permission to add user attributes to the user pool schema	Write	userpool*		
AddUserPoolClientSecret	Grants permission to add a new secret to a confidential client	Write	userpool*		
AdminAddUserToGroup	Grants permission to add any user to any group	Write	userpool*		
AdminConfirmSignUp	Grants permission to confirm any user's registration without a confirmation code	Write	userpool*		
AdminCreateUser	Grants permission to create new users and send welcome messages via email or SMS	Write	userpool*		
AdminDeleteUser	Grants permission to delete any user	Write	userpool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AdminDeleteUserAttributes	Grants permission to delete attributes from any user	Write	userpool*		
AdminDisableProviderForUser	Grants permission to unlink any user pool user from a third-party identity provider (IdP) user	Write	userpool*		
AdminDisableUser	Grants permission to deactivate any user	Write	userpool*		
AdminEnableUser	Grants permission to activate any user	Write	userpool*		
AdminForgetDevice	Grants permission to deregister any user's devices	Write	userpool*		
AdminGetDevice	Grants permission to get information about any user's devices	Read	userpool*		
AdminGetUser	Grants permission to look up any user by user name	Read	userpool*		
AdminInitiateAuth	Grants permission to authenticate any user	Write	userpool*		
AdminLinkProviderForUser	Grants permission to link any user pool user to a third-party IdP user	Write	userpool*		
AdminListDevices	Grants permission to list any user's remembered devices	List	userpool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AdminListGroupsForUser	Grants permission to list the groups that any user belongs to	List	userpool*		
AdminListUserAuthEvents	Grants permission to lists sign-in events for any user	Read	userpool*		
AdminRemoveUserFromGroup	Grants permission to remove any user from any group	Write	userpool*		
AdminResetUserPassword	Grants permission to reset any user's password	Write	userpool*		
AdminRespondToAuthChallenge	Grants permission to respond to an authentication challenge during the authentication of any user	Write	userpool*		
AdminSetUserMFAPreference	Grants permission to set any user's preferred MFA method	Write	userpool*		
AdminSetUserPassword	Grants permission to set any user's password	Write	userpool*		
AdminSetUserSettings	Grants permission to set user settings for any user	Write	userpool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AdminUpdateAuthEventFeedback	Grants permission to update advanced security feedback for any user's authentication event	Write	userpool*		
AdminUpdateDeviceStatus	Grants permission to update the status of any user's remembered devices	Write	userpool*		
AdminUpdateUserAttributes	Grants permission to updates any user's standard or custom attributes	Write	userpool*		
AdminUserGlobalSignOut	Grants permission to sign out any user from all sessions	Write	userpool*		
AssociateSoftwareToken	Grants permission to return a unique generated shared secret key code for the user	Write			
AssociateWebACL [permission only]	Grants permission to associate the user pool with an AWS WAF web ACL	Write	userpool* webacl*		
ChangePassword	Grants permission to change the password for a specified user in a user pool	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ConfirmDevice	Grants permission to confirm tracking of the device. This API call is the call that begins device tracking	Write			
ConfirmForgotPassword	Grants permission to allow a user to enter a confirmation code to reset a forgotten password	Write			
ConfirmSignUp	Grants permission to confirm registration of a user and handles the existing alias from a previous user	Write			
CreateGroup	Grants permission to create new user pool groups	Write	userpool*		
CreateIdentityProvider	Grants permission to add identity providers to user pools	Write	userpool*		
CreateManagedLoginBranding	Grants permission to create a branding settings for managed login and associate it with an app client	Write	userpool*		
CreateResourceServer	Grants permission to create and configure scopes for OAuth 2.0 resource servers	Write	userpool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTerms	Grants permission to create terms and associate it with an app client	Write	userpool*		
CreateUserImportJob	Grants permission to create user CSV import jobs	Write	userpool*		
CreateUserPool	Grants permission to create and set password policy for user pools	Write		aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	
CreateUserPoolClient	Grants permission to create user pool app clients	Write	userpool*		
CreateUserPoolDomain	Grants permission to add user pool domains	Write	userpool*		
DeleteGroup	Grants permission to delete any empty user pool group	Write	userpool*		
DeleteIdentityProvider	Grants permission to delete any identity provider from user pools	Write	userpool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteManagedLoginBranding	Grants permission to delete the managed login branding style for any app client	Write	userpool*		
DeleteResourceServer	Grants permission to delete any OAuth 2.0 resource server from user pools	Write	userpool*		
DeleteTerms	Grants permission to delete terms for an app client	Write	userpool*		
DeleteUser	Grants permission to allow a user to delete one's self	Write			
DeleteUserAttributes	Grants permission to delete the attributes for a user	Write			
DeleteUserPool	Grants permission to delete user pools	Write	userpool*		
DeleteUserPoolClient	Grants permission to delete any user pool app client	Write	userpool*		
DeleteUserPoolClientSecret	Grants permission to delete a secret from a list of secrets associated with a client	Write	userpool*		
DeleteUserPoolDomain	Grants permission to delete any user pool domain	Write	userpool*		
DescribeIdentityProvider	Grants permission to describe any user pool identity provider	Read	userpool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeManagedLoginBranding	Grants permission to get the detailed information about the branding style of managed login	Read	userpool*		
DescribeManagedLoginBrandingByClient	Grants permission to get the detailed information about the branding style of managed login associated with an appclient	Read	userpool*		
DescribeResourceServer	Grants permission to describe any OAuth 2.0 resource server	Read	userpool*		
DescribeRiskConfiguration	Grants permission to describe the risk configuration settings of user pools and app clients	Read	userpool*		
DescribeTerms	Grants permission to get the detailed information about terms for an app client	Read	userpool*		
DescribeUserImportJob	Grants permission to describe any user import job	Read	userpool*		
DescribeUserPool	Grants permission to describe user pools	Read	userpool*		
DescribeUserPoolClient	Grants permission to describe any user pool app client	Read	userpool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeUserPoolDomain	Grants permission to describe any user pool domain	Read			
DisassociateWebACL [permission only]	Grants permission to disassociate the user pool with an AWS WAF web ACL	Write	userpool*		
ForgetDevice	Grants permission to forget the specified device	Write			
ForgotPassword	Grants permission to send a message to the end user with a confirmation code that is required to change the user's password	Write			
GetCSVHeader	Grants permission to generate headers for a user import .csv file	Read	userpool*		
GetDevice	Grants permission to get the device	Read			
GetGroup	Grants permission to describe a user pool group	Read	userpool*		
GetIdentityProviderByIdentifier	Grants permission to correlate a user pool IdP identifier to the IdP Name	Read	userpool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetLogDeliveryConfiguration	Grants permission to get the detailed activity logging configuration for a user pool	Read	userpool*		
GetSigningCertificate	Grants permission to look up signing certificates for user pools	Read	userpool*		
GetTokensFromRefreshToken	Grants permission to update user tokens with refresh tokens	Write			
GetUICustomization	Grants permission to get UI customization information for the hosted UI of any app client	Read	userpool*		
GetUser	Grants permission to get the user attributes and metadata for a user	Read			
GetUserAttributeVerificationCode	Grants permission to get the user attribute verification code for the specified attribute name	Read			
GetUserPoolMfaConfig	Grants permission to look up the MFA configuration of user pools	Read	userpool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetWebACLForResource [permission only]	Grants permission to get the AWS WAF web ACL that is associated with an Amazon Cognito user pool	Read	userpool*		
GlobalSignOut	Grants permission to sign out users from all devices	Write			
InitiateAuth	Grants permission to initiate the authentication flow	Write			
ListDevices	Grants permission to list the devices	List			
ListGroups	Grants permission to list all groups in user pools	List	userpool*		
ListIdentityProviders	Grants permission to list all identity providers in user pools	List	userpool*		
ListResourceServers	Grants permission to list all resource servers in user pools	List	userpool*		
ListResourcesForWebACL [permission only]	Grants permission to list the user pools that are associated with an AWS WAF web ACL	List	webacl*		
ListTagsForResource	Grants permission to list the tags that are assigned to an Amazon Cognito user pool	List	userpool		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTerms	Grants permission to list all terms for a user pool	List	userpool*		
ListUserImportJobs	Grants permission to list all user import jobs	List	userpool*		
ListUserPoolClientSecrets	Grants permission to list all secrets associated with a client	List	userpool*		
ListUserPoolClients	Grants permission to list all app clients in user pools	List	userpool*		
ListUserPools	Grants permission to list all user pools	List			
ListUsers	Grants permission to list all user pool users	List	userpool*		
ListUsersInGroup	Grants permission to list the users in any group	List	userpool*		
ResendConfirmationCode	Grants permission to resend the confirmation (for confirmation of registration) to a specific user in the user pool	Write			
RespondToAuthChallenge	Grants permission to respond to the authentication challenge	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RevokeToken	Grants permission to revoke all of the access tokens generated by the specified refresh token	Write			
SetLogDeliveryConfiguration	Grants permission to set up or modify the detailed activity logging configuration of a user pool	Write	userpool*		
SetRiskConfiguration	Grants permission to set risk configuration for user pools and app clients	Write	userpool*		
SetUICustomization	Grants permission to customize the hosted UI for any app client	Write	userpool*		
SetUserMFAPreference	Grants permission to set MFA preference for the user in the userpool	Write			
SetUserPoolMfaConfig	Grants permission to set user pool MFA configuration	Write	userpool*		
SetUserSettings	Grants permission to set the user settings like multi-factor authentication (MFA)	Write			
SignUp	Grants permission to register the user in the specified user pool and creates a user name, password, and user attributes	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartUserImportJob	Grants permission to start any user import job	Write	userpool*		
StopUserImportJob	Grants permission to stop any user import job	Write	userpool*		
TagResource	Grants permission to tag a user pool	Tagging	userpool		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag a user pool	Tagging	userpool		
				aws:TagKeys	
UpdateAuthEventFeedback	Grants permission to update the feedback for the user authentication event	Write	userpool*		
UpdateDeviceStatus	Grants permission to update the device status	Write			
UpdateGroup	Grants permission to update the configuration of any group	Write	userpool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateIdentityProvider	Grants permission to update the configuration of any user pool IdP	Write	userpool*		
UpdateManagedLoginBranding	Grants permission to update the branding settings of a managed login	Write	userpool*		
UpdateResourceServer	Grants permission to update the configuration of any OAuth 2.0 resource server	Write	userpool*		
UpdateTerms	Grants permission to update terms for an app client	Write	userpool*		
UpdateUserAttributes	Grants permission to allow a user to update a specific attribute (one at a time)	Write			
UpdateUserPool	Grants permission to updates the configuration of user pools	Write	userpool*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateUserPoolClient	Grants permission to update any user pool client	Write	userpool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateUserPoolDomain	Grants permission to replace the certificate for any custom domain	Write	userpool*		
VerifySoftwareToken	Grants permission to register a user's entered TOTP code and mark the user's software token MFA status as verified if successful	Write			
VerifyUserAttribute	Grants permission to verify a user attribute using a one time verification code	Write			

Resource types defined by Amazon Cognito User Pools

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
userpool	`arn:${Partition}:cognito-idp:${Region}:${Account}:userpool/${UserPoolId}`	aws:ResourceTag/${TagKey}
webacl	`arn:${Partition}:wafv2:${Region}:${Account}:${Scope}/webacl/${Name}/${Id}`	

Condition keys for Amazon Cognito User Pools

Amazon Cognito User Pools defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by a key that is present in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Comprehend

Amazon Comprehend (service prefix: `comprehend`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Condition keys for Amazon Comprehend

Actions defined by Amazon Comprehend

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchDetectDominantLanguage	Grants permission to detect the language or languages present in the list of text documents	Read			
BatchDetectEntities	Grants permission to detect the named entities ("People", "Places", "Locations", etc) within the given list of text documents	Read			
BatchDetectKeyPhrases	Grants permission to detect the phrases in the list of text documents that are most indicative of the content	Read			
BatchDetectSentiment	Grants permission to detect the sentiment of a text in the list of documents (Positive, Negative, Neutral, or Mixed)	Read			
BatchDetectSyntax	Grants permission to detect syntactic information (like Part of Speech, Tokens) in a list of text documents	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchDetectTargetedSentiment	Grants permission to detect the sentiments associated with specific entities (such as brands or products) within the given list of text documents	Read			
ClassifyDocument	Grants permission to create a new document classification request to analyze a single document in real-time, using a previously created and trained custom model and an endpoint	Read	document-classifier-endpoint*		
ContainsPiiEntities	Grants permission to classify the personally identifiable information within given documents in real-time	Read			
CreateDataset	Grants permission to create a new dataset within a flywheel	Write	flywheel*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateDocumentClassifier	Grants permission to create a new document classifier that you can use to categorize documents	Write	document-classifier*		
				aws:RequestTag/${TagKey} aws:TagKeys comprehend:VolumeKmsKey comprehend:ModelKmsKey comprehend:OutputKmsKey comprehend:VpcSecurityGroupIds comprehend:VpcSubnets	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateEndpoint	Grants permission to create a model-specific endpoint for synchronous inference for a previously trained custom model	Write	document-classifier*		
			document-classifier-endpoint*	aws:RequestTag/${TagKey} aws:TagKeys	
			entity-recognizer*		
			entity-recognizer-endpoint*	aws:RequestTag/${TagKey} aws:TagKeys	
			flywheel		
CreateEntityRecognizer	Grants permission to create an entity recognizer using submitted files	Write	entity-recognizer*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys comprehend:VolumeKmsKey comprehend:ModelKmsKey comprehend:VpcSecurityGroupIds comprehend:VpcSubnets	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateFlywheel	Grants permission to create a new flywheel that you can use to train model versions	Write	flywheel*	aws:RequestTag/${TagKey} aws:TagKeys comprehend:VolumeKmsKey comprehend:ModelKmsKey comprehend:DataLakeKmsKey comprehend:VpcSecurityGroupIds comprehend:VpcSubnets	
			document-classifier		
			entity-recognizer		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteDocumentClassifier	Grants permission to delete a previously created document classifier	Write	document-classifier*		
DeleteEndpoint	Grants permission to delete a model-specific endpoint for a previously-trained custom model. All endpoints must be deleted in order for the model to be deleted	Write	document-classifier-endpoint*		
			entity-recognizer-endpoint*		
DeleteEntityRecognizer	Grants permission to delete a submitted entity recognizer	Write	entity-recognizer*		
DeleteFlywheel	Grants permission to Delete a flywheel	Write	flywheel*		
DeleteResourcePolicy	Grants permission to remove policy on resource	Write	document-classifier*		
			entity-recognizer*		
DescribeDataset	Grants permission to get the properties associated with a dataset	Read	flywheel-dataset*		
DescribeDocumentClassificationJob	Grants permission to get the properties associated with a document classification job	Read	document-classification-job*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeDocumentClassifier	Grants permission to get the properties associated with a document classifier	Read	document-classifier*		
DescribeDominantLanguageDetectionJob	Grants permission to get the properties associated with a dominant language detection job	Read	dominant-language-detection-job*		
DescribeEndpoint	Grants permission to get the properties associated with a specific endpoint. Use this operation to get the status of an endpoint	Read	document-classifier-endpoint*		
			entity-recognizer-endpoint*		
DescribeEntitiesDetectionJob	Grants permission to get the properties associated with an entities detection job	Read	entities-detection-job*		
DescribeEntityRecognizer	Grants permission to provide details about an entity recognizer including status, S3 buckets containing training data, recognizer metadata, metrics, and so on	Read	entity-recognizer*		
DescribeEventsDetectionJob	Grants permission to get the properties associated with an Events detection job	Read	events-detection-job*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeFlywheel	Grants permission to get the properties associated with a flywheel	Read	flywheel*		
DescribeFlywheelIteration	Grants permission to get the properties associated with a flywheel iteration for a flywheel	Read	flywheel*		
				comprehend:FlywheelIterationId	
DescribeKeyPhrasesDetectionJob	Grants permission to get the properties associated with a key phrases detection job	Read	key-phrases-detection-job*		
DescribePiiEntitiesDetectionJob	Grants permission to get the properties associated with a PII entities detection job	Read	pii-entities-detection-job*		
DescribeResourcePolicy	Grants permission to read attached policy on resource	Read	document-classifier*		
			entity-recognizer*		
DescribeSentimentDetectionJob	Grants permission to get the properties associated with a sentiment detection job	Read	sentiment-detection-job*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeTargetedSentimentDetectionJob	Grants permission to get the properties associated with a targeted sentiment detection job	Read	targeted-sentiment-detection-job*		
DescribeTopicsDetectionJob	Grants permission to get the properties associated with a topic detection job	Read	topics-detection-job*		
DetectDominantLanguage	Grants permission to detect the language or languages present in the text	Read			
DetectEntities	Grants permission to detect the named entities ("People", "Places", "Locations", etc) within the given text document	Read	entity-recognizer-endpoint		
DetectKeyPhrases	Grants permission to detect the phrases in the text that are most indicative of the content	Read			
DetectPiiEntities	Grants permission to detect the personally identifiable information entities ("Name", "SSN", "PIN", etc) within the given text document	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DetectSentiment	Grants permission to detect the sentiment of a text in a document (Positive, Negative, Neutral, or Mixed)	Read			
DetectSyntax	Grants permission to detect syntactic information (like Part of Speech, Tokens) in a text document	Read			
DetectTargetedSentiment	Grants permission to detect the sentiments associated with specific entities (such as brands or products) in a document	Read			
DetectToxicContent	Grants permission to detect toxic content within the given list of text segments	Read			
ImportModel	Grants permission to import a trained Comprehend model	Write	document-classifier*		
			entity-recognizer*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

Resource types defined by Amazon Comprehend

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
targeted-sentiment-detection-job	`arn:${Partition}:comprehend:${Region}:${Account}:targeted-sentiment-detection-job/${JobId}`	aws:ResourceTag/${TagKey}
document-classifier	`arn:${Partition}:comprehend:${Region}:${Account}:document-classifier/${DocumentClassifierName}`	aws:ResourceTag/${TagKey}
document-classifier-endpoint	`arn:${Partition}:comprehend:${Region}:${Account}:document-classifier-endpoint/${DocumentClassifierEndpointName}`	aws:ResourceTag/${TagKey}
entity-recognizer	`arn:${Partition}:comprehend:${Region}:${Account}:entity-recognizer/${EntityRecognizerName}`	aws:ResourceTag/${TagKey}
entity-recognizer-endpoint	`arn:${Partition}:comprehend:${Region}:${Account}:entity-recognizer-endpoint/${EntityRecognizerEndpointName}`	aws:ResourceTag/${TagKey}
dominant-language-detection-job	`arn:${Partition}:comprehend:${Region}:${Account}:dominant-language-detection-job/${JobId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
entities-detection-job	arn:${Partition}:comprehend:${Region}:${Account}:entities-detection-job/${JobId}	aws:ResourceTag/${TagKey}
pii-entities-detection-job	arn:${Partition}:comprehend:${Region}:${Account}:pii-entities-detection-job/${JobId}	aws:ResourceTag/${TagKey}
events-detection-job	arn:${Partition}:comprehend:${Region}:${Account}:events-detection-job/${JobId}	aws:ResourceTag/${TagKey}
key-phrases-detection-job	arn:${Partition}:comprehend:${Region}:${Account}:key-phrases-detection-job/${JobId}	aws:ResourceTag/${TagKey}
sentiment-detection-job	arn:${Partition}:comprehend:${Region}:${Account}:sentiment-detection-job/${JobId}	aws:ResourceTag/${TagKey}
topics-detection-job	arn:${Partition}:comprehend:${Region}:${Account}:topics-detection-job/${JobId}	aws:ResourceTag/${TagKey}
document-classification-job	arn:${Partition}:comprehend:${Region}:${Account}:document-classification-job/${JobId}	aws:ResourceTag/${TagKey}
flywheel	arn:${Partition}:comprehend:${Region}:${Account}:flywheel/${FlywheelName}	aws:ResourceTag/${TagKey}
flywheel-dataset	arn:${Partition}:comprehend:${Region}:${Account}:flywheel/${FlywheelName}/dataset/${DatasetName}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Comprehend

Amazon Comprehend defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by requiring tag values present in a resource creation request	String
aws:ResourceTag/${TagKey}	Filters access by requiring tag value associated with the resource	String
aws:TagKeys	Filters access by requiring the presence of mandatory tags in the request	ArrayOfString
comprehend:DataLakeKmsKey	Filters access by the DataLake Kms Key associated with the flywheel resource in the request	ARN
comprehend:FlywheelIterationId	Filters access by particular Iteration Id for a flywheel	String
comprehend:ModelKmsKey	Filters access by the model KMS key associated with the resource in the request	ARN
comprehend:OutputKmsKey	Filters access by the output KMS key associated with the resource in the request	ARN
comprehend:VolumeKmsKey	Filters access by the volume KMS key associated with the resource in the request	ARN

Condition keys	Description	Type
comprehend:VpcSecurityGroupIds	Filters access by the list of all VPC security group ids associated with the resource in the request	ArrayOfString
comprehend:VpcSubnets	Filters access by the list of all VPC subnets associated with the resource in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Comprehend Medical

Amazon Comprehend Medical (service prefix: `comprehendmedical`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon Comprehend Medical

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of

access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeEntitiesDetectionV2Job	Grants permission to describe the properties of a medical entity detection job that you have submitted	Read			
DescribeICD10CMInferenceJob	Grants permission to describe the properties of an ICD-10-CM linking job that you have submitted	Read			
DescribePHIDetectionJob	Grants permission to describe the properties of a PHI entity detection job that you have submitted	Read			
DescribeRxNormInferenceJob	Grants permission to describe the properties of an RxNorm linking job that you have submitted	Read			
DescribeSNOMEDCTInferenceJob	Grants permission to describe the properties of a SNOMED-CT linking job that you have submitted	Read			
DetectEntitiesV2	Grants permission to detect the named medical entities, and their relationships and traits within the given text document	Read			
DetectPHI	Grants permission to detect the protected health	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	information (PHI) entities within the given text document				
InferICD10CM	Grants permission to detect the medical condition entities within the given text document and link them to ICD-10-CM codes	Read			
InferRxNorm	Grants permission to detect the medication entities within the given text document and link them to RxCUI concept identifiers from the National Library of Medicine RxNorm database	Read			
InferSNOMEDCT	Grants permission to detect the medical condition, anatomy, and test, treatment, and procedure entities within the given text document and link them to SNOMED-CT codes	Read			
ListEntitiesDetectionV2Jobs	Grants permission to list the medical entity detection jobs that you have submitted	Read			
ListICD10CMInferenceJobs	Grants permission to list the ICD-10-CM linking jobs that you have submitted	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListPHIDetectionJobs	Grants permission to list the PHI entity detection jobs that you have submitted	Read			
ListRxNormInferenceJobs	Grants permission to list the RxNorm linking jobs that you have submitted	Read			
ListSNOMEDCTInferenceJobs	Grants permission to list the SNOMED-CT linking jobs that you have submitted	Read			
StartEntitiesDetectionV2Job	Grants permission to start an asynchronous medical entity detection job for a collection of documents	Write			
StartICD10CMInferenceJob	Grants permission to start an asynchronous ICD-10-CM linking job for a collection of documents	Write			
StartPHIDetectionJob	Grants permission to start an asynchronous PHI entity detection job for a collection of documents	Write			
StartRxNormInferenceJob	Grants permission to start an asynchronous RxNorm linking job for a collection of documents	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartSNOMEDCTInferenceJob	Grants permission to start an asynchronous SNOMED-CT linking job for a collection of documents	Write			
StopEntitiesDetectionV2Job	Grants permission to stop a medical entity detection job	Write			
StopICD10CMInferenceJob	Grants permission to stop an ICD-10-CM linking job	Write			
StopPHIDetectionJob	Grants permission to stop a PHI entity detection job	Write			
StopRxNormInferenceJob	Grants permission to stop an RxNorm linking job	Write			
StopSNOMEDCTInferenceJob	Grants permission to stop a SNOMED-CT linking job	Write			

Resource types defined by Amazon Comprehend Medical

Amazon Comprehend Medical does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon Comprehend Medical, specify `"Resource": "*"` in your policy.

Condition keys for Amazon Comprehend Medical

Amazon Comprehend Medical defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS Compute Optimizer

AWS Compute Optimizer (service prefix: `compute-optimizer`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Compute Optimizer

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteRecommendationPreferences	Grants permission to delete recommendation preferences	Write		compute-optimizer:ResourceType	autoscaling:DescribeAutoScalingGroups ec2:DescribeInstances rds:DescribeDBClusters rds:DescribeDBInstances
DescribeRecommendationExportJobs	Grants permission to view the status of recommendation export jobs	List			
ExportAutoScalingGroupRecommendations	Grants permission to export AutoScaling group recommendations to S3 for the provided accounts	Write			autoscaling:DescribeAutoScalingGroups compute-optimizer:GetAutoSc

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					alingGroupRecommendations
ExportEBSVolumeRecommendations	Grants permission to export EBS volume recommendations to S3 for the provided accounts	Write			compute-optimizer:GetEBSVolumeRecommendations ec2:DescribeVolumes
ExportEC2InstanceRecommendations	Grants permission to export EC2 instance recommendations to S3 for the provided accounts	Write			compute-optimizer:GetEC2InstanceRecommendations ec2:DescribeInstances

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ExportECSServiceRecommendations	Grants permission to export ECS service recommendations to S3 for the provided accounts	Write			compute-optimizer:GetECSServiceRecommendations ecs:ListClusters ecs:ListServices
ExportIdleRecommendations	Grants permission to export idle recommendations to S3 for the provided accounts	Write			compute-optimizer:GetIdleRecommendations

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ExportLambdaFunctionRecommendations	Grants permission to export Lambda function recommendations to S3 for the provided accounts	Write			compute-optimizer:GetLambdaFunctionRecommendations lambda:ListFunctions lambda:ListProvisionedConcurrencyConfigs

Actions defined by AWS Compute Optimizer Automation

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateAccounts	Grants permission to associate member accounts with the management account	Write			
CreateAutomationRule	Grants permission to create automation rule	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAutomationRule	Grants permission to delete automation rule	Write	AutomationRule*	aws:ResourceTag/${TagKey}	
DisassociateAccounts	Grants permission to disassociate member accounts from the management account	Write			
GetAutomationEvent	Grants permission to get automation event details	Read			
GetAutomationRule	Grants permission to get automation rule	Read	AutomationRule*	aws:ResourceTag/${TagKey}	
GetEnrollmentConfiguration	Grants permission to get enrollment configuration	Read			
ListAccounts	Grants permission to list the accounts in your organization that are enrolled in Compute Optimizer and whether they have enabled the Automation feature	List			
ListAutomationEventSteps	Grants permission to list automation event steps	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAutomationEventSummaries	Grants permission to list automation event summaries	List			
ListAutomationEvents	Grants permission to list automation events	List			
ListAutomationRulePreview	Grants permission to list automation rule preview results	List			ec2:DescribeVolumes
ListAutomationRulePreviewSummaries	Grants permission to list automation rule preview summaries	List			
ListAutomationRules	Grants permission to list automation rules	List			
ListRecommendedActionSummaries	Grants permission to list recommended action summaries	List			
ListRecommendedActions	Grants permission to list recommended actions	List			ec2:DescribeVolumes
ListTagsForResource	Grants permission to list tags for automation rule	List	AutomationRule*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RollbackAutomationEvent	Grants permission to initiate a rollback for an automation event	Write			
StartAutomationEvent	Grants permission to initiate an on-demand automation for a recommended action	Write			
TagResource	Grants permission to add tags to automation rule	Tagging	AutomationRule*	aws:ResourceTag/${TagKey}	
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from automation rule	Tagging	AutomationRule*	aws:ResourceTag/${TagKey}	
				aws:TagKeys	
UpdateAutomationRule	Grants permission to update automation rule	Write	AutomationRule*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateEnrollmentConfiguration	Grants permission to update enrollment configuration for the Compute Optimizer automation feature	Write			

Resource types defined by AWS Compute Optimizer Automation

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
AutomationRule	`arn:${Partition}:compute-optimizer::${Account}:automation-rule/${RuleId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Compute Optimizer Automation

AWS Compute Optimizer Automation defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Config

AWS Config (service prefix: `config`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Config

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateResourceTypes	Grants permission to add all specified resource types to the RecordingGroup of configuration recorder and includes those resource types when recording	Write	ConfigurationRecorder*		
BatchGetAggregateResourceConfig	Grants permission to return the current configuration items for resources that are present in your AWS Config aggregator	Read	ConfigurationAggregator*		
BatchGetResourceConfig	Grants permission to return the current configuration for one or more requested resources	Read			
DeleteAggregationAuthorization	Grants permission to delete the authorization granted to the specified configuration aggregator account in a specified region	Write	AggregationAuthorization*		
DeleteConfigRule	Grants permission to delete the specified AWS Config rule and all of its evaluation results	Write	ConfigRule*		
DeleteConfigurationAggregator	Grants permission to delete the specified configuration aggregator and the aggregate	Write	ConfigurationAggregator*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	d data associated with the aggregator				
DeleteConfigurationRecorder	Grants permission to delete the customer managed configuration recorder	Write	ConfigurationRecorder*		
DeleteConformancePack	Grants permission to delete the specified conformance pack and all the AWS Config rules and all evaluation results within that conformance pack	Write	ConformancePack*		
DeleteDeliveryChannel	Grants permission to delete the delivery channel	Write			
DeleteEvaluationResults	Grants permission to delete the evaluation results for the specified Config rule	Write	ConfigRule*		
DeleteOrganizationConfigRule	Grants permission to delete the specified organization config rule and all of its evaluation results from all member accounts in that organization	Write	OrganizationConfigRule*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteOrganizationConformancePack	Grants permission to delete the specified organization conformance pack and all of its evaluation results from all member accounts in that organization	Write	OrganizationConformancePack*		
DeletePendingAggregationRequest	Grants permission to delete pending authorization requests for a specified aggregator account in a specified region	Write			
DeleteRemediationConfiguration	Grants permission to delete the remediation configuration	Write	RemediationConfiguration*		
DeleteRemediationExceptions	Grants permission to delete one or more remediation exceptions for specific resource keys for a specific AWS Config Rule	Write			
DeleteResourceConfig	Grants permission to record the configuration state for a custom resource that has been deleted	Write			
DeleteRetentionConfiguration	Grants permission to delete the retention configuration	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteServiceLinkedConfigurationRecorder	Grants permission to delete the service-linked configuration recorder	Write	ConfigurationRecorder*		
				config:ConfigurationRecorderServicePrincipal	
DeleteStoredQuery	Grants permission to delete the stored query for an AWS account in an AWS Region	Write	StoredQuery*		
DeliverConfigSnapshot	Grants permission to schedule delivery of a configuration snapshot to the Amazon S3 bucket in the specified delivery channel	Read			
DescribeAggregateComplianceByConfigRules	Grants permission to return a list of compliant and noncompliant rules with the number of resources for compliant and noncompliant rules	Read	ConfigurationAggregator*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeAggregateComplianceByConformancePacks	Grants permission to return a list of compliant and noncompliant conformance packs along with count of compliant, non-compliant and total rules within each conformance pack	Read	ConfigurationAggregator*		
DescribeAggregationAuthorizations	Grants permission to return a list of authorizations granted to various aggregator accounts and regions	List			
DescribeComplianceByConfigRule	Grants permission to indicate whether the specified AWS Config rules are compliant	Read			
DescribeComplianceByResource	Grants permission to indicate whether the specified AWS resources are compliant	Read			
DescribeConfigRuleEvaluationStatus	Grants permission to return status information for each of your AWS managed Config rules	Read			
DescribeConfigRules	Grants permission to return details about your AWS Config rules	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeConfigurationAggregatorSourcesStatus	Grants permission to return status information for sources within an aggregator	Read	ConfigurationAggregator*		
DescribeConfigurationAggregators	Grants permission to return the details of one or more configuration aggregators	List			
DescribeConfigurationRecorderStatus	Grants permission to return the current status of the specified configuration recorder	Read	ConfigurationRecorder*		
				config:ConfigurationRecorderServicePrincipal	
DescribeConfigurationRecorders	Grants permission to return the names of one or more specified configuration recorders	Read	ConfigurationRecorder*		
				config:ConfigurationRecorderServicePrincipal	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeConformancePackCompliance	Grants permission to return compliance information for each rule in that conformance pack	Read	ConformancePack*		
DescribeConformancePackStatus	Grants permission to provide one or more conformance packs deployment status	Read			
DescribeConformancePacks	Grants permission to return a list of one or more conformance packs	List			
DescribeDeliveryChannelStatus	Grants permission to return the current status of the specified delivery channel	Read			
DescribeDeliveryChannels	Grants permission to return details about the specified delivery channel	List			
DescribeOrganizationConfigRuleStatuses	Grants permission to provide organization config rule deployment status for an organization	Read			
DescribeOrganizationConfigRules	Grants permission to return a list of organization config rules	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeOrganizationConformancePackStatuses	Grants permission to provide organization conformance pack deployment status for an organization	Read			
DescribeOrganizationConformancePacks	Grants permission to return a list of organization conformance packs	List			
DescribePendingAggregationRequests	Grants permission to return a list of all pending aggregation requests	List			
DescribeRemediationConfigurations	Grants permission to return the details of one or more remediation configurations	List	RemediationConfiguration*		
DescribeRemediationExceptions	Grants permission to return the details of one or more remediation exceptions	List			
DescribeRemediationExecutionStatus	Grants permission to provide a detailed view of a Remediation Execution for a set of resources including state, timestamps and any error messages for steps that have failed	Read	RemediationConfiguration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeRetentionConfigurations	Grants permission to return the details of one or more retention configurations	List			
DisassociateResourceTypes	Grants permission to remove all specified resource types from the RecordingGroup of configuration recorder and excludes these resource types when recording	Write	ConfigurationRecorder*		
GetAggregateComplianceDetailsByConfigRule	Grants permission to return the evaluation results for the specified AWS Config rule for a specific resource in a rule	Read	ConfigurationAggregator*		
GetAggregateConfigRuleComplianceSummary	Grants permission to return the number of compliant and noncompliant rules for one or more accounts and regions in an aggregator	Read	ConfigurationAggregator*		
GetAggregateConformancePackComplianceSummary	Grants permission to return the number of compliant and noncompliant conformance packs for one or more accounts and regions in an aggregator	Read	ConfigurationAggregator*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAggregateDiscoveredResourceCounts	Grants permission to return the resource counts across accounts and regions that are present in your AWS Config aggregator	Read	ConfigurationAggregator*		
GetAggregateResourceConfig	Grants permission to return configuration item that is aggregated for your specific resource in a specific source account and region	Read	ConfigurationAggregator*		
GetComplianceDetailsByConfigRule	Grants permission to return the evaluation results for the specified AWS Config rule	Read	ConfigRule*		
GetComplianceDetailsByResource	Grants permission to return the evaluation results for the specified AWS resource	Read			
GetComplianceSummaryByConfigRule	Grants permission to return the number of AWS Config rules that are compliant and noncompliant, up to a maximum of 25 for each	Read			
GetComplianceSummaryByResourceType	Grants permission to return the number of resources that are compliant and the number that are noncompliant	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetConformancePackComplianceDetails	Grants permission to return compliance details of a conformance pack for all AWS resources that are monitered by conformance pack	Read	ConformancePack*		
GetConformancePackComplianceSummary	Grants permission to provide compliance summary for one or more conformance packs	Read	ConformancePack*		
GetCustomRulePolicy	Grants permission to return the policy definition containing the logic for your AWS Config Custom Policy rule	Read	ConfigRule*		
GetDiscoveredResourceCounts	Grants permission to return the resource types, the number of each resource type, and the total number of resources that AWS Config is recording in this region for your AWS account	Read			
GetOrganizationConfigRuleDetailedStatus	Grants permission to return detailed status for each member account within an organization for a given organization config rule	Read	OrganizationConfigRule*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetOrganizationConformancePackDetailedStatus	Grants permission to return detailed status for each member account within an organization for a given organization conformance pack	Read	OrganizationConformancePack*		
GetOrganizationCustomRulePolicy	Grants permission to return the policy definition containing the logic for your organization AWS Config Custom Policy rule	Read	OrganizationConfigRule*		
GetResourceConfigHistory	Grants permission to return a list of configuration items for the specified resource	Read			
GetResourceEvaluationSummary	Grants permission to return the summary of resource evaluations for a specific resource evaluation ID	Read			
GetStoredQuery	Grants permission to return the details of a specific stored query	Read	StoredQuery*		
ListAggregateDiscoveredResources	Grants permission to accept a resource type and returns a list of resource identifiers that are aggregated for a specific resource type across accounts and regions	List	ConfigurationAggregator*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListConfigurationRecorders	Grants permission to list the configuration recorder summaries for an AWS account in an AWS Region	List			
ListConformancePackComplianceScores	Grants permission to return the percentage of compliant rule-resource combinations in a conformance pack compared to the number of total possible rule-resource combinations	List			
ListDiscoveredResources	Grants permission to accept a resource type and returns a list of resource identifiers for the resources of that type	List			
ListResourceEvaluations	Grants permission to list the resource evaluation summaries for an AWS account in an AWS Region	List			
ListStoredQueries	Grants permission to list the stored queries for an AWS account in an AWS Region	List

