The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptQualificationRequest	The AcceptQualificationRequest operation grants a Worker's request for a Qualification	Write			
ApproveAssignment	The ApproveAssignment operation approves the results of a completed assignment	Write			
AssociateQualificationWithWorker	The AssociateQualificationWithWorker operation gives a Worker a Qualification	Write			
CreateAdditionalAssignmentsForHIT	The CreateAdditionalAssignmentsForHIT operation increases the maximum number of assignments of an existing HIT	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateHIT	The CreateHIT operation creates a new HIT (Human Intelligence Task)	Write			
CreateHITType	The CreateHITType operation creates a new HIT type	Write			
CreateHITWithHITType	The CreateHITWithHITType operation creates a new Human Intelligence Task (HIT) using an existing HITTypeID generated by the CreateHITType operation	Write			
CreateQualificationType	The CreateQualificationType operation creates a new Qualification type, which is represented by a QualificationType data structure	Write			
CreateWorkerBlock	The CreateWorkerBlock operation allows you to prevent a Worker from working on your HITs	Write			
DeleteHIT	The DeleteHIT operation disposes of a HIT that is no longer needed	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteQualificationType	The DeleteQualificationType disposes a Qualification type and disposes any HIT types that are associated with the Qualification type	Write			
DeleteWorkerBlock	The DeleteWorkerBlock operation allows you to reinstate a blocked Worker to work on your HITs	Write			
DisassociateQualificationFromWorker	The DisassociateQualificationFromWorker revokes a previously granted Qualification from a user	Write			
GetAccountBalance	The GetAccountBalance operation retrieves the amount of money in your Amazon Mechanical Turk account	Read			
GetAssignment	The GetAssignment retrieves an assignment with an AssignmentStatus value of Submitted, Approved, or Rejected, using the assignment's ID	Read			
GetFileUploadURL	The GetFileUploadURL operation generates and returns a temporary URL	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetHIT	The GetHIT operation retrieves the details of the specified HIT	Read			
GetQualificationScore	The GetQualificationScore operation returns the value of a Worker's Qualification for a given Qualification type	Read			
GetQualificationType	The GetQualificationType operation retrieves information about a Qualification type using its ID	Read			
ListAssignmentsForHIT	The ListAssignmentsForHIT operation retrieves completed assignments for a HIT	List			
ListBonusPayments	The ListBonusPayments operation retrieves the amounts of bonuses you have paid to Workers for a given HIT or assignment	List			
ListHITs	The ListHITs operation returns all of a Requester's HITs	List			
ListHITsForQualificationType	The ListHITsForQualificationType operation returns the HITs that use the given QualififcationType for a QualificationRequirement	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListQualificationRequests	The ListQualificationRequests operation retrieves requests for Qualifications of a particular Qualification type	List			
ListQualificationTypes	The ListQualificationTypes operation searches for Qualification types using the specified search query, and returns a list of Qualification types	List			
ListReviewPolicyResultsForHIT	The ListReviewPolicyResultsForHIT operation retrieves the computed results and the actions taken in the course of executing your Review Policies during a CreateHIT operation	List			
ListReviewableHITs	The ListReviewableHITs operation returns all of a Requester's HITs that have not been approved or rejected	List			
ListWorkerBlocks	The ListWorkersBlocks operation retrieves a list of Workers who are blocked from working on your HITs	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListWorkersWithQualificationType	The ListWorkersWithQualificationType operation returns all of the Workers with a given Qualification type	List			
NotifyWorkers	The NotifyWorkers operation sends an email to one or more Workers that you specify with the Worker ID	Write			
RejectAssignment	The RejectAssignment operation rejects the results of a completed assignment	Write			
RejectQualificationRequest	The RejectQualificationRequest operation rejects a user's request for a Qualification	Write			
SendBonus	The SendBonus operation issues a payment of money from your account to a Worker	Write			
SendTestEventNotification	The SendTestEventNotification operation causes Amazon Mechanical Turk to send a notification message as if a HIT event occurred, according to the provided notification specification	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateExpirationForHIT	The UpdateExpirationForHIT operation allows you extend the expiration time of a HIT beyond is current expiration or expire a HIT immediately	Write			
UpdateHITReviewStatus	The UpdateHITReviewStatus operation toggles the status of a HIT	Write			
UpdateHITTypeOfHIT	The UpdateHITTypeOfHIT operation allows you to change the HITType properties of a HIT	Write			
UpdateNotificationSettings	The UpdateNotificationSettings operation creates, updates, disables or re-enables notifications for a HIT type	Write			
UpdateQualificationType	The UpdateQualificationType operation modifies the attributes of an existing Qualification type, which is represented by a QualificationType data structure	Write			

Resource types defined by Amazon Mechanical Turk

Amazon Mechanical Turk does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon Mechanical Turk, specify `"Resource": "*"` in your policy.