PutConformancePack	Grants permission to create or update a conformance pack	Write	ConformancePack*		iam:CreateServiceLinkedRole iam:PassRole s3:GetObject s3:ListBucket ssm:GetDocument
PutDeliveryChannel	Grants permission to create a delivery channel object to deliver configuration information to an Amazon S3 bucket and Amazon SNS topic	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutEvaluations	Grants permission to be used by an AWS Lambda function to deliver evaluation results to AWS Config	Write			
PutExternalEvaluation	Grants permission to deliver evaluation result to AWS Config	Write	ConfigRule*		
PutOrganizationConfigRule	Grants permission to add or update organization config rule for your entire organization evaluating whether your AWS resources comply with your desired configurations	Write	OrganizationConfigRule*		iam:CreateServiceLinkedRole iam:PassRole organizations:EnableAWSServiceAccess organizations:ListDelegatedAdministrators

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutOrganizationConformancePack	Grants permission to add or update organization conformance pack for your entire organization evaluating whether your AWS resources comply with your desired configurations	Write	OrganizationConformancePack*		iam:CreateServiceLinkedRole iam:PassRole organizations:EnableAWSServiceAccess organizations:ListDelegatedAdministrators s3:GetObject
PutRemediationConfigurations	Grants permission to add or update the remediation configuration with a specific AWS Config rule with the selected target or action	Write	RemediationConfiguration*		iam:PassRole
PutRemediationExceptions	Grants permission to add or update remediation exceptions for specific resources for a specific AWS Config rule	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutResourceConfig	Grants permission to record the configuration state for the resource provided in the request	Write			
PutRetentionConfiguration	Grants permission to create and update the retention configuration with details about retention period (number of days) that AWS Config stores your historical information	Write			
PutServiceLinkedConfigurationRecorder	Grants permission to create a new service-linked configuration recorder to record the resource configurations in scope for the linked service	Write		aws:RequestTag/${TagKey} aws:TagKeys config:ConfigurationRecorderServicePrincipal	iam:CreateServiceLinkedRole iam:PassRole
PutStoredQuery	Grants permission to save a new query or updates an existing saved query	Write	StoredQuery*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
SelectAggregateResourceConfig	Grants permission to accept a structured query language (SQL) SELECT command and an aggregator to query configuration state of AWS resources across multiple accounts and regions, performs the corresponding search, and returns resource configurations matching the properties	Read	ConfigurationAggregator*		
SelectResourceConfig	Grants permission to accept a structured query language (SQL) SELECT command, performs the corresponding search, and returns resource configurations matching the properties	Read			
StartConfigRulesEvaluation	Grants permission to evaluate your resources against the specified Config rules	Write	ConfigRule*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartConfigurationRecorder	Grants permission to the customer managed configuration recorder to start recording configurations of the AWS resources you have selected to record in your AWS account	Write	ConfigurationRecorder*		
StartRemediationExecution	Grants permission to run an on-demand remediation for the specified AWS Config rules against the last known remediation configuration	Write			iam:PassRole
StartResourceEvaluation	Grants permission to evaluate your resource details against the AWS Config rules in your account	Write			cloudformation:DescribeType
StopConfigurationRecorder	Grants permission to the customer managed configuration recorder to stop recording configurations of the AWS resources you have selected to record in your AWS account	Write	ConfigurationRecorder*		
TagResource	Grants permission to associate the specified tags to a resource with the specified resourceArn	Tagging	AggregationAuthorization		
			ConfigRule		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ConfigurationAggregator		
			ConfigurationRecorder		
			ConformancePack		
			OrganizationConfigRule		
			OrganizationConformancePack		
			StoredQuery		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to delete specified tags from a resource	Tagging	AggregationAuthorization		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ConfigRule		
			ConfigurationAggregator		
			ConfigurationRecorder		
			ConformancePack		
			OrganizationConfigRule		
			OrganizationConformancePack		
			StoredQuery		
				aws:TagKeys	

Resource types defined by AWS Config

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
AggregationAuthorization	arn:${Partition}:config:${Region}:${Account}:aggregation-authorization/${AggregatorAccount}/${AggregatorRegion}	aws:ResourceTag/${TagKey}
ConfigurationAggregator	arn:${Partition}:config:${Region}:${Account}:config-aggregator/${AggregatorId}	aws:ResourceTag/${TagKey}
ConfigRule	arn:${Partition}:config:${Region}:${Account}:config-rule/${ConfigRuleId}	aws:ResourceTag/${TagKey}
ConformancePack	arn:${Partition}:config:${Region}:${Account}:conformance-pack/${ConformancePackName}/${ConformancePackId}	aws:ResourceTag/${TagKey}
OrganizationConfigRule	arn:${Partition}:config:${Region}:${Account}:organization-config-rule/${OrganizationConfigRuleId}	aws:ResourceTag/${TagKey}
OrganizationConformancePack	arn:${Partition}:config:${Region}:${Account}:organization-conformance-pack/${OrganizationConformancePackId}	aws:ResourceTag/${TagKey}
RemediationConfiguration	arn:${Partition}:config:${Region}:${Account}:remediation-configuration/${RemediationConfigurationId}	
StoredQuery	arn:${Partition}:config:${Region}:${Account}:stored-query/${StoredQueryName}/${StoredQueryId}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
ConfigurationRecorder	arn:${Partition}:config:${Region}:${Account}:configuration-recorder/${RecorderName}/${RecorderId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Config

AWS Config defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters access by tag-value associated with the resource	String
aws:TagKeys	Filters access by the presence of mandatory tags in the request	ArrayOfString
config:ConfigurationRecorderServicePrincipal	Filters access by service principal of the configuration recorder	String

Actions, resources, and condition keys for Amazon Connect

Amazon Connect (service prefix: connect) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon Connect

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ActivateEvaluationForm	Grants permission to activate an evaluation form in the specified Amazon Connect instance. After the evaluation form is activated, it is available to start new evaluations based on the form	Write	evaluation-form*		
				connect:InstanceId	
AdminGetEmergencyAccessToken	Grants permission to federate into an Amazon Connect instance (Log in for emergency access functiona	Write	instance*		connect:DescribeInstance

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	lity in the Amazon Connect console)				connect:ListInstances ds:DescribeDirectories
Associate Analytics DataSet	Grants permission to grant access and to associate a dataset with the specified AWS account	Write	instance*		
				connect:InstanceId	
Associate ApprovedOrigin	Grants permission to associate approved origin for an existing Amazon Connect instance	Write	instance*		
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateBot	Grants permission to associate a Lex bot for an existing Amazon Connect instance	Write	instance*		iam:AttachRolePolicy iam:CreateServiceLinkedRole iam:PutRolePolicy lex:CreateResourcePolicy lex:DescribeBotAlias lex:GetBot lex:UpdateResourcePolicy
				connect:InstanceId	
Associate ContactWithUser	Grants permission to associate a contact with a user using the Amazon Connect API	Write	contact*		
			instance*		
			user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				connect:PreferredUserArn aws:ResourceTag/${TagKey} connect:InstanceId	
Associate CustomerProfilesDomain [permission only]	Grants permission to associate a Customer Profiles domain for an existing Amazon Connect instance	Write	instance*		iam:AttachRolePolicy iam:CreateServiceLinkedRole iam:PutRolePolicy profile:GetDomain
Associate DefaultVocabulary	Grants permission to default vocabulary for an existing Amazon Connect instance	Write	instance*		
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateEmailAddressAlias	Grants permission to associate an alias with an email address resource in an Amazon Connect instance	Write	email-address*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
AssociateFlow	Grants permission to associate a resource with a flow in an Amazon Connect instance	Write	contact-flow* wildcard-phone-number*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateInstanceStorageConfig	Grants permission to associate instance storage for an existing Amazon Connect instance	Write	instance*		ds:DescribeDirectories firehose:DescribeDeliveryStream iam:AttachRolePolicy iam:CreateServiceLinkedRole iam:PutRolePolicy kinesis:DescribeStream kms:CreateGrant kms:DescribeKey s3:GetBucketAcl

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					s3:GetBucketLocation
				connect:StorageResourceType connect:InstanceId	
Associate LambdaFunction	Grants permission to associate a Lambda function for an existing Amazon Connect instance	Write	instance*		lambda:AddPermission
				connect:InstanceId	
Associate LexBot	Grants permission to associate a Lex bot for an existing Amazon Connect instance	Write	instance*		iam:AttachRolePolicy iam:CreateServiceLinkedRole iam:PutRolePolicy lex:GetBot
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociatePhoneNumberContactFlow	Grants permission to associate contact flow resources to phone number resources in an Amazon Connect instance	Write	contact-flow*		
			phone-number*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
AssociateQueueEmailAddresses	Grants permission to associate a set of email addresses with a queue	Write	queue*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
AssociateQueueQuickConnects	Grants permission to associate quick connects with a queue in an Amazon Connect instance	Write	queue*		
			quick-connect*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
AssociateRoutingProfileQueues	Grants permission to associate queues with a routing profile in an Amazon Connect instance	Write	queue*		
			routing-profile*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
AssociateSecurityKey	Grants permission to associate a security key for an existing Amazon Connect instance	Write	instance*		
				connect:InstanceId	
AssociateSecurityProfiles	Grants permission to associate security profiles with an AI agent in an Amazon Connect instance	Write	instance*		
			security-profile*		
			ai-agent		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
AssociateTrafficDistributionGroupUser	Grants permission to associate a user to a traffic distribution group in the specified Amazon Connect instance	Write	instance*		connect:DescribeUser connect:SearchUsers
			traffic-distribution-group*		
			user*		
				connect:InstanceId aws:ResourceTag/${TagKey} connect:SearchTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateUserProficiencies	Grants permission to associate user proficiencies to a user in an Amazon Connect instance	Write	instance*		
			user*		
				connect:InstanceId	
AssociateWorkspace	Grants permission to associate a workspace with a user or routing profile in an Amazon Connect instance	Write	workspace*		
			routing-profile		
			user		
				aws:ResourceTag/${TagKey} connect:InstanceId	
BatchAssociateAnalyticsDataSet	Grants permission to grant access and to associate the datasets with the specified AWS account	Write	instance*		
				connect:InstanceId	
BatchCreateDataTableValue	Grants permission to batch create values in a data table in an Amazon Connect instance	Write	data-table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId connect:ExpressionValue connect:PrimaryAttribute/${PrimaryAttribute}	
BatchDeleteDataTableValue	Grants permission to batch delete values in a data table in an Amazon Connect instance	Write	data-table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId connect:PrimaryAttribute/${PrimaryAttribute}	
BatchDescribeDataTableValue	Grants permission to batch describe values in a data table in an Amazon Connect instance	Read	data-table*		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:PrimaryAttribute/${PrimaryAttribute}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchDisassociateAnalyticsDataSet	Grants permission to revoke access and to disassociate the datasets with the specified AWS account	Write	instance*		
				connect:InstanceId	
BatchGetAttachedFileMetadata	Grants permission to get metadata for multiple attached files from an Amazon Connect instance	Read	attached-file*		
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys connect:InstanceId	
BatchGetFlowAssociation	Grants permission to get summary information about the flow associations for the specified Amazon Connect instance	List	wildcard-phone-number*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
BatchPutContact	Grants permission to put contacts in an Amazon Connect instance	Write	instance*		
			queue		
				connect:InstanceId	
BatchUpdateDataTableValue	Grants permission to batch update values in a data table in an Amazon Connect instance	Write	data-table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId connect:ExpressionValue connect:PrimaryAttribute/${PrimaryAttribute}	
ClaimPhoneNumber	Grants permission to claim phone number resources in an Amazon Connect instance or traffic distribution group	Write	instance*		
			traffic-distribution-group*		
			wildcard-phone-number*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys connect:InstanceId	
CompleteAttachedFileUpload	Grants permission to complete an attached file upload in an Amazon Connect instance	Write	attached-file*		
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys connect:InstanceId	
CreateAgentStatus	Grants permission to create agent status in an Amazon Connect instance	Write	agent-status*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys connect:InstanceId	
CreateAuthenticationProfile	Grants permission to create authentication profile resources in an Amazon Connect instance	Write	authentication-profile*		
				connect:InstanceId	
CreateContact	Grants permission to create a new contact using the Amazon Connect API	Write	instance*		
			contact		
			user		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId connect:ContactInitiationMethod	
CreateContactFlow	Grants permission to create a contact flow in an Amazon Connect instance	Write	contact-flow*		
				aws:RequestTag/${TagKey} aws:TagKeys connect:InstanceId connect:FlowType	
CreateContactFlowModule	Grants permission to create a contact flow module in an Amazon Connect instance	Write	contact-flow-module*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys connect:InstanceId	
CreateContactFlowModuleAlias	Grants permission to create an alias of a flow module version in an Amazon Connect instance	Write	contact-flow-module*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
CreateContactFlowModuleVersion	Grants permission to create a version of a flow module in an Amazon Connect instance	Write	contact-flow-module*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateContactFlowVersion	Grants permission to create a version a flow in an Amazon Connect instance	Write	contact-flow*		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:FlowType	
CreateDataTable	Grants permission to create a dataTable in an Amazon Connect instance	Write	data-table*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
CreateDataTableAttribute	Grants permission to create an attribute for a data table in an Amazon Connect instance	Write	data-table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
CreateEmailAddress	Grants permission to create an email address resource in an Amazon Connect instance	Write	instance*		
				aws:RequestTag/${TagKey} aws:TagKeys connect:InstanceId	
CreateEvaluationForm	Grants permission to create an evaluation form in the specified Amazon Connect instance. The form can be used to define questions related to agent performance, and create sections to organize such questions. Question and section identifiers cannot be duplicated within the same evaluation form	Write	evaluation-form*		
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateHoursOfOperation	Grants permission to create hours of operation in an Amazon Connect instance	Write	hours-of-operation*		
				aws:RequestTag/${TagKey} aws:TagKeys connect:InstanceId	
CreateHoursOfOperationOverride	Grants permission to create an hours of operation override in an Amazon Connect instance	Write	hours-of-operation*		
			instance*		
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateInstance	Grants permission to create a new Amazon Connect instance	Write		aws:RequestTag/${TagKey} aws:TagKeys	ds:AuthorizeApplication ds:CheckAlias ds:CreateAlias ds:CreateDirectory ds:CreateIdentityPoolDirectory ds:DeleteDirectory ds:DescribeDirectories ds:UnauthorizeApplication iam:AttachRolePolicy

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateUserHierarchyGroup	Grants permission to create a user hierarchy group in an Amazon Connect instance	Write	hierarchy-group		
				aws:RequestTag/${TagKey} aws:TagKeys connect:InstanceId	
CreateView	Grants permission to create a view in an Amazon Connect instance	Write	customer-managed-view*		
				aws:RequestTag/${TagKey} aws:TagKeys connect:InstanceId	
CreateViewVersion	Grants permission to create a view version in an Amazon Connect instance	Write	customer-managed-view*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
CreateVocabulary	Grants permission to create a vocabulary in an Amazon Connect instance	Write	vocabulary*		
				aws:RequestTag/${TagKey} aws:TagKeys connect:InstanceId	
CreateWorkspace	Grants permission to create a workspace in an Amazon Connect instance	Write	workspace*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys connect:InstanceId	
CreateWorkspacePage	Grants permission to create a workspace page in an Amazon Connect instance	Write	workspace* aws-managed-view customer-managed-view		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeactivateEvaluationForm	Grants permission to deactivate an evaluation form in the specified Amazon Connect instance. After a form is deactivated, it is no longer available for users to start new evaluations based on the form	Write	evaluation-form*		
				connect:InstanceId	
DeleteAttachedFile	Grants permission to delete an attached file from an Amazon Connect instance	Write	attached-file*		cases:DeleteRelatedItem
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys connect:InstanceId	
DeleteContactEvaluation	Grants permission to delete a contact evaluation in the specified Amazon Connect instance	Write	contact-evaluation*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
DeleteContactFlow	Grants permission to delete a contact flow in an Amazon Connect instance	Write	contact-flow*		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:FlowType	
DeleteContactFlowModule	Grants permission to delete a contact flow module in an Amazon Connect instance	Write	contact-flow-module*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteContactFlowModuleAlias	Grants permission to delete an alias of a flow module version in an Amazon Connect instance	Write	contact-flow-module*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DeleteContactFlowModuleVersion	Grants permission to delete a version of a flow module in an Amazon Connect instance	Write	contact-flow-module*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DeleteContactFlowVersion	Grants permission to delete a version of a flow in an Amazon Connect instance	Write	contact-flow*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId connect:FlowType	
DeleteDataTable	Grants permission to delete a data table in an Amazon Connect instance	Write	data-table*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DeleteDataTableAttribute	Grants permission to delete an attribute of a data table in an Amazon Connect instance	Write	data-table*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteEmailAddress	Grants permission to delete an email address resource in an Amazon Connect instance	Write	email-address*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DeleteEvaluationForm	Grants permission to delete an evaluation form in the specified Amazon Connect instance. If the version property is provided, only the specified version of the evaluation form is deleted	Write	evaluation-form*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DeleteHoursOfOperation	Grants permission to delete hours of operation in an Amazon Connect instance	Write	hours-of-operation*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteHoursOfOperationOverride	Grants permission to delete an hours of operation override in an Amazon Connect instance	Write	hours-of-operation*		
			instance*		
				connect:InstanceId	
DeleteInstance	Grants permission to delete an Amazon Connect instance. When you remove an instance, the link to an existing AWS directory is also removed	Write	instance*		ds:DeleteDirectory ds:DescribeDirectories ds:UnauthorizeApplication
				connect:InstanceId aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteIntegrationAssociation	Grants permission to delete an integration association from an Amazon Connect instance. The association must not have any use cases associated with it	Write	instance*		app-integrations:DeleteApplicationAssociation app-integrations:DeleteEventIntegrationAssociation app-integrations:UntagResource connect:DescribeInstance ds:DescribeDirectories events:DeleteRule

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					events:ListTargetsByRule events:RemoveTargets
			integration-association*		
				connect:InstanceId	
DeleteNotification	Grants permission to delete a notification in an Amazon Connect instance	Write	notification*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DeletePredefinedAttribute	Grants permission to delete a predefined attribute in an Amazon Connect instance	Write	instance*		
				connect:InstanceId	
DeletePrompt	Grants permission to delete a prompt in an Amazon Connect instance	Write	prompt*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
DeletePushNotificationRegistration	Grants permission to delete a push notification registration for an Amazon Connect instance	Write	instance*		
				connect:InstanceId	
DeleteQueue	Grants permission to delete a queue in an Amazon Connect instance	Write	queue*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DeleteQuickConnect	Grants permission to delete a quick connect in an Amazon Connect instance	Write	quick-connect*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteRoutingProfile	Grants permission to delete routing profiles in an Amazon Connect instance	Write	routing-profile*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DeleteRule	Grants permission to delete a rule in an Amazon Connect instance	Write	rule*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DeleteSecurityProfile	Grants permission to delete a security profile in an Amazon Connect instance	Write	security-profile*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteTaskTemplate	Grants permission to delete a task template in an Amazon Connect instance	Write	task-template*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DeleteTrafficDistributionGroup	Grants permission to delete a traffic distribution group	Write	traffic-distribution-group*		
				aws:ResourceTag/${TagKey}	
DeleteUseCase	Grants permission to delete a use case from an integration association	Write	instance*		connect:DescribeInstance ds:DescribeDirectories
			use-case*		
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteUser	Grants permission to delete a user in an Amazon Connect instance	Write	user*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DeleteUserHierarchyGroup	Grants permission to delete a user hierarchy group in an Amazon Connect instance	Write	hierarchy-group*		
				connect:InstanceId	
DeleteView	Grants permission to delete a view in an Amazon Connect instance	Write	customer-managed-view*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DeleteViewVersion	Grants permission to delete a view version in an Amazon Connect instance	Write	customer-managed-view-version*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
DeleteVocabulary	Grants permission to delete a vocabulary in an Amazon Connect instance	Write	vocabulary*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DeleteWorkspace	Grants permission to delete a workspace in an Amazon Connect instance	Write	workspace*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DeleteWorkspaceMedia	Grants permission to delete workspace media in an Amazon Connect instance	Write	workspace*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
DeleteWorkspacePage	Grants permission to delete a workspace page in an Amazon Connect instance	Write	workspace*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DescribeAgentStatus	Grants permission to describe agent status in an Amazon Connect instance	Read	agent-status*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DescribeAuthenticationProfile	Grants permission to describe authentication profile resources in an Amazon Connect instance	Read	authentication-profile*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				connect:InstanceId	
DescribeContact	Grants permission to describe a contact in an Amazon Connect instance	Read	contact*		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:ContactAssociationId connect:Channel connect:UserArn	
DescribeContactEvaluation	Grants permission to describe a contact evaluation in the specified Amazon Connect instance	Read	contact-evaluation*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
DescribeContactFlow	Grants permission to describe a contact flow in an Amazon Connect instance	Read	contact-flow*		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:FlowType	
DescribeContactFlowModule	Grants permission to describe a contact flow module in an Amazon Connect instance	Read	contact-flow-module*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeContactFlowModuleAlias	Grants permission to describe an alias of a flow module version in an Amazon Connect instance	Read	contact-flow-module*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DescribeDataTable	Grants permission to describe a data table in an Amazon Connect instance	Read	data-table*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DescribeDataTableAttribute	Grants permission to describe an attribute of a data table in an Amazon Connect instance	Read	data-table*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeEmailAddress	Grants permission to describe an email address resource in an Amazon Connect instance	Read	email-address*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DescribeEvaluationForm	Grants permission to describe an evaluation form in the specified Amazon Connect instance. If the version property is not provided, the latest version of the evaluation form is described	Read	evaluation-form*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DescribeForecastingPlanningSchedulingIntegration [permission only]	Grants permission to describe the status of forecasting, planning, and scheduling integration on an Amazon Connect instance	Read	instance*		
				connect:InstanceId	
DescribeHoursOfOperation	Grants permission to describe hours of operation in an Amazon Connect instance	Read	hours-of-operation*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
DescribeHoursOfOperationOverride	Grants permission to describe an hours of operation override in an Amazon Connect instance	Read	hours-of-operation*		
			instance*		
				connect:InstanceId	
DescribeInstance	Grants permission to view details of an Amazon Connect instance and is also required to create an instance	Read	instance*		ds:DescribeDirectories
				connect:InstanceId aws:ResourceTag/${TagKey}	
DescribeInstanceAttribute	Grants permission to view the attribute details of an existing Amazon Connect instance	Read	instance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				connect:AttributeType connect:InstanceId	
DescribeInstanceStorageConfig	Grants permission to view the instance storage configuration for an existing Amazon Connect instance	Read	instance*		
				connect:StorageResourceType connect:InstanceId	
DescribeNotification	Grants permission to describe a notification in an Amazon Connect instance	Read	notification*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DescribePhoneNumber	Grants permission to describe phone number resources in an Amazon Connect instance or traffic distribution group	Read	phone-number*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribePredefinedAttribute	Grants permission to describe a predefined attribute in an Amazon Connect instance	Read	instance*		
				connect:InstanceId	
DescribePrompt	Grants permission to describe a prompt in an Amazon Connect instance	Read	prompt*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DescribeQueue	Grants permission to describe a queue in an Amazon Connect instance	Read	queue*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DescribeQuickConnect	Grants permission to describe a quick connect in an Amazon Connect instance	Read	quick-connect*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
DescribeRoutingProfile	Grants permission to describe a routing profile in an Amazon Connect instance	Read	routing-profile*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DescribeRule	Grants permission to describe a rule in an Amazon Connect instance	Read	rule*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DescribeSecurityProfile	Grants permission to describe a security profile in an Amazon Connect instance	Read	security-profile*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
DescribeTrafficDistributionGroup	Grants permission to describe a traffic distribution group	Read	traffic-distribution-group*		
				aws:ResourceTag/${TagKey}	
DescribeUser	Grants permission to describe a user in an Amazon Connect instance	Read	user*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DescribeUserHierarchyGroup	Grants permission to describe a hierarchy group for an Amazon Connect instance	Read	hierarchy-group*		
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeUserHierarchyStructure	Grants permission to describe the hierarchy structure for an Amazon Connect instance	Read	instance*		
				connect:InstanceId	
DescribeView	Grants permission to describe a view in an Amazon Connect instance		aws-managed-view*		
			customer-managed-view*		
			qualified-aws-managed-view*		
			qualified-customer-managed-view*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeVocabulary	Grants permission to describe a vocabulary in an Amazon Connect instance	Read	vocabulary*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DescribeWorkspace	Grants permission to describe a workspace in an Amazon Connect instance	Read	workspace*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DisassociateAnalyticsDataSet	Grants permission to revoke access and to disassociate a dataset with the specified AWS account	Write	instance*		
				connect:InstanceId	
DisassociateApprovedOrigin	Grants permission to disassociate approved origin for an existing Amazon Connect instance	Write	instance*		
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateBot	Grants permission to disassociate a Lex bot for an existing Amazon Connect instance	Write	instance*		iam:AttachRolePolicy iam:CreateServiceLinkedRole iam:PutRolePolicy lex:DeleteResourcePolicy lex:UpdateResourcePolicy
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateCustomerProfilesDomain [permission only]	Grants permission to disassociate a Customer Profiles domain for an existing Amazon Connect instance	Write	instance*		iam:AttachRolePolicy iam:DeleteRolePolicy iam:DetachRolePolicy iam:GetPolicy iam:GetPolicyVersion iam:GetRolePolicy
DisassociateEmailAddressAlias	Grants permission to disassociate an alias from an email address resource in an Amazon Connect instance	Write	email-address*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateFlow	Grants permission to disassociate a resource from a flow in an Amazon Connect instance	Write	wildcard-phone-number*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DisassociateInstanceStorageConfig	Grants permission to disassociate instance storage for an existing Amazon Connect instance	Write	instance*		
				connect:StorageResourceType connect:InstanceId	
DisassociateLambdaFunction	Grants permission to disassociate a Lambda function for an existing Amazon Connect instance	Write	instance*		lambda:RemovePermission
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateLexBot	Grants permission to disassociate a Lex bot for an existing Amazon Connect instance	Write	instance*		iam:AttachRolePolicy iam:CreateServiceLinkedRole iam:PutRolePolicy
				connect:InstanceId	
DisassociatePhoneNumberContactFlow	Grants permission to disassociate contact flow resources from phone number resources in an Amazon Connect instance	Write	phone-number*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DisassociateQueueEmailAddresses	Grants permission to disassociate a set of email addresses from a queue	Write	queue*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateQueueQuickConnects	Grants permission to disassociate quick connects from a queue in an Amazon Connect instance	Write	queue*		
			quick-connect*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DisassociateRoutingProfileQueues	Grants permission to disassociate queues from a routing profile in an Amazon Connect instance	Write	routing-profile*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DisassociateSecurityKey	Grants permission to disassociate the security key for an existing Amazon Connect instance	Write	instance*		
				connect:InstanceId	
DisassociateSecurityProfiles	Grants permission to disassociate security profiles with an AI agent in an Amazon Connect instance	Write	instance*		
			security-profile*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ai-agent		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DisassociateTrafficDistributionGroupUser	Grants permission to disassociate a user from a traffic distribution group in the specified Amazon Connect instance	Write	instance*		
			traffic-distribution-group*		
			user*		
				connect:InstanceId aws:ResourceTag/${TagKey}	
DisassociateUserProficiencies	Grants permission to disassociate user proficiencies from a user in an Amazon Connect instance	Write	instance*		
			user*		
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateWorkspace	Grants permission to disassociate a workspace from a user or routing profile in an Amazon Connect instance	Write	workspace*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
DismissUserContact	Grants permission to dismiss terminated Contact from Agent CCP	Write	user*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
EvaluateDataTableValues	Grants permission to evaluate values in a data table in an Amazon Connect instance	Read	data-table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId connect:PrimaryAttribute/${PrimaryAttribute}	
GetAttachedFile	Grants permission to get an attached file from an Amazon Connect instance	Read	attached-file*		
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetContactAttributes	Grants permission to retrieve the contact attributes for the specified contact	Read	contact*		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:ContactAssociationId connect:Channel connect:UserArn	
GetContactMetrics	Grants permission to get contact metrics in an Amazon Connect instance	Read	contact*		
			instance*		
				connect:InstanceId	
GetCurrentMetricData	Grants permission to retrieve current metric data for queues and routing profiles in an Amazon Connect instance	Read	queue*		
			routing-profile*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
GetCurrentUserData	Grants permission to retrieve current user data in an Amazon Connect instance	Read	hierarchy-group*		
			queue*		
			routing-profile*		
			user*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
GetEffectiveHoursOfOperations	Grants permission to get effective hours of operation resources in an Amazon Connect instance	Read	hours-of-operation*		
			instance*		
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetFederationToken	Grants permission to federate into an Amazon Connect instance when using SAML-based authentication for identity management	Read	instance*		
				connect:InstanceId	
GetFlowAssociation	Grants permission to get information about the flow associations for the specified Amazon Connect instance	Read	wildcard-phone-number*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
GetMetricData	Grants permission to retrieve historical metric data for queues in an Amazon Connect instance	Read	queue*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
GetMetricDataV2	Grants permission to retrieve metric data in an Amazon Connect instance	Read	hierarchy-group*		
			queue*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			routing-profile*		
			user*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
GetPromptFile	Grants permission to get details about a prompt's presigned Amazon S3 URL in an Amazon Connect instance	Read	prompt*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
GetTaskTemplate	Grants permission to get details about specified task template in an Amazon Connect instance	Read	task-template*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTrafficDistribution	Grants permission to read traffic distribution for a traffic distribution group	List	traffic-distribution-group*		
				aws:ResourceTag/${TagKey}	
ImportPhoneNumber	Grants permission to import phone number resources to an Amazon Connect instance	Write	instance*		sms-voice:DescribePhoneNumbers social-messaging:GetLinkedWhatsAppBusinessAccountPhoneNumber social-messaging:TagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			wildcard-phone-number*		
				aws:RequestTag/${TagKey} aws:TagKeys	
ImportWorkspaceMedia	Grants permission to import workspace media in an Amazon Connect instance	Write	workspace*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
ListAgentStatuses	Grants permission to list agent statuses in an Amazon Connect instance	List	wildcard-agent-status*		
ListAnalyticsDataAssociations	Grants permission to list the association status of a dataset for a given Amazon Connect instance	List	instance*		
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAnalyticsDataLakeDataSets	Grants permission to list data lake datasets available to associate with for a given Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListApprovedOrigins	Grants permission to view approved origins of an existing Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListAssociatedContacts	Grants permission to list the contacts associated with an email address in an Amazon Connect instance	List	contact*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
ListAuthenticationProfiles	Grants permission to list authentication profile resources in an Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListBots	Grants permission to view the Lex bots of an existing Amazon Connect instance	List	instance*		
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListContactEvaluations	Grants permission to list contact evaluations in the specified Amazon Connect instance	List	instance*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
ListContactFlowModuleAliases	Grants permission to list the aliases of a flow module in an Amazon Connect instance	List	contact-flow-module*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
ListContactFlowModuleVersions	Grants permission to list all the versions of a flow module in an Amazon Connect instance	List	contact-flow-module*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListContactFlowModules	Grants permission to list contact flow module resources in an Amazon Connect instance	List	instance*		
ListContactFlowVersions	Grants permission to list all the versions a flow in an Amazon Connect instance	List	contact-flow*		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:FlowType	
ListContactFlows	Grants permission to list contact flow resources in an Amazon Connect instance	List	wildcard-contact-flow*		
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListContactReferences	Grants permission to list references associated with a contact in an Amazon Connect instance	List	contact*		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:ContactAssociationId connect:Channel connect:UserArn	
ListDataTableAttributes	Grants permission to list attributes of a data table in an Amazon Connect instance	List	data-table*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDataTablePrimaryValues	Grants permission to list primary values in a data table in an Amazon Connect instance	List	data-table*		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:PrimaryAttribute/${PrimaryAttribute}	
ListDataTableValues	Grants permission to list values in a data table in an Amazon Connect instance	List	data-table*		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:PrimaryAttribute/${PrimaryAttribute}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDataTables	Grants permission to list data tables in an Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListDefaultVocabularies	Grants permission to list default vocabularies associated with a Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListEntitySecurityProfiles	Grants permission to list security profiles associated with an entity in an Amazon Connect instance	List	instance*		
			ai-agent		
				aws:ResourceTag/${TagKey} connect:InstanceId	
ListEvaluationFormVersions	Grants permission to list versions of an evaluation form in the specified Amazon Connect instance	List	evaluation-form*		
				connect:InstanceId	
ListEvaluationForms	Grants permission to list evaluation forms in the specified Amazon Connect instance	List	instance*		
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListFlowAssociations	Grants permission to list summary information about the flow associations for the specified Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListHoursOfOperationOverrides	Grants permission to list hours of operation override resources in an Amazon Connect instance	List	hours-of-operation*		
			instance*		
				connect:InstanceId	
ListHoursOfOperations	Grants permission to list hours of operation resources in an Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListInstanceAttributes	Grants permission to view the attributes of an existing Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListInstanceStorageConfigs	Grants permission to view storage configurations of an existing Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListInstances	Grants permission to view the Amazon Connect instances associated with an AWS account	List			ds:DescribeDirectories

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListIntegrationAssociations	Grants permission to list summary information about the integration associations for the specified Amazon Connect instance	List	instance*		connect:DescribeInstance ds:DescribeDirectories
				connect:InstanceId	
ListLambdaFunctions	Grants permission to view the Lambda functions of an existing Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListLexBots	Grants permission to view the Lex bots of an existing Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListNotifications	Grants permission to list notifications in an Amazon Connect instance	Read	instance*		
				connect:InstanceId	
ListPhoneNumbers	Grants permission to list phone number resources in an Amazon Connect instance	List	wildcard-legacy-phone-number*		
ListPhoneNumbersV2	Grants permission to list phone number resources in an Amazon Connect instance	List	wildcard-phone-number*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListPredefinedAttributes	Grants permission to list predefined attributes in an Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListPrompts	Grants permission to list prompt resources in an Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListQueueEmailAddresses	Grants permission to list the email address metadata associated with a queue	List	queue*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
ListQueueQuickConnects	Grants permission to list quick connect resources in a queue in an Amazon Connect instance	List	queue*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
ListQueues	Grants permission to list queue resources in an Amazon Connect instance	List	wildcard-queue*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListQuickConnects	Grants permission to list quick connect resources in an Amazon Connect instance	List	wildcard-quick-connect*		
ListRealtimeContactAnalysisSegments	Grants permission to list the analysis segments for a real-time analysis session	Read	contact*		
				aws:ResourceTag/${TagKey}	
ListRealtimeContactAnalysisSegmentsV2	Grants permission to list the analysis segments for a real-time chat analytics session	List	contact*		
				aws:ResourceTag/${TagKey} connect:ListRealtimeContactAnalysisSegmentsByOutputType connect:ListRealtimeContactAnalysisSegmentsBySegmentType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListRoutingProfileManualAssignmentQueues	Grants permission to list manual assignment queue resources in a routing profile in an Amazon Connect instance	List	routing-profile*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
ListRoutingProfileQueues	Grants permission to list queue resources in a routing profile in an Amazon Connect instance	List	routing-profile*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
ListRoutingProfiles	Grants permission to list routing profile resources in an Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListRules	Grants permission to list rules associated with a Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListSecurityKeys	Grants permission to view the security keys of an existing Amazon Connect instance	List	instance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				connect:InstanceId	
ListSecurityProfileApplications	Grants permission to list applications associated with a specific security profile in an Amazon Connect instance	List	security-profile*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
ListSecurityProfileFlowModules	Grants permission to list flow modules associated with a security profile in an Amazon Connect instance	List	instance*		
			security-profile*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
ListSecurityProfilePermissions	Grants permission to list permissions associated with security profile in an Amazon Connect instance	List	security-profile*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
ListSecurityProfiles	Grants permission to list security profile resources in an Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListTagsForResource	Grants permission to list tags for an Amazon Connect resource	Read	agent-status		
			contact-evaluation		
			contact-flow		
			contact-flow-module		
			evaluation-form		
			hierarchy-group		
			hours-of-operation		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			integration-association		
			phone-number		
			prompt		
			queue		
			quick-connect		
			routing-profile		
			rule		
			security-profile		
			traffic-distribution-group		
			use-case		
			user		
			wildcard-phone-number		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
ListTaskTemplates	Grants permission to list task template resources in an Amazon Connect instance	List	instance*		
ListTrafficDistributionGroupUsers	Grants permission to list the active user associations for a traffic distribution group	List	traffic-distribution-group*		
				aws:ResourceTag/${TagKey}	
ListTrafficDistributionGroups	Grants permission to list traffic distribution groups	List	traffic-distribution-group*		
ListUseCases	Grants permission to list the use cases of an integration association	List	instance*		connect:DescribeInstance ds:DescribeDirectories

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				connect:InstanceId	
ListUserHierarchyGroups	Grants permission to list the hierarchy group resources in an Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListUserNotifications	Grants permission to list notifications for a user in an Amazon Connect instance	Read	user*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
ListUserProficiencies	Grants permission to list user proficiencies from a user in an Amazon Connect instance	List	instance*		
			user*		
				connect:InstanceId	
ListUsers	Grants permission to list user resources in an Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListViewVersions	Grants permission to list the view versions in an Amazon Connect instance	List	aws-managed-view*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			customer-managed-view*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
ListViews	Grants permission to list the views in an Amazon Connect instance	List	instance*		
				connect:InstanceId	
ListWorkspaceMedia	Grants permission to list workspace media in an Amazon Connect instance	List	workspace*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
ListWorkspacePages	Grants permission to list workspace pages in an Amazon Connect instance	List	workspace*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
ListWorkspaces	Grants permission to list workspaces in an Amazon Connect instance	List	instance*		
				connect:InstanceId	
MonitorContact	Grants permission to monitor an ongoing contact	Write	contact*		
			instance*		
			user*		
				connect:MonitorCapabilities aws:ResourceTag/${TagKey} connect:InstanceId	
PauseContact	Grants permission to pause an ongoing contact	Write	contact*		
			instance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			contact-flow		
				aws:ResourceTag/${TagKey} connect:InstanceId	
PutUserStatus	Grants permission to switch User Status in an Amazon Connect instance	Write	agent-status*		
			instance*		
			user*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
ReleasePhoneNumber	Grants permission to release phone number resources in an Amazon Connect instance	Write	phone-number*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Replicate Instance	Grants permission to create a replica of an Amazon Connect instance	Write	instance*		ds:AuthorizeApplication ds:CheckAlias ds:CreateAlias ds:CreateDirectory ds:CreateIdentityPoolDirectory ds:DeleteDirectory ds:DescribeDirectories ds:UnauthorizeApplication iam:AttachRolePolicy

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					iam:CreateServiceLinkedRole iam:PutRolePolicy
				aws:RequestTag/${TagKey} aws:TagKeys connect:InstanceId	
ResumeContact	Grants permission to resume a paused contact	Write	contact*		
			instance*		
			contact-flow		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ResumeContactRecording	Grants permission to resume recording for the specified contact	Write	contact*		
				aws:ResourceTag/${TagKey} connect:ContactAssociationId connect:Channel connect:UserArn	
SearchAgentStatuses	Grants permission to search agent status resources in an Amazon Connect instance	Read	instance*		connect:DescribeAgentStatus
				connect:InstanceId connect:SearchTag/${TagKey}	
SearchAvailablePhoneNumbers	Grants permission to search phone number resources in an Amazon Connect instance or traffic distribution group	List	wildcard-phone-number*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SearchContactEvaluations	Grants permission to search evaluation resources in an Amazon Connect instance	Read	instance*		connect:DescribeContactEvaluation
				connect:InstanceId connect:SearchTag/${TagKey}	
SearchContactFlowModules	Grants permission to search contact flow module resources in an Amazon Connect instance	Read	instance*		connect:DescribeContactFlowModule
				connect:InstanceId connect:SearchTag/${TagKey}	
SearchContactFlows	Grants permission to search contact flow resources in an Amazon Connect instance	Read	instance*		connect:DescribeContactFlow

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				connect:InstanceId connect:SearchTag/${TagKey} connect:FlowType	
SearchContacts	Grants permission to search contacts in an Amazon Connect instance	Read	instance*		connect:DescribeContact
				connect:SearchTag/${TagKey} connect:InstanceId connect:SearchContactsByContactAnalysis connect:Channel connect:PreferredUserArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SearchDataTables	Grants permission to search data tables in an Amazon Connect instance	Read	instance*		connect:DescribeDataTable
				connect:InstanceId connect:SearchTag/${TagKey}	
SearchEmailAddresses	Grants permission to search email address resources in an Amazon Connect instance	Read	instance*		connect:DescribeEmailAddress
				connect:InstanceId connect:SearchTag/${TagKey}	
SearchEvaluationForms	Grants permission to search evaluation forms resources in an Amazon Connect instance	Read	instance*		connect:DescribeEvaluationForm
				connect:InstanceId connect:SearchTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SearchHoursOfOperationOverrides	Grants permission to search hours of operation override resources in an Amazon Connect instance	Read	hours-of-operation*		connect:DescribeHoursOfOperation connect:ListHoursOfOperationOverrides
			instance*		
				connect:InstanceId connect:SearchTag/${TagKey}	
SearchHoursOfOperations	Grants permission to search hours of operation resources in an Amazon Connect instance	Read	instance*		connect:DescribeHoursOfOperation
				connect:InstanceId connect:SearchTag/${TagKey}	
SearchNotifications		Read	instance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	Grants permission to search notifications in an Amazon Connect instance			connect:InstanceId connect:SearchTag/${TagKey}	
SearchPredefinedAttributes	Grants permission to search predefined attributes in an Amazon Connect instance	Read	instance*		connect:DescribePredefinedAttribute
				connect:InstanceId	
SearchPrompts	Grants permission to search prompt resources in an Amazon Connect instance	Read	instance*		connect:DescribePrompt
				connect:InstanceId connect:SearchTag/${TagKey}	
SearchQueues	Grants permission to search queue resources in an Amazon Connect instance	Read	instance*		connect:DescribeQueue

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				connect:InstanceId connect:SearchTag/${TagKey}	
SearchQuickConnects	Grants permission to search quick connect resources in an Amazon Connect instance	Read	instance*		connect:DescribeQuickConnect
				connect:InstanceId connect:SearchTag/${TagKey}	
SearchResourceTags	Grants permission to search tags that are used in an Amazon Connect instance	List	instance*		
				connect:InstanceId aws:ResourceTag/${TagKey}	
SearchRoutingProfiles	Grants permission to search routing profile resources in an Amazon Connect instance	Read	instance*		connect:DescribeRoutingProfile

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				connect:InstanceId connect:SearchTag/${TagKey}	
SearchSecurityProfiles	Grants permission to search security profile resources in an Amazon Connect instance	Read	instance*		connect:DescribeSecurityProfile
				connect:InstanceId connect:SearchTag/${TagKey}	
SearchUserHierarchyGroups	Grants permission to search user hierarchy group resources in an Amazon Connect instance	Read	instance*		connect:DescribeUserHierarchyGroup
				connect:InstanceId connect:SearchTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SearchUsers	Grants permission to search user resources in an Amazon Connect instance	Read	instance*		connect:DescribeUser connect:ListUserProficiencies
				connect:InstanceId connect:SearchTag/${TagKey}	
SearchViews	Grants permission to search views in an Amazon Connect instance	Read	instance*		connect:DescribeView
				connect:InstanceId connect:SearchTag/${TagKey}	
SearchVocabularies	Grants permission to search vocabularies in a Amazon Connect instance	List	vocabulary*		
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SearchWorkspaceAssociations	Grants permission to search workspace associations in an Amazon Connect instance	Read	workspace*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
SearchWorkspaces	Grants permission to search workspaces in an Amazon Connect instance	Read	instance*		connect:DescribeWorkspace
				connect:InstanceId connect:SearchTag/${TagKey}	
SendChatIntegrationEvent	Grants permission to send chat integration events using the Amazon Connect API	Write			
SendIntegrationEvent [permission only]	Grants permission to send integration events using the Amazon Connect API	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SendOutboundChatMessage [permission only]	Grants permission to send outbound chat messages using the Amazon Connect API	Write	instance*		social-messaging:SendWhatsAppMessage wisdom:GetMessageTemplate wisdom:RenderMessageTemplate
			phone-number*		
				connect:InstanceId connect:Subtype	
SendOutboundEmail	Grants permission to send outbound email using the Amazon Connect API	Write	instance*		
				connect:InstanceId	
StartAttachedFileUpload	Grants permission to start an attached file upload in an Amazon Connect instance	Write	attached-file*		cases:CreateRelatedItem

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys connect:InstanceId connect:UserArn	
StartChatContact	Grants permission to initiate a chat using the Amazon Connect API	Write	contact-flow*		
			contact		
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartContactEvaluation	Grants permission to start an empty evaluation in the specified Amazon Connect instance, using the given evaluation form for the particular contact. The evaluation form version used for the contact evaluation corresponds to the currently activated version. If no version is activated for the evaluation form, the contact evaluation cannot be started	Write	contact*		
			contact-evaluation*		
			evaluation-form*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
StartContactMediaProcessing	Grants permission to start message processing on an ongoing contact	Write	contact*		
			instance*		
				connect:InstanceId	
StartContactRecording	Grants permission to start recording for the specified contact	Write	contact*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:ContactAssociationId connect:Channel connect:UserArn	
StartContactStreaming	Grants permission to start chat streaming using the Amazon Connect API	Write	instance*		
				aws:ResourceTag/${TagKey}	
StartEmailContact	Grants permission to initiate an inbound email using the Amazon Connect API	Write	contact-flow		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartForecastingPlanningSchedulingIntegration [permission only]	Grants permission to enable forecasting, planning, and scheduling integration on an Amazon Connect instance	Write	instance*		
				connect:InstanceId	
StartOutboundChatContact	Grants permission to initiate an outbound chat using the Amazon Connect API	Write	contact-flow*		wisdom:GetMessageTemplate wisdom:RenderMessageTemplate
			instance*		
			contact		
			phone-number		
				connect:InstanceId connect:Subtype	
StartOutboundEmailContact	Grants permission to initiate an outbound email using the Amazon Connect API	Write	contact-flow		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
StartOutboundVoiceContact	Grants permission to initiate outbound calls using the Amazon Connect API	Write	contact*		
StartScreenSharing	Grants permission to start screen sharing for contact	Write	contact* instance*		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:ContactAssociationId connect:Channel connect:UserArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartTaskContact	Grants permission to initiate a task using the Amazon Connect API	Write	contact-flow*		
			contact		
			quick-connect		
			task-template		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:AssignmentType	
StartWebRTCContact	Grants permission to initiate a WebRTC contact using the Amazon Connect API	Write	contact-flow*		
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StopContact	Grants permission to stop contacts that were initiated using the Amazon Connect API. If you use this operation on an active contact the contact ends, even if the agent is active on a call with a customer	Write	contact*		
				connect:InstanceId connect:ContactAssociationId connect:Channel connect:UserArn	
StopContactMediaProcessing	Grants permission to stop message processing on an ongoing contact	Write	contact*		
			instance*		
				connect:InstanceId	
StopContactRecording	Grants permission to stop recording for the specified contact	Write	contact*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:ContactAssociationId connect:Channel connect:UserArn	
StopContactStreaming	Grants permission to stop chat streaming using the Amazon Connect API	Write	instance*		
				aws:ResourceTag/${TagKey}	
StopForecastingPlanningSchedulingIntegration [permission only]	Grants permission to disable forecasting, planning, and scheduling integration on an Amazon Connect instance	Write	instance*		
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SubmitContactEvaluation	Grants permission to submit a contact evaluation in the specified Amazon Connect instance. Answers included in the request are merged with existing answers for the given evaluation. If no answers or notes are passed, the evaluation is submitted with the existing answers and notes. You can delete an answer or note by passing an empty object ({}) to the question identifier	Write	contact-evaluation*		
				connect:InstanceId	
SuspendContactRecording	Grants permission to suspend recording for the specified contact	Write	contact*		
				aws:ResourceTag/${TagKey} connect:ContactAssociationId connect:Channel connect:UserArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagContact	Grants permission to tag a contact in an Amazon Connect instance	Write	contact*		
				aws:TagKeys aws:RequestTag/${TagKey} connect:InstanceId connect:ContactAssociationId connect:Channel connect:UserArn	
TagResource	Grants permission to tag an Amazon Connect resource	Tagging	agent-status		
			contact-evaluation		
			contact-flow		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			contact-flow-module

			rule		
			security-profile		
			task-template		
			traffic-distribution-group		
			use-case		
			user		
			vocabulary		
			wildcard-phone-number		
				aws:TagKeys	
UpdateAgentStatus	Grants permission to update agent status in an Amazon Connect instance	Write	agent-status*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateAuthenticationProfile	Grants permission to update authentication profile resources in an Amazon Connect instance	Write	authentication-profile*		
				connect:InstanceId	
UpdateContact	Grants permission to update a contact in an Amazon Connect instance	Write	contact*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId connect:ContactAssociationId connect:Channel connect:UserArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateContactAttributes	Grants permission to create or update the contact attributes associated with the specified contact	Write	contact*		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:ContactAssociationId connect:Channel connect:UserArn	
UpdateContactEvaluation	Grants permission to update details about a contact evaluation in the specified Amazon Connect instance. A contact evaluation must be in the draft state. Answers included in the request are merged with existing answers for the given evaluation. An answer or note can be deleted by passing an empty object ({}) to the question identifier	Write	contact-evaluation*		
				connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateContactFlowContent	Grants permission to update contact flow content in an Amazon Connect instance	Write	contact-flow*		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:FlowType	
UpdateContactFlowMetadata	Grants permission to update the metadata of a contact flow in an Amazon Connect instance	Write	contact-flow*		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:FlowType	
UpdateContactFlowModuleAlias	Grants permission to update an alias of a flow module version in an Amazon Connect instance	Write	contact-flow-module*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateContactFlowModuleContent	Grants permission to update contact flow module content in an Amazon Connect instance	Write	contact-flow-module*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateContactFlowModuleMetadata	Grants permission to update the metadata of a contact flow module in an Amazon Connect instance	Write	contact-flow-module*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateContactFlowName	Grants permission to update the name and description of a contact flow in an Amazon Connect instance	Write	contact-flow*		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:FlowType	
UpdateContactRoutingData	Grants permission to update routing properties on a contact in an Amazon Connect instance	Write	contact*		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:ContactAssociationId connect:Channel connect:UserArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateContactSchedule	Grants permission to update the schedule of a contact that is already scheduled in an Amazon Connect instance	Write	contact*		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:ContactAssociationId connect:Channel connect:UserArn	
UpdateDataTableAttribute	Grants permission to update an attribute of a data table in an Amazon Connect instance	Write	data-table*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateDataTableMetadata	Grants permission to update metadata of a data table in an Amazon Connect instance	Write	data-table*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateDataTablePrimaryValues	Grants permission to update primary values in a data table in an Amazon Connect instance	Write	data-table*		
				aws:ResourceTag/${TagKey} connect:InstanceId connect:PrimaryAttribute/${PrimaryAttribute}	
UpdateEmailAddressMetadata	Grants permission to update the metadata of an email address resource in an Amazon Connect instance	Write	email-address*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateEvaluationForm	Grants permission to update details about a specific evaluation form version in the specified Amazon Connect instance. Question and section identifiers cannot be duplicated within the same evaluation form	Write	evaluation-form*		
				connect:InstanceId	
UpdateHoursOfOperation	Grants permission to update hours of operation in an Amazon Connect instance	Write	hours-of-operation*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateHoursOfOperationOverride	Grants permission to update an hours of operation override in an Amazon Connect instance	Write	hours-of-operation*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			instance*		
				connect:InstanceId	
UpdateInstanceAttribute	Grants permission to update the attribute for an existing Amazon Connect instance	Write	instance*		ds:DescribeDirectories iam:AttachRolePolicy iam:CreateServiceLinkedRole iam:PutRolePolicy logs:CreateLogGroup
				connect:AttributeType connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateInstanceStorageConfig	Grants permission to update the storage configuration for an existing Amazon Connect instance	Write	instance*		ds:DescribeDirectories firehose:DescribeDeliveryStream iam:AttachRolePolicy iam:CreateServiceLinkedRole iam:PutRolePolicy kinesis:DescribeStream kms:CreateGrant kms:DescribeKey s3:GetBucketAcl

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					s3:GetBucketLocation
				connect:StorageResourceType connect:InstanceId	
UpdateNotificationContent	Grants permission to update the content of a notification in an Amazon Connect instance	Write	notification*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateParticipantAuthentication	Grants permission to update and continue authentication for a specific contact	Write	instance*		
				connect:InstanceId	
UpdateParticipantRoleConfig	Grants permission to update participant role configurations associated with a contact	Write	contact*		
			instance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdatePhoneNumber	Grants permission to update phone number resources in an Amazon Connect instance or traffic distribution group	Write	instance*		
			phone-number*		
			traffic-distribution-group*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdatePhoneNumberMetadata	Grants permission to update the metadata of a phone number resource in an Amazon Connect instance or traffic distribution group	Write	phone-number*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdatePredefinedAttribute	Grants permission to update a predefined attribute in an Amazon Connect instance	Write	instance*		
				connect:InstanceId	
UpdatePrompt	Grants permission to update a prompt's name, description, and Amazon S3 URI in an Amazon Connect instance	Write	prompt*		kms:Decrypt s3:GetObject s3:GetObjectAcl
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateQueueHoursOfOperation	Grants permission to update queue hours of operation in an Amazon Connect instance	Write	hours-of-operation*		
			queue*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateQueueMaxContacts	Grants permission to update queue capacity in an Amazon Connect instance	Write	queue*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateQueueName	Grants permission to update a queue name and description in an Amazon Connect instance	Write	queue*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateQueueOutboundCallerConfig	Grants permission to update queue outbound caller config in an Amazon Connect instance	Write	queue*		
			contact-flow		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			phone-number		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateQueueOutboundEmailConfig	Grants permission to update the outbound email configuration for a queue in an Amazon Connect instance	Write	queue*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateQueueStatus	Grants permission to update queue status in an Amazon Connect instance	Write	queue*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateQuickConnectConfig	Grants permission to update the configuration of a quick connect in an Amazon Connect instance	Write	quick-connect*		
			contact-flow		
			queue		
			user		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateQuickConnectName	Grants permission to update a quick connect name and description in an Amazon Connect instance	Write	quick-connect*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateRoutingProfileAgentAvailabilityTimer	Grants permission to update a routing profile agent availability timer in an Amazon Connect instance	Write	routing-profile*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateRoutingProfileConcurrency	Grants permission to update the concurrency in a routing profile in an Amazon Connect instance	Write	routing-profile*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateRoutingProfileDefaultOutboundQueue	Grants permission to update the outbound queue in a routing profile in an Amazon Connect instance	Write	queue*		
			routing-profile*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateRoutingProfileName	Grants permission to update a routing profile name and description in an Amazon Connect instance	Write	routing-profile*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateRoutingProfileQueues	Grants permission to update the queues in routing profile in an Amazon Connect instance	Write	routing-profile*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateRule	Grants permission to update a rule for an existing Amazon Connect instance	Write	rule*		
				connect:InstanceId	
UpdateSecurityProfile	Grants permission to update a security profile group for a user in an Amazon Connect instance	Write	security-profile*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateTaskTemplate	Grants permission to update task template belonging to a Amazon Connect instance	Write	task-template*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateTrafficDistribution	Grants permission to update traffic distribution for a traffic distribution group	Write	traffic-distribution-group*		
				aws:ResourceTag/${TagKey}	
UpdateUserHierarchy	Grants permission to update a hierarchy group for a user in an Amazon Connect instance	Write	user*		
			hierarchy-group		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateUserHierarchyGroupName	Grants permission to update a user hierarchy group name in an Amazon Connect instance	Write	hierarchy-group*		
				connect:InstanceId	
UpdateUserHierarchyStructure	Grants permission to update user hierarchy structure in an Amazon Connect instance	Write	instance*		
				connect:InstanceId	
UpdateUserIdentityInfo	Grants permission to update identity information for a user in an Amazon Connect instance	Write	user*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateUserNotificationStatus	Grants permission to update the status of a user notification in an Amazon Connect instance	Write	user*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateUserPhoneConfig	Grants permission to update phone configuration settings for a user in an Amazon Connect instance	Write	user*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateUserProficiencies	Grants permission to update user proficiencies from a user in an Amazon Connect instance	Write	instance*		
			user*		
				connect:InstanceId	
UpdateUserRoutingProfile	Grants permission to update a routing profile for a user in an Amazon Connect instance	Write	routing-profile*		
			user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateUserSecurityProfiles	Grants permission to update security profiles for a user in an Amazon Connect instance	Write	security-profile* user*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateViewContent	Grants permission to update a view's content in an Amazon Connect instance	Write	customer-managed-view*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateViewMetadata	Grants permission to update a view's metadata in an Amazon Connect instance	Write	customer-managed-view*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateWorkspaceMetadata	Grants permission to update workspace metadata in an Amazon Connect instance	Write	workspace*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateWorkspacePage	Grants permission to update a workspace page in an Amazon Connect instance	Write	workspace*		
			aws-managed-view		
			customer-managed-view		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateWorkspaceTheme	Grants permission to update workspace theme in an Amazon Connect instance	Write	workspace*		
				aws:ResourceTag/${TagKey} connect:InstanceId	
UpdateWorkspaceVisibility	Grants permission to update workspace visibility in an Amazon Connect instance	Write	workspace*		
				aws:ResourceTag/${TagKey} connect:InstanceId	

Resource types defined by Amazon Connect

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
instance	`arn:${Partition}:connect:${Region}:${Account}:instance/${InstanceId}`	aws:ResourceTag/${TagKey}
contact	`arn:${Partition}:connect:${Region}:${Account}:instance/${InstanceId}/contact/${ContactId}`	
user	`arn:${Partition}:connect:${Region}:${Account}:instance/${InstanceId}/agent/${UserId}`	aws:ResourceTag/${TagKey}
routing-profile	`arn:${Partition}:connect:${Region}:${Account}:instance/${InstanceId}/routing-profile/${RoutingProfileId}`	aws:ResourceTag/${TagKey}
security-profile	`arn:${Partition}:connect:${Region}:${Account}:instance/${InstanceId}/security-profile/${SecurityProfileId}`	aws:ResourceTag/${TagKey}
authentication-profile	`arn:${Partition}:connect:${Region}:${Account}:instance/${InstanceId}/authentication-profile/${AuthenticationProfileId}`	
hierarchy-group	`arn:${Partition}:connect:${Region}:${Account}:instance/${InstanceId}/agent-group/${HierarchyGroupId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Connect

Amazon Connect defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by using tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by using tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by using tag keys in the request	ArrayOfString
connect:AssignmentType	Filters access by restricting access to create contacts based on Assignment Type	String
connect:AttributeType	Filters access by the attribute type of the Amazon Connect instance	String
connect:Channel	Filters access by Channel	String
connect:ContactAssociationId	Filters access by ContactAssociationId	String
connect:ContactInitiationMethod	Filters access by restricting access to create contacts based on the initiation method of the contact	String
connect:ExpressionValue	Filters access by restricting data table operations based on expression type	String

Condition keys	Description	Type
connect:FlowType	Filters access by Flow type	ArrayOfString
connect:InstanceId	Filters access by restricting federation into specified Amazon Connect instances	String
connect:ListRealtimeContactAnalysisSegmentsByOutputType	Filters access by restricting the listed segments using the output type of the Amazon Connect Contact Lens real-time segment	String
connect:ListRealtimeContactAnalysisSegmentsBySegmentType	Filters access by restricting the listed segments using the segment types of the Amazon Connect Contact Lens real-time segment	ArrayOfString
connect:MonitorCapabilities	Filters access by restricting the monitor capabilities of the user in the request	ArrayOfString
connect:PreferredUserArn	Filters access by PreferredUserArn	ARN
connect:PrimaryAttribute/${PrimaryAttribute}	Filters access by restricting which primary attributes the user can manage	String
connect:SearchContactsByContactAnalysis	Filters access by restricting searches using analysis outputs from Amazon Connect Contact Lens	ArrayOfString

Condition keys	Description	Type
connect:SearchTag/${TagKey}	Filters access by TagFilter condition passed in the search request	String
connect:StorageResourceType	Filters access by restricting the storage resource type of the Amazon Connect instance storage configuration	String
connect:Subtype	Filters access by restricting creation of a contact for specific subtypes	String
connect:UserArn	Filters access by UserArn	ARN

Actions, resources, and condition keys for Amazon Connect Cases

Amazon Connect Cases (service prefix: `cases`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon Connect Cases

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy,

you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetCaseRule	Grants permission to retrieve information about the case rules in the case domain	Read	CaseRule*		
			Domain*		
BatchGetField	Grants permission to retrieve information about the fields in the case domain	Read	Domain*		
			Field*		
BatchPutFieldOptions	Grants permission to update the field options in the case domain	Write	Domain*		
			Field*		
CreateCase	Grants permission to create a case in the case domain	Write	Case*		
			Domain*		
			Field*		
			Template*		
				connect:UserArn	
CreateCaseRule	Grants permission to create a case rule in the case domain	Write	CaseRule*		
			Domain*		
CreateDomain	Grants permission to create a new case domain	Write			
CreateField	Grants permission to create a field in the case domain	Write	Domain*		
			Field*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateLayout	Grants permission to create a layout in the case domain	Write	Domain*		
			Layout*		
CreateRelatedItem	Grants permission to create a related item associated to a case in the case domain	Write	Case*		
			Domain*		
			RelatedItem*		
				connect:UserArn	
CreateTemplate	Grants permission to create a template in the case domain	Write	Domain*		
			Layout*		
			Template*		
DeleteCase	Grants permission to delete the case in the case domain	Write	Case*		
			Domain*		
DeleteCaseRule	Grants permission to delete the case rule in the case domain	Write	CaseRule*		
			Domain*		
DeleteDomain	Grants permission to delete the domain	Write	Domain*		
DeleteField	Grants permission to delete the field in the case domain	Write	Domain*		
			Field*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteLayout	Grants permission to delete the layout in the case domain	Write	Domain*		
			Layout*		
DeleteRelatedItem	Grants permission to delete the related item associated to the case in the case domain	Write	Case*		
			Domain*		
			RelatedItem*		
DeleteTemplate	Grants permission to delete the template in the case domain	Write	Domain*		
			Template*		
GetCase	Grants permission to retrieve information about a case in the case domain	Read	Case*		
			Domain*		
			Field*		
GetCaseAuditEvents	Grants permission to view audit history of a case	Read	Case*		
			Domain*		
GetCaseEventConfiguration	Grants permission to retrieve information about the case event configuraton in the case domain	Read	Domain*		
GetDomain	Grants permission to retrieve information about the case domain	Read	Domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetLayout	Grants permission to retrieve information about the layout in the case domain	Read	Domain*		
			Layout*		
GetTemplate	Grants permission to retrieve information about the template in the case domain	Read	Domain*		
			Template*		
ListCaseRules	Grants permission to list case rules in the case domain	List	Domain*		
ListCasesForContact	Grants permission to list cases for a specific contact in the case domain	List	Domain*		
ListDomains	Grants permission to list all domains in the aws account	List			
ListFieldOptions	Grants permission to list field options for a single select field in the case domain	List	Domain*		
			Field*		
ListFields	Grants permission to list fields in the case domain	List	Domain*		
ListLayouts	Grants permission to list layouts in the case domain	List	Domain*		
ListTagsForResource	Grants permission to list the tags for the specified resource	Read			
ListTemplates	Grants permission to list templates in the case domain	List	Domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutCaseEventConfiguration	Grants permission to insert or update the case event configuration in the case domain	Write	Domain*		
SearchCases	Grants permission to search for cases in the case domain	Read	Domain*		
SearchRelatedItems	Grants permission to search for related items associated to the case in the case domain	Read	Case*

			Template*		

Resource types defined by Amazon Connect Cases

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Case	`arn:${Partition}:cases:${Region}:${Account}:domain/${DomainId}/case/${CaseId}`	aws:ResourceTag/${TagKey}
Domain	`arn:${Partition}:cases:${Region}:${Account}:domain/${DomainId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
Field	arn:${Partition}:cases:${Region}:${Account}:domain/${DomainId}/field/${FieldId}	aws:ResourceTag/${TagKey}
Layout	arn:${Partition}:cases:${Region}:${Account}:domain/${DomainId}/layout/${LayoutId}	aws:ResourceTag/${TagKey}
RelatedItem	arn:${Partition}:cases:${Region}:${Account}:domain/${DomainId}/case/${CaseId}/related-item/${RelatedItemId}	aws:ResourceTag/${TagKey}
Template	arn:${Partition}:cases:${Region}:${Account}:domain/${DomainId}/template/${TemplateId}	aws:ResourceTag/${TagKey}
CaseRule	arn:${Partition}:cases:${Region}:${Account}:domain/${DomainId}/case-rule/${CaseRuleId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Connect Cases

Amazon Connect Cases defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tags that are passed in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by tags associated with the resource	String
aws:TagKeys	Filters access by tag keys that are passed in the request	ArrayOfString
connect:UserArn	Filters access by connect's UserArn	ARN

Actions, resources, and condition keys for Amazon Connect Customer Profiles

Amazon Connect Customer Profiles (service prefix: `profile`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Connect Customer Profiles

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddProfileKey	Grants permission to add a profile key	Write	domains*		
BatchGetCalculatedAttributeForProfile	Grants permission to retrieve a calculated attribute for the specific profiles in the domain	Read	calculated-attributes*		
			domains*		
BatchGetProfile	Grants permission to get profiles in the domain	Read	domains*		
CreateCalculatedAttributeDefinition	Grants permission to create a calculated attribute definition in the domain	Write	calculated-attributes*	aws:RequestTag/${TagKey} aws:TagKeys	
			domains*		
CreateDomain	Grants permission to create a Domain	Write	domains*	aws:RequestTag/${TagKey} aws:TagKeys	iam:CreateServiceLinkedRole
CreateDomainLayout	Grants permission to create a layout in the domain	Write	domains*		
			layouts*	aws:RequestTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} aws:TagKeys	
CreateEventStream	Grants permission to put an event stream in a domain	Write	domains*		iam:PutRolePolicy kinesis:DescribeStreamSummary
			event-streams*	aws:RequestTag/${TagKey} aws:TagKeys	
CreateEventTrigger	Grants permission to create an event trigger in the domain	Write	domains*		
			event-triggers*	aws:RequestTag/${TagKey} aws:TagKeys	
CreateIntegrationWorkflow	Grants permission to create an integration workflow in a domain	Write	domains*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			integrations*	aws:RequestTag/${TagKey} aws:TagKeys	
CreateProfile	Grants permission to create a profile in the domain	Write	domains*		
CreateRecommender	Grants permission to create a Recommender in the domain	Write	domains*		
			recommenders*	aws:RequestTag/${TagKey} aws:TagKeys	
CreateSegmentDefinition	Grants permission to create a segment definition in the domain	Write	domains*		
			segment-definitions*	aws:RequestTag/${TagKey} aws:TagKeys	
CreateSegmentEstimate	Grants permission to create a segment estimate in the domain	Write	domains*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSegmentSnapshot	Grants permission to create a segment snapshot in the domain	Write	domains*		
			segment-definitions*		
CreateSnapshot [permission only]	Grants permission to create a snapshot in the domain	Write	domains*		
CreateUploadJob	Grants permission to create an upload job in the domain	Write	domains*		
DeleteCalculatedAttributeDefinition	Grants permission to delete a calculated attribute definition in the domain	Write	calculated-attributes*		
			domains*		
DeleteDomain	Grants permission to delete a Domain	Write	domains*		
DeleteDomainLayout	Grants permission to delete a layout in the domain	Write	domains*		
			layouts*		
DeleteDomainObjectType	Grants permission to delete a specific domain object type in the domain	Write	domain-object-types*		
			domains*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteEventStream	Grants permission to delete an event stream in a domain	Write	domains*		iam:DeleteRolePolicy
			event-streams*		
DeleteEventTrigger	Grants permission to delete an event trigger in the domain	Write	domains*		
			event-triggers*		
DeleteIntegration	Grants permission to delete a integration in a domain	Write	domains*		
			integrations*		
DeleteProfile	Grants permission to delete a profile	Write	domains*		
DeleteProfileKey	Grants permission to delete a profile key	Write	domains*		
DeleteProfileObject	Grants permission to delete a profile object	Write	domains*		
			object-types*		
DeleteProfileObjectType	Grants permission to delete a specific profile object type in the domain	Write	domains*		
			object-types*		
DeleteRecommender	Grants permission to delete a recommender in a domain	Write	domains*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			recommenders*		
DeleteSegmentDefinition	Grants permission to delete a segment definition in the domain	Write	domains*		
			segment-definitions*		
DeleteWorkflow	Grants permission to delete a workflow in a domain	Write	domains*		
DetectProfileObjectType	Grants permission to auto detect object type	Read	domains*		
GetAutoMergingPreview	Grants permission to get a preview of auto merging in a domain	Read	domains*		
GetCalculatedAttributeDefinition	Grants permission to get a calculated attribute definition in the domain	Read	calculated-attributes*		
			domains*		
GetCalculatedAttributeForProfile	Grants permission to retrieve a calculated attribute for a specific profile in the domain	Read	calculated-attributes*		
			domains*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDomain	Grants permission to get a specific domain in an account	Read	domains*		
GetDomainLayout	Grants permission to get a layout in the domain	Read	domains*		
			layouts*		
GetDomainObjectType	Grants permission to get a specific domain object type in the domain	Read	domain-object-types*		
			domains*		
GetEventStream	Grants permission to get a specific event stream in a domain	Read	domains*		kinesis:DescribeStreamSummary
			event-streams*		
GetEventTrigger	Grants permission to get an event trigger in the domain	Read	domains*		
			event-triggers*		
GetIdentityResolutionJob	Grants permission to get an identity resolution job in a domain	Read	domains*		
GetIntegration	Grants permission to get a specific integrations in a domain	Read	domains*		
			integrations*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetMatches	Grants permission to get profile matches in a domain	List	domains*		
GetObjectTypeAttributeStatistics	Grants permission to get statistics of a specific attribute for object type in the domain	Read	domains*		
			object-types*		
GetProfileHistoryRecord	Grants permission to get a profile history record for a profile in a domain	Read	domains*		
GetProfileInsights	Grants permission to list insights for a profile	Read	domains*		
GetProfileObjectType	Grants permission to get a specific profile object type in the domain	Read	domains*		
			object-types*		
GetProfileObjectTypeTemplate	Grants permission to get a specific object type template	Read			
GetProfileRecommendations	Grants permission to list recommendations for a profile	Read	domains*		
			recommenders*		
GetRecommender	Grants permission to get Recommender details in a domain	Read	domains*		
			recommenders*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

UpdateProfile	Grants permission to update a profile in the domain	Write	domains*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateRecommender	Grants permission to update a Recommender in the domain	Write	domains*		
			recommenders*		

Resource types defined by Amazon Connect Customer Profiles

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
domains	`arn:${Partition}:profile:${Region}:${Account}:domains/${DomainName}`	aws:ResourceTag/${TagKey}
object-types	`arn:${Partition}:profile:${Region}:${Account}:domains/${DomainName}/object-types/${ObjectTypeName}`	aws:ResourceTag/${TagKey}
integrations	`arn:${Partition}:profile:${Region}:${Account}:domains/${DomainName}/integrations/${Uri}`	aws:ResourceTag/${TagKey}
event-streams	`arn:${Partition}:profile:${Region}:${Account}:domains/${DomainName}/event-streams/${EventStreamName}`	aws:ResourceTag/${TagKey}
calculated-attributes	`arn:${Partition}:profile:${Region}:${Account}:domains/${DomainName}/calc`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
	ulated-attributes/${CalculatedAttribuuteName}	
segment-definitions	arn:${Partition}:profile:${Region}:${Account}:domains/${DomainName}/segment-definitions/${SegmentDefinitionName}	aws:ResourceTag/${TagKey}
event-triggers	arn:${Partition}:profile:${Region}:${Account}:domains/${DomainName}/event-triggers/${EventTriggerName}	aws:ResourceTag/${TagKey}
layouts	arn:${Partition}:profile:${Region}:${Account}:domains/${DomainName}/layouts/${LayoutDefinitionName}	aws:ResourceTag/${TagKey}
recommenders	arn:${Partition}:profile:${Region}:${Account}:domains/${DomainName}/recommenders/${RecommenderTypeName}	aws:ResourceTag/${TagKey}
domain-object-types	arn:${Partition}:profile:${Region}:${Account}:domains/${DomainName}/domain-object-types/${ObjectTypeName}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Connect Customer Profiles

Amazon Connect Customer Profiles defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a key that is present in the request the user makes to the customer profile service	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair	String
aws:TagKeys	Filters access by the list of all the tag key names present in the request the user makes to the customer profile service	ArrayOfString

Actions, resources, and condition keys for Amazon Connect Health

Amazon Connect Health (service prefix: `health-agent`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Connect Health