Condition keys for Amazon Mechanical Turk

MechanicalTurk has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon MemoryDB

Amazon MemoryDB (service prefix: `memorydb`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon MemoryDB

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which

the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Note

When you create a MemoryDB for Redis policy in IAM you must use the "*" wildcard character for the Resource block. For information about using the following MemoryDB for Redis API actions in an IAM policy, see MemoryDB Actions and IAM.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchUpdateCluster	Grants permissions to apply service updates	Write	cluster*		ec2:CreateNetworkInterface ec2:DeleteNetworkInterface ec2:DescribeNetworkInterfaces ec2:DescribeSubnets ec2:DescribeVpcs s3:GetObject
				aws:ResourceTag/${TagKey}	
Connect	Allows an IAM user or role to connect as a specified MemoryDB user to a node in a cluster	Write	cluster*		
			user*		
				aws:ResourceTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey}

				aws:ResourceTag/${TagKey}	
UpdateUser	Grants permissions to update a user	Write	user*		
				aws:ResourceTag/${TagKey} memorydbUserAuthenticationMode	

Resource types defined by Amazon MemoryDB

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Note

The resource name in the ARN string should be lowercase to be effective.

Resource types	ARN	Condition keys
multiregionparametergroup	arn:${Partition}:memorydb::${Account}:multiregionparametergroup/${MultiRegionParameterGroupName}	
parametergroup	arn:${Partition}:memorydb:${Region}:${Account}:parametergroup/${ParameterGroupName}	aws:ResourceTag/${TagKey}
subnetgroup	arn:${Partition}:memorydb:${Region}:${Account}:subnetgroup/${SubnetGroupName}	aws:ResourceTag/${TagKey}
multiregioncluster	arn:${Partition}:memorydb::${Account}:multiregioncluster/${ClusterName}	aws:ResourceTag/${TagKey} memorydb:TLSEnabled
cluster	arn:${Partition}:memorydb:${Region}:${Account}:cluster/${ClusterName}	aws:ResourceTag/${TagKey}
snapshot	arn:${Partition}:memorydb:${Region}:${Account}:snapshot/${SnapshotName}	aws:ResourceTag/${TagKey}
user	arn:${Partition}:memorydb:${Region}:${Account}:user/${UserName}	aws:ResourceTag/${TagKey}
acl	arn:${Partition}:memorydb:${Region}:${Account}:acl/${AclName}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
reservednode	`arn:${Partition}:memorydb:${Region}:${Account}:reservednode/${ReservationID}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon MemoryDB

Amazon MemoryDB defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters actions based on the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters actions based on the tags associated with the resource	String
aws:TagKeys	Filters actions based on the tag keys that are passed in the request	ArrayOfString
memorydb:TLSEnabled	Filters access by the TLSEnabled parameter present in the request or defaults to true value if parameter is not present	Bool
memorydb:UserAuthenticationMode	Filters access by the UserAuthenticationMode.Type parameter in the request	String

Actions, resources, and condition keys for Amazon Message Delivery Service

Amazon Message Delivery Service (service prefix: `ec2messages`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Topics

Actions defined by Amazon Message Delivery Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcknowledgeMessage	Grants permission to acknowledge a message, ensuring it will not be delivered again	Write			
DeleteMessage	Grants permission to delete a message	Write			
FailMessage	Grants permission to fail a message, signifying the	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	message could not be processed successfully, ensuring it cannot be replied to or delivered again				
GetEndpoint	Grants permission to route traffic to the correct endpoint based on the given destination for the messages	Read			
GetMessages	Grants permission to deliver messages to clients/instances using long polling	Read		ssm:SourceInstanceARN ec2:SourceInstanceARN	
SendReply	Grants permission to send replies from clients/instances to upstream service	Write		ssm:SourceInstanceARN ec2:SourceInstanceARN	

Resource types defined by Amazon Message Delivery Service

Amazon Message Delivery Service does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon Message Delivery Service, specify `"Resource": "*"` in your policy.

Condition keys for Amazon Message Delivery Service

Amazon Message Delivery Service defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
ec2:SourceInstanceARN	Filters access by the ARN of the instance from which the request originated	ARN
ssm:SourceInstanceARN	Filters access by verifying the Amazon Resource Name (ARN) of the AWS Systems Manager's managed instance from which the request is made. This key is not present when the request comes from the managed instance authenticated with an IAM role associated with EC2 instance profile	ARN

Actions, resources, and condition keys for Amazon Message Gateway Service

Amazon Message Gateway Service (service prefix: `ssmmessages`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Message Gateway Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateControlChannel	Grants permission to register a control channel for an instance to send control messages to Systems Manager service	Write		ssm:SourceInstanceARN ec2:SourceInstanceARN	
CreateDataChannel	Grants permission to register a data channel for an instance to send data messages to Systems Manager service	Write			
OpenControlChannel	Grants permission to open a websocket connection for a registered control channel stream from an instance to Systems Manager service	Write			
OpenDataChannel	Grants permission to open a websocket connection for a registered data channel	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	stream from an instance to Systems Manager service				

Resource types defined by Amazon Message Gateway Service

Amazon Message Gateway Service does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon Message Gateway Service, specify `"Resource": "*"` in your policy.