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ActivateSubscription	Grants permission to activate a subscription to enable billing for a user	Write	Domain*		
			Subscription*		
CancelAppointment [permission only]	Grants permission to cancel an appointment	Write	Domain*		
			Integration*		
CreateAgent [permission only]	Grants permission to create a new agent with an initial version in DRAFT state	Write	Agent*		
			Domain*		
CreateDomain	Grants permission to create a new domain for managing HealthAgent resources	Write		aws:RequestTag/${TagKey}	health-agent:TagResource
				aws:TagKeys	iam:PassRole
CreateIntegration [permission only]	Grants permission to create a new integration for a domain	Write	Domain*		
			Integration*		
CreateSession [permission only]	Grants permission to create a new session with specified agent configurations	Write	Agent*		
			Domain*		
			Session*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSubscription	Grants permission to create a new subscription within a domain for billing and user management	Write	Domain*		
			Subscription*		
DeactivateSubscription	Grants permission to deactivate a subscription to stop billing for a user	Write	Domain*		
			Subscription*		
DeleteAgent [permission only]	Grants permission to delete an agent configuration and all its versions	Write	Agent*		
			Domain*		
DeleteDomain	Grants permission to delete a domain and all associated resources	Write	Domain*		
DeleteIntegration [permission only]	Grants permission to delete an integration	Write	Domain*		
			Integration*		
GetAgent [permission only]	Grants permission to retrieve an agent configuration, defaulting to the most recent version if not specified	Read	Agent*		
			Domain*		
GetCareTeamProvider [permission only]	Grants permission to retrieve the care team provider of a patient	Read	Domain*		
			Integration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDomain	Grants permission to retrieve information about a domain	Read	Domain*		
GetIntegration [permission only]	Grants permission to get an existing integration	Read	Domain*		
			Integration*		
GetMedicalScribeListeningSession	Grants permission to retrieve details about an existing Medical Scribe listening session	Read	Domain*		
			Subscription*		
GetPatient [permission only]	Grants permission to retrieve patient information	Read	Domain*		
			Integration*		
GetPatientInsightsJob	Grants permission to get details of a started patient insights job	Read	Domain*		
			PatientInsightsJob*		
GetPractitioner [permission only]	Grants permission to retrieve practitioner information	Read	Domain*		
			Integration*		
GetSessionContext [permission only]	Grants permission to retrieve structured session context including attributes and collected data	Read	Domain*		
			Session*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSubscription	Grants permission to retrieve information about a subscription	Read	Domain*		
			Subscription*		
InvokeAgent [permission only]	Grants permission to invoke an agent within a session with streaming response support	Write	Domain*		
			Session*		
ListAgents [permission only]	Grants permission to list all agents in a domain	List	Domain*		
ListAppointmentSlots [permission only]	Grants permission to list available appointment slots	Read	Domain*		
			Integration*		
ListDomains	Grants permission to list domains for a given account	List			
ListIntegrations [permission only]	Grants permission to list integrations for a domain	List	Domain*		
ListPatientAppointments [permission only]	Grants permission to list patient appointments	Read	Domain*		
			Integration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListPatientInsuranceCoverages [permission only]	Grants permission to list patient insurance coverages	Read	Domain*		
			Integration*		
ListProviders [permission only]	Grants permission to retrieve active providers available for scheduling appointments with a patient	Read	Domain*		
			Integration*		
ListSubscriptions	Grants permission to list all subscriptions within a domain	List	Domain*		
ListTagsForResource	Grants permission to list the tags for the specified resource	List	Domain		
MatchPatient [permission only]	Grants permission to match a patient	Read	Domain*		
			Integration*		
PublishAgent [permission only]	Grants permission to publish an agent configuration version	Write	Agent*		
			Domain*		
RescheduleAppointment [permission only]	Grants permission to reschedule an appointment	Write	Domain*		
			Integration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ScheduleAppointment [permission only]	Grants permission to schedule an appointment for a patient	Write	Domain*		
			Integration*		
StartMedicalScribeListeningSession	Grants permission to start a new Medical Scribe listening session for real-time audio transcription	Write	Domain*		
			Subscription*		
StartPatientInsightsJob	Grants permission to start a new patient insights job	Write	Domain*		
			PatientInsightsJob*		
TagResource	Grants permission to add the specified tags to the specified resource	Tagging	Domain	aws:ResourceTag/${TagKey}	
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove the tags identified by the TagKeys list from a resource	Tagging	Domain		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAgent [permission only]	Grants permission to update a draft agent configuration, creating a new draft version if none exists	Write	Agent*		
			Domain*		
UpdateIntegration [permission only]	Grants permission to update an existing integration	Write	Domain*		
			Integration*		
UpdateSession [permission only]	Grants permission to update session attributes such as departmentId and appointmentType	Write	Domain*		
			Session*		

Resource types defined by Amazon Connect Health

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Domain	`arn:${Partition}:health-agent:${Region}:${Account}:domain/${DomainId}`	aws:ResourceTag/${TagKey}
PatientInsightsJob	`arn:${Partition}:health-agent:${Region}:${Account}:domain/${DomainId}/patient-insights-job/${JobId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
Subscription	arn:${Partition}:health-agent:${Region}:${Account}:domain/${DomainId}/subscription/${SubscriptionId}	aws:ResourceTag/${TagKey}
Integration	arn:${Partition}:health-agent:${Region}:${Account}:domain/${DomainId}/integration/${IntegrationId}	aws:ResourceTag/${TagKey}
Agent	arn:${Partition}:health-agent:${Region}:${Account}:domain/${DomainId}/agent/${AgentId}	aws:ResourceTag/${TagKey}
Session	arn:${Partition}:health-agent:${Region}:${Account}:domain/${DomainId}/session/${SessionId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Connect Health

Amazon Connect Health defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String

Condition keys	Description	Type
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Connect Outbound Campaigns

Amazon Connect Outbound Campaigns (service prefix: `connect-campaigns`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon Connect Outbound Campaigns

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCampaign	Grants permission to create a campaign	Write	campaign*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
DeleteCampaign	Grants permission to delete a campaign	Write	campaign*		
DeleteCampaignChannelSubtypeConfig	Grants permission to delete the channel subtype configuration of a campaign	Write	campaign*		
DeleteCampaignCommunicationLimits	Grants permission to delete the communication limits configuration of a campaign	Write	campaign*		
DeleteCampaignCommunicationTime	Grants permission to delete the communication time configuration of a campaign	Write	campaign*		
DeleteConnectInstanceConfig	Grants permission to remove configuration information for an Amazon Connect instance	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteConnectInstanceIntegration	Grants permission to remove integration information for an Amazon Connect instance	Write			
DeleteInstanceOnboardingJob	Grants permission to remove onboarding job for an Amazon Connect instance	Write			
DescribeCampaign	Grants permission to describe a specific campaign	Read	campaign*		
				aws:RequestTag/${TagKey}	
GetCampaignState	Grants permission to get state of a campaign	Read	campaign*		
				aws:RequestTag/${TagKey}	
GetCampaignStateBatch	Grants permission to get state of campaigns	Read	campaign*		
				aws:RequestTag/${TagKey}	
GetConnectInstanceConfig	Grants permission to get configuration information for an Amazon Connect instance	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetInstanceCommunicationLimits	Grants permission to get the communication limits configuration of an Amazon Connect instance	Read			
GetInstanceOnboardingJobStatus	Grants permission to get onboarding job status for an Amazon Connect instance	Read			
ListCampaigns	Grants permission to provide summary of all campaigns	List		aws:RequestTag/${TagKey}	
ListConnectInstanceIntegrations	Grants permission to provide summary of all integrations with an Amazon Connect instance	List			
ListTagsForResource	Grants permission to list tags for a resource	Read	campaign		
				aws:ResourceTag/${TagKey}	
PauseCampaign	Grants permission to pause a campaign	Write	campaign*		
PutConnectInstanceIntegration	Grants permission to put an integration configuration with an Amazon Connect instance	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutDialRequestBatch	Grants permission to create dial requests for the specified campaign	Write	campaign*		
PutInstanceCommunicationLimits	Grants permission to put the communication limits configuration of an Amazon Connect instance	Write			
PutOutboundRequestBatch	Grants permission to create dial requests for the specified campaign	Write	campaign*		
PutProfileOutboundRequestBatch	Grants permission to create profile outbound requests for the specified campaign	Write	campaign*		
ResumeCampaign	Grants permission to resume a campaign	Write	campaign*		
StartCampaign	Grants permission to start a campaign	Write	campaign*		
StartInstanceOnboardingJob	Grants permission to start onboarding job for an Amazon Connect instance	Write			
StopCampaign	Grants permission to stop a campaign	Write	campaign*		
TagResource	Grants permission to tag a resource	Tagging	campaign*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to untag a resource	Tagging	campaign*		
				aws:TagKeys	
UpdateCampaignChannelSubtypeConfig	Grants permission to update the channel subtype configuration of a campaign	Write	campaign*		
UpdateCampaignCommunicationLimits	Grants permission to update the communication limits configuration of a campaign	Write	campaign*		
UpdateCampaignCommunicationTime	Grants permission to update the communication time configuration of a campaign	Write	campaign*		
UpdateCampaignDialerConfig	Grants permission to update the dialer configuration of a campaign	Write	campaign*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateCampaignFlowAssociation	Grants permission to update the flow association of a campaign	Write	campaign*		
UpdateCampaignName	Grants permission to update the name of a campaign	Write	campaign*		
UpdateCampaignOutboundCallConfig	Grants permission to update the outbound call configuration of a campaign	Write	campaign*		
UpdateCampaignSchedule	Grants permission to update the schedule of a campaign	Write	campaign*		
UpdateCampaignSource	Grants permission to update the source of a campaign	Write	campaign*		

Resource types defined by Amazon Connect Outbound Campaigns

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
campaign	arn:${Partition}:connect-campaigns:${Region}:${Account}:campaign/${CampaignId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Connect Outbound Campaigns

Amazon Connect Outbound Campaigns defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by actions based on the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by actions based on tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by actions based on the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Connect Voice ID

Amazon Connect Voice ID (service prefix: voiceid) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Management Console Mobile App

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDeviceIdentity	Grants permission to retrieve the device identity for a Console Mobile App device	Read	DeviceIdentity*		
ListDeviceIdentities	Grants permission to retrieve a list of device identities	List			

Resource types defined by AWS Management Console Mobile App

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
DeviceIdentity	`arn:${Partition}:consoleapp::${Account}:device/${DeviceId}/identity/${IdentityId}`	

Condition keys for AWS Management Console Mobile App

Console Mobile App has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Consolidated Billing

AWS Consolidated Billing (service prefix: `consolidatedbilling`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Consolidated Billing

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy,

you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAccountBillingRole [permission only]	Grants permission to get account role (Payer, Linked, Regular)	Read			
ListLinkedAccounts [permission only]	Grants permission to get list of member/linked accounts	List			

Resource types defined by AWS Consolidated Billing

AWS Consolidated Billing does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Consolidated Billing, specify `"Resource": "*"` in your policy.

Condition keys for AWS Consolidated Billing

Consolidated Billing has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Control Catalog

AWS Control Catalog (service prefix: `controlcatalog`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS Control Catalog

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetControl	Grants permission to return details about a specific control	Read	control*		
ListCommonControls	Grants permission to return a paginated list of common controls from the AWS Control Catalog	List			
ListControlMappings	Grants permission to return a paginated list of control mappings from the AWS Control Catalog	List			
ListControls	Grants permission to return a paginated list of all available controls in the AWS Control Catalog library	List	control*		
ListDomains	Grants permission to return a paginated list of domains from the AWS Control Catalog	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListObjectives	Grants permission to return a paginated list of objectives from the AWS Control Catalog	List			

Resource types defined by AWS Control Catalog

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
common-control	`arn:${Partition}:controlcatalog:::common-control/${CommonControlId}`	
control	`arn:${Partition}:controlcatalog:::control/${ControlId}`	
domain	`arn:${Partition}:controlcatalog:::domain/${DomainId}`	
objective	`arn:${Partition}:controlcatalog:::objective/${ObjectiveId}`	

Condition keys for AWS Control Catalog

Control Catalog has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Control Tower

AWS Control Tower (service prefix: `controltower`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Control Tower

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a

resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateLandingZone	Grants permission to create a landing zone	Write		aws:RequestTag/${TagKey}	controltower:TagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
CreateManagedAccount [permission only]	Grants permission to create an account managed by AWS Control Tower	Write			
DeleteLandingZone	Grants permission to delete AWS Control Tower landing zone	Write	LandingZone*		
DeregisterManagedAccount [permission only]	Grants permission to deregister an account created through the account factory from AWS Control Tower	Write			
DeregisterOrganizationalUnit [permission only]	Grants permission to deregister an organizational unit from AWS Control Tower management	Write			
DescribeAccountFactoryConfig [permission only]	Grants permission to describe the current account factory configuration	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeCoreService [permission only]	Grants permission to describe resources managed by core accounts in AWS Control Tower	Read			
DescribeGuardrail [permission only]	Grants permission to describe a guardrail	Read			
DescribeGuardrailForTarget [permission only]	Grants permission to describe a guardrail for a organizational unit	Read			
DescribeLandingZoneConfiguration [permission only]	Grants permission to describe the current Landing Zone configuration	Read			
DescribeManagedAccount [permission only]	Grants permission to describe an account created through account factory	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeManagedOrganizationalUnit [permission only]	Grants permission to describe an AWS Organizations organizational unit managed by AWS Control Tower	Read			
DescribeRegisterOrganizationalUnitOperation [permission only]	Grants permission to describe a Register Organizational Unit Operation	Read			
DescribeSingleSignOn [permission only]	Grants permission to describe the current AWS Control Tower IAM Identity Center configuration	Read			
DisableBaseline	Grants permission to disable a Baseline on a target	Write	EnabledBaseline*		
DisableControl	Grants permission to remove a control from an organizational unit	Write	EnabledControl*		
DisableGuardrail [permission only]	Grants permission to disable a guardrail from an organizational unit	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableBaseline	Grants permission to enable a Baseline on a target	Write		aws:RequestTag/${TagKey} aws:TagKeys	controltower:TagResource
EnableControl	Grants permission to activate a control for an organizational unit	Write	EnabledControl		controltower:TagResource
				aws:RequestTag/${TagKey} aws:TagKeys	
EnableGuardrail [permission only]	Grants permission to enable a guardrail to an organizational unit	Write			
GetAccountInfo [permission only]	Grants permission to describe an account email and validate that it exists	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAvailableUpdates [permission only]	Grants permission to list available updates for the current AWS Control Tower deployment	Read			
GetBaseline	Grants permission to get Baseline details	Read	Baseline*		
GetBaselineOperation	Grants permission to get the current status of a particular Baseline operation	Read			
GetControlOperation	Grants permission to get the current status of a particular EnabledControl or DisableControl operation	Read			
GetEnabledBaseline	Grants permission to get an enabled Baseline	Read	EnabledBaseline*		
GetEnabledControl	Grants permission to get an enabled control from an organizational unit	Read	EnabledControl*		
GetGuardrailComplianceStatus [permission only]	Grants permission to get the current compliance status of a guardrail	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetHomeRegion [permission only]	Grants permission to get the home region of the AWS Control Tower setup	Read			
GetLandingZone	Grants permission to get the current status of the landing zone setup	Read	LandingZone*		
GetLandingZoneDriftStatus	Grants permission to get the current landing zone drift status	Read			
GetLandingZoneOperation	Grants permission to get the current status of a particular landing zone operation	Read			
GetLandingZoneStatus [permission only]	Grants permission to get the current status of the landing zone setup	Read			
ListBaselines	Grants permission to list Baselines	List			
ListControlOperations	Grants permission to list all control operations	List			
ListDirectoryGroups [permission only]	Grants permission to list the current directory groups available through IAM Identity Center	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDriftDetails	Grants permission to list occurrences of drift in AWS Control Tower	Read			
ListEnabledBaselines	Grants permission to list enabled Baselines	List			
ListEnabledControls	Grants permission to list all enabled controls in a specified organizational unit	List			
ListEnabledGuardrails [permission only]	Grants permission to list currently enabled guardrails	List			
ListExtendedGovernancePrecheckDetails [permission only]	Grants permission to list Precheck details for an Organizational Unit	List			
ListExternalConfigRuleCompliance	Grants permission to list the compliance of external AWS Config rules	Read			
ListGuardrailViolations [permission only]	Grants permission to list existing guardrail violations	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListGuardrails [permission only]	Grants permission to list all available guardrails	List			
ListGuardrailsForTarget [permission only]	Grants permission to list guardrails and their current state for a organizational unit	List			
ListLandingZoneOperations	Grants permission to list all landing zone operations	List			
ListLandingZones	Grants permission to list all landing zones	List			
ListManagedAccounts [permission only]	Grants permission to list accounts managed through AWS Control Tower	List			
ListManagedAccountsForGuardrail [permission only]	Grants permission to list managed accounts with a specified guardrail applied	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListManagedAccountsForParent [permission only]	Grants permission to list managed accounts under an organizational unit	List			
ListManagedOrganizationalUnits [permission only]	Grants permission to list organizational units managed by AWS Control Tower	List			
ListManagedOrganizationalUnitsForGuardrail [permission only]	Grants permission to list managed organizational units that have a specified guardrail applied	List			
ListTagsForResource	Grants permission to list the tags for a resource	Read	EnabledBaseline		
			EnabledControl		
			LandingZone		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ManageOrganizationalUnit [permission only]	Grants permission to set up an organizational unit to be managed by AWS Control Tower	Write			
PerformPreLaunchChecks [permission only]	Grants permission to perform validations in an account	Read			
ResetEnabledBaseline	Grants permission to reset an enabled Baseline	Write	EnabledBaseline*		
ResetEnabledControl	Grants permission to reset an enabled control for an organizational unit	Write	EnabledControl*		
ResetLandingZone	Grants permission to reset a landing zone	Write	LandingZone*		
SetupLandingZone [permission only]	Grants permission to set up or update AWS Control Tower landing zone	Write			
TagResource	Grants permission to add tags to a resource	Tagging	EnabledBaseline		
			EnabledControl		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			LandingZone		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from a resource	Tagging	EnabledBaseline		
			EnabledControl		
			LandingZone		
				aws:TagKeys	
UpdateAccountFactoryConfig [permission only]	Grants permission to update the account factory configuration	Write			
UpdateEnabledBaseline	Grants permission to update an enabled Baseline	Write	EnabledBaseline*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateEnabledControl	Grants permission to update an enabled control for an organizational unit	Write	EnabledControl*		
UpdateLandingZone	Grants permission to update a landing zone	Write	LandingZone*		

Resource types defined by AWS Control Tower

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
EnabledControl	`arn:${Partition}:controltower:${Region}:${Account}:enabledcontrol/${EnabledControlId}`	aws:ResourceTag/${TagKey}
Baseline	`arn:${Partition}:controltower:${Region}::baseline/${BaselineId}`	
EnabledBaseline	`arn:${Partition}:controltower:${Region}:${Account}:enabledbaseline/${EnabledBaselineId}`	aws:ResourceTag/${TagKey}
LandingZone	`arn:${Partition}:controltower:${Region}:${Account}:landingzone/${LandingZoneId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Control Tower

AWS Control Tower defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Cost and Usage Report

AWS Cost and Usage Report (service prefix: `cur`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

				aws:TagKeys aws:ResourceTag/${TagKey}	
UpdateAnomalyMonitor	Grants permission to update an existing Anomaly Monitor	Write	anomalymonitor*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
UpdateAnomalySubscription	Grants permission to update an existing Anomaly Subscription	Write	anomalysubscription*		
				aws:ResourceTag/${TagKey}	
UpdateConsoleActionSetEnforced [permission only]	Grants permission to change whether existing or fine-grained IAM actions will be used to control authorization to Billing, Cost Management, and Account consoles	Write			
UpdateCostAllocationTagsStatus	Grants permission to update existing Cost Allocation Tags status	Write			
UpdateCostCategoryDefinition	Grants permission to update an existing Cost Category	Write	costcategory*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateNotification Subscription [permission only]	Grants permission to update Reservation expiration alerts	Write			
UpdatePreferences [permission only]	Grants permission to edit Cost Explorer Preferences page	Write			
UpdateReport [permission only]	Grants permission to update Cost Explorer Reports	Write			

Resource types defined by AWS Cost Explorer Service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
anomalysubscription	`arn:${Partition}:ce::${Account}:anomalysubscription/${Identifier}`	aws:ResourceTag/${TagKey}
anomalymonitor	`arn:${Partition}:ce::${Account}:anomalymonitor/${Identifier}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
costcategory	arn:${Partition}:ce::${Account}:costcategory/${Identifier}	aws:ResourceTag/${TagKey}
billingview	arn:${Partition}:billing::${Account}:billingview/${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Cost Explorer Service

AWS Cost Explorer Service defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Cost Optimization Hub

AWS Cost Optimization Hub (service prefix: cost-optimization-hub) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS Cost Optimization Hub

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetPreferences	Grants permission to get preferences	Read			
GetRecommendation	Grants permission to get resource configuration and estimated cost impact for a recommendation	Read			
ListEfficiencyMetrics	Grants permission to list efficiency metric scores by group	List			
ListEnrollmentStatuses	Grants permission to list enrollment statuses for the specified account or all members under a management account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListRecommendationSummaries	Grants permission to list recommendation summaries by group	List			cost-optimization-hub:GetRecommendation
ListRecommendations	Grants permission to list summary view of recommendations	List			cost-optimization-hub:GetRecommendation
UpdateEnrollmentStatus	Grants permission to update the enrollment status	Write			
UpdatePreferences	Grants permission to update preferences	Write			

Resource types defined by AWS Cost Optimization Hub

AWS Cost Optimization Hub does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Cost Optimization Hub, specify `"Resource": "*"` in your policy.

Condition keys for AWS Cost Optimization Hub

Cost Optimization Hub has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Customer Verification Service

AWS Customer Verification Service (service prefix: `customer-verification`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.

Topics

Actions defined by AWS Customer Verification Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action

with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCustomerVerificationDetails [permission only]	Grants permission to create customer verification data	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateUploadUrls [permission only]	Grants permission to create upload URLs	Write			
GetCustomerVerificationDetails [permission only]	Grants permission to get customer verification data	Read			
GetCustomerVerificationEligibility [permission only]	Grants permission to get customer verification eligibility	Read			
UpdateCustomerVerificationDetails [permission only]	Grants permission to update customer verification data	Write			

Resource types defined by AWS Customer Verification Service

AWS Customer Verification Service does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Customer Verification Service, specify `"Resource": "*"` in your policy.

Condition keys for AWS Customer Verification Service

Customer Verification Service has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Data Exchange

AWS Data Exchange (service prefix: `dataexchange`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Data Exchange

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a

resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptDataGrant	Grants permission to accept a data grant	Write	data-grants*		
CancelJob	Grants permission to cancel a job	Write	jobs*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAsset [permission only]	Grants permission to create an asset (for example, in a Job)	Write	revisions*		
CreateDataGrant	Grants permission to create a data grant	Write	data-grants*		dataexchange:PublishToDataGrant
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDataSet	Grants permission to create a data set	Write	data-sets*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateEventAction	Grants permission to create an event action	Write	event-actions*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateJob	Grants permission to create a job to import or export assets	Write	jobs*		
				dataexchange:JobType	
CreateRevision	Grants permission to create a revision	Write	data-sets*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAsset	Grants permission to delete an asset	Write	assets*		
DeleteDataGrant	Grants permission to delete a data grant	Write	data-grants*		
DeleteDataSet	Grants permission to delete a data set	Write	data-sets*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			entitled-data-sets*		
DeleteEventAction	Grants permission to delete an event action	Write	event-actions*		
DeleteRevision	Grants permission to delete a revision	Write	revisions*		
GetAsset	Grants permission to get information about an asset and to export it (for example, in a Job)	Read	assets*		
			entitled-assets*		
GetDataGrant	Grants permission to get a data grant	Read	data-grants*		
GetDataSet	Grants permission to get information about a data set	Read	data-sets*		
			entitled-data-sets*		
GetEventAction	Grants permission to get an event action	Read	event-actions*		
GetJob	Grants permission to get information about a job	Read	jobs*		
GetReceivedDataGrant	Grants permission to get a received data grant	Read	data-grants*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetRevision	Grants permission to get information about a revision	Read	entitled-revisions *		
			revisions *		
ListDataGrants	Grants permission to list data grants for the account	List			
ListDataSetRevisions	Grants permission to list the revisions of a data set	List	data-sets *		
			entitled-data-sets *		
ListDataSets	Grants permission to list data sets for the account	List			
ListEventActions	Grants permission to list event actions for the account	List			
ListJobs	Grants permission to list jobs for the account	List			
ListReceivedDataGrants	Grants permission to list received data grants for the account	List			
ListRevisionAssets	Grants permission to get list the assets of a revision	List	entitled-revisions *		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			revisions*		
ListTagsForResource	Grants permission to list the tags that you associated with the specified resource	List	data-grants		
			data-sets		
			event-actions		
			revisions		
PublishDataSet [permission only]	Grants permission to publish a data set to a product	Write	data-sets*		
PublishToDataGrant [permission only]	Grants permission to publish a data set to a data grant	Write	data-sets*		
				aws:RequestTag/${TagKey} aws:TagKeys	
RevokeRevision	Grants permission to revoke subscriber access to a revision	Write	revisions*		
SendApiAsset	Grants permission to send a request to an API asset	Write	assets*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			entitled-assets*		
SendDataSetNotification	Grants permission to send a notification to subscribers of a data set	Write	data-sets*		
StartJob	Grants permission to start a job	Write	jobs*		dataexchange:CreateAsset dataexchange:DeleteDataSet dataexchange:GetAsset dataexchange:GetDataSet dataexchange:GetRevision dataexchange:PublishDataSet redshift:AuthorizeDataShare

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to add one or more tags to a specified resource	Tagging	data-grants		
			data-sets		
			event-actions		
			revisions		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove one or more tags from a specified resource	Tagging	data-grants		
			data-sets		
			event-actions		
			revisions		
				aws:TagKeys	
UpdateAsset	Grants permission to get update information about an asset	Write	assets*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateDataSet	Grants permission to update information about a data set	Write	data-sets*		
UpdateEventAction	Grants permission to update information for an event action	Write	event-actions*		
UpdateRevision	Grants permission to update information about a revision	Write	revisions*		dataexchange:PublishDataSet dataexchange:PublishToDataGrant

Resource types defined by AWS Data Exchange

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
jobs	`arn:${Partition}:dataexchange:${Region}:${Account}:jobs/${JobId}`	dataexchange:JobType

Resource types	ARN	Condition keys
data-sets	arn:${Partition}:dataexchange:${Region}:${Account}:data-sets/${DataSetId}	aws:ResourceTag/${TagKey}
entitled-data-sets	arn:${Partition}:dataexchange:${Region}::data-sets/${DataSetId}	
revisions	arn:${Partition}:dataexchange:${Region}:${Account}:data-sets/${DataSetId}/revisions/${RevisionId}	aws:ResourceTag/${TagKey}
entitled-revisions	arn:${Partition}:dataexchange:${Region}::data-sets/${DataSetId}/revisions/${RevisionId}	
assets	arn:${Partition}:dataexchange:${Region}:${Account}:data-sets/${DataSetId}/revisions/${RevisionId}/assets/${AssetId}	
entitled-assets	arn:${Partition}:dataexchange:${Region}::data-sets/${DataSetId}/revisions/${RevisionId}/assets/${AssetId}	
event-actions	arn:${Partition}:dataexchange:${Region}:${Account}:event-actions/${EventActionId}	aws:ResourceTag/${TagKey}
data-grants	arn:${Partition}:dataexchange:${Region}:${Account}:data-grants/${DataGrantId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Data Exchange

AWS Data Exchange defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the allowed set of values for each of the mandatory tags in the create request	String
aws:ResourceTag/${TagKey}	Filters access by the tag value associated with the resource	String
aws:TagKeys	Filters access by the presence of mandatory tags in the create request	ArrayOfString
dataexchange:JobType	Filters access by the specified job type	String

Actions, resources, and condition keys for Amazon Data Lifecycle Manager

Amazon Data Lifecycle Manager (service prefix: `dlm`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon Data Lifecycle Manager

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateLifecyclePolicy	Grants permission to create a data lifecycle policy to manage the scheduled creation and retention of Amazon EBS snapshots. You may have up to 100 policies	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteLifecyclePolicy	Grants permission to delete an existing data lifecycle policy. In addition, this action halts the creation and deletion of snapshots that the policy specified. Existing snapshots are not affected	Write	policy*		
GetLifecyclePolicies	Grants permission to returns a list of summary descriptions of data lifecycle policies	List			
GetLifecyclePolicy	Grants permission to return a complete description of a single data lifecycle policy	Read	policy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTagsForResource	Grants permission to list the tags associated with a resource	Read	policy*		
TagResource	Grants permission to add or update tags of a resource	Tagging	policy*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags associated with a resource	Tagging	policy*		
				aws:TagKeys	
UpdateLifecyclePolicy	Grants permission to update an existing data lifecycle policy	Write	policy*		

Resource types defined by Amazon Data Lifecycle Manager

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
policy	`arn:${Partition}:dlm:${Region}:${Account}:policy/${ResourceName}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Data Lifecycle Manager

Amazon Data Lifecycle Manager defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Data Pipeline

AWS Data Pipeline (service prefix: `datapipeline`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.

- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS Data Pipeline

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ActivatePipeline	Grants permission to validate the specified pipeline and starts processing pipeline tasks. If the pipeline does not pass validation, activation fails	Write	pipeline*		
				datapipeline:PipelineCreator datapipeline:Tag/${TagKey} datapipeline:workerGroup	
AddTags	Grants permission to add or modify tags for the specified pipeline	Tagging	pipeline*		
				datapipeline:Pipel	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ineCreator datapipeline:Tag/${TagKey} aws:TagKeys aws:RequestTag/${TagKey}	
CreatePipeline	Grants permission to create a new, empty pipeline	Write		aws:RequestTag/${TagKey} aws:TagKeys datapipeline:Tag/${TagKey}	datapipeline:AddTags
DeactivatePipeline	Grants permission to Deactivate the specified running pipeline	Write	pipeline*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				datapipeline:PipelineCreator datapipeline:Tag/${TagKey} datapipeline:workerGroup	
DeletePipeline	Grants permission to delete a pipeline, its pipeline definition, and its run history	Write	pipeline*		
				datapipeline:PipelineCreator datapipeline:Tag/${TagKey}	
DescribeObjects	Grants permission to get the object definitions for a set of objects associated with the pipeline	Read	pipeline*		
				datapipeline:PipelineCreator datapipeline:Tag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribePipelines	Grants permission to retrieves metadata about one or more pipelines	Read	pipeline*		
				datapipeline:PipelineCreator datapipeline:Tag/${TagKey}	
EvaluateExpression	Grants permission to task runners to call EvaluateExpression, to evaluate a string in the context of the specified object	Read	pipeline*		
				datapipeline:PipelineCreator datapipeline:Tag/${TagKey}	
GetAccountLimits [permission only]	Grants permission to call GetAccountLimits	List			
GetPipelineDefinition	Grants permission to gets the definition of the specified pipeline	Read	pipeline*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				datapipeline:PipelineCreator datapipeline:Tag/${TagKey} datapipeline:workerGroup	
ListPipelines	Grants permission to list the pipeline identifiers for all active pipelines that you have permission to access	List			
PollForTask	Grants permission to task runners to call PollForTask, to receive a task to perform from AWS Data Pipeline	Write		datapipeline:workerGroup	
PutAccountLimits [permission only]	Grants permission to call PutAccountLimits	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutPipelineDefinition	Grants permission to add tasks, schedules, and preconditions to the specified pipeline	Write	pipeline*		
				datapipeline:PipelineCreator datapipeline:Tag/${TagKey} datapipeline:workerGroup	
QueryObjects	Grants permission to query the specified pipeline for the names of objects that match the specified set of conditions	Read	pipeline*		
				datapipeline:PipelineCreator datapipeline:Tag/${TagKey}	
RemoveTags	Grants permission to remove existing tags from the specified pipeline	Tagging	pipeline*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				datapipeline:PipelineCreator datapipeline:Tag/${TagKey} aws:TagKeys aws:RequestTag/${TagKey}	
ReportTaskProgress	Grants permission to task runners to call ReportTaskProgress, when they are assigned a task to acknowledge that it has the task	Write	pipeline*		
ReportTaskRunnerHeartbeat	Grants permission to task runners to call ReportTaskRunnerHeartbeat every 15 minutes to indicate that they are operational	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SetStatus	Grants permission to requests that the status of the specified physical or logical pipeline objects be updated in the specified pipeline	Write	pipeline*		
				datapipeline:PipelineCreator datapipeline:Tag/${TagKey}	
SetTaskStatus	Grants permission to task runners to call SetTaskStatus to notify AWS Data Pipeline that a task is completed and provide information about the final status	Write	pipeline*		
ValidatePipelineDefinition	Grants permission to validate the specified pipeline definition to ensure that it is well formed and can be run without error	Read	pipeline*		
				datapipeline:PipelineCreator datapipeline:Tag/${TagKey} datapipeline:workerGroup	

Resource types defined by AWS Data Pipeline

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
pipeline	`arn:${Partition}:datapipeline:${Region}:${Account}:pipeline/${PipelineId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Data Pipeline

AWS Data Pipeline defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Condition keys	Description	Type
datapipeline:PipelineCreator	Filters access by the IAM user that created the pipeline	ArrayOfString
datapipeline:Tag/${TagKey}	Filters access by customer-specified key/value pair that can be attached to a resource	String
datapipeline:workerGroup	Filters access by the name of a worker group for which a Task Runner retrieves work	ArrayOfString

Actions, resources, and condition keys for AWS Database Migration Service

AWS Database Migration Service (service prefix: dms) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Condition keys for AWS Database Migration Service

Actions defined by AWS Database Migration Service

You can specify the following actions in the Action element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddTagsToResource	Grants permission to add metadata tags to DMS resources, including replication instances, endpoints, security groups, and migration tasks	Tagging	Certificate		
			DataMigration		
			DataProvider		
			Endpoint		
			EventSubscription		
			InstanceProfile		
			MigrationProject		
			ReplicationConfig		
			ReplicationInstance		
			ReplicationSubnetGroup		
			ReplicationTask		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ReplicationTaskAssessmentRun		
			ReplicationTaskIndividualAssessment		
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys dms:req-tag/${TagKey}	
ApplyPendingMaintenanceAction	Grants permission to apply a pending maintenance action to a resource (for example, to a replication instance)	Write	ReplicationInstance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateExtensionPack	Grants permission to associate a extension pack	Write	MigrationProject*		
BatchStartRecommendations	Grants permission to start the analysis of up to 20 source databases to recommend target engines for each source database	Write			
CancelMetadataModelConversion	Grants permission to cancel a single metadata model conversion operation that was started with StartMetadataModelConversion	Write	MigrationProject*		
CancelMetadataModelCreation	Grants permission to cancel a single metadata model creation operation that was started with StartMetadataModelCreation	Write	MigrationProject*		
CancelReplicationTaskAssessmentRun	Grants permission to cancel a single premigration assessment run	Write	ReplicationTaskAssessmentRun*		
CreateDataMigration	Grants permission to create a database migration using the provided settings	Write	MigrationProject*		iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys dms:req-tag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateDataProvider	Grants permission to create an data provider using the provided settings	Write		aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys dms:req-tag/${TagKey}	iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateEndpoint	Grants permission to create an endpoint using the provided settings	Write		aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys dms:req-tag/${TagKey}	iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateEventSubscription	Grants permission to create an AWS DMS event notification subscription	Write		aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys dms:req-tag/${TagKey}	
CreateFleetAdvisorCollector	Grants permission to create a Fleet Advisor collector using the specified parameters	Write			iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateInstanceProfile	Grants permission to create an instance profile using the provided settings	Write		aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys dms:req-tag/${TagKey}	iam:PassRole
CreateMigrationProject	Grants permission to create an migration project using the provided settings	Write	DataProvider* InstanceProfile*		iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys dms:req-tag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateOutboundIntegration [permission only]	Grants permission to DMS to create resources for zero-ETL integrations with self managed databases	Write		aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys dms:req-tag/${TagKey}	iam:PassRole
CreateReplicationConfig	Grants permission to create a replication config using the provided settings	Write	Endpoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys dms:req-tag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateReplicationInstance	Grants permission to create a replication instance using the specified parameters	Write		aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys dms:req-tag/${TagKey}	iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateReplicationSubnetGroup	Grants permission to create a replication subnet group given a list of the subnet IDs in a VPC	Write		aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys dms:req-tag/${TagKey}	
CreateReplicationTask	Grants permission to create a replication task using the specified parameters	Write	Endpoint* ReplicationInstance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys dms:req-tag/${TagKey}	
DeleteCertificate	Grants permission to delete the specified certificate	Write	Certificate*		
DeleteConnection	Grants permission to delete the specified connection between a replication instance and an endpoint	Write	Endpoint* ReplicationInstance*		
DeleteDataMigration	Grants permission to delete the specified database migration	Write	DataMigration*		
DeleteDataProvider	Grants permission to delete the specified data provider	Write	DataProvider*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteEndpoint	Grants permission to delete the specified endpoint	Write	Endpoint*		
DeleteEventSubscription	Grants permission to delete an AWS DMS event subscription	Write	EventSubscription*		
DeleteFleetAdvisorCollector	Grants permission to delete the specified Fleet Advisor collector	Write			
DeleteFleetAdvisorDatabases	Grants permission to delete the specified Fleet Advisor databases	Write			
DeleteInstanceProfile	Grants permission to delete the specified instance profile	Write	InstanceProfile*		
DeleteMigrationProject	Grants permission to delete the specified migration project	Write	MigrationProject*		
DeleteReplicationConfig	Grants permission to delete the specified replication config	Write	ReplicationConfig*		
DeleteReplicationInstance	Grants permission to delete the specified replication instance	Write	ReplicationInstance*		
DeleteReplicationSubnetGroup	Grants permission to deletes a subnet group	Write	ReplicationSubnetGroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteReplicationTask	Grants permission to delete the specified replication task	Write	ReplicationTask*		
DeleteReplicationTaskAssessmentRun	Grants permission to delete the record of a single premigration assessment run	Write	ReplicationTaskAssessmentRun*		
DescribeAccountAttributes	Grants permission to list all of the AWS DMS attributes for a customer account	Read			
DescribeApplicableIndividualAssessments	Grants permission to list individual assessments that you can specify for a new premigration assessment run	Read	ReplicationInstance		
			ReplicationTask		
DescribeCertificates	Grants permission to provide a description of the certificate	Read			
DescribeConnections	Grants permission to describe the status of the connections that have been made between the replication instance and an endpoint	Read			
DescribeConversionConfiguration	Grants permission to return information about DMS Schema Conversion project configuration	Read	MigrationProject*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeDataMigrations	Grants permission to return information about database migrations for your account in the specified region	Read			
DescribeEndpointSettings	Grants permission to return the possible endpoint settings available when you create an endpoint for a specific database engine	Read			
DescribeEndpointTypes	Grants permission to return information about the type of endpoints available	Read			
DescribeEndpoints	Grants permission to return information about the endpoints for your account in the current region	Read			
DescribeEngineVersions	Grants permission to return information about the available versions for DMS replication instances	Read			
DescribeEventCategories	Grants permission to list categories for all event source types, or, if specified, for a specified source type	Read			
DescribeEventSubscriptions	Grants permission to list all the event subscriptions for a customer account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeEvents	Grants permission to list events for a given source identifier and source type	Read			
DescribeFleetAdvisorCollectors	Grants permission to return a paginated list of Fleet Advisor collectors in your account based on filter settings	Read			
DescribeFleetAdvisorDatabases	Grants permission to return a paginated list of Fleet Advisor databases in your account based on filter settings	Read			
DescribeFleetAdvisorLsaAnalysis	Grants permission to return a paginated list of descriptions of large-scale assessment (LSA) analyses produced by your Fleet Advisor collectors	Read			
DescribeFleetAdvisorSchemaObjectSummary	Grants permission to return a paginated list of descriptions of schemas discovered by your Fleet Advisor collectors based on filter settings	Read			
DescribeFleetAdvisorSchemas	Grants permission to return a paginated list of schemas discovered by your Fleet Advisor collectors based on filter settings	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeMetadataModel	Grants permission to get detailed information about the specified metadata model, including its definition and corresponding converted objects in the target database if applicable	Read	Migration Project*		
DescribeMetadataModelChildren	Grants permission to get a list of child metadata models for the specified metadata model in the database hierarchy	Read	Migration Project*		
DescribeMetadataModelCreations	Grants permission to return a paginated list of metadata model creation requests for a migration project	Read	Migration Project*		
DescribeMetadataModelImports	Grants permission to return information about start metadata model import operations for a migration project	Read	Migration Project*		
DescribeOrderableReplicationInstances	Grants permission to return information about the replication instance types that can be created in the specified region	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribePendingMaintenanceActions	Grants permission to return information about pending maintenance actions	Read			
DescribeRecommendationLimitations	Grants permission to return a paginated list of descriptions of limitations for recommendations of target AWS engines	Read			
DescribeRecommendations	Grants permission to return a paginated list of descriptions of target engine recommendations for your source databases	Read			
DescribeRefreshSchemasStatus	Grants permission to returns the status of the RefreshSchemas operation	Read	Endpoint*		
DescribeReplicationConfigs	Grants permission to describe replication configs	Read			
DescribeReplicationInstanceTaskLogs	Grants permission to return information about the task logs for the specified task	Read	ReplicationInstance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:TagKeys	
DescribeReplicationInstances	Grants permission to return information about replication instances for your account in the current region	Read			
DescribeReplicationSubnetGroups	Grants permission to return information about the replication subnet groups	Read			
DescribeReplicationTableStatistics	Grants permission to describe replication table statistics	Read	ReplicationConfig*		
DescribeReplicationTaskAssessmentResults	Grants permission to return the latest task assessment results from Amazon S3	Read	ReplicationTask		
DescribeReplicationTaskAssessmentRuns	Grants permission to return a paginated list of premigration assessment runs based on filter settings	Read	ReplicationInstance		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ReplicationTask		
			ReplicationTaskAssessmentRun		
DescribeReplicationTaskIndividualAssessments	Grants permission to return a paginated list of individual assessments based on filter settings	Read	ReplicationTask		
			ReplicationTaskAssessmentRun		
DescribeReplicationTasks	Grants permission to return information about replication tasks for your account in the current region	Read			
DescribeReplications	Grants permission to describe replications	Read			
DescribeSchemas	Grants permission to return information about the schema for the specified endpoint	Read	Endpoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeTableStatistics	Grants permission to return table statistics on the database migration task, including table name, rows inserted, rows updated, and rows deleted	Read	ReplicationTask*		
ExportMetadataModelAssessment	Grants permission to export the specified metadata model assessment	Write	MigrationProject		
GetTargetSelectionRules	Grants permission to convert source selection rules into their target counterparts for schema conversion operations	Read	MigrationProject*		
ImportCertificate	Grants permission to upload the specified certificate	Write		aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys	
ListDataProviders	Grants permission to list the AWS DMS attributes for a data providers	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListExtensionPacks	Grants permission to list the AWS DMS attributes for a extension packs	Read	MigrationProject		
ListInstanceProfiles	Grants permission to list the AWS DMS attributes for a instance profiles	Read	InstanceProfile		
ListMetadataModelAssessmentActionItems [permission only]	Grants permission to list the AWS DMS attributes for a metadata model assessment action items. Note. Despite this action requires StartMetadataModelImport, the latter does not currently authorize the described Schema Conversion operation	Read	MigrationProject		dms:StartMetadataModelImport
ListMetadataModelAssessments	Grants permission to list the AWS DMS attributes for a metadata model assessments	Read	MigrationProject		
ListMetadataModelConversions	Grants permission to list the AWS DMS attributes for a metadata model conversions	Read	MigrationProject		
ListMetadataModelExports	Grants permission to list the AWS DMS attributes for a metadata model exports	Read	MigrationProject		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListMigrationProjects	Grants permission to list the AWS DMS attributes for a migration projects. Note. Despite this action requires DescribeMigrationProjects and DescribeConversion Configuration, both required actions do not currently authorize the described Schema Conversion operation	Read	DataProvider		dms:DescribeConversionConfiguration
			InstanceProfile		
			MigrationProject		
ListTagsForResource	Grants permission to list all tags for an AWS DMS resource	Read	Certificate		
			DataMigration		
			DataProvider		
			Endpoint		
			EventSubscription		
			InstanceProfile		
			MigrationProject		
			ReplicationConfig		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ReplicationInstance		
			ReplicationSubnetGroup		
			ReplicationTask		
			ReplicationTaskAssessmentRun		
			ReplicationTaskIndividualAssessment		
ModifyDataMigration	Grants permission to modify the specified database migration	Write	DataMigration*		iam:PassRole
ModifyEndpoint	Grants permission to modify the specified endpoint	Write	Endpoint*		iam:PassRole
			Certificate		
ModifyEventSubscription	Grants permission to modify an existing AWS DMS event notification subscription	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyFleetAdvisorCollector [permission only]	Grants permission to modify the name and description of the specified Fleet Advisor collector	Write			
ModifyFleetAdvisorCollectorStatuses [permission only]	Grants permission to modify the status of the specified Fleet Advisor collector	Write			
ModifyOutboundIntegration [permission only]	Grants permission to DMS to modify resources for zero-ETL integrations with self managed databases	Write			iam:PassRole
ModifyReplicationConfig	Grants permission to modify the specified replication config	Write	ReplicationConfig*		
ModifyReplicationInstance	Grants permission to modify the replication instance to apply new settings	Write	ReplicationInstance*		
ModifyReplicationSubnetGroup	Grants permission to modify the settings for the specified replication subnet group	Write			
ModifyReplicationTask	Grants permission to modify the specified replication task	Write	ReplicationTask*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
MoveReplicationTask	Grants permission to move the specified replication task to a different replication instance	Write	ReplicationInstance*		
			ReplicationTask*		
RebootReplicationInstance	Grants permission to reboot a replication instance. Rebooting results in a momentary outage, until the replication instance becomes available again	Write	ReplicationInstance*		
RefreshSchemas	Grants permission to populate the schema for the specified endpoint	Write	Endpoint*		
			ReplicationInstance*		
ReloadReplicationTables	Grants permission to reload the target database table with the source for a replication	Write	ReplicationConfig*		
ReloadTables	Grants permission to reload the target database table with the source data	Write	ReplicationTask*		
RemoveTagsFromResource	Grants permission to remove metadata tags from a DMS resource	Tagging	Certificate		
			DataMigration		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			DataProvider		
			Endpoint		
			EventSubscription		
			InstanceProfile		
			MigrationProject		
			ReplicationConfig		
			ReplicationInstance		
			ReplicationSubnetGroup		
			ReplicationTask		
			ReplicationTaskAssessmentRun		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ReplicationTaskIndividualAssessment		
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys	
RunFleetAdvisorLsaAnalysis	Grants permission to run a large-scale assessment (LSA) analysis on every Fleet Advisor collector in your account	Write			
StartDataMigration	Grants permission to start the database migration	Write	DataMigration*		
StartMetadataModelAssessment	Grants permission to start a new assessment of metadata model	Write	MigrationProject*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartMetadataModelConversion	Grants permission to start a new conversion of metadata model	Write	MigrationProject*		
StartMetadataModelCreation	Grants permission to create source metadata model of the given type with the specified properties for schema conversion operations	Write	MigrationProject*		
StartMetadataModelExportAsScripts	Grants permission to start a new export of metadata model as script	Write	MigrationProject*		
StartMetadataModelExportToTarget	Grants permission to start a new export of metadata model to target	Write	MigrationProject*		
StartMetadataModelImport	Grants permission to start a new import of metadata model	Write	MigrationProject*		
StartRecommendations	Grants permission to start the analysis of your source database to provide recommendations of target engines	Write			
StartReplication	Grants permission to start a replication	Write	ReplicationConfig*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartReplicationTask	Grants permission to start the replication task	Write	ReplicationTask*		
StartReplicationTaskAssessment	Grants permission to start the replication task assessment for unsupported data types in the source database	Write	ReplicationTask*		
StartReplicationTaskAssessmentRun	Grants permission to start a new premigration assessment run for one or more individual assessments of a migration task	Write	ReplicationTask*		iam:PassRole
StopDataMigration	Grants permission to stop the database migration	Write	DataMigration*		
StopReplication	Grants permission to stop a replication	Write	ReplicationConfig*		
StopReplicationTask	Grants permission to stop the replication task	Write	ReplicationTask*		
TestConnection	Grants permission to test the connection between the replication instance and the endpoint	Read	Endpoint*		
			ReplicationInstance*		
UpdateConversionConfiguration	Grants permission to update a conversion configuration	Write	MigrationProject*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateDataProvider	Grants permission to update the specified data provider	Write	DataProvider*		
UpdateInstanceProfile	Grants permission to update the specified instance profile	Write	InstanceProfile*		
UpdateMigrationProject	Grants permission to update the specified migration project	Write	MigrationProject*		
UpdateSubscriptionsToEventBridge	Grants permission to migrate DMS subcriptions to Eventbridge	Write			
UploadFileMetadataList [permission only]	Grants permission to upload files to your Amazon S3 bucket	Write			

Resource types defined by AWS Database Migration Service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Certificate	arn:${Partition}:dms:${Region}:${Account}:cert:*	aws:ResourceTag/${TagKey} dms:cert-tag/${TagKey}
DataProvider	arn:${Partition}:dms:${Region}:${Account}:data-provider:*	aws:ResourceTag/${TagKey} dms:data-provider-tag/${TagKey}
DataMigration	arn:${Partition}:dms:${Region}:${Account}:data-migration:*	aws:ResourceTag/${TagKey} dms:data-migration-tag/${TagKey}
Endpoint	arn:${Partition}:dms:${Region}:${Account}:endpoint:*	aws:ResourceTag/${TagKey} dms:endpoint-tag/${TagKey}
EventSubscription	arn:${Partition}:dms:${Region}:${Account}:es:*	aws:ResourceTag/${TagKey} dms:es-tag/${TagKey}
InstanceProfile	arn:${Partition}:dms:${Region}:${Account}:instance-profile:*	aws:ResourceTag/${TagKey} dms:instance-profile-tag/${TagKey}

Resource types	ARN	Condition keys
Migration Project	arn:${Partition}:dms:${Region}:${Account}:migration-project:*	aws:ResourceTag/${TagKey} dms:migration-project-tag/${TagKey}
ReplicationConfig	arn:${Partition}:dms:${Region}:${Account}:replication-config:*	aws:ResourceTag/${TagKey} dms:replication-config-tag/${TagKey}
ReplicationInstance	arn:${Partition}:dms:${Region}:${Account}:rep:*	aws:ResourceTag/${TagKey} dms:rep-tag/${TagKey}
ReplicationSubnetGroup	arn:${Partition}:dms:${Region}:${Account}:subgrp:*	aws:ResourceTag/${TagKey} dms:subgrp-tag/${TagKey}
ReplicationTask	arn:${Partition}:dms:${Region}:${Account}:task:*	aws:ResourceTag/${TagKey} dms:task-tag/${TagKey}
ReplicationTaskAssessmentRun	arn:${Partition}:dms:${Region}:${Account}:assessment-run:*	aws:ResourceTag/${TagKey} dms:assessment-run-tag/${TagKey}

Resource types	ARN	Condition keys
ReplicationTaskIndividualAssessment	arn:${Partition}:dms:${Region}:${Account}:individual-assessment:*	aws:ResourceTag/${TagKey} dms:individual-assessment-tag/${TagKey}

Condition keys for AWS Database Migration Service

AWS Database Migration Service defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the presence of tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
dms:assessment-run-tag/${TagKey}	Filters access by the presence of tag key-value pairs in the request for AssessmentRun	String
dms:cert-tag/${TagKey}	Filters access by the presence of tag key-value pairs in the request for Certificate	String

Condition keys	Description	Type
dms:data-migration-tag/${TagKey}	Filters access by the presence of tag key-value pairs in the request for DataMigration	String
dms:data-provider-tag/${TagKey}	Filters access by the presence of tag key-value pairs in the request for DataProvider	String
dms:endpoint-tag/${TagKey}	Filters access by the presence of tag key-value pairs in the request for Endpoint	String
dms:es-tag/${TagKey}	Filters access by the presence of tag key-value pairs in the request for EventSubscription	String
dms:individual-assessment-tag/${TagKey}	Filters access by the presence of tag key-value pairs in the request for IndividualAssessment	String
dms:instance-profile-tag/${TagKey}	Filters access by the presence of tag key-value pairs in the request for InstanceProfile	String
dms:migration-project-tag/${TagKey}	Filters access by the presence of tag key-value pairs in the request for MigrationProject	String
dms:rep-tag/${TagKey}	Filters access by the presence of tag key-value pairs in the request for ReplicationInstance	String
dms:replication-config-tag/${TagKey}	Filters access by the presence of tag key-value pairs in the request for ReplicationConfig	String
dms:req-tag/${TagKey}	Filters access by the presence of tag key-value pairs in the given request	String

Condition keys	Description	Type
dms:subgrp-tag/${TagKey}	Filters access by the presence of tag key-value pairs in the request for ReplicationSubnetGroup	String
dms:task-tag/${TagKey}	Filters access by the presence of tag key-value pairs in the request for ReplicationTask	String

Actions, resources, and condition keys for Database Query Metadata Service

Database Query Metadata Service (service prefix: `dbqms`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Resource types defined by Database Query Metadata Service
- Condition keys for Database Query Metadata Service

Actions defined by Database Query Metadata Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of

access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateFavoriteQuery	Grants permission to create a new favorite query	Write			
CreateQueryHistory	Grants permission to add a query to the history	Write			
CreateTab	Grants permission to create a new query tab	Write			
DeleteFavoriteQueries	Grants permission to delete saved queries	Write			
DeleteQueryHistory	Grants permission to delete a historical query	Write			
DeleteTab	Grants permission to delete query tab	Write			
DescribeFavoriteQueries	Grants permission to list saved queries and associated metadata	List			
DescribeQueryHistory	Grants permission to list history of queries that were run	List			
DescribeTabs	Grants permission to list query tabs and associated metadata	List			
GetQueryString	Grants permission to retrieve favorite or history query string by id	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateFavoriteQuery	Grants permission to update saved query and description	Write			
UpdateQueryHistory	Grants permission to update the query history	Write			
UpdateTab	Grants permission to update query tab	Write			

Resource types defined by Database Query Metadata Service

Database Query Metadata Service does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Database Query Metadata Service, specify `"Resource": "*"` in your policy.

Condition keys for Database Query Metadata Service

DBQMS has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS DataSync

AWS DataSync (service prefix: `datasync`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS DataSync

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddStorageSystem	Grants permission to create a storage system	Write	agent*		
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
CancelTaskExecution	Grants permission to cancel execution of a sync task	Write	taskexecution*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAgent	Grants permission to activate an agent that you have deployed on your host	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateLocationAzureBlob	Grants permission to create an endpoint for a Microsoft Azure Blob Storage container	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateLocationEfs	Grants permission to create an endpoint for an Amazon EFS file system	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateLocationFsxLustre	Grants permission to create an endpoint for an Amazon Fsx Lustre	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateLocationFsxOntap	Grants permission to create an endpoint for Amazon FSx for ONTAP	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateLocationFsxOpenZfs	Grants permission to create an endpoint for Amazon FSx for OpenZFS	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateLocationFsxWindows	Grants permission to create an endpoint for an Amazon FSx Windows File Server file system	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateLocationHdfs	Grants permission to create an endpoint for an Amazon Hdfs	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateLocationNfs	Grants permission to create an endpoint for a NFS file system	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateLocationObjectStorage	Grants permission to create an endpoint for a self-managed object storage bucket	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateLocationS3	Grants permission to create an endpoint for an Amazon S3 bucket	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateLocationSmb	Grants permission to create an endpoint for an SMB file system	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateTask	Grants permission to create a sync task	Write	location*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			agent		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAgent	Grants permission to delete an agent	Write	agent*		
DeleteLocation	Grants permission to delete a location used by AWS DataSync	Write	location*		
DeleteTask	Grants permission to delete a sync task	Write	task*		
DescribeAgent	Grants permission to view metadata such as name, network interfaces, and the status (that is, whether the agent is running or not) about a sync agent	Read	agent*		
DescribeDiscoveryJob	Grants permission to describe metadata about a discovery job	Read	discovery job*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeLocationAzureBlob	Grants permission to view metadata, such as the path information about an Azure Blob Storage sync location	Read	location*		
DescribeLocationEfs	Grants permission to view metadata, such as the path information about an Amazon EFS sync location	Read	location*		
DescribeLocationFsxLustre	Grants permission to view metadata, such as the path information about an Amazon FSx Lustre sync location	Read	location*		
DescribeLocationFsxOntap	Grants permission to view metadata, such as the path information about an Amazon FSx for ONTAP sync location	Read	location*		
DescribeLocationFsxOpenZfs	Grants permission to view metadata, such as the path information about an Amazon FSx OpenZFS sync location	Read	location*		
DescribeLocationFsxWindows	Grants permission to view metadata, such as the path information about an Amazon FSx Windows sync location	Read	location*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeLocationHdfs	Grants permission to view metadata, such as the path information about an Amazon HDFS sync location	Read	location*		
DescribeLocationNfs	Grants permission to view metadata, such as the path information, about a NFS sync location	Read	location*		
DescribeLocationObjectStorage	Grants permission to view metadata about a self-managed object storage server location	Read	location*		
DescribeLocationS3	Grants permission to view metadata, such as bucket name, about an Amazon S3 bucket sync location	Read	location*		
DescribeLocationSmb	Grants permission to view metadata, such as the path information, about an SMB sync location	Read	location*		
DescribeStorageSystem	Grants permission to view metadata about a storage system	Read	storagesystem*		
DescribeStorageSystemResourceMetrics	Grants permission to describe resource metrics collected by a discovery job	List	discoveryjob*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeStorageSystemResources	Grants permission to describe resources identified by a discovery job	List	discoveryjob*		
DescribeTask	Grants permission to view metadata about a sync task	Read	task*		
DescribeTaskExecution	Grants permission to view metadata about a sync task that is being executed	Read	taskexecution*		
				aws:ResourceTag/${TagKey}	
GenerateRecommendations	Grants permission to generate recommendations for a resource identified by a discovery job	Write	discoveryjob*		
ListAgents	Grants permission to list agents owned by an AWS account in a region specified in the request	List			
ListDiscoveryJobs	Grants permission to list discovery jobs	List			
ListLocations	Grants permission to list source and destination sync locations	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListStorageSystems	Grants permission to list storage systems	List			
ListTagsForResource	Grants permission to list tags that have been added to the specified resource	Read	agent		
			discoveryjob		
			location		
			storagesystem		
			task		
			taskexecution		
ListTaskExecutions	Grants permission to list executed sync tasks	List		aws:ResourceTag/${TagKey}	
ListTasks	Grants permission to list of all the sync tasks	List			
RemoveStorageSystem	Grants permission to delete a storage system	Write	storagesystem*		
StartDiscoveryJob	Grants permission to start a discovery job for a storage system	Write	storagesystem*		
StartTaskExecution		Write	task*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	Grants permission to start a specific invocation of a sync task			aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
StopDiscoveryJob	Grants permission to stop a discovery job	Write	discoveryjob*		
TagResource	Grants permission to apply a key-value pair to an AWS resource	Tagging	agent		
			discoveryjob		
			location		
			storagesystem		
			task		
			taskexecution		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove one or more tags from the specified resource	Tagging	agent		
			discoveryjob		
			location		
			storagesystem		
			task		
			taskexecution		
				aws:TagKeys	
UpdateAgent	Grants permission to update the name of an agent	Write	agent*		
UpdateDiscoveryJob	Grants permission to update a discovery job	Write	discoveryjob*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateLocationAzureBlob	Grants permission to update an Azure Blob Storage sync location	Write	location*		
UpdateLocationEfs	Grants permission to update an EFS sync Location	Write	location*		
UpdateLocationFsxLustre	Grants permission to update an FSx Lustre sync Location	Write	location*		
UpdateLocationFsxOntap	Grants permission to update an FSx ONTAP sync Location	Write	location*		
UpdateLocationFsxOpenZfs	Grants permission to update an FSx OpenZFS sync Location	Write	location*		
UpdateLocationFsxWindows	Grants permission to update an FSx Windows sync Location	Write	location*		
UpdateLocationHdfs	Grants permission to update an HDFS sync Location	Write	location*		
UpdateLocationNfs	Grants permission to update an NFS sync Location	Write	location*		
UpdateLocationObjectStorage	Grants permission to update a self-managed object storage server location	Write	location*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateLocationS3	Grants permission to update an S3 sync Location	Write	location*		
UpdateLocationSmb	Grants permission to update a SMB sync location	Write	location*		
UpdateStorageSystem	Grants permission to update a storage system	Write	storagesystem*		
UpdateTask	Grants permission to update metadata associated with a sync task	Write	task*		
UpdateTaskExecution	Grants permission to update execution of a sync task	Write	taskexecution*		
				aws:ResourceTag/${TagKey}	

Resource types defined by AWS DataSync

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
agent	arn:${Partition}:datasync:${Region}:${AccountId}:agent/${AgentId}	aws:ResourceTag/${TagKey}
location	arn:${Partition}:datasync:${Region}:${AccountId}:location/${LocationId}	aws:ResourceTag/${TagKey}
task	arn:${Partition}:datasync:${Region}:${AccountId}:task/${TaskId}	aws:ResourceTag/${TagKey}
taskexecution	arn:${Partition}:datasync:${Region}:${AccountId}:task/${TaskId}/execution/${ExecutionId}	aws:ResourceTag/${TagKey}
storagesystem	arn:${Partition}:datasync:${Region}:${AccountId}:system/${StorageSystemId}	aws:ResourceTag/${TagKey}
discoveryjob	arn:${Partition}:datasync:${Region}:${AccountId}:system/${StorageSystemId}/job/${DiscoveryJobId}	aws:ResourceTag/${TagKey}

Condition keys for AWS DataSync

AWS DataSync defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tag key-value pairs in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by the tag key-value pairs associated with the resource	String
aws:TagKeys	Filters access by the tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon DataZone

Amazon DataZone (service prefix: `datazone`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon DataZone

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptPredictions	Grants permission to accept prediction	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptSubscriptionRequest	Grants permission to approve a subscription request for a Data Asset	Write			
AddEntityOwner	Grants permission to add an owner to an entity like domain unit	Write			
AddPolicyGrant	Grants permission to add a policy grant	Permissions management			
AssociateEnvironmentRole	Grants permission to associate a role in a default service blueprint environment	Write			
AssociateGovernedTerms	Grants permission to associate governed terms to an asset	Write			
BatchDeleteLinkedTypes [permission only]	Grants permission to remove linked type items from an Amazon DataZone Domain	Write	domain*		
BatchGetAttributesMetadata	Grants permission to retrieve attributes metadata	Read			
BatchGetCell	Grants permission to batch get cells	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetCellRun	Grants permission to batch get cell runs	Read			
BatchPutAttributesMetadata	Grants permission to create and update attributes metadata	Write			
BatchPutLinkedTypes [permission only]	Grants permission to put linked type items to an Amazon DataZone Domain	Write	domain*		
CancelMetadataGenerationRun	Grants permission to cancel metadata generation run	Write			
CancelSubscription	Grants permission to revoke or unsubscribe an approved subscription to Data Asset	Write			
CreateAccountPool	Grants permission to create an account pool	Write			
CreateAsset	Grants permission to create asset	Write			
CreateAssetFilter	Grants permission to create asset filter	Write			
CreateAssetRevision	Grants permission to create new revision of an asset	Write			
CreateAssetType	Grants permission to create an asset type	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCell	Grants permission to create cells	Write			
CreateCellRun	Grants permission to create cell runs	Write			
CreateConnection	Grants permission to create connections	Write			
CreateDataProduct	Grants permission to create data product	Write			
CreateDataProductRevision	Grants permission to create data product revision	Write			
CreateDataSource	Grants permission to create a new DataSource	Write			
CreateDomain	Grants permission to provision a domain which is a top level entity that contains other Amazon DataZone resources	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateDomainUnit	Grants permission to create a domain unit	Write			
CreateEnvironment	Grants permission to create a collection of configurated resources used to publish and subscribe to data	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateEnvironmentAction	Grants permission to create an environment action in a default service blueprint environment	Write			
CreateEnvironmentBlueprint	Grants permission to create a custom Environment Blueprint that allow user to add Environments to their Project	Write			
CreateEnvironmentProfile	Grants permission to create a template from a Blueprint that can be used to create a Environment	Write			
CreateFormType	Grants permission to create a form type or a new revision of it	Write			
CreateGlossary	Grants permission to create a business glossary	Write			
CreateGlossaryTerm	Grants permission to create a glossary term	Write			
CreateGroupProfile	Grants permission to create a DataZone group profile for an IAM Identity Center group	Write			
CreateListingChangeSet	Grants permission to create listing change set	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateNotebook	Grants permission to create notebooks	Write			
CreateProject	Grants permission to create a Project to enable your team to publish and subscribe to data	Write			
CreateProjectMembership	Grants permission to add a user to a Project	Write			
CreateProjectProfile	Grants permission to create a project profile	Write			
CreateRule	Grants permission to create rule	Write			
CreateSubscriptionGrant	Grants permission to create a grant for an approved subscription on a subscription target	Write			
CreateSubscriptionRequest	Grants permission to create a subscription request for a Data Asset	Write			
CreateSubscriptionTarget	Grants permission to create a subscription target for a Environment in the project	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateUserProfile	Grants permission to create a user profile for an existing user in the customers IAM Identity Center	Write			
DeleteAccountPool	Grants permission to delete an account pool	Write			
DeleteAsset	Grants permission to delete an asset	Write			
DeleteAssetFilter	Grants permission to delete asset filter	Write			
DeleteAssetType	Grants permission to delete an asset type	Write			
DeleteCell	Grants permission to delete cells	Write			
DeleteCellRun	Grants permission to delete cell runs	Write			
DeleteConnection	Grants permission to delete connections	Write			
DeleteDataExportConfiguration	Grants permission to delete DataZone catalog data export configuration	Write			
DeleteDataProduct	Grants permission to delete data product	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteDataSource	Grants permission to update existing DataSource	Write			
DeleteDomain	Grants permission to delete a provisioned domain	Write	domain*		
DeleteDomainSharingPolicy [permission only]	Grants permission to delete a resource policy for a DataZone Domain	Permissions management			
DeleteDomainUnit	Grants permission to delete an existing domain unit	Write			
DeleteEnvironment	Grants permission to Delete Environment	Write			
DeleteEnvironmentAction	Grants permission to delete an environment action in a default service blueprint environment	Write			
DeleteEnvironmentBlueprint	Grants permission to delete Environment Blueprint	Write			
DeleteEnvironmentBlueprintConfiguration	Grants permission to delete environment blueprint configuration	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteEnvironmentProfile	Grants permission to delete Environment Profile	Write			
DeleteFormType	Grants permission to delete a form type	Write			
DeleteGlossary	Grants permission to delete a business glossary	Write			
DeleteGlossaryTerm	Grants permission to delete a glossary term	Write			
DeleteListing	Grants permission to delete listing	Write			
DeleteNotebook	Grants permission to delete notebooks	Write			
DeleteProject	Grants permission to delete a Project that enables your team to publish and subscribe to data	Write			
DeleteProjectMembership	Grants permission to remove a user from a project	Write			
DeleteProjectProfile	Grants permission to delete a project profile	Write			
DeleteRule	Grants permission to delete rule	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteSubscriptionGrant	Grants permission to delete a subscription grant from a subscription target	Write			
DeleteSubscriptionRequest	Grants permission to delete a pending subscription request for a Data Asset	Write			
DeleteSubscriptionTarget	Grants permission to delete a subscription target from a Environment in the project	Write			
DeleteTimeSeriesDataPoints	Grants permission to delete existing TimeSeriesDataPoints	Write			
DisassociateEnvironmentRole	Grants permission to disassociate a role in a default service blueprint environment	Write			
DisassociateGovernedTerms	Grants permission to disassociate governed terms to an asset	Write			
GenerateCode	Grants permission to generate code	Write			
GetAccountPool	Grants permission to get account pool details	Read			
GetAsset	Grants permission to retrieve an asset	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAssetFilter	Grants permission to get asset filter	Read			
GetAssetType	Grants permission to get an asset type	Read			
GetCell	Grants permission to get cells	Read			
GetCellRun	Grants permission to get cell runs	Read			
GetCellRunResult	Grants permission to get cell run result	Read			
GetConnection	Grants permission to get connections	Read			
GetConversation	Grants permission to get conversations	Read			
GetDataExportConfiguration	Grants permission to retrieve DataZone catalog data export configuration	Read			
GetDataProduct	Grants permission to get data product	Read			
GetDataSource	Grants permission to Get a existing DataSource in Amazon DataZone using its identifier	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDataSourceRun	Grants permission to get DataSource run job in Amazon DataZone using it's identifier	Read			
GetDomain	Grants permission to retrieve information about a domain	Read	domain*		
GetDomainExecutionRoleCredentials [permission only]	Grants permission to use features that require access to domain execution role credentials	Read			
GetDomainSharingPolicy [permission only]	Grants permission to retrieve a resource policy for a DataZone Domain	Read			
GetDomainUnit	Grants permission to get an existing domain unit	Read			
GetEnvironment	Grants permission to get Environment details	Read			
GetEnvironmentAction	Grants permission to get an environment action in a default service blueprint environment	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetEnvironmentActionLink [permission only]	Grants permission to get environment action link	Read			
GetEnvironmentBlueprint	Grants permission to get Environment Blueprint details	Read			
GetEnvironmentBlueprintConfiguration	Grants permission to get environment blueprint configuration	Read			
GetEnvironmentCredentials	Grants permission to get short term credentials that assume the Environment user role	Read			
GetEnvironmentProfile	Grants permission to get Environment Profile details	Read			
GetFormType	Grants permission to get a form type	Read			
GetGlossary	Grants permission to get a business glossary	Read			
GetGlossaryTerm	Grants permission to get a glossary term	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetGroupProfile	Grants permission to retrieve an existing DataZone group profile	Read			
GetIamPortalLoginUrl	Grants permission to an IAM principal to log into the DataZone Portal	Permissions management			
GetJobRun	Grants permission to get job runs	Read			
GetLineageEvent	Grants permission to get lineage events	Read			
GetLineageNode	Grants permission to get the lineage node	Read			
GetListing	Grants permission to get listing	Read			
GetMetadataGenerationRun	Grants permission to get metadata generation run	Read			
GetNotebook	Grants permission to get notebooks	Read			
GetNotebookCompute	Grants permission to get notebook compute	Read			
GetNotebookExport	Grants permission to get notebook exports	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetProject	Grants permission to get Project details	Read			
GetProjectProfile	Grants permission to get project profile details	Read			
GetRule	Grants permission to get rule	Read			
GetSubscription	Grants permission to retrieve a subscription	Read			
GetSubscriptionEligibility [permission only]	Grants permission to get subscription eligibilty	Read			
GetSubscriptionGrant	Grants permission to retireve a subscription grant	Read			
GetSubscriptionRequestDetails	Grants permission to reject a subscription request for a Data Asset	Read			
GetSubscriptionTarget	Grants permission to retireve details of subscription target	Read			
GetTimeSeriesDataPoint	Grants permission to get an existing TimeSeriesDataPoints in Amazon DataZone using its identifier	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetUpdateEligibility	Grants permission to get update eligibility status for project constructs	Read			
GetUserProfile	Grants permission to retrieve a user profile for an existing user in the DataZone Domain	Read			
ListAccountEnvironments	Grants permission to list Environments across all domains in an AWS Account	List			
ListAccountPools	Grants permission to list account pools	List			
ListAccountsInAccountPool	Grants permission to list accounts in an account pool	List			
ListAssetFilters	Grants permission to list asset filters	List			
ListAssetRevisions	Grants permission to list revisions of an asset	List			
ListCellRuns	Grants permission to list cell runs	List			
ListConnections	Grants permission to list connections	List			
ListConversations	Grants permission to list conversations	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDataProductRevisions	Grants permission to list data product revisions	List			
ListDataSourceRunActivities	Grants permission to list DataSource runs job's activities on Asset	List			
ListDataSourceRuns	Grants permission to list DataSource runs job	List			
ListDataSources	Grants permission to list existing DataSources	List			
ListDomainUnitsForParent	Grants permission to list child domain units for a given parent domain unit	List			
ListDomains	Grants permission to retrieve all domains	List			
ListEntityOwners	Grants permission to list owners of an entity like domain unit	List			
ListEnvironmentActions	Grants permission to list environment actions in a default service blueprint environment	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListEnvironmentBlueprintConfigurationSummaries [permission only]	Grants permission to list environment blueprint configuration summaries	List			
ListEnvironmentBlueprintConfigurations	Grants permission to list environment blueprint configurations	List			
ListEnvironmentBlueprints	Grants permission to list Domain for Environment Blueprints	List			
ListEnvironmentProfiles	Grants permission to list Domain for Environment Profiles	List			
ListEnvironments	Grants permission to show Environments in the Domain	List			
ListGroupsForUser	Grants permission to list all the DataZone group profiles that the DataZone user profile is a member of	List			
ListJobRuns	Grants permission to list job runs	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListLineageEvents	Grants permission to list lineage events	List			
ListLineageNodeHistory	Grants permission to list historical versions of lineage node	List			
ListLinkedTypes [permission only]	Grants permission to list linked type items linked to an Amazon DataZone Domain	List	domain*		
ListMetadataGenerationRuns	Grants permission to list metadata generation runs	List			
ListNotebooks	Grants permission to list notebooks	List			
ListNotifications	Grants permission to list notifications and events for a datazone user	List			
ListPolicyGrants	Grants permission to list policy grants	List			
ListProjectMemberships	Grants permission to list Project Members	List			
ListProjectProfiles	Grants permission to list project profiles	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListProjects	Grants permission to list Projects	List			
ListRules	Grants permission to list rules	List			
ListSubscriptionGrants	Grants permission to List subscription grants for a subscribed principal	List			
ListSubscriptionRequests	Grants permission to list subscription requests	List			
ListSubscriptionTargets	Grants permission to list subscription targets	List			
ListSubscriptions	Grants permission to list subscriptions	List			
ListTagsForResource	Grants permission to retrieve all tags associated with a resource	Read	domain		
ListTimeSeriesDataPoints	Grants permission to list existing TimeSeriesDataPoints	List			
ListWarehouseMetadata [permission only]	Grants permission to list available Manager Secrets	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PostLineageEvent	Grants permission to post lineage events	Write			
PostTimeSeriesDataPoints	Grants permission to post a new TimeSeriesDataPoints	Write			
ProvisionDomain [permission only]	Grants permission to provision domain with default project setup	Write			
PutCellRunResult	Grants permission to put cell run results	Write			
PutDataExportConfiguration	Grants permission to create and update DataZone catalog data export configuration	Write			
PutDomainSharingPolicy [permission only]	Grants permission to add a resource policy for a DataZone Domain	Permissions management			
PutEnvironmentBlueprintConfiguration	Grants permission to put environment blueprint configuration	Write			
QueryGraph	Grants permission to query graph	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RefreshToken [permission only]	Grants permission to refresh token	Write			
RejectPredictions	Grants permission to reject prediction	Write			
RejectSubscriptionRequest	Grants permission to reject a subscription request for a Data Asset	Write			
RemoveEntityOwner	Grants permission to remove an existing owner of an entity like domain unit	Write			
RemovePolicyGrant	Grants permission to remove a policy grant	Permissions management			
RevokeSubscription	Grants permission to revoke a subscription	Permissions management			
Search	Grants permission to search datazone entities	List			
SearchGroupProfiles	Grants permission to search DataZone group profiles and IAM Identity Center groups	List			
SearchListings	Grants permission to search listings	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SearchRules [permission only]	Grants permission to search rules	List			
SearchTypes	Grants permission to search types such asset types and form types in a domain	List			
SearchUserProfiles	Grants permission to search DataZone user profiles, IAM Identity Center users, and DataZone IAM principal profiles	List			
SendMessage	Grants permission to send messages	Write			
SsoLogin [permission only]	Grants permission to login using SSO	Write			
SsoLogout [permission only]	Grants permission to logout as SSO user	Write			
StartAccountBootstrapAction [permission only]	Grants permission to start account bootstrap action for a domain	Write			
StartConversation	Grants permission to start conversations	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartDataSourceRun	Grants permission to start a DataSource run job	Write			
StartMetadataGenerationRun	Grants permission to start metadata generation run	Write			
StartNotebookCompute	Grants permission to start notebook compute	Write			
StartNotebookExport	Grants permission to export notebooks	Write			
StartNotebookImport	Grants permission to import notebooks	Write			
StopMetadataGenerationRun	Grants permission to stop metadata generation run	Write			
StopNotebookCompute	Grants permission to stop notebook compute	Write			
TagResource	Grants permission to add or update tags to a resource	Tagging	domain*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UntagResource	Grants permission to remove tags associated with a resource	Tagging	domain*		
				aws:TagKeys	
UpdateAccountPool	Grants permission to update an account pool	Write			
UpdateAssetFilter	Grants permission to update asset filter	Write			
UpdateCell	Grants permission to update cells	Write			
UpdateCellRun	Grants permission to update cell runs	Write			
UpdateConnection	Grants permission to update connections	Write			
UpdateDataSource	Grants permission to update existing DataSource	Write			
UpdateDataSourceRunActivities [permission only]	Grants permission to update data source run activities	Write			
UpdateDomain	Grants permission to update information for a domain	Write	domain*		
UpdateDomainUnit	Grants permission to update an existing domain unit	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateEnvironment	Grants permission to update Environment settings	Write			
UpdateEnvironmentAction	Grants permission to update an environment action in a default service blueprint environment	Write			
UpdateEnvironmentBlueprint	Grants permission to update Environment Blueprint settings	Write			
UpdateEnvironmentConfiguration [permission only]	Grants permission to update environment configuration	Write			
UpdateEnvironmentDeploymentStatus [permission only]	Grants permission to update status of the Environment deployment	Write			
UpdateEnvironmentProfile	Grants permission to update EnvironmentProfile configuration	Write			
UpdateGlossary	Grants permission to update a business glossary	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateGlossaryTerm	Grants permission to update a glossary term	Write			
UpdateGroupProfile	Grants permission to update a DataZone group profile	Write			
UpdateNotebook	Grants permission to update notebooks	Write			
UpdateProject	Grants permission to update a Project that enables your team to publish and subscribe to data	Write			
UpdateProjectProfile	Grants permission to update a project profile	Write			
UpdateRule	Grants permission to update rule	Write			
UpdateSubscriptionGrantStatus	Grants permission to update a subscription grant status for custom grants	Write			
UpdateSubscriptionRequest	Grants permission to update business reason for subscription request for a Data Asset	Write			
UpdateSubscriptionTarget	Grants permission to update a subscription target	Write			
UpdateUserProfile	Grants permission to update a DataZone user profile	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ValidatePassRole [permission only]	Grants permission to validate pass role	Write			