Condition keys for Amazon Message Gateway Service

Amazon Message Gateway Service defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
ec2:SourceInstanceARN	Filters access by the ARN of the instance from which the request originated	ARN
ssm:SourceInstanceARN	Filters access by verifying the Amazon Resource Name (ARN) of the AWS Systems Manager's managed instance from which the request is made. This key is not present when the request comes from the managed instance authenticated with an IAM role associated with EC2 instance profile	ARN

Actions, resources, and condition keys for AWS Microservice Extractor for .NET

AWS Microservice Extractor for .NET (service prefix: `serviceextract`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Microservice Extractor for .NET

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit

resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetConfig [permission only]	Grants permission to get required configuration for the AWS Microservice Extractor for .NET desktop client	Read			

Resource types defined by AWS Microservice Extractor for .NET

AWS Microservice Extractor for .NET does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Microservice Extractor for .NET, specify `"Resource": "*"` in your policy.

Condition keys for AWS Microservice Extractor for .NET

Microservice Extractor for .NET has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Migration Acceleration Program Credits

AWS Migration Acceleration Program Credits (service prefix: `mapcredits`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.

Actions defined by AWS Migration Acceleration Program Credits

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAssociatedPrograms [permission only]	Grants permission to view the user's associated Migration Acceleration Program agreements	List	agreement*		
ListQuarterCredits [permission only]	Grants permission to view Migration Acceleration Program agreements credits associated with the user's payer account	List	agreement*		
ListQuarterSpend [permission only]	Grants permission to view Migration Acceleration Program agreements eligible spend associated with the user's payer account	List	agreement*		

Resource types defined by AWS Migration Acceleration Program Credits

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
agreement	`arn:${Partition}:mapcredits:::${Agreement}/${AgreementId}`	

Condition keys for AWS Migration Acceleration Program Credits

MapCredits has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Migration Hub

AWS Migration Hub (service prefix: `mgh`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Migration Hub

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which

the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptConnection	Grants permission to accept a connection	Write	ConnectionResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
AssociateAutomationUnitRole	Grants permission to associate an IAM role to an automation unit	Write	AutomationUnitResource*		
AssociateCreatedArtifact	Grants permission to associate a given AWS artifact to a MigrationTask	Write	migrationTask*		
AssociateDiscoveredResource	Grants permission to associate a given ADS resource to a MigrationTask	Write	migrationTask*		
AssociateSourceResource	Grants permission to associate source resource	Write	migrationTask*		
BatchAssociateIamRoleWithConnection	Grants permission to batch-associate IAM roles with a connection	Write	ConnectionResource*		
BatchDisassociateIamRoleFromConnection	Grants permission to batch-disassociate IAM roles from a connection	Write	ConnectionResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAutomationRun	Grants permission to create an automation unit run	Write			
CreateAutomationUnit	Grants permission to create an automation unit	Write			
CreateHomeRegionControl	Grants permission to create a Migration Hub Home Region Control	Write			
CreateProgressUpdateStream	Grants permission to create a ProgressUpdateStream	Write	progressUpdateStream*		
DeleteAutomationRun	Grants permission to delete an automation unit run	Write	AutomationRunResource*		
DeleteAutomationUnit	Grants permission to delete an automation unit	Write	AutomationUnitResource*		
DeleteConnection	Grants permission to delete a connection	Write	ConnectionResource*		
DeleteHomeRegionControl	Grants permission to delete a Migration Hub Home Region Control	Write			
DeleteProgressUpdateStream	Grants permission to delete a ProgressUpdateStream	Write	progressUpdateStream*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeApplicationState	Grants permission to get an Application Discovery Service Application's state	Read			
DescribeAutomationRun	Grants permission to describe an automation unit run	Read	AutomationRunResource*		
DescribeAutomationUnit	Grants permission to describe an automation unit	Read	AutomationUnitResource*		
DescribeHomeRegionControls	Grants permission to list Home Region Controls	List			
DescribeMigrationTask	Grants permission to describe a MigrationTask	Read	migrationTask*		
DisassociateAutomationUnitRole	Grants permission to disassociate an IAM role from an automation unit	Write	AutomationUnitResource*		
DisassociateCreatedArtifact	Grants permission to disassociate a given AWS artifact from a MigrationTask	Write	migrationTask*		
DisassociateDiscoveredResource	Grants permission to disassociate a given ADS resource from a MigrationTask	Write	migrationTask*		
DisassociateSourceResource	Grants permission to diassociate source resource	Write	migrationTask*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetConnection	Grants permission to get a connection	Read	ConnectionResource*		
GetHomeRegion	Grants permission to get the Migration Hub Home Region	Read			
ImportMigrationTask	Grants permission to import a MigrationTask	Write	migrationTask*		
ListApplicationStates	Grants permission to list Application statuses	List			
ListAutomationRuns	Grants permission to list automation unit runs	List			
ListAutomationUnits	Grants permission to list automation units	List			
ListConnectionRoles	Grants permission to list connection roles	List	ConnectionResource*		
ListConnections	Grants permission to list connections	List			
ListCreatedArtifacts	Grants permission to list associated created artifacts for a MigrationTask	List	migrationTask*		
ListDiscoveredResources	Grants permission to list associated ADS resources from MigrationTask	List	migrationTask*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListMigrationTaskUpdates	Grants permission to list migration tasks updates	List	migrationTask*		
ListMigrationTasks	Grants permission to list MigrationTasks	List			
ListProgressUpdateStreams	Grants permission to to list ProgressUpdateStreams	List			
ListSourceResources	Grants permission to list source resources	List	migrationTask*		
ListTagsForResource	Grants permission to list tags for a resource	List			
NotifyApplicationState	Grants permission to update an Application Discovery Service Application's state	Write			
NotifyMigrationTaskState	Grants permission to notify latest MigrationTask state	Write	migrationTask*		
PutResourceAttributes	Grants permission to put ResourceAttributes	Write	migrationTask*		
RejectConnection	Grants permission to reject a connection	Write	ConnectionResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to tag a resource	Tagging		aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to untag a resource	Tagging		aws:TagKeys	