Resource types defined by Amazon DataZone

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
domain	`arn:${Partition}:datazone:${Region}:${Account}:domain/${DomainId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon DataZone

Amazon DataZone defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
datazone:domainId	Filters access by the domain ID passed in the request	String
datazone:projectId	Filters access by the project ID passed in the request	String
datazone:userId	Filters access by the user ID passed in the request	String

Actions, resources, and condition keys for AWS Deadline Cloud

AWS Deadline Cloud (service prefix: `deadline`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Resource types defined by AWS Deadline Cloud
- Condition keys for AWS Deadline Cloud

Actions defined by AWS Deadline Cloud

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateMemberToFarm	Grants permission to associate a member to a farm	Permissions management	farm*		identitystore:DescribeGroup identitystore:DescribeUser identitystore:ListGroupMembershipsForMember
				deadline:AssociatedMembershipLevel deadline:MembershipLevel	
AssociateMemberToFleet	Grants permission to associate a member to a fleet	Permissions management	fleet*		identitystore:DescribeGroup

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					identitystore:DescribeUser identitystore:ListGroupMembershipsForMember
				deadline:AssociatedMembershipLevel deadline:MembershipLevel	
AssociateMemberToJob	Grants permission to associate a member to a job	Permissions management	job*		identitystore:DescribeGroup identitystore:DescribeUser identitystore:ListGroupMembershipsForMember

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				deadline:AssociatedMembershipLevel deadline:MembershipLevel	
AssociateMemberToQueue	Grants permission to associate a member to a queue	Permissions management	queue*		identitystore:DescribeGroup identitystore:DescribeUser identitystore:ListGroupMembershipsForMember
				deadline:AssociatedMembershipLevel deadline:MembershipLevel	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssumeFleetRoleForRead	Grants permission to assume a fleet role for read-only access	Write	fleet*		identitystore:ListGroupMembershipsForMember
AssumeFleetRoleForWorker	Grants permission to assume a fleet role for a worker	Write	worker*		
AssumeQueueRoleForRead	Grants permission to assume a queue role for read-only access	Write	queue*		identitystore:ListGroupMembershipsForMember
AssumeQueueRoleForUser	Grants permission to assume a queue role for a user	Write	queue*		identitystore:ListGroupMembershipsForMember
AssumeQueueRoleForWorker	Grants permission to assume a queue role for a worker	Write	queue* worker*		
BatchGetJobEntity	Grants permission to get a job entity for a worker	Read	worker*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CopyJobTemplate	Grants permission to copy a job template to an Amazon S3 bucket	Write	job*		identitystore:ListGroupMembershipsForMember s3:PutObject
CreateBudget	Grants permission to create a budget	Write	budget*		deadline:TagResource identitystore:ListGroupMembershipsForMember
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateFarm	Grants permission to create a farm	Write	farm*		deadline:TagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

Resource types defined by AWS Deadline Cloud

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
budget	`arn:${Partition}:deadline:${Region}:${Account}:farm/${FarmId}/budget/${BudgetId}`	aws:ResourceTag/${TagKey} deadline:FarmMembershipLevels

Resource types	ARN	Condition keys
farm	arn:${Partition}:deadline:${Region}:${Account}:farm/${FarmId}	aws:ResourceTag/${TagKey} deadline:FarmMembershipLevels
fleet	arn:${Partition}:deadline:${Region}:${Account}:farm/${FarmId}/fleet/${FleetId}	aws:ResourceTag/${TagKey} deadline:FarmMembershipLevels deadline:FleetMembershipLevels
job	arn:${Partition}:deadline:${Region}:${Account}:farm/${FarmId}/queue/${QueueId}/job/${JobId}	aws:ResourceTag/${TagKey} deadline:FarmMembershipLevels deadline:JobMembershipLevels deadline:QueueMembershipLevels
license-endpoint	arn:${Partition}:deadline:${Region}:${Account}:license-endpoint/${LicenseEndpointId}	aws:ResourceTag/${TagKey}
monitor	arn:${Partition}:deadline:${Region}:${Account}:monitor/${MonitorId}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
queue	arn:${Partition}:deadline:${Region}:${Account}:farm/${FarmId}/queue/${QueueId}	aws:ResourceTag/${TagKey} deadline:FarmMembershipLevels deadline:QueueMembershipLevels
worker	arn:${Partition}:deadline:${Region}:${Account}:farm/${FarmId}/fleet/${FleetId}/worker/${WorkerId}	aws:ResourceTag/${TagKey} deadline:FarmMembershipLevels deadline:FleetMembershipLevels

Condition keys for AWS Deadline Cloud

AWS Deadline Cloud defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
deadline:AssociatedMembershipLevel	Filters access by the associated membership level of the principal provided in the request	String
deadline:CalledAction	Filters access by the allowed action in the request	String
deadline:FarmMembershipLevels	Filters access by membership levels on the farm	ArrayOfString
deadline:FleetMembershipLevels	Filters access by membership levels on the fleet	ArrayOfString
deadline:JobMembershipLevels	Filters access by membership levels on the job	ArrayOfString
deadline:MembershipLevel	Filters access by the membership level passed in the request	String
deadline:PrincipalId	Filters access by the principle ID provided in the request	String
deadline:QueueMembershipLevels	Filters access by membership levels on the queue	ArrayOfString

Condition keys	Description	Type
deadline: RequesterPrincipalId	Filters access by the user calling the Deadline Cloud API	String

Actions, resources, and condition keys for Amazon Detective

Amazon Detective (service prefix: `detective`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon Detective

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptInvitation	Grants permission to accept an invitation to become a member of a behavior graph	Write	Graph*		
BatchGetGraphMemberDatasources	Grants permission to retrieve the datasource package history for the specified member accounts in a behavior graph managed by this account	Read	Graph*		
BatchGetMembershipDatasources	Grants permission to retrieve the datasource package history of the caller account for the specified graphs	Read			
CreateGraph	Grants permission to create a behavior graph and begin to aggregate security information	Write		aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	detective:TagResource
CreateMembers	Grants permission to request the membership of one or more accounts in a behavior	Write	Graph*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	graph managed by this account				
DeleteGraph	Grants permission to delete a behavior graph and stop aggregating security information	Write	Graph*		
DeleteMembers	Grants permission to remove member accounts from a behavior graph managed by this account	Write	Graph*		
DescribeOrganizationConfiguration	Grants permission to view the current configuration related to the Amazon Detective integration with AWS Organizations	Read	Graph*		organizations:DescribeOrganization
DisableOrganizationAdminAccount	Grants permission to remove the Amazon Detective delegated administrator account for an organization	Write			organizations:DescribeOrganization
DisassociateMembership	Grants permission to remove the association of this account with a behavior graph	Write	Graph*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableOrganizationAdminAccount	Grants permission to designate the Amazon Detective delegated administrator account for an organization	Write			iam:CreateServiceLinkedRole organizations:DescribeOrganization organizations:EnableAWSServiceAccess organizations:RegisterDelegatedAdministrator
GetFreeTrialEligibility [permission only]	Grants permission to retrieve a behavior graph's eligibility for a free trial period	Read	Graph*		
GetGraphIngestState [permission only]	Grants permission to retrieve the data ingestion state of a behavior graph	Read	Graph*		
GetInvestigation	Grants permission to get an investigation's status and metadata	Read	Graph*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetMembers	Grants permission to retrieve details on specified members of a behavior graph	Read	Graph*		
GetPricingInformation [permission only]	Grants permission to retrieve information about Amazon Detective's pricing	Read			
GetUsageInformation [permission only]	Grants permission to list usage information of a behavior graph	Read	Graph*		
InvokeAssistant [permission only]	Grants permission to invoke Detective's Assistant	Read	Graph*		
ListDatasourcePackages	Grants permission to list a graph's datasource package ingest states and timestamps for the most recent state changes in a behavior graph managed by this account	List	Graph*		
ListGraphs	Grants permission to list behavior graphs managed by this account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListHighDegreeEntities [permission only]	Grants permission to retrieve high volume entities whose relationships cannot be stored by Detective	List	Graph*		
ListIndicators	Grants permission to list the indicators of an investigation	List	Graph*		
ListInvestigations	Grants permission to list the investigations of a behavior graph	List	Graph*		
ListInvitations	Grants permission to retrieve details on the behavior graphs to which this account has been invited to join	List			
ListMembers	Grants permission to retrieve details on all members of a behavior graph	List	Graph*		
ListOrganizationAdminAccount	Grants permission to view the current Amazon Detective delegated administrator account for an organization	List			organizations:DescribeOrganization
ListTagsForResource	Grants permission to list the tag values that are assigned to a behavior graph	List	Graph*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RejectInvitation	Grants permission to reject an invitation to become a member of a behavior graph	Write	Graph*		
SearchGraph [permission only]	Grants permission to search the data stored in a behavior graph	Read	Graph*		
StartInvestigation	Grants permission to start investigations	Write	Graph*		
StartMonitoringMember	Grants permission to start data ingest for a member account that has a status of ACCEPTED_BUT_DISABLED	Write	Graph*		
TagResource	Grants permission to assign tag values to a behavior graph	Tagging	Graph*		
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
UntagResource	Grants permission to remove tag values from a behavior graph	Tagging	Graph*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
UpdateDatasourcePackages	Grants permission to enable or disable datasource package(s) in a behavior graph managed by this account	Write	Graph*		
UpdateInvestigationState	Grants permission to update an investigation's state and metadata	Write	Graph*		
UpdateOrganizationConfiguration	Grants permission to update the current configuration related to the Amazon Detective integration with AWS Organizations	Write	Graph*		organizations:DescribeOrganization

Resource types defined by Amazon Detective

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Graph	`arn:${Partition}:detective:${Region}:${Account}:graph:${ResourceId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Detective

Amazon Detective defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by specifying the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by specifying the tags associated with the resource	String
aws:TagKeys	Filters access by specifying the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Device Farm

AWS Device Farm (service prefix: `devicefarm`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.

Actions defined by AWS Device Farm

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateDevicePool	Grants permission to create a device pool within a project	Write	project*		
CreateInstanceProfile	Grants permission to create a device instance profile	Write			
CreateNetworkProfile	Grants permission to create a network profile within a project	Write	project*		
CreateProject	Grants permission to create a project for mobile testing	Write			ec2:CreateNetworkInterface ec2:DescribeSecurityGroups ec2:DescribeSubnets ec2:DescribeVpcs iam:CreateServiceLinkedRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateRemoteAccessSession	Grants permission to start a remote access session to a device instance	Write	device*		
			project*		
			deviceinstance		
			upload		
CreateTestGridProject	Grants permission to create a project for desktop testing	Write			ec2:CreateNetworkInterface ec2:DescribeSecurityGroups ec2:DescribeSubnets ec2:DescribeVpcs iam:CreateServiceLinkedRole
CreateTestGridUrl	Grants permission to generate a new pre-signed url used to access our test grid service	Write	testgrid-project*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateUpload	Grants permission to upload a new file or app within a project	Write	project*		
CreateVPCEConfiguration	Grants permission to create an Amazon Virtual Private Cloud (VPC) endpoint configuration	Write			
DeleteDevicePool	Grants permission to delete a user-generated device pool	Write	devicepool*		
DeleteInstanceProfile	Grants permission to delete a user-generated instance profile	Write	instanceprofile*		
DeleteNetworkProfile	Grants permission to delete a user-generated network profile	Write	networkprofile*		
DeleteProject	Grants permission to delete a mobile testing project	Write	project*		
DeleteRemoteAccessSession	Grants permission to delete a completed remote access session and its results	Write	session*		
DeleteRun	Grants permission to delete a run	Write	run*		
DeleteTestGridProject	Grants permission to delete a desktop testing project	Write	testgrid-project*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteUpload	Grants permission to delete a user-uploaded file	Write	upload*		
DeleteVPCEConfiguration	Grants permission to delete an Amazon Virtual Private Cloud (VPC) endpoint configuration	Write	vpceconfiguration*		
GetAccountSettings	Grants permission to retrieve the number of unmetered iOS and/or unmetered Android devices purchased by the account	Read			
GetDevice	Grants permission to retrieve the information of a unique device type	Read	device*		
GetDeviceInstance	Grants permission to retireve the information of a device instance	Read	deviceinstance*		
GetDevicePool	Grants permission to retireve the information of a device pool	Read	devicepool*		
GetDevicePoolCompatibility	Grants permission to retrieve information about the compatibility of a test and/or app with a device pool	Read	devicepool*		
			upload		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetInstanceProfile	Grants permission to retrieve the information of an instance profile	Read	instanceprofile*		
GetJob	Grants permission to retrieve the information of a job	Read	job*		
GetNetworkProfile	Grants permission to retrieve the information of a network profile	Read	networkprofile*		
GetOfferingStatus	Grants permission to retrieve the current status and future status of all offerings purchased by an AWS account	Read			
GetProject	Grants permission to retrieve information about a mobile testing project	Read	project*		
GetRemoteAccessSession	Grants permission to retrieve the link to a currently running remote access session	Read	session*		
GetRun	Grants permission to retrieve the information of a run	Read	run*		
GetSuite	Grants permission to retrieve the information of a testing suite	Read	suite*		
GetTest	Grants permission to retrieve the information of a test case	Read	test*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTestGridProject	Grants permission to retrieve information about a desktop testing project	Read	testgrid-project*		
GetTestGridSession	Grants permission to retireve the information of a test grid session	Read	testgrid-project		
			testgrid-session		
GetUpload	Grants permission to retireve the information of an uploaded file	Read	upload*		
GetVPCEConfiguration	Grants permission to retireve the information of an Amazon Virtual Private Cloud (VPC) endpoint configuration	Read	vpceconfiguration*		
InstallToRemoteAccessSession	Grants permission to install an application to a device in a remote access session	Write	session*		
			upload*		
ListArtifacts	Grants permission to list the artifacts in a project	List	job		
			run		
			suite		
			test		
ListDeviceInstances	Grants permission to list the information of device instances	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDevicePools	Grants permission to list the information of device pools	List	project*		
ListDevices	Grants permission to list the information of unique device types	List			
ListInstanceProfiles	Grants permission to list the information of device instance profiles	List			
ListJobs	Grants permission to list the information of jobs within a run	List	run*		
ListNetworkProfiles	Grants permission to list the information of network profiles within a project	List	project*		
ListOfferingPromotions	Grants permission to list the offering promotions	List			
ListOfferingTransactions	Grants permission to list all of the historical purchases, renewals, and system renewal transactions for an AWS account	List			
ListOfferings	Grants permission to list the products or offerings that the user can manage through the API	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListProjects	Grants permission to list the information of mobile testing projects for an AWS account	List			
ListRemoteAccessSessions	Grants permission to list the information of currently running remote access sessions	List	project*		
ListRuns	Grants permission to list the information of runs within a project	List	project*		
ListSamples	Grants permission to list the information of samples within a project	List	job*		
ListSuites	Grants permission to list the information of testing suites within a job	List	job*		
ListTagsForResource	Grants permission to list the tags of a resource	List	device		
			deviceinstance		
			devicepool		
			instanceprofile		
			networkprofile		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			project

Resource types defined by AWS Device Farm

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
project	arn:${Partition}:devicefarm:${Region}:${Account}:project:${ResourceId}	aws:ResourceTag/${TagKey}
run	arn:${Partition}:devicefarm:${Region}:${Account}:run:${ResourceId}	aws:ResourceTag/${TagKey}
job	arn:${Partition}:devicefarm:${Region}:${Account}:job:${ResourceId}	
suite	arn:${Partition}:devicefarm:${Region}:${Account}:suite:${ResourceId}	
test	arn:${Partition}:devicefarm:${Region}:${Account}:test:${ResourceId}	
upload	arn:${Partition}:devicefarm:${Region}:${Account}:upload:${ResourceId}	
artifact	arn:${Partition}:devicefarm:${Region}:${Account}:artifact:${ResourceId}	
sample	arn:${Partition}:devicefarm:${Region}:${Account}:sample:${ResourceId}	
networkprofile	arn:${Partition}:devicefarm:${Region}:${Account}:networkprofile:${ResourceId}	aws:ResourceTag/${TagKey}
deviceinstance	arn:${Partition}:devicefarm:${Region}::deviceinstance:${ResourceId}	aws:ResourceTag/${TagKey}
session	arn:${Partition}:devicefarm:${Region}:${Account}:session:${ResourceId}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
devicepool	arn:${Partition}:devicefarm:${Region}:${Account}:devicepool:${ResourceId}	aws:ResourceTag/${TagKey}
device	arn:${Partition}:devicefarm:${Region}::device:${ResourceId}	aws:ResourceTag/${TagKey}
instanceprofile	arn:${Partition}:devicefarm:${Region}:${Account}:instanceprofile:${ResourceId}	aws:ResourceTag/${TagKey}
vpceconfiguration	arn:${Partition}:devicefarm:${Region}:${Account}:vpceconfiguration:${ResourceId}	aws:ResourceTag/${TagKey}
testgrid-project	arn:${Partition}:devicefarm:${Region}:${Account}:testgrid-project:${ResourceId}	aws:ResourceTag/${TagKey}
testgrid-session	arn:${Partition}:devicefarm:${Region}:${Account}:testgrid-session:${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Device Farm

AWS Device Farm defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters actions based on the allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters actions based on tag-value assoicated with the resource	String
aws:TagKeys	Filters actions based on the presence of mandatory tags in the request	ArrayOfString

Actions, resources, and condition keys for AWS DevOps Agent Service

AWS DevOps Agent Service (service prefix: `aidevops`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS DevOps Agent Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AllowVendedLogDeliveryForResource [permission only]	Grants permission to authorize vended logs	Permissions management			
AssociateService	Grants permission to associate service	Write	agentspace*		
			associations*		
CreateAgentSpace	Grants permission to create agentspace	Write	agentspace*		
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
CreateBacklogTask	Grants permission to create a new backlog task	Write	agentspace*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateChat	Grants permission to create a chat	Write	agentspace*		
CreateKnowledgeItem	Grants permission to create a new knowledge item	Write	agentspace*		
DeleteAgentSpace	Grants permission to delete agentspace	Write	agentspace*		
				aws:ResourceTag/${TagKey}	
DeleteKnowledgeItem	Grants permission to delete a knowledge item	Write	agentspace*		
DeregisterService	Grants permission to deregister a service	Write	service*		
				aws:ResourceTag/${TagKey}	
DescribeSupportLevel	Grants permission to describe a chat for a case	Write	agentspace*		
DisableOperatorApp	Grants permission to disable the Operator App access to the given AgentSpace	Write	agentspace*		
DisassociateService	Grants permission to disassociate service	Write	agentspace*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			associations*		
DiscoverTopology	Grants permission to discover topology information	Write	agentspace*		
EnableOperatorApp	Grants permission to enable the Operator App to access the given AgentSpace	Write	agentspace*		
EndChatForCase	Grants permission to end a chat for a case	Write	agentspace*		
GetAccountUsage	Grants permission to retrieve account usage information	Read			
GetAgentSpace	Grants permission to get agentspace	Read	agentspace*		
				aws:ResourceTag/${TagKey}	
GetAssociation	Grants permission to get association	Read	agentspace*		
			associations*

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			service	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag a resource	Tagging	agentspace	aws:ResourceTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			service	aws:ResourceTag/${TagKey} aws:TagKeys	
				aws:ResourceTag/${TagKey} aws:TagKeys	
UpdateAgentSpace	Grants permission to update agentspace	Write	agentspace*		
				aws:ResourceTag/${TagKey}	
UpdateAssociation	Grants permission to update association	Write	agentspace*		
			associations*		
UpdateBacklogTask	Grants permission to update a task	Write	agentspace*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateGoal	Grants permission to update a goal	Write	agentspace*		
UpdateKnowledgeItem	Grants permission to update a knowledge item	Write	agentspace*		
UpdateOperatorAppIdpConfig	Grants permission to update the external Identity Provider configuration for the Operator App	Write	agentspace*		
UpdateRecommendation	Grants permission to update a recommendation	Write	agentspace*		
ValidateAwsAssociations	Grants permission to validate aws association	Write	agentspace*		

Resource types defined by AWS DevOps Agent Service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
agentspace	arn:${Partition}:aidevops:${Region}:${Account}:agentspace/${AgentSpaceId}	aws:ResourceTag/${TagKey}
associations	arn:${Partition}:aidevops:${Region}:${Account}:agentspace/${AgentSpaceId}/associations/${AssociationId}	
service	arn:${Partition}:aidevops:${Region}:${Account}:service/${ServiceId}	aws:ResourceTag/${TagKey}

Condition keys for AWS DevOps Agent Service

AWS DevOps Agent Service defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon DevOps Guru

Amazon DevOps Guru (service prefix: `devops-guru`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon DevOps Guru

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddNotificationChannel	Grants permission to add a notification channel to DevOps Guru	Write	topic*		sns:GetTopicAttributes sns:SetTopicAttributes

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteInsight	Grants permission to delete specified insight in your account	Write			
DescribeAccountHealth	Grants permission to view the health of operations in your AWS account	Read			
DescribeAccountOverview	Grants permission to view the health of operations within a time range in your AWS account	Read			
DescribeAnomaly	Grants permission to list the details of a specified anomaly	Read			
DescribeEventSourcesConfig	Grants permission to retrieve details about event sources for DevOps Guru	Read			
DescribeFeedback	Grants permission to view the feedback details of a specified insight	Read			
DescribeInsight	Grants permission to list the details of a specified insight	Read			
DescribeOrganizationHealth	Grants permission to view the health of operations in your organization	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeOrganizationOverview	Grants permission to view the health of operations within a time range in your organization	Read			
DescribeOrganizationResourceCollectionHealth	Grants permission to view the health of operations for each AWS CloudFormation stack or AWS Services or accounts specified in DevOps Guru in your organization	Read			
DescribeResourceCollectionHealth	Grants permission to view the health of operations for each AWS CloudFormation stack specified in DevOps Guru	Read			
DescribeServiceIntegration	Grants permission to view the integration status of services that can be integrated with DevOps Guru	Read			
GetCostEstimation	Grants permission to list service resource cost estimates	Read			
GetResourceCollection	Grants permission to list AWS CloudFormation stacks that DevOps Guru is configured to use	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAnomaliesForInsight	Grants permission to list anomalies of a given insight in your account	List		devops-guru:ServiceNames	
ListAnomalousLogGroups	Grants permission to list log anomalies of a given insight in your account	List			
ListEvents	Grants permission to list resource events that are evaluated by DevOps Guru	List			
ListInsights	Grants permission to list insights in your account	List			
ListMonitoredResources	Grants permission to list resource monitored by DevOps Guru in your account	List			
ListNotificationChannels	Grants permission to list notification channels configured for DevOps Guru in your account	List			
ListOrganizationInsights	Grants permission to list insights in your organization	List			
ListRecommendations	Grants permission to list a specified insight's recommendations	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutFeedback	Grants permission to submit a feedback to DevOps Guru	Write			
RemoveNotificationChannel	Grants permission to remove a notification channel from DevOps Guru	Write	topic*		sns:GetTopicAttributes sns:SetTopicAttributes
SearchInsights	Grants permission to search insights in your account	List		devops-guru:ServiceNames	
SearchOrganizationInsights	Grants permission to search insights in your organization	List			
StartCostEstimation	Grants permission to start the creation of an estimate of the monthly cost	Read			
UpdateEventSourcesConfig	Grants permission to update an event source for DevOps Guru	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateResourceCollection	Grants permission to update the list of AWS CloudFormation stacks that are used to specify which AWS resources in your account are analyzed by DevOps Guru	Write			
UpdateServiceIntegration	Grants permission to enable or disable a service that integrates with DevOps Guru	Write			

Resource types defined by Amazon DevOps Guru

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
topic	`arn:${Partition}:sns:${Region}:${Account}:${TopicName}`	

Condition keys for Amazon DevOps Guru

Amazon DevOps Guru defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
devops-guru:ServiceNames	Filters access by API to restrict access to given AWS service names	ArrayOfString

Actions, resources, and condition keys for AWS Diagnostic tools

AWS Diagnostic tools (service prefix: `ts`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Diagnostic tools

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetExecution	Grants permission to get details about specific	Read	execution *		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	execution within AWS Diagnostic tools				
GetExecutionOutput	Grants permission to get details about specific execution output within AWS Diagnostic tools	Read	execution*		
GetTool	Grants permission to get details about specific tool within AWS Diagnostic tools	Read	tool*		
ListExecutions	Grants permission to list all available execution within AWS Diagnostic tools	List			
ListTagsForResource	Grants permission to list the tags for an AWS Diagnostic tools resource	Read	execution*		
				aws:RequestTag/${TagKey} aws:TagKeys	
ListTools	Grants permission to list all available tools within AWS Diagnostic tools	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartExecution	Grants permission to start an execution workflow of specific tool within AWS Diagnostic tools	Write		aws:RequestTag/${TagKey} aws:TagKeys	iam:PassRole
TagResource	Grants permission to tag an AWS Diagnostic tools resource	Tagging	execution*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag an AWS Diagnostic tools resource	Tagging	execution*		
				aws:TagKeys	

Resource types defined by AWS Diagnostic tools

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
execution	arn:${Partition}:ts::${Account}:execution/${UserId}/${ToolId}/${ExecutionId}	aws:ResourceTag/${TagKey}
tool	arn:${Partition}:ts::aws:tool/${ToolId}	

Condition keys for AWS Diagnostic tools

AWS Diagnostic tools defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters access by tag-value associated with the resource	String
aws:TagKeys	Filters access by the presence of mandatory tags in the request	ArrayOfString

Actions, resources, and condition keys for AWS Direct Connect

AWS Direct Connect (service prefix: directconnect) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Direct Connect

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptDirectConnectGatewayAssociationProposal	Grants permission to accept a proposal request to attach a virtual private gateway to a Direct Connect gateway	Write	dx-gateway*		
AllocateConnectionOnInterconnect	Grants permission to create a hosted connection on an interconnect	Write	dxcon*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AllocateHostedConnection	Grants permission to create a new hosted connection between a AWS Direct Connect partner's network and a specific AWS Direct Connect location	Write	dxcon		
			dxlag		
				aws:RequestTag/${TagKey} aws:TagKeys	
AllocatePrivateVirtualInterface	Grants permission to provision a private virtual interface to be owned by a different customer	Write	dxcon		
			dxlag		
				aws:RequestTag/${TagKey} aws:TagKeys	
AllocatePublicVirtualInterface	Grants permission to provision a public virtual interface to be owned by a different customer	Write	dxcon		
			dxlag		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AllocateTransitVirtualInterface	Grants permission to provision a transit virtual interface to be owned by a different customer	Write	dxcon		
			dxlag		
				aws:RequestTag/${TagKey} aws:TagKeys	
AssociateConnectionWithLag	Grants permission to associate a connection with a LAG	Write	dxcon*		
			dxlag*		
AssociateHostedConnection	Grants permission to associate a hosted connection and its virtual interfaces with a link aggregation group (LAG) or interconnect	Write	dxcon*		
			dxcon		
			dxlag		
AssociateMacSecKey	Grants permission to associate a MAC Security (MACsec) Connection Key Name (CKN)/ Connectivity Association Key (CAK) pair with an AWS Direct Connect dedicated connection	Write	dxcon		
			dxlag		
AssociateVirtualInterface	Grants permission to associate a virtual interface with a specified link aggregation group (LAG) or connection	Write	dxvif*		
			dxcon		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			dxlag		
ConfirmConnection	Grants permission to confirm the creation of a hosted connection on an interconnect	Write	dxcon*		
ConfirmCustomerAgreement	Grants permission to confirm the the terms of agreement when creating the connection or link aggregation group (LAG)	Write			
ConfirmPrivateVirtualInterface	Grants permission to accept ownership of a private virtual interface created by another customer	Write	dxvif*		
ConfirmPublicVirtualInterface	Grants permission to accept ownership of a public virtual interface created by another customer	Write	dxvif*		
ConfirmTransitVirtualInterface	Grants permission to accept ownership of a transit virtual interface created by another customer	Write	dxvif*		
CreateBGPPeer	Grants permission to create a BGP peer on the specified virtual interface	Write	dxvif*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateConnection	Grants permission to create a new connection between the customer network and a specific AWS Direct Connect location	Write	dxlag		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDirectConnectGateway	Grants permission to create a Direct Connect gateway, which is an intermediate object that enables you to connect a set of virtual interfaces and virtual private gateways	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateDirectConnectGatewayAssociation	Grants permission to create an association between a Direct Connect gateway and a virtual private gateway	Write	dx-gateway*		
CreateDirectConnectGatewayAssociationProposal	Grants permission to create a proposal to associate the specified virtual private gateway with the specified Direct Connect gateway	Write	dx-gateway*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateInterconnect	Grants permission to create a new interconnect between a AWS Direct Connect partner's network and a specific AWS Direct Connect location	Write	dxlag		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateLag	Grants permission to create a link aggregation group (LAG) with the specified number of bundled physical connections between the customer network and a specific AWS Direct Connect location	Write	dxcon		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreatePrivateVirtualInterface	Grants permission to create a new private virtual interface	Write	dxcon		
			dxlag		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreatePublicVirtualInterface	Grants permission to create a new public virtual interface	Write	dxcon		
			dxlag		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateTransitVirtualInterface	Grants permission to create a new transit virtual interface	Write	dxcon		
			dxlag		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteBGPPeer	Grants permission to delete the specified BGP peer on the specified virtual interface with the specified customer address and ASN	Write	dxvif*		
DeleteConnection	Grants permission to delete the connection	Write	dxcon*		
DeleteDirectConnectGateway	Grants permission to delete the specified Direct Connect gateway	Write	dx-gateway*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteDirectConnectGatewayAssociation	Grants permission to delete the association between the specified Direct Connect gateway and virtual private gateway	Write	dx-gateway*		
DeleteDirectConnectGatewayAssociationProposal	Grants permission to delete the association proposal request between the specified Direct Connect gateway and virtual private gateway	Write			
DeleteInterconnect	Grants permission to delete the specified interconnect	Write	dxcon*		
DeleteLag	Grants permission to delete the specified link aggregation group (LAG)	Write	dxlag*		
DeleteVirtualInterface	Grants permission to delete a virtual interface	Write	dxvif*		
DescribeConnectionLoa	Grants permission to describe the LOA-CFA for a Connection	Read	dxcon*		
DescribeConnections	Grants permission to describe all connections in this region	Read	dxcon		
DescribeConnectionsOnInterconnect	Grants permission to describe a list of connections that have been provisioned on the given interconnect	Read	dxcon*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeCustomerMetadata	Grants permission to view a list of customer agreements, along with their signed status and whether the customer is an NNIPartner, NNIPartnerV2, or a nonPartner	Read			
DescribeDirectConnectGatewayAssociationProposals	Grants permission to describe one or more association proposals for connection between a virtual private gateway and a Direct Connect gateway	Read	dx-gateway		
DescribeDirectConnectGatewayAssociations	Grants permission to describe the associations between your Direct Connect gateways and virtual private gateways	Read	dx-gateway		
DescribeDirectConnectGatewayAttachments	Grants permission to describe the attachments between your Direct Connect gateways and virtual interfaces	Read	dx-gateway		
DescribeDirectConnectGateways	Grants permission to describe all your Direct Connect gateways or only the specified Direct Connect gateway	Read	dx-gateway		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeHostedConnections	Grants permission to describe the hosted connections that have been provisioned on the specified interconnect or link aggregation group (LAG)	Read	dxcon		
			dxlag		
DescribeInterconnectLoa	Grants permission to describe the LOA-CFA for an Interconnect	Read	dxcon*		
DescribeInterconnects	Grants permission to describe a list of interconnects owned by the AWS account	Read	dxcon		
DescribeLags	Grants permission to describe all your link aggregation groups (LAG) or the specified LAG	Read	dxlag		
DescribeLoa	Grants permission to describe the LOA-CFA for a connection, interconnect, or link aggregation group (LAG)	Read	dxcon		
			dxlag		
DescribeLocations	Grants permission to describe the list of AWS Direct Connect locations in the current AWS region	Read			
DescribeRouterConfiguration	Grants permission to describe Details about the router for a virtual interface	Read	dxvif*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeTags	Grants permission to describe the tags associated with the specified AWS Direct Connect resources	Read	dx-gateway		
			dxcon		
			dxlag		
			dxvif		
DescribeVirtualGateways	Grants permission to describe a list of virtual private gateways owned by the AWS account	Read			
DescribeVirtualInterfaces	Grants permission to describe all virtual interfaces for an AWS account	Read	dxcon		
			dxlag		
			dxvif		
DisassociateConnectionFromLag	Grants permission to disassociate a connection from a link aggregation group (LAG)	Write	dxcon*		
			dxlag*		
DisassociateMacSecKey	Grants permission to remove the association between a MAC Security (MACsec) security key and an AWS Direct Connect dedicated connection	Write	dxcon		
			dxlag		
ListVirtualInterfaceTestHistory	Grants permission to list the virtual interface failover test history	List	dxvif*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartBgpFailoverTest	Grants permission to start the virtual interface failover test that verifies your configuration meets your resiliency requirements by placing the BGP peering session in the DOWN state. You can then send traffic to verify that there are no outages	Write	dxvif*		
StopBgpFailoverTest	Grants permission to stop the virtual interface failover test	Write	dxvif*		
TagResource	Grants permission to add the specified tags to the specified AWS Direct Connect resource. Each resource can have a maximum of 50 tags	Tagging	dx-gateway		
			dxcon		
			dxlag		
			dxvif		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove one or more tags from the specified AWS Direct Connect resource	Tagging	dx-gateway		
			dxcon		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			dxlag		
			dxvif		
				aws:TagKeys	
UpdateConnection	Grants permission to update the AWS Direct Connect dedicated connection configuration. You can update the following parameters for a connection: The connection name or The connection's MAC Security (MACsec) encryption mode	Write	dxcon*		
UpdateDirectConnectGateway	Grants permission to update the name of a Direct Connect gateway	Write	dx-gateway*		
UpdateDirectConnectGatewayAssociation	Grants permission to update the specified attributes of the Direct Connect gateway association	Write			
UpdateLag	Grants permission to update the attributes of the specified link aggregation group (LAG)	Write	dxlag*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateVirtualInterfaceAttributes	Grants permission to update the specified attributes of the specified virtual private interface	Write	dxvif*		

Resource types defined by AWS Direct Connect

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
dxcon	`arn:${Partition}:directconnect:${Region}:${Account}:dxcon/${ConnectionId}`	aws:ResourceTag/${TagKey}
dxlag	`arn:${Partition}:directconnect:${Region}:${Account}:dxlag/${LagId}`	aws:ResourceTag/${TagKey}
dxvif	`arn:${Partition}:directconnect:${Region}:${Account}:dxvif/${VirtualInterfaceId}`	aws:ResourceTag/${TagKey}
dx-gateway	`arn:${Partition}:directconnect::${Account}:dx-gateway/${DirectConnectGatewayId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Direct Connect

AWS Direct Connect defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by actions based on the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by actions based on tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by actions based on the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS Directory Service

AWS Directory Service (service prefix: `ds`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Directory Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptSharedDirectory	Grants permission to accept a directory sharing request that was sent from the directory owner account	Write	directory*		
AccessDSData [permission only]	Grants permission to access directory data using the Directory Service Data API	Permissions management	directory*		
AddIpRoutes	Grants permission to add a CIDR address block to correctly route traffic to and from your Microsoft AD on Amazon Web Services	Write	directory*		ec2:AuthorizeSecurityGroupEgress ec2:AuthorizeSecurityGroupIngress ec2:DescribeSecurityGroups
AddRegion	Grants permission to add two domain controllers in	Write	directory*		ec2:AuthorizeSecur

CreateLogSubscription	Grants permission to create a subscription to forward real time Directory Service domain controller security logs to the specified CloudWatch log group in your AWS account	Write	directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateMicrosoftAD	Grants permission to create a Microsoft AD in the AWS cloud	Write		aws:RequestTag/${TagKey} aws:TagKeys	ec2:AuthorizeSecurityGroupEgress ec2:AuthorizeSecurityGroupIngress ec2:CreateNetworkInterface ec2:CreateSecurityGroup ec2:CreateTags ec2:DescribeNetworkInterfaces ec2:DescribeSubnets ec2:DescribeVpcs

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSnapshot	Grants permission to create a snapshot of a Simple AD or Microsoft AD directory in the AWS cloud	Write	directory*		
CreateTrust	Grants permission to initiate the creation of the AWS side of a trust relationship between a Microsoft AD in the AWS cloud and an external domain	Write	directory*		
DeleteADAssessment	Grants permission to delete a directory assessment	Write			
DeleteConditionalForwarder	Grants permission to delete a conditional forwarder that has been set up for your AWS directory	Write	directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteDirectory	Grants permission to delete an AWS Directory Service directory	Write	directory*		ec2:DeleteNetworkInterface ec2:DeleteSecurityGroup ec2:DescribeNetworkInterfaces ec2:RevokeSecurityGroupEgress ec2:RevokeSecurityGroupIngress
DeleteLogSubscription	Grants permission to delete the specified log subscription	Write	directory*		
DeleteSnapshot	Grants permission to delete a directory snapshot	Write	directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteTrust	Grants permission to delete an existing trust relationship between your Microsoft AD in the AWS cloud and an external domain	Write	directory*		
DeregisterCertificate	Grants permission to delete from the system the certificate that was registered for a secured LDAP connection	Write	directory*		
DeregisterEventTopic	Grants permission to remove the specified directory as a publisher to the specified SNS topic	Write	directory*		
DescribeADAssessment	Grants permission to describe a directory assessment	Read			
DescribeCAEnrollmentPolicy	Grants permission to describe the ca enrollment status of a specified directory	Read	directory*		
DescribeCertificate	Grants permission to display information about the certificate registered for a secured LDAP connection	Read	directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeClientAuthenticationSettings	Grants permission to retrieve information about the type of client authentication for the specified directory, if the type is specified. If no type is specified, information about all client authentication types that are supported for the specified directory is retrieved. Currently, only SmartCard is supported	Read	directory*		
DescribeConditionalForwarders	Grants permission to obtain information about the conditional forwarders for this account	Read	directory*		
DescribeDirectories	Grants permission to obtain information about the directories that belong to this account	List			
DescribeDirectoryDataAccess	Grants permission to describe the Directory Service Data API status for the specified directory	Read	directory*		
DescribeDomainControllers	Grants permission to provide information about any domain controllers in your directory	Read	directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeEventTopics	Grants permission to obtain information about which SNS topics receive status messages from the specified directory	Read	directory*		
DescribeHybridADUpdate	Grants permission to describe the updates of a specified hybrid directory	Read	directory*		
DescribeLDAPSSettings	Grants permission to describe the status of LDAP security for the specified directory	Read	directory*		
DescribeRegions	Grants permission to provide information about the Regions that are configured for multi-Region replication	Read	directory*		
DescribeSettings	Grants permission to retrieve information about the configurable settings for the specified directory	Read	directory*		
DescribeSharedDirectories	Grants permission to return the shared directories in your account	Read	directory*		
DescribeSnapshots	Grants permission to obtain information about the directory snapshots that belong to this account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeTrusts	Grants permission to obtain information about the trust relationships for this account	Read			
DescribeUpdateDirectory	Grants permission to describe the updates of a directory for a particular update type	Read	directory*		
DisableCAEnrollmentPolicy	Grants permission to disable the ca enrollment of a specified directory	Write	directory*		
DisableClientAuthentication	Grants permission to disable alternative client authentication methods for the specified directory	Write	directory*		
DisableDirectoryDataAccess	Grants permission to disable the Directory Service Data API for the specified directory	Write	directory*		
DisableLDAPS	Grants permission to deactivate LDAP secure calls for the specified directory	Write	directory*		
DisableRadius	Grants permission to disable multi-factor authentication (MFA) with the Remote Authentication Dial In User Service (RADIUS) server for an AD Connector directory	Write	directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableRoleAccess [permission only]	Grants permission to disable AWS Management Console access for identity in your AWS Directory	Write	directory*		
DisableSso	Grants permission to disable single-sign on for a directory	Write	directory*		
EnableCAEnrollmentPolicy	Grants permission to enable the ca enrollment of a specified directory	Write	directory*		acm-pca:DescribeCertificateAuthority pca-connector-ad:GetConnector
EnableClientAuthentication	Grants permission to enable alternative client authentication methods for the specified directory	Write	directory*		
EnableDirectoryDataAccess	Grants permission to enable the Directory Service Data API for the specified directory	Write	directory*		
EnableLDAPS	Grants permission to activate the switch for the specific directory to always use LDAP secure calls	Write	directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableRadius	Grants permission to enable multi-factor authentication (MFA) with the Remote Authentication Dial In User Service (RADIUS) server for an AD Connector directory	Write	directory*		
EnableRoleAccess [permission only]	Grants permission to enable AWS Management Console access for identity in your AWS Directory	Write	directory*		iam:PassRole
EnableSso	Grants permission to enable single-sign on for a directory	Write	directory*		
GetAuthorizedApplicationDetails [permission only]	Grants permission to retrieve the details of the authorized applications on a directory	Read	directory*		
GetDirectoryLimits	Grants permission to obtain directory limit information for the current region	Read			
GetSnapshotLimits	Grants permission to obtain the manual snapshot limits for a directory	Read	directory*		
ListADAssessments	Grants permission to list directory assessments	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAuthorizedApplications [permission only]	Grants permission to obtain the AWS applications authorized for a directory	Read	directory*		
ListCertificates	Grants permission to list all the certificates registered for a secured LDAP connection, for the specified directory	List	directory*		
ListIpRoutes	Grants permission to list the address blocks that you have added to a directory	Read	directory*		
ListLogSubscriptions	Grants permission to list the active log subscriptions for the AWS account	Read			
ListSchemaExtensions	Grants permission to list all schema extensions applied to a Microsoft AD Directory	List	directory*		
ListTagsForResource	Grants permission to list all tags on an Amazon Directory Services directory	Read	directory*		
RegisterCertificate	Grants permission to register a certificate for secured LDAP connection	Write	directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RegisterEventTopic	Grants permission to associate a directory with an SNS topic	Write	directory*		sns:GetTopicAttributes
RejectSharedDirectory	Grants permission to reject a directory sharing request that was sent from the directory owner account	Write	directory*		
RemoveIpRoutes	Grants permission to remove IP address blocks from a directory	Write	directory*		
RemoveRegion	Grants permission to stop all replication and removes the domain controllers from the specified Region. You cannot remove the primary Region with this operation	Write	directory*		
RemoveTagsFromResource	Grants permission to remove tags from an Amazon Directory Services directory	Tagging	directory*		ec2:DeleteTags
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ResetUserPassword	Grants permission to reset the password for any user in your AWS Managed Microsoft AD or Simple AD directory	Write	directory*		
RestoreFromSnapshot	Grants permission to restore a directory using an existing directory snapshot	Write	directory*		
ShareDirectory	Grants permission to share a specified directory in your AWS account (directory owner) with another AWS account (directory consumer). With this operation you can use your directory from any AWS account and from any Amazon VPC within an AWS Region	Write	directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartADAssessment	Grants permission to start a directory assessment	Write			ec2:AuthorizeSecurityGroupEgress ec2:AuthorizeSecurityGroupIngress ec2:CreateNetworkInterface ec2:CreateNetworkInterfacePermission ec2:CreateSecurityGroup ec2:DeleteNetworkInterface ec2:DeleteSecurityGroup ec2:DescribeNetwor

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					kInterfaces ec2:DescribeSubnets ec2:DescribeVpcs ssm:GetCommandInvocation ssm:GetConnectionStatus ssm:ListCommands ssm:SendCommand
StartSchemaExtension	Grants permission to apply a schema extension to a Microsoft AD directory	Write	directory*		
UnauthorizeApplication [permission only]	Grants permission to unauthorize an application from your AWS Directory	Write	directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UnshareDirectory	Grants permission to stop the directory sharing between the directory owner and consumer accounts	Write	directory*		
UpdateAuthorizedApplication [permission only]	Grants permission to update an authorized application for your AWS Directory	Write	directory*		
UpdateConditionalForwarder	Grants permission to update a conditional forwarder that has been set up for your AWS directory	Write	directory*		
UpdateDirectory [permission only]	Grants permission to update the configurations like service account credentials or DNS server IP addresses for the specified directory	Write	directory*		
UpdateDirectorySetup	Grants permission to update the directory for a particular update type	Write	directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateHybridAD	Grants permission to update configurations for a specified hybrid directory	Write	directory*		ec2:AuthorizeSecurityGroupEgress ec2:AuthorizeSecurityGroupIngress ec2:CreateNetworkInterface ec2:CreateNetworkInterfacePermission ec2:CreateSecurityGroup ec2:CreateTags ec2:DescribeNetworkInterfaces ec2:DescribeSubnets

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					ec2:DescribeVpcs secretsmanager:DescribeSecret secretsmanager:GetSecretValue ssm:GetCommandInvocation ssm:GetConnectionStatus ssm:ListCommands ssm:SendCommand

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateNumberOfDomainControllers	Grants permission to add or remove domain controllers to or from the directory. Based on the difference between current value and new value (provided through this API call), domain controllers will be added or removed. It may take up to 45 minutes for any new domain controllers to become fully active once the requested number of domain controllers is updated. During this time, you cannot make another update request	Write	directory*		
UpdateRadius	Grants permission to update the Remote Authentication Dial In User Service (RADIUS) server information for an AD Connector directory	Write	directory*		
UpdateSettings	Grants permission to update the configurable settings for the specified directory	Write	directory*		
UpdateTrust	Grants permission to update the trust that has been set up between your AWS Managed Microsoft AD directory and an on-premises Active Directory	Write	directory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
VerifyTrust	Grants permission to verify a trust relationship between your Microsoft AD in the AWS cloud and an external domain	Read	directory *		

Resource types defined by AWS Directory Service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
directory	`arn:${Partition}:ds:${Region}:${Account}:directory/${DirectoryId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Directory Service

AWS Directory Service defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the value of the request to AWS DS	String
aws:ResourceTag/${TagKey}	Filters access by the AWS DS Resource being acted upon	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Directory Service Data

AWS Directory Service Data (service prefix: `ds-data`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- Condition keys for AWS Directory Service Data

Actions defined by AWS Directory Service Data

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddGroupMember	Grants permission to add a member to a group on a directory	Write	directory*		ds:AccessDSData
				ds-data:SAMAccountName ds-data:MemberName ds-data:Realm ds-data:MemberRealm ds-data:Identifier	
CreateGroup	Grants permission to create a group on a directory	Write	directory*		ds:AccessDSData
				ds-data:SAMAccountName ds-data:Identifier ds-data:Realm	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateUser	Grants permission to create a user on a directory	Write	directory *		ds:AccessDSData
				ds-data:SAMAccountName ds-data:Identifier ds-data:Realm	
DeleteGroup	Grants permission to delete a group on a directory	Write	directory *		ds:AccessDSData
				ds-data:SAMAccountName ds-data:Identifier ds-data:Realm	
DeleteUser	Grants permission to delete a user on a directory	Write	directory *		ds:AccessDSData

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ds-data:SAMAccountName ds-data:Identifier ds-data:Realm	
DescribeGroup	Grants permission to describe a group on a directory	Read	directory*		ds:AccessDSData
				ds-data:SAMAccountName ds-data:Identifier ds-data:Realm	
DescribeUser	Grants permission to describe a user on a directory	Read	directory*		ds:AccessDSData

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ds-data:SAMAccountName ds-data:Identifier ds-data:Realm	
DisableUser	Grants permission to disable a user on a directory	Write	directory*		ds:AccessDSData
				ds-data:SAMAccountName ds-data:Identifier ds-data:Realm	
ListGroupMembers	Grants permission to list members in a group on a directory	List	directory*		ds:AccessDSData

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ds-data:SAMAccountName ds-data:Realm ds-data:MemberRealm ds-data:Identifier	
ListGroups	Grants permission to list groups on a directory	List	directory*		ds:AccessDSData
				ds-data:Realm	
ListGroupsForMember	Grants permission to list the groups that a member is in on a directory	List	directory*		ds:AccessDSData

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ds-data:SAMAccountName ds-data:Realm ds-data:MemberRealm ds-data:Identifier	
ListUsers	Grants permission to list users on a directory	List	directory*		ds:AccessDSData
				ds-data:Realm	
RemoveGroupMember	Grants permission to remove a member from a group on a directory	Write	directory*		ds:AccessDSData

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ds-data:SAMAccountName ds-data:MemberName ds-data:Realm ds-data:MemberRealm ds-data:Identifier	
SearchGroups	Grants permission to search for groups on a directory	Read	directory*		ds-data:DescribeGroup ds:AccessDSData
				ds-data:Realm	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SearchUsers	Grants permission to search for users on a directory	Read	directory*		ds-data:DescribeUser ds:AccessDSData
				ds-data:Realm	
UpdateGroup	Grants permission to update a group on a directory	Write	directory*		ds:AccessDSData
				ds-data:SAMAccountName ds-data:Identifier ds-data:Realm	
UpdateUser	Grants permission to update a user on a directory	Write	directory*		ds:AccessDSData

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ds-data:SAMAccountName ds-data:Identifier ds-data:Realm	

Resource types defined by AWS Directory Service Data

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
directory	`arn:${Partition}:ds:${Region}:${Account}:directory/${DirectoryId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Directory Service Data

AWS Directory Service Data defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by the AWS DS Resource being acted upon	String
ds-data:Identifier	Filters access by the type of identifier provided in the request (i.e. SAM Account Name)	String
ds-data:MemberName	Filters access by the directory SAM Account Name included in the MemberName input of the request	String
ds-data:MemberRealm	Filters access by the directory realm name included in the MemberRealm input of the request	String
ds-data:Realm	Filters access by the directory realm name for the request	String
ds-data:SAMAccountName	Filters access by the directory SAM Account Name included in the SAMAccountName input of the request	String

Actions, resources, and condition keys for Amazon DocumentDB Elastic Clusters

Amazon DocumentDB Elastic Clusters (service prefix: `docdb-elastic`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Resource types defined by Amazon DocumentDB Elastic Clusters

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
cluster	`arn:${Partition}:docdb-elastic:${Region}:${Account}:cluster/${ResourceId}`	aws:ResourceTag/${TagKey}
cluster-snapshot	`arn:${Partition}:docdb-elastic:${Region}:${Account}:cluster-snapshot/${ResourceId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon DocumentDB Elastic Clusters

Amazon DocumentDB Elastic Clusters defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the set of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the set of tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the set of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon DynamoDB

Amazon DynamoDB (service prefix: `dynamodb`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon DynamoDB

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateTableReplica [permission only]	Grants permission to create multi account global table replica	Write	table*		
BatchGetItem	Grants permission to return the attributes of one or more items from one or more tables	Read	table*	dynamodb:Attributes dynamodb:LeadingKeys dynamodb:ReturnConsumedCapacity dynamodb:Select	
BatchWriteItem	Grants permission to put or delete multiple items in one or more tables	Write	table*	dynamodb:Attributes	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				dynamodb:LeadingKeys dynamodb:ReturnConsumedCapacity	
ConditionCheckItem	Grants permission to the ConditionCheckItem operation checks the existence of a set of attributes for the item with the given primary key	Read	table*		
				dynamodb:Attributes dynamodb:LeadingKeys dynamodb:ReturnConsumedCapacity dynamodb:ReturnValues	
CreateBackup	Grants permission to create a backup for an existing table	Write	table*		
CreateGlobalTable	Grants permission to create a global table from an existing table	Write	global-table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			table*		
CreateGlobalTableWitness [permission only]	Grants permission to add a Witness to a Global Table	Write	table*		
CreateTable	Grants permission to the CreateTable operation adds a new table to your account	Write	table*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateTableReplica [permission only]	Grants permission to add a new replica table	Write	table*		
DeleteBackup	Grants permission to delete an existing backup of a table	Write	backup*		
DeleteGlobalTableWitness [permission only]	Grants permission to remove a Witness from a Global Table	Write	table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteItem	Grants permission to deletes a single item in a table by primary key	Write	table*		
				dynamodb:Attributes dynamodb:EnclosingOperation dynamodb:LeadingKeys dynamodb:ReturnConsumedCapacity dynamodb:ReturnValues	
DeleteResourcePolicy	Grants permission to delete the resource-based policy attached to the resource	Permissions management	stream*		
			table*		
DeleteTable	Grants permission to the DeleteTable operation which deletes a table and all of its items	Write	table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteTableReplica [permission only]	Grants permission to delete a replica table and all of its items	Write	table*		
DescribeBackup	Grants permission to describe an existing backup of a table	Read	backup*		
DescribeContinuousBackups	Grants permission to check the status of the backup restore settings on the specified table	Read	table*		
DescribeContributorInsights	Grants permission to describe the contributor insights status and related details for a given table or global secondary index	Read	table* index		
DescribeEndpoints	Grants permission to return the regional endpoint information	Read			
DescribeExport	Grants permission to describe an existing Export of a table	Read	export*		
DescribeGlobalTable	Grants permission to return information about the specified global table	Read	global-table*		
DescribeGlobalTableSettings	Grants permission to return settings information about the specified global table	Read	global-table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeImport	Grants permission to describe an existing import	Read	import*		
DescribeKinesisStreamingDestination	Grants permission to grant permission to describe the status of Kinesis streaming and related details for a given table	Read	table*		
DescribeLimits	Grants permission to return the current provisioned-capacity limits for your AWS account in a region, both for the region as a whole and for any one DynamoDB table that you create there	Read			
DescribeReservedCapacity [permission only]	Grants permission to describe one or more of the Reserved Capacity purchased	Read			
DescribeReservedCapacityOfferings [permission only]	Grants permission to describe Reserved Capacity offerings that are available for purchase	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeStream	Grants permission to return information about a stream, including the current status of the stream, its Amazon Resource Name (ARN), the composition of its shards, and its corresponding DynamoDB table	Read	stream*		
DescribeTable	Grants permission to return information about the table	Read	table*		
DescribeTableReplicaAutoScaling	Grants permission to describe the auto scaling settings across all replicas of the global table	Read	table*		
DescribeTimeToLive	Grants permission to give a description of the Time to Live (TTL) status on the specified table	Read	table*		
DisableKinesisStreamingDestination	Grants permission to grant permission to stop replication from the DynamoDB table to the Kinesis data stream	Write	table*		
EnableKinesisStreamingDestination	Grants permission to grant permission to start table data replication to the specified Kinesis data stream at a timestamp chosen during the enable workflow	Write	table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ExportTableToPointInTime	Grants permission to initiate an Export of a DynamoDB table to S3	Write	table*		
GetAbacStatus [permission only]	Grants permission to view the status of Attribute Based Access Control for the account	Read			
GetItem	Grants permission to the GetItem operation that returns a set of attributes for the item with the given primary key	Read	table*		
				dynamodb:Attributes	
				dynamodb:EnclosingOperation	
				dynamodb:LeadingKeys	
				dynamodb:ReturnConsumedCapacity	
				dynamodb:Select	
GetRecords	Grants permission to retrieve the stream records from a given shard	Read	stream*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetResourcePolicy	Grants permission to view a resource-based policy for a resource	Read	stream*		
			table*		
GetShardIterator	Grants permission to return a shard iterator	Read	stream*		
ImportTable	Grants permission to initiate an import from S3 to a DynamoDB table	Write	table*		
InjectError [permission only]	Grants permission to start experiments on a Global Table	Write		dynamodb:FisActionId dynamodb:FisTargetArns	
ListBackups	Grants permission to list backups associated with the account and endpoint	List			
ListContributorInsights	Grants permission to list the ContributorInsightsSummary for all tables and global secondary indexes associated with the current account and endpoint	List			
ListExports	Grants permission to list exports associated with the account and endpoint	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListGlobalTables	Grants permission to list all global tables that have a replica in the specified region	List			
ListImports	Grants permission to list imports associated with the account and endpoint	List			
ListStreams	Grants permission to return an array of stream ARNs associated with the current account and endpoint	Read			
ListTables	Grants permission to return an array of table names associated with the current account and endpoint	List			
ListTagsOfResource	Grants permission to list all tags on an Amazon DynamoDB resource	Read	table*		
PartiQLDelete	Grants permission to delete a single item in a table by primary key	Write	table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				dynamodb:Attributes dynamodb:EnclosingOperation dynamodb:LeadingKeys dynamodb:ReturnValues	
PartiQLInsert	Grants permission to create a new item, if an item with same primary key does not exist in the table	Write	table*		
				dynamodb:Attributes dynamodb:EnclosingOperation dynamodb:LeadingKeys	
PartiQLSelect	Grants permission to read a set of attributes for items from a table or index	Read	table*		
			index		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				dynamodb:Attributes dynamodb:EnclosingOperation dynamodb:FullTableScan dynamodb:LeadingKeys dynamodb:Select	
PartiQLUpdate	Grants permission to edit an existing item's attributes	Write	table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				dynamodb:Attributes dynamodb:EnclosingOperation dynamodb:LeadingKeys dynamodb:ReturnValues	
PurchaseReservedCapacityOfferings [permission only]	Grants permission to purchases reserved capacity for use with your account	Write			
PutItem	Grants permission to create a new item, or replace an old item with a new item	Write	table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				dynamodb:Attributes dynamodb:EnclosingOperation dynamodb:LeadingKeys dynamodb:ReturnConsumedCapacity dynamodb:ReturnValues	
PutResourcePolicy	Grants permission to attach a resource-based policy to the resource	Permissions management	stream* table*		
Query	Grants permission to use the primary key of a table or a secondary index to directly access items from that table or index	Read	table* index		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				dynamodb:Attributes dynamodb:LeadingKeys dynamodb:ReturnConsumedCapacity dynamodb:ReturnValues dynamodb:Select	
ReadDataForReplication [permission only]	Grants permission to read data from a multi account global table replica	Read	table*		
ReplicateSettings [permission only]	Grants permission to configure settings for a multi account global table replica	Write	table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RestoreTableFromAwsBackup [permission only]	Grants permission to create a new table from recovery point on AWS Backup	Write	table*		
RestoreTableFromBackup	Grants permission to create a new table from an existing backup	Write	backup*		dynamodb:BatchWriteItem dynamodb:DeleteItem dynamodb:GetItem dynamodb:PutItem dynamodb:Query dynamodb:Scan dynamodb:UpdateItem
			table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RestoreTableToPointInTime	Grants permission to restore a table to a point in time	Write	table*		dynamodb:BatchWriteItem dynamodb:DeleteItem dynamodb:GetItem dynamodb:PutItem dynamodb:Query dynamodb:Scan dynamodb:UpdateItem
Scan	Grants permission to return one or more items and item attributes by accessing every item in a table or a secondary index	Read	table* index		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				dynamodb:Attributes dynamodb:ReturnConsumedCapacity dynamodb:ReturnValues dynamodb:Select	
StartAwsBackupJob [permission only]	Grants permission to create a backup on AWS Backup with advanced features enabled	Write	table*		
TagResource	Grants permission to associate a set of tags with an Amazon DynamoDB resource	Tagging	table*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UntagResource	Grants permission to remove the association of tags from an Amazon DynamoDB resource	Tagging	table*		
				aws:TagKeys	
UpdateAbacStatus [permission only]	Grants permission to update the status of Attribute Based Access Control for the account	Permissions management			
UpdateContinuousBackups	Grants permission to enable or disable continuous backups	Write	table*		
UpdateContributorInsights	Grants permission to update the status for contributor insights for a specific table or global secondary index	Write	table*		
			index		
UpdateGlobalTable	Grants permission to add or remove replicas in the specified global table	Write	global-table*		
			table*		
UpdateGlobalTableSettings	Grants permission to update settings of the specified global table	Write	global-table*		
			table*		
UpdateGlobalTableVersion [permission only]	Grants permission to update version of the specified global table	Write	global-table*		
			table		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateItem	Grants permission to edit an existing item's attributes, or adds a new item to the table if it does not already exist	Write	table*		
				dynamodb:Attributes dynamodb:EnclosingOperation dynamodb:LeadingKeys dynamodb:ReturnConsumedCapacity dynamodb:ReturnValues	
UpdateKinesisStreamingDestination	Grants permission to update data replication configurations for the specified Kinesis data stream	Write	table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateTable	Grants permission to modify the provisioned throughput settings, global secondary indexes, or DynamoDB Streams settings for a given table	Write	table*		
UpdateTableReplicaAutoScaling	Grants permission to update auto scaling settings on your replica table	Write	table*		
UpdateTimeToLive	Grants permission to enable or disable TTL for the specified table	Write	table*		
WriteDataForReplication [permission only]	Grants permission to write data to a multi account global table replica	Write	table*		

Resource types defined by Amazon DynamoDB

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
index	arn:${Partition}:dynamodb:${Region}:${Account}:table/${TableName}/index/${IndexName}	aws:ResourceTag/${TagKey}
stream	arn:${Partition}:dynamodb:${Region}:${Account}:table/${TableName}/stream/${StreamLabel}	
table	arn:${Partition}:dynamodb:${Region}:${Account}:table/${TableName}	aws:ResourceTag/${TagKey}
backup	arn:${Partition}:dynamodb:${Region}:${Account}:table/${TableName}/backup/${BackupName}	
export	arn:${Partition}:dynamodb:${Region}:${Account}:table/${TableName}/export/${ExportName}	
global-table	arn:${Partition}:dynamodb::${Account}:global-table/${GlobalTableName}	
import	arn:${Partition}:dynamodb:${Region}:${Account}:table/${TableName}/import/${ImportName}	

Condition keys for Amazon DynamoDB

Amazon DynamoDB defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Note

For information about how to use context keys to refine DynamoDB access using an IAM policy, see Using IAM Policy Conditions for Fine-Grained Access Control in the *Amazon DynamoDB Developer Guide*.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
dynamodb:Attributes	Filters access by attribute (field or column) names of the table	ArrayOfString
dynamodb:EnclosingOperation	Filters access by blocking Transactions APIs calls and allow the non-Transaction APIs calls and vice-versa	String
dynamodb:FirstPartitionKeyValues	Filters access by the first partition key of the table	ArrayOfString
dynamodb:FisActionId	Filters access by the ID of an AWS FIS action	String
dynamodb:FisTargetArns	Filters access by the ARN of an AWS FIS target	ArrayOfARN

Condition keys	Description	Type
dynamodb:FourthPartitionKeyValues	Filters access by the forth partition key of the table	ArrayOfString
dynamodb:FullTableScan	Filters access by blocking full table scan	Bool
dynamodb:LeadingKeys	Filters access by the first partition key of the table	ArrayOfString
dynamodb:ReturnConsumedCapacity	Filters access by the ReturnConsumedCapacity parameter of a request. Contains either "TOTAL" or "NONE"	String
dynamodb:ReturnValues	Filters access by the ReturnValues parameter of request. Contains one of the following: "ALL_OLD", "UPDATED_OLD","ALL_NEW","UPDATED_NEW", or "NONE"	String
dynamodb:SecondPartitionKeyValues	Filters access by the second partition key of the table	ArrayOfString
dynamodb:Select	Filters access by the Select parameter of a Query or Scan request	String
dynamodb:ThirdPartitionKeyValues	Filters access by the third partition key of the table	ArrayOfString

Actions, resources, and condition keys for Amazon DynamoDB Accelerator (DAX)

Amazon DynamoDB Accelerator (DAX) (service prefix: `dax`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon DynamoDB Accelerator (DAX)

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetItem	Grants permission to return the attributes of one or more items from one or more tables	Read	application*		
BatchWriteItem	Grants permission to put or delete multiple items in one or more tables	Write	application*		
ConditionCheckItem	Grants permission to the ConditionCheckItem operation that checks the existence of a set of attributes for the item with the given primary key	Read	application*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCluster	Grants permission to create a DAX cluster	Write	application*		dax:CreateParameterGroup dax:CreateSubnetGroup ec2:CreateNetworkInterface ec2:DeleteNetworkInterface ec2:DescribeNetworkInterfaces ec2:DescribeSecurityGroups ec2:DescribeSubnets ec2:DescribeVpcs iam:GetRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					iam:PassRole
CreateParameterGroup	Grants permission to create a parameter group	Write			
CreateSubnetGroup	Grants permission to create a subnet group	Write			
DecreaseReplicationFactor	Grants permission to remove one or more nodes from a DAX cluster	Write	application*		
DeleteCluster	Grants permission to delete a previously provisioned DAX cluster	Write	application*		
DeleteItem	Grants permission to delete a single item in a table by primary key	Write	application*		
				dax:EnclosingOperation	
DeleteParameterGroup	Grants permission to delete the specified parameter group	Write			
DeleteSubnetGroup	Grants permission to delete a subnet group	Write			
DescribeClusters	Grants permission to return information about all provisioned DAX clusters	List	application		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeDefaultParameters	Grants permission to return the default system parameter information for DAX	List			
DescribeEvents	Grants permission to return events related to DAX clusters and parameter groups	List			
DescribeParameterGroups	Grants permission to return a list of parameter group descriptions	List			
DescribeParameters	Grants permission to return the detailed parameter list for a particular parameter group	Read			
DescribeSubnetGroups	Grants permission to return a list of subnet group descriptions	List			
GetItem	Grants permission to the GetItem operation that returns a set of attributes for the item with the given primary key	Read	application*		
				dax:EnclosingOperation	
IncreaseReplicationFactor	Grants permission to add one or more nodes to a DAX cluster	Write	application*		
ListTags	Grants permission to return a list all of the tags for a DAX cluster	Read	application*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutItem	Grants permission to create a new item, or replace an old item with a new item	Write	application*		
				dax:EnclosingOperation	
Query	Grants permission to use the primary key of a table or a secondary index to directly access items from that table or index	Read	application*		
RebootNode	Grants permission to reboot a single node of a DAX cluster	Write	application*		
Scan	Grants permission to return one or more items and item attributes by accessing every item in a table or a secondary index	Read	application*		
TagResource	Grants permission to associate a set of tags with a DAX resource	Tagging	application*		
UntagResource	Grants permission to remove the association of tags from a DAX resource	Tagging	application*		
UpdateCluster	Grants permission to modify the settings for a DAX cluster	Write	application*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateItem	Grants permission to edit an existing item's attributes, or adds a new item to the table if it does not already exist	Write	application*		
				dax:EnclosingOperation	
UpdateParameterGroup	Grants permission to modify the parameters of a parameter group	Write			
UpdateSubnetGroup	Grants permission to modify an existing subnet group	Write			

Resource types defined by Amazon DynamoDB Accelerator (DAX)

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
application	`arn:${Partition}:dax:${Region}:${Account}:cache/${ClusterName}`	

Condition keys for Amazon DynamoDB Accelerator (DAX)

Amazon DynamoDB Accelerator (DAX) defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions

under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
dax:EnclosingOperation	Used to block Transactions APIs calls and allow the non-Transaction APIs calls and vice-versa	String

Actions, resources, and condition keys for Amazon EC2

Amazon EC2 (service prefix: ec2) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon EC2

You can specify the following actions in the Action element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptAddressTransfer	Grants permission to accept an Elastic IP address transfer	Write	elastic-ip*	aws:RequestTag/${TagKey} aws:TagKeys ec2:AllocationId ec2:Domain ec2:PublicIpAddress	ec2:CreateTags
				ec2:Region	
AcceptCapacityReservationBillingOwnership	Grants permission to accept assign billing of the available capacity of a shared Capacity Reservation to the calling account	Write	capacity-reservation*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:CapacityReservationFleet	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:CreateDate ec2:DestinationCapacityReservationId ec2:EbsOptimized ec2:EndDate ec2:EndDateType ec2:InstanceCount ec2:InstanceMatchCriteria ec2:InstancePlatform ec2:InstanceType ec2:OutpostArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:PlacementGroup ec2:ResourceTag/${TagKey} ec2:SourceCapacityReservationId ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptReservedInstancesExchangeQuote	Grants permission to accept a Convertible Reserved Instance exchange quote	Write	reserved-instances*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:InstanceType ec2:ReservedInstancesOfferingType ec2:ResourceTag/${TagKey} ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptTransitGatewayMulticastDomainAssociations	Grants permission to accept a request to associate subnets with a transit gateway multicast domain	Write	transit-gateway-attachment	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
			transit-gateway-multicast-domain	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayMulticastDomainId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptTransitGatewayPeeringAttachment	Grants permission to accept a transit gateway peering attachment request	Write	transit-gateway-attachment*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
				ec2:Region	
AcceptTransitGatewayVpcAttachment	Grants permission to accept a request to attach a VPC to a transit gateway	Write	transit-gateway-attachment*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
AcceptVpcEndpointConnections	Grants permission to accept one or more interface VPC endpoint connections to your VPC endpoint service	Write	vpc-endpoint-service*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:VpceMultiRegion ec2:VpceSupportedRegion	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptVpcPeeringConnection	Grants permission to accept a VPC peering connection request	Write	vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
			vpc-peering-connection*	aws:ResourceTag/${TagKey} ec2:AccepterVpc ec2:RequesterVpc ec2:ResourceTag/${TagKey} ec2:VpcPeeringConnectionID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
AdvertiseByoipCidr	Grants permission to advertise an IP address range that is provisioned for use in AWS through bring your own IP addresses (BYOIP)	Write		ec2:Region	
AllocateAddress	Grants permission to allocate an Elastic IP address (EIP) to your account	Write	elastic-ip*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags
			ipam-pool	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ipv4pool-ec2	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AllocateHosts	Grants permission to allocate a Dedicated Host to your account	Write	dedicated-host*	aws:RequestTag/${TagKey} aws:TagKeys ec2:AutoPlacement ec2:AvailabilityZone ec2:HostRecovery ec2:InstanceType ec2:Quantity	ec2:CreateTags
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AllocateIpamPoolCidr	Grants permission to allocate a CIDR from an Amazon VPC IP Address Manager (IPAM) pool	Write	ipam-pool*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ApplySecurityGroupsToClientVpnTargetNetwork	Grants permission to apply a security group to the association between a Client VPN endpoint and a target network	Write	client-vpn-endpoint*	aws:ResourceTag/${TagKey} ec2:ClientRootCertificateChainArn ec2:CloudwatchLogGroupArn ec2:CloudwatchLogStreamArn ec2:DirectoryArn ec2:ResourceTag/${TagKey} ec2:SamlProviderArn ec2:ServerCertificateArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			security-group*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID ec2:Vpc	
			vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssignIpv6Addresses	Grants permission to assign one or more IPv6 addresses to a network interface	Write	network-interface*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:ManagedResourceOperator ec2:NetworkInterfaceID ec2:ResourceTag/${TagKey} ec2:Subnet ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssignPrivateIpAddresses	Grants permission to assign one or more secondary private IP addresses to a network interface	Write	network-interface*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:ManagedResourceOperator ec2:NetworkInterfaceID ec2:ResourceTag/${TagKey} ec2:Subnet ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssignPrivateNatGatewayAddress	Grants permission to assign one or more secondary private IP addresses to a private NAT gateway	Write	natgateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
AssociateAddress	Grants permission to associate an Elastic IP address (EIP) with an instance or a network interface	Write	elastic-ip	aws:ResourceTag/${TagKey} ec2:AllocationId ec2:Domain ec2:PublicIpAddress ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			instance	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy

			network-interface	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:ManagedResourceOperator ec2:NetworkInterfaceID ec2:ResourceTag/${TagKey} ec2:Subnet ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateCapacityReservationBillingOwner	Grants permission to assign billing of the unused capacity of a shared Capacity Reservation to a consumer account	Write	capacity-reservation*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:CapacityReservationFleet ec2:CreateDate ec2:DestinationCapacityReservationId ec2:EbsOptimized ec2:EndDate ec2:EndDateType ec2:InstanceCount	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMatchCriteria ec2:InstancePlatform ec2:InstanceType ec2:OutpostArn ec2:PlacementGroup ec2:ResourceTag/${TagKey} ec2:SourceCapacityReservationId ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateClientVpnTargetNetwork	Grants permission to associate a target network with a Client VPN endpoint	Write	client-vpn-endpoint*	aws:ResourceTag/${TagKey} ec2:ClientRootCertificateChainArn ec2:CloudwatchLogGroupArn ec2:CloudwatchLogStreamArn ec2:DirectoryArn ec2:ResourceTag/${TagKey} ec2:SamlProviderArn ec2:ServerCertificateArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			subnet*	aws:ResourceTag/${TagKey} ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:SubnetID	
				ec2:Region	
AssociateDhcpOptions	Grants permission to associate or disassociate a set of DHCP options with a VPC	Write	dhcp-options*	aws:ResourceTag/${TagKey} ec2:DhcpOptionsID ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	
AssociateEnclaveCertificateIamRole	Grants permission to associate an ACM certificate with an IAM role to be used in an EC2 Enclave	Write	certificate*		
			role*		
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateIamInstanceProfile	Grants permission to associate an IAM instance profile with a running or stopped instance	Write	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:NewInstanceProfile ec2:PlacementGroup ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	
AssociateInstanceEventWindow	Grants permission to associate one or more targets with an event window	Write	instance-event-window*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
AssociateIpamByoasn	Grants permission to associate an Autonomous System Number (ASN) with a BYOIP CIDR	Write		ec2:Region	
AssociateIpamResourceDiscovery	Grants permission to associate an IPAM resource discovery with an Amazon VPC IPAM	Write	ipam*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	ec2:CreateTags
			ipam-resource-discovery*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ipam-resource-discovery-association*	aws:RequestTag/${TagKey} aws:TagKeys	
				ec2:Region	
AssociateNatGatewayAddress	Grants permission to associate an Elastic IP address and private IP address with a public Nat gateway	Write	elastic-ip*	aws:ResourceTag/${TagKey} ec2:AllocationId ec2:Domain ec2:PublicIpAddress ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			natgateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
AssociateRouteServer	Grants permission to associate a route server with a VPC	Write	route-server*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpc*	aws:ResourceTag/${TagKey} ec2:Ipv4IpamPoolId ec2:Ipv6IpamPoolId ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Associate RouteTable	Grants permission to associate a subnet or gateway with a route table	Write	route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:RouteTableID ec2:Vpc	
			internet-gateway	aws:ResourceTag/${TagKey} ec2:InternetGatewayID ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ipv4pool-ec2	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			subnet	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpn-gateway	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
AssociateSecurityGroupVpc	Grants permission to associate a security group with another VPC in the same Region	Write	security-group*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpc*	aws:ResourceTag/${TagKey} ec2:Ipv4IpamPoolId ec2:Ipv6IpamPoolId ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateSubnetCidrBlock	Grants permission to associate a CIDR block with a subnet	Write	subnet*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:Ipv6IpamPoolId ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ipam-pool	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateTransitGatewayMulticastDomain	Grants permission to associate an attachment and list of subnets with a transit gateway multicast domain	Write	subnet*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-attachment*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
			transit-gateway-multicast-domain*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayMulticastDomainId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateTransitGatewayPolicyTable	Grants permission to associate a policy table with a transit gateway attachment	Write	transit-gateway-attachment*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
			transit-gateway-policy-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayPolicyTableId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateTransitGatewayRouteTable	Grants permission to associate an attachment with a transit gateway route table	Write	transit-gateway-attachment*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
			transit-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayRouteTableId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateTrunkInterface	Grants permission to associate a branch network interface with a trunk network interface	Write		ec2:Region	
AssociateVerifiedAccessInstanceWebAcl [permission only]	Grants permission to associate an AWS Web Application Firewall (WAF) web access control list (ACL) with a Verified Access instance	Write	verified-access-instance*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Associate VpcCidrBlock	Grants permission to associate a CIDR block with a VPC	Write	vpc*	aws:ResourceTag/${TagKey} ec2:Ipv4IpamPoolId ec2:Ipv6IpamPoolId ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
			ipam-pool	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ipv6pool-ec2	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
AttachAppliance ToNatGateway [permission only]	Grants permission to attach an appliance with a public/private Natgateway	Permissions management	natgateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AttachClassicLinkVpc	Grants permission to link an EC2-Classic instance to a ClassicLink-enabled VPC through one or more of the VPC's security groups	Write	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
			security-group*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	
AttachInternetGateway	Grants permission to attach an internet gateway to a VPC	Write	internet-gateway*	aws:ResourceTag/${TagKey} ec2:InternetGatewayID ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AttachNetworkInterface	Grants permission to attach a network interface to an instance	Write	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			network-interface*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:ManagedResourceOperator ec2:NetworkInterfaceID ec2:ResourceTag/${TagKey} ec2:Subnet ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AttachResourcesToPlacementGroup [permission only]	Grants permission to attach resources to a placement group	Permissions management	placement-group*	aws:ResourceTag/${TagKey} ec2:PlacementGroupName ec2:PlacementGroupStrategy ec2:ResourceTag/${TagKey}	
				ec2:Region	
AttachVerifiedAccessTrustProvider	Grants permission to attach a trust provider to a Verified Access instance	Write	verified-access-instance*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			verified-access-trust-provider*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AttachVolume	Grants permission to attach an EBS volume to a running or stopped instance and expose it to the instance with the specified device name	Write	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			volume*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:Encrypted ec2:ManagedResourceOperator ec2:ParentSnapshot ec2:ParentVolume ec2:ResourceTag/${TagKey} ec2:VolumeID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:VolumeInitializationRate ec2:VolumeIops ec2:VolumeSize ec2:VolumeThroughput ec2:VolumeType	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AttachVpnGateway	Grants permission to attach a virtual private gateway to a VPC	Write	vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
			vpn-gateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AuthorizeClientVpnIngress	Grants permission to add an inbound authorization rule to a Client VPN endpoint	Write	client-vpn-endpoint*	aws:ResourceTag/${TagKey} ec2:ClientRootCertificateChainArn ec2:CloudwatchLogGroupArn ec2:CloudwatchLogStreamArn ec2:DirectoryArn ec2:ResourceTag/${TagKey} ec2:SamlProviderArn ec2:ServerCertificateArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
AuthorizeSecurityGroupEgress	Grants permission to add one or more outbound rules to a VPC security group. Policies using the security-group-rule resource-level permission are only enforced when the API request includes TagSpecifications	Write	security-group*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID ec2:Vpc	ec2:CreateTags
			security-group-rule	aws:RequestTag/${TagKey} aws:TagKeys	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AuthorizeSecurityGroupIngress	Grants permission to add one or more inbound rules to a VPC security group. Policies using the security-group-rule resource-level permission are only enforced when the API request includes TagSpecifications	Write	security-group*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID ec2:Vpc	ec2:CreateTags
			security-group-rule	aws:RequestTag/${TagKey} aws:TagKeys	
				ec2:Region	
BundleInstance	Grants permission to bundle an instance store-backed Windows instance	Write		ec2:Region	
CancelBundleTask	Grants permission to cancel a bundling operation	Write		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelCapacityReservation	Grants permission to cancel a Capacity Reservation and release the reserved capacity	Write	capacity-reservation*	aws:ResourceTag/${TagKey} ec2:CapacityReservationFleet	
				ec2:Region	
CancelCapacityReservationFleets	Grants permission to cancel one or more Capacity Reservation Fleets	Write	capacity-reservation-fleet*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	ec2:CancelCapacityReservation
				ec2:Region	
CancelConversionTask	Grants permission to cancel an active conversion task	Write		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelDeclarativePoliciesReport	Grants permission to cancel a declarative policies report	Write	declarative-policies-report*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
CancelExportTask	Grants permission to cancel an active export task	Write	export-image-task	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			export-instance-task	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
CancelImageLaunchPermission	Grants permission to remove your AWS account from the launch permissions for the specified AMI	Permissions management	image*	aws:ResourceTag/${TagKey} ec2:ImageID ec2:ImageType ec2:Owner ec2:Public ec2:ResourceTag/${TagKey} ec2:RootDeviceType	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelImportTask	Grants permission to cancel an in-process import virtual machine or import snapshot task	Write	import-image-task	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			import-snapshot-task	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
CancelReservedInstancesListing	Grants permission to cancel a Reserved Instance listing on the Reserved Instance Marketplace	Write		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelSpotFleetRequests	Grants permission to cancel one or more Spot Fleet requests	Write	spot-fleet-request*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
CancelSpotInstanceRequests	Grants permission to cancel one or more Spot Instance requests	Write	spot-instances-request*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
ConfirmProductInstance	Grants permission to determine whether an owned product code is associated with an instance	Write		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CopyFpgaImage	Grants permission to copy a source Amazon FPGA image (AFI) to the current Region. Resource-level permissions specified for this action apply to the new AFI only. They do not apply to the source AFI	Write	fpga-image*	ec2:Owner	
				ec2:Region	
CopyImage	Grants permission to copy an Amazon Machine Image (AMI) from a source Region to the current Region	Write	image*	aws:RequestTag/${TagKey} aws:TagKeys ec2:ImageID ec2:Owner	ec2:CreateTags
			snapshot*	aws:RequestTag/${TagKey} aws:TagKeys	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CopySnapshot	Grants permission to copy a point-in-time snapshot of an EBS volume and store it in Amazon S3. Resource-level permissions specified for this action apply to both the snapshot copy and the source snapshot	Write	snapshot*	aws:RequestTag/${TagKey} aws:TagKeys ec2:Encrypted ec2:OutpostArn ec2:Owner ec2:ParentSnapshot ec2:ParentVolume ec2:ProductCode ec2:SnapshotID ec2:SnapshotTime ec2:VolumeSize	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CopyVolumes	Grants permission to create a copy of an EBS volume. Resource-level permissions specified for this action apply to the source and copied volume. Condition keys for the copied volume correspond to parameters specified in the CopyVolumes API request	Write	volume*	aws:RequestTag/${TagKey} aws:TagKeys ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:Encrypted ec2:ManagedResourceOperator ec2:ParentSnapshot ec2:ParentVolume ec2:VolumeInitializationRate	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:VolumeIops ec2:VolumeSize ec2:VolumeThroughput ec2:VolumeType	
				ec2:Region	
CreateCapacityManagerDataExport	Grants permission to create a new S3 Data Export for Capacity Manager	Write	capacity-manager-data-export*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCapacityReservation	Grants permission to create a Capacity Reservation	Write	capacity-reservation*	aws:RequestTag/${TagKey} aws:TagKeys ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CapacityReservationFleet ec2:EbsOptimized ec2:EndDate ec2:EndDateType ec2:EphemeralStorage	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceCount ec2:InstanceMatchCriteria ec2:InstancePlatform ec2:InstanceType ec2:OutpostArn ec2:PlacementGroup ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCapacityReservationBySplitting	Grants permission to create a new Capacity Reservation by splitting the available capacity of the source Capacity Reservation	Write	capacity-reservation*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:CapacityReservationFleet ec2:CreateDate ec2:DestinationCapacityReservationId ec2:EbsOptimized ec2:EndDate ec2:EndDateType ec2:InstanceCount	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMatchCriteria ec2:InstancePlatform ec2:InstanceType ec2:OutpostArn ec2:PlacementGroup ec2:ResourceTag/${TagKey} ec2:SourceCapacityReservationId ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCapacityReservationFleet	Grants permission to create a Capacity Reservation Fleet	Write	capacity-reservation-fleet*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateCapacityReservation ec2:CreateTags ec2:DescribeCapacityReservations ec2:DescribeInstances
				ec2:Region	
CreateCarrierGateway	Grants permission to create a carrier gateway and provides CSP connectivity to VPC customers	Write	carrier-gateway*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateClientVpnEndpoint	Grants permission to create a Client VPN endpoint	Write	client-vpn-endpoint*	aws:RequestTag/${TagKey} aws:TagKeys ec2:ClientRootCertificateChainArn ec2:CloudwatchLogGroupArn ec2:CloudwatchLogStreamArn ec2:DirectoryArn ec2:SamlProviderArn ec2:ServerCertificateArn	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			security-group	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID	
			vpc	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateClientVpnRoute	Grants permission to add a network route to a Client VPN endpoint's route table	Write	client-vpn-endpoint*	aws:ResourceTag/${TagKey} ec2:ClientRootCertificateChainArn ec2:CloudwatchLogGroupArn ec2:CloudwatchLogStreamArn ec2:DirectoryArn ec2:ResourceTag/${TagKey} ec2:SamlProviderArn ec2:ServerCertificateArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			subnet*	aws:ResourceTag/${TagKey} ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:SubnetID	
				ec2:Region	
CreateCoipCidr	Grants permission to create a range of customer-owned IP (CoIP) addresses	Write	coip-pool*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCoipPool	Grants permission to create a pool of customer-owned IP (CoIP) addresses	Write	coip-pool*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags
			local-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
CreateCoipPoolPermission [permission only]	Grants permission to allow a service to access a customer-owned IP (CoIP) pool	Permissions management	coip-pool*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCustomerGateway	Grants permission to create a customer gateway, which provides information to AWS about your customer gateway device	Write	customer-gateway*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags
				ec2:Region	
CreateDefaultSubnet	Grants permission to create a default subnet in a specified Availability Zone in a default VPC	Write		ec2:Region	
CreateDefaultVpc	Grants permission to create a default VPC with a default subnet in each Availability Zone	Write		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateDelegateMacVolumeOwnershipTask	Grants permission to create a volume ownership delegation task for an Apple silicon Mac instance	Write	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceMarketType ec2:InstanceMetadataTags	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceProfile ec2:InstanceType ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			mac-modification-task*	aws:RequestTag/${TagKey} aws:TagKeys	
				ec2:Region	
CreateDhcpOptions	Grants permission to create a set of DHCP options for a VPC	Write	dhcp-options*	aws:RequestTag/${TagKey} aws:TagKeys ec2:DhcpOptionsID	ec2:CreateTags
				ec2:Region	
CreateEgressOnlyInternetGateway	Grants permission to create an egress-only internet gateway for a VPC	Write	egress-only-internet-gateway*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateFleet	Grants permission to launch an EC2 Fleet. Resource-level permissions for this action do not include the resources specified in a launch template. To specify resource-level permissions for resources specified in a launch template, you must include the resources in the RunInstances action statement	Write	fleet*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags
			instance*	aws:RequestTag/${TagKey} aws:TagKeys ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceBandwi	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				dthWeighting ec2:InstanceID ec2:InstanceProfile ec2:InstanceType ec2:PlacementGroup ec2:RootDeviceType ec2:Tenancy

				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:ProductCode	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	
CreateInternetGateway	Grants permission to create an internet gateway for a VPC	Write	internet-gateway*	aws:RequestTag/${TagKey} aws:TagKeys ec2:InternetGatewayID	ec2:CreateTags
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateInterruptibleCapacityReservationAllocation	Grants permission to create an interruptible Capacity Reservation by specifying the number of unused instances you want to allocate from your source reservation	Write	capacity-reservation*	aws:RequestTag/${TagKey} aws:TagKeys ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CreateDate ec2:EbsOptimized ec2:EndDate ec2:EndDateType ec2:InstanceCount ec2:InstanceMatchCriteria	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstancePlatform ec2:InstanceType ec2:InterruptibleCapacityReservationId ec2:InterruptionType ec2:IsInterruptible ec2:SourceCapacityReservationId ec2:TargetInstanceCount ec2:Tenancy	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
CreateIpam	Grants permission to create an Amazon VPC IP Address Manager (IPAM)	Write	ipam*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags iam:CreateServiceLinkedRole
				ec2:Region	
CreateIpamExternalResourceVerificationToken	Grants permission to create a verification token, which proves ownership of an external resource	Write	ipam*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	ec2:CreateTags
			ipam-external-resource-verification-token*	aws:RequestTag/${TagKey} aws:TagKeys	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateIpamPolicy	Grants permission to create a policy in Amazon VPC IP Address Manager (IPAM) that defines rules for allocating public IPv4 addresses from IPAM pools to AWS resources	Write	ipam*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	ec2:CreateTags
			ipam-policy*	aws:RequestTag/${TagKey} aws:TagKeys	
				ec2:Region	
CreateIpamPool	Grants permission to create an IP address pool for Amazon VPC IP Address Manager (IPAM), which is a collection of contiguous IP address CIDRs	Write	ipam-pool*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ipam-scope*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
CreateIpamPrefixListResolver	Grants permission to create an IPAM prefix list resolver that defines rules for selecting CIDRs to include in prefix lists	Write	ipam*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	ec2:CreateTags
			ipam-prefix-list-resolver*	aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ipam-scope	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
CreateIpamPrefixListResolverTarget	Grants permission to create an IPAM prefix list resolver target that links a resolver to a managed prefix list	Write	ipam-prefix-list-resolver*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	ec2:CreateTags
			ipam-prefix-list-resolver-target*	aws:RequestTag/${TagKey} aws:TagKeys	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateIpamResourceDiscovery	Grants permission to create an IPAM resource discovery	Write	ipam-resource-discovery*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags iam:CreateServiceLinkedRole
				ec2:Region	
CreateIpamScope	Grants permission to create an Amazon VPC IP Address Manager (IPAM) scope, which is the highest-level container within IPAM	Write	ipam*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	ec2:CreateTags
			ipam-scope*	aws:RequestTag/${TagKey} aws:TagKeys	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateKeyPair	Grants permission to create a 2048-bit RSA key pair	Write	key-pair*	aws:RequestTag/${TagKey} aws:TagKeys ec2:KeyPairType	ec2:CreateTags
				ec2:Region	
CreateLaunchTemplate	Grants permission to create a launch template	Write	launch-template*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags ssm:GetParameters
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateLaunchTemplateVersion	Grants permission to create a new version of a launch template	Write	launch-template*	aws:ResourceTag/${TagKey} ec2:ManagedResourceOperator ec2:ResourceTag/${TagKey}	ssm:GetParameters
				ec2:Region	
CreateLocalGatewayRoute	Grants permission to create a static route for a local gateway route table	Write	local-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			local-gateway-virtual-interface-group	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			network-interface	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:NetworkInterfaceID ec2:ResourceTag/${TagKey} ec2:Subnet ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			prefix-list	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
CreateLocalGatewayRouteTable	Grants permission to create a local gateway route table	Write	local-gateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	ec2:CreateTags
			local-gateway-route-table*	aws:RequestTag/${TagKey} aws:TagKeys	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateLocalGatewayRouteTablePermission [permission only]	Grants permission to allow a service to access a local gateway route table	Permissions management	local-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
CreateLocalGatewayRouteTableVirtualInterfaceGroupAssociation	Grants permission to create a local gateway route table virtual interface group association	Write	local-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	ec2:CreateTags
			local-gateway-route-table-virtual-interface-group-association*	aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			local-gateway-virtual-interface-group*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
CreateLocalGatewayRouteTableVpcAssociation	Grants permission to associate a VPC with a local gateway route table	Write	local-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	ec2:CreateTags
			local-gateway-route-table-vpc-association*	aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	
CreateLocalGatewayVirtualInterface	Grants permission to create a local gateway virtual interface	Write	local-gateway-virtual-interface*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			local-gateway-virtual-interface-group*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			outpost-lag*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
CreateLocalGatewayVirtualInterfaceGroup	Grants permission to create a local gateway virtual interface group	Write	local-gateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			local-gateway-virtual-interface-group*	aws:RequestTag/${TagKey} aws:TagKeys	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateMacSystemIntegrityProtectionModificationTask	Grants permission to create a System Integrity Protection (SIP) modification task for an Amazon EC2 Mac instance	Write	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceMarketType ec2:InstanceMetadataTags	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceProfile ec2:InstanceType ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			mac-modification-task*	aws:RequestTag/${TagKey} aws:TagKeys	
				ec2:Region	
CreateManagedPrefixList	Grants permission to create a managed prefix list	Write	prefix-list*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags
				ec2:Region	
CreateNatGateway	Grants permission to create a NAT gateway in a subnet	Write	natgateway*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			elastic-ip	aws:ResourceTag/${TagKey} ec2:AllocationId ec2:Domain ec2:PublicIpAddress ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			subnet	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-connect-peer*	aws:RequestTag/${TagKey} aws:TagKeys ec2:transitGatewayConnectPeerId	
				ec2:Region	
CreateTransitGatewayMeteringPolicy	Grants permission to create a metering policy for a transit gateway	Write	transit-gateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayId	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-metering-policy*	aws:RequestTag/${TagKey} aws:TagKeys ec2:transitGatewayMeteringPolicyId	
			transit-gateway-attachment	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTransitGatewayMeteringPolicyEntry	Grants permission to create an entry for a transit gateway metering policy	Write	transit-gateway-metering-policy*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayMeteringPolicyId	
			transit-gateway-attachment	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTransitGatewayMulticastDomain	Grants permission to create a multicast domain for a transit gateway	Write	transit-gateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayId	ec2:CreateTags
			transit-gateway-multicast-domain*	aws:RequestTag/${TagKey} aws:TagKeys ec2:transitGatewayMulticastDomainId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTransitGatewayPeeringAttachment	Grants permission to request a transit gateway peering attachment between a requester and accepter transit gateway	Write	transit-gateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayId	ec2:CreateTags
			transit-gateway-attachment*	aws:RequestTag/${TagKey} aws:TagKeys ec2:transitGatewayAttachmentId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTransitGatewayPolicyTable	Grants permission to create a transit gateway policy table	Write	transit-gateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayId	ec2:CreateTags
			transit-gateway-policy-table*	aws:RequestTag/${TagKey} aws:TagKeys ec2:transitGatewayPolicyTableId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTransitGatewayPrefixListReference	Grants permission to create a transit gateway prefix list reference	Write	prefix-list*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			transit-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayRouteTableId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-attachment	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
				ec2:Region	
CreateTransitGatewayRoute	Grants permission to create a static route for a transit gateway route table	Write	transit-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayRouteTableId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-attachment	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
				ec2:Region	
CreateTransitGatewayRouteTable	Grants permission to create a route table for a transit gateway	Write	transit-gateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayId	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-route-table*	aws:RequestTag/${TagKey} aws:TagKeys ec2:transitGatewayRouteTableId	
				ec2:Region	
CreateTransitGatewayRouteTableAnnouncement	Grants permission to create an announcement for a transit gateway route table	Write	transit-gateway-attachment*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayRouteTableId	
			transit-gateway-route-table-announcement*	aws:RequestTag/${TagKey} aws:TagKeys ec2:transitGatewayRouteTableAnnouncementId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTransitGatewayVpcAttachment	Grants permission to attach a VPC to a transit gateway	Write	subnet*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc	ec2:CreateTags
			transit-gateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-attachment*	aws:RequestTag/${TagKey} aws:TagKeys ec2:transitGatewayAttachmentId	
			vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateVerifiedAccessEndpoint	Grants permission to create a Verified Access endpoint	Write	verified-access-endpoint*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags
			verified-access-group*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			network-interface	aws:ResourceTag/${TagKey} ec2:AuthorizedUser ec2:AvailabilityZone ec2:NetworkInterfaceID ec2:Permission ec2:ResourceTag/${TagKey} ec2:Subnet ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			security-group	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			subnet	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc	
				ec2:Region	
CreateVerifiedAccessGroup	Grants permission to create a Verified Access group	Write	verified-access-group*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			verified-access-instance*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
CreateVerifiedAccessInstance	Grants permission to create a Verified Access instance	Write	verified-access-instance*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags
				ec2:Region	
CreateVerifiedAccessTrustProvider	Grants permission to create a verified trust provider	Write	verified-access-trust-provider*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateVolume	Grants permission to create an EBS volume	Write	volume*	aws:RequestTag/${TagKey} aws:TagKeys ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:Encrypted ec2:KmsKeyId ec2:ParentSnapshot ec2:VolumeID ec2:VolumeInitializationRate	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:VolumeIops ec2:VolumeSize ec2:VolumeThroughput ec2:VolumeType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			snapshot	aws:ResourceTag/${TagKey} ec2:Encrypted ec2:Owner ec2:ParentVolume ec2:ResourceTag/${TagKey} ec2:SnapshotTime ec2:VolumeSize	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateVpc	Grants permission to create a VPC with a specified CIDR block	Write	vpc*	aws:RequestTag/${TagKey} aws:TagKeys ec2:Ipv4IpamPoolId ec2:Ipv6IpamPoolId ec2:VpcID	ec2:CreateTags
			ipam-pool	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ipv6pool-ec2	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
CreateVpcBlockPublicAccessExclusion	Grants permission to create an exclusion list for blocked public access on a VPC	Write	vpc-block-public-access-exclusion*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			subnet	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpc	aws:ResourceTag/${TagKey} ec2:Ipv4IpamPoolId ec2:Ipv6IpamPoolId ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateVpcEncryptionControl	Grants permission to create a VPC Encryption Control	Write	vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	ec2:CreateTags
			vpc-encryption-control*	aws:RequestTag/${TagKey} aws:TagKeys	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateVpcEndpoint	Grants permission to create a VPC endpoint for an AWS service	Write	vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:VpcID	ec2:CreateTags ec2:DescribeSecurityGroups ec2:DescribeSubnets ec2:DescribeVpcs route53:AssociateVPCWithHostedZone

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpc-endpoint*	aws:RequestTag/${TagKey} aws:TagKeys ec2:VpceMultiRegion ec2:VpcePrivateDnsPreference ec2:VpcePrivateDnsSpecifiedDomains ec2:VpceServiceName ec2:VpceServiceOwner ec2:VpceServiceRegion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			route-table	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:RouteTableID	
			security-group	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			subnet	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SubnetID	
				ec2:Region	
CreateVpcEndpointConnectionNotification	Grants permission to create a connection notification for a VPC endpoint or VPC endpoint service	Write	vpc-endpoint	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpc-endpoint-service	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:VpceMultiRegion ec2:VpceServiceRegion	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateVpcEndpointServiceConfiguration	Grants permission to create a VPC endpoint service configuration to which service consumers (AWS accounts, IAM users, and IAM roles) can connect	Write	vpc-endpoint-service*	aws:RequestTag/${TagKey} aws:TagKeys ec2:VpceMultiRegion ec2:VpceServicePrivateDnsName ec2:VpceServiceRegion	ec2:CreateTags
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateVpcPeeringConnection	Grants permission to request a VPC peering connection between two VPCs	Write	vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	ec2:CreateTags
			vpc-peering-connection*	aws:RequestTag/${TagKey} aws:TagKeys ec2:AccepterVpc ec2:RequesterVpc ec2:VpcPeeringConnectionID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
CreateVpnConcentrator	Grants permission to create a VPN concentrator that aggregates multiple VPN connections to a transit gateway	Write	vpn-concentrator*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags
			transit-gateway	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateVpnConnection	Grants permission to create a VPN connection between a virtual private gateway or transit gateway and a customer gateway	Write	customer-gateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpn-connection*	aws:RequestTag/${TagKey} aws:TagKeys ec2:AuthenticationType ec2:DPDTimeoutSeconds ec2:GatewayType ec2:IKEVersions ec2:InsideTunnelCidr ec2:InsideTunnelIpv6Cidr ec2:Phase1DHGroup	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Phase1EncryptionAlgorithms ec2:Phase1IntegrityAlgorithms ec2:Phase1LifetimeSeconds ec2:Phase2DHGroup ec2:Phase2EncryptionAlgorithms ec2:Phase2IntegrityAlgorithms ec2:Phase2LifetimeSeconds ec2:RekeyFuzzPercentage	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:RekeyMarginTimeSeconds ec2:ReplayWindowSizePackets ec2:RoutingType	
			transit-gateway	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-attachment	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
			vpn-concentrator	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpn-gateway	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
CreateVpnConnectionRoute	Grants permission to create a static route for a VPN connection between a virtual private gateway and a customer gateway	Write	vpn-connection*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
CreateVpnGateway	Grants permission to create a virtual private gateway	Write	vpn-gateway*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
DeleteCapacityManagerDataExport	Grants permission to delete an existing Capacity Manager data export configuration	Write	capacity-manager-data-export*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteCarrierGateway	Grants permission to delete a carrier gateway	Write	carrier-gateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteClientVpnEndpoint	Grants permission to delete a Client VPN endpoint	Write	client-vpn-endpoint*	aws:ResourceTag/${TagKey} ec2:ClientRootCertificateChainArn ec2:CloudwatchLogGroupArn ec2:CloudwatchLogStreamArn ec2:DirectoryArn ec2:ResourceTag/${TagKey} ec2:SamlProviderArn ec2:ServerCertificateArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteClientVpnRoute	Grants permission to delete a route from a Client VPN endpoint	Write	client-vpn-endpoint*	aws:ResourceTag/${TagKey} ec2:ClientRootCertificateChainArn ec2:CloudwatchLogGroupArn ec2:CloudwatchLogStreamArn ec2:DirectoryArn ec2:ResourceTag/${TagKey} ec2:SamlProviderArn ec2:ServerCertificateArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			subnet	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteCoipCidr	Grants permission to delete a range of customer-owned IP (CoIP) addresses	Write	coip-pool*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteCoipPool	Grants permission to delete a pool of customer-owned IP (CoIP) addresses	Write	coip-pool*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteCoipPoolPermission [permission only]	Grants permission to deny a service from accessing a customer-owned IP (CoIP) pool	Permissions management	coip-pool*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteCustomerGateway	Grants permission to delete a customer gateway	Write	customer-gateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteDhcpOptions	Grants permission to delete a set of DHCP options	Write	dhcp-options*	aws:ResourceTag/${TagKey} ec2:DhcpOptionsID ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteEgressOnlyInternetGateway	Grants permission to delete an egress-only internet gateway	Write	egress-only-internet-gateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteFleets	Grants permission to delete one or more EC2 Fleets	Write	fleet*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteFlowLogs	Grants permission to delete one or more flow logs	Write	vpc-flow-log*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteFpgaImage	Grants permission to delete an Amazon FPGA Image (AFI)	Write	fpga-image*	aws:ResourceTag/${TagKey} ec2:Owner ec2:Public ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteImageUsageReport	Grants permission to delete an AMI usage report	Write	image-usage-report*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteInstanceConnectEndpoint	Grants permission to delete an EC2 Instance Connect Endpoint	Write	instance-connect-endpoint*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SubnetID	
				ec2:Region	
DeleteInstanceEventWindow	Grants permission to delete the specified event window	Write	instance-event-window*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteInternetGateway	Grants permission to delete an internet gateway	Write	internet-gateway*	aws:ResourceTag/${TagKey} ec2:InternetGatewayID ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteIpam	Grants permission to delete an Amazon VPC IP Address Manager (IPAM) and remove all monitored data associated with the IPAM including the historical data for CIDRs	Write	ipam*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteIpamExternalResourceVerificationToken	Grants permission to delete a verification token, which proves ownership of an external resource	Write	ipam-external-resource-verification-token*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteIpamPolicy	Grants permission to delete an Amazon VPC IP Address Manager (IPAM) policy	Write	ipam-policy*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteIpamPool	Grants permission to delete an Amazon VPC IP Address Manager (IPAM) pool	Write	ipam-pool*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteIpamPrefixListResolver	Grants permission to delete an IPAM prefix list resolver	Write	ipam-prefix-list-resolver*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteIpamPrefixListResolverTarget	Grants permission to delete an IPAM prefix list resolver target	Write	ipam-prefix-list-resolver-target*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteIpamResourceDiscovery	Grants permission to delete an IPAM resource discovery	Write	ipam-resource-discovery*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteIpamScope	Grants permission to delete the scope for an Amazon VPC IP Address Manager (IPAM)	Write	ipam-scope*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteKeyPair	Grants permission to delete a key pair by removing the public key from Amazon EC2	Write	key-pair	aws:ResourceTag/${TagKey} ec2:KeyPairName ec2:KeyPairType ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteLaunchTemplate	Grants permission to delete a launch template and its associated versions	Write	launch-template*	aws:ResourceTag/${TagKey} ec2:ManagedResourceOperator ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteLaunchTemplateVersions	Grants permission to delete one or more versions of a launch template	Write	launch-template*	aws:ResourceTag/${TagKey} ec2:ManagedResourceOperator ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteLocalGatewayRoute	Grants permission to delete a route from a local gateway route table	Write	local-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			prefix-list	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteLocalGatewayRouteTable	Grants permission to delete a local gateway route table	Write	local-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
DeleteLocalGatewayRouteTablePermission [permission only]	Grants permission to deny a service from accessing a local gateway route table	Permissions management	local-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteLocalGatewayRouteTableVirtualInterfaceGroupAssociation	Grants permission to delete a local gateway route table virtual interface group association	Write	local-gateway-route-table-virtual-interface-group-association*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteLocalGatewayRouteTableVpcAssociation	Grants permission to delete an association between a VPC and local gateway route table	Write	local-gateway-route-table-vpc-association*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteLocalGatewayVirtualInterface	Grants permission to delete a local gateway virtual interface	Write	local-gateway-virtual-interface*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteLocalGatewayVirtualInterfaceGroup	Grants permission to delete a local gateway virtual interface group	Write	local-gateway-virtual-interface-group*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteManagedPrefixList	Grants permission to delete a managed prefix list	Write	prefix-list*	aws:ResourceTag/${TagKey} ec2:IpamPrefixListResolverTargetId ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteNatGateway	Grants permission to delete a NAT gateway	Write	natgateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteNetworkAcl	Grants permission to delete a network ACL	Write	network-acl*	aws:ResourceTag/${TagKey} ec2:NetworkAclID ec2:ResourceTag/${TagKey} ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteNetworkAclEntry	Grants permission to delete an inbound or outbound entry (rule) from a network ACL	Write	network-acl*	aws:ResourceTag/${TagKey} ec2:NetworkAclID ec2:ResourceTag/${TagKey} ec2:Vpc	
				ec2:Region	
DeleteNetworkInsightsAccessScope	Grants permission to delete a Network Access Scope	Write	network-insights-access-scope*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteNetworkInsightsAccessScopeAnalysis	Grants permission to delete a Network Access Scope analysis	Write	network-insights-access-scope-analysis*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteNetworkInsightsAnalysis	Grants permission to delete a network insights analysis	Write	network-insights-analysis*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteNetworkInsightsPath	Grants permission to delete a network insights path	Write	network-insights-path*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteNetworkInterface	Grants permission to delete a detached network interface	Write	network-interface*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:ManagedResourceOperator ec2:NetworkInterfaceID ec2:ResourceTag/${TagKey} ec2:Subnet ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteNetworkInterfacePermission	Grants permission to delete a permission that is associated with a network interface	Permissions management	network-interface	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:ManagedResourceOperator ec2:NetworkInterfaceID ec2:ResourceTag/${TagKey} ec2:Subnet ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteOdbNetworkPeering [permission only]	Grants permission to allow Oracle Database@AWS to delete a peering connection between an ODB network and a VPC	Permissions management	vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeletePlacementGroup	Grants permission to delete a placement group	Write	placement-group*	aws:ResourceTag/${TagKey} ec2:PlacementGroupName ec2:PlacementGroupStrategy ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeletePublicIpv4Pool	Grants permission to delete a public IPv4 address pool for public IPv4 CIDRs that you own and brought to Amazon to manage with Amazon VPC IP Address Manager (IPAM)	Write	ipv4pool-ec2*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteQueuedReservedInstances	Grants permission to delete the queued purchases for the specified Reserved Instances	Write	reserved-instances*	aws:ResourceTag/${TagKey} ec2:InstanceType ec2:ReservedInstancesOfferingType ec2:ResourceTag/${TagKey} ec2:Tenancy	
				ec2:Region	
DeleteResourcePolicy [permission only]	Grants permission to remove an IAM policy that enables cross-account sharing from a resource	Permissions management	ipam-pool	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			placement-group	aws:ResourceTag/${TagKey} ec2:PlacementGroupName ec2:PlacementGroupStrategy ec2:ResourceTag/${TagKey}	
			verified-access-group	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteRoute	Grants permission to delete a route from a route table	Write	route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:RouteTableID ec2:Vpc	
				ec2:Region	
DeleteRouteServer	Grants permission to delete a route server	Write	route-server*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	sns:DeleteTopic
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteRouteServerEndpoint	Grants permission to delete a route server endpoint	Write	route-server-endpoint*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:ResourceTag/${TagKey}	ec2:DeleteNetworkInterface ec2:DeleteSecurityGroup ec2:RevokeSecurityGroupIngress
				ec2:Region	
DeleteRouteServerPeer	Grants permission to delete a route server peer	Write	route-server-peer*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:ResourceTag/${TagKey}	ec2:RevokeSecurityGroupIngress
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteRouteTable	Grants permission to delete a route table	Write	route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:RouteTableID ec2:Vpc	
				ec2:Region	
DeleteSecondaryNetwork	Grants permission to delete a secondary network	Write	secondary-network*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteSecondarySubnet	Grants permission to delete a secondary subnet	Write	secondary-subnet*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteSecurityGroup	Grants permission to delete a security group	Write	security-group*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteSnapshot	Grants permission to delete a snapshot of an EBS volume	Write	snapshot*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:OutpostArn ec2:Owner ec2:ParentVolume ec2:ResourceTag/${TagKey} ec2:SnapshotID ec2:SnapshotTime ec2:VolumeSize	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteSpotDatafeedSubscription	Grants permission to delete a data feed for Spot Instances	Write		ec2:Region	
DeleteSubnet	Grants permission to delete a subnet	Write	subnet*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc	
				ec2:Region	
DeleteSubnetCidrReservation	Grants permission to delete a subnet CIDR reservation	Write		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteTags	Grants permission to delete one or more tags from Amazon EC2 resources	Tagging	capacity-block	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			capacity-manager-data-export	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			capacity-reservation	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			capacity-reservation-fleet	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			carrier-gateway	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			client-vpn-endpoint	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			coip-pool	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			customer-gateway	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			declarative-policies-report	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			dedicated-host	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			dhcp-options	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys ec2:ResourceTag/${TagKey}