Resource types defined by AWS Migration Hub

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
progressUpdateStream	`arn:${Partition}:mgh:${Region}:${Account}:progressUpdateStream/${Stream}`	
migrationTask	`arn:${Partition}:mgh:${Region}:${Account}:progressUpdateStream/${Stream}/migrationTask/${Task}`	
AutomationRunResource	`arn:${Partition}:mgh:${Region}:${Account}:automation-run/${RunID}`	mgh:AutomationRunResourceRunID

Resource types	ARN	Condition keys
AutomationUnitResource	arn:${Partition}:mgh:${Region}:${Account}:automation-unit/${AutomationUnitId}	mgh:AutomationUnitResourceAutomationUnitArn
ConnectionResource	arn:${Partition}:mgh:${Region}:${Account}:${ConnectionArn}	aws:ResourceTag/${TagKey} mgh:ConnectionResourceConnectionArn

Condition keys for AWS Migration Hub

AWS Migration Hub defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access based on the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access based on the tags associated with the resource	String
aws:TagKeys	Filters access based on the tag keys that are passed in the request	ArrayOfString
mgh:AutomationRunResourceRunID	AutomationRunResource resource runID identifier	String

Condition keys	Description	Type
mgh:AutomationUnitResourceAutomationUnitArn	AutomationUnitResource resource automationUnitArn identifier	ARN
mgh:ConnectionResourceConnectionArn	ConnectionResource resource connectionArn identifier	String

Actions, resources, and condition keys for AWS Migration Hub Orchestrator

AWS Migration Hub Orchestrator (service prefix: `migrationhub-orchestrator`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Migration Hub Orchestrator

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy,

you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTemplate	Grants permission to create a custom template	Write			
CreateWorkflow	Grants permission to create a workflow based on the selected template	Write	template*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateWorkflowStep	Grants permission to create a step under a workflow and a specific step group	Write	workflow*		
CreateWorkflowStepGroup	Grants permission to to create a custom step group for a given workflow	Write	workflow*		
DeleteTemplate	Grants permission to delete a custom template	Write	template*		
DeleteWorkflow	Grants permission to a workflow	Write	workflow*		
DeleteWorkflowStep	Grants permission to delete a step from a specific step group under a workflow	Write	workflow*		
DeleteWorkflowStepGroup	Grants permission to delete a step group associated with a workflow	Write	workflow*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetMessage	Grants permission to the plugin to receive information from the service	Read			
GetTemplate	Grants permission to get retrieve metadata for a Template	Read	template*		
GetTemplateStep	Grants permission to retrieve details of a step associated with a template and a step group	Read	template*		
GetTemplateStepGroup	Grants permission to retrieve metadata of a step group under a template	Read	template*		
GetWorkflow	Grants permission to retrieve metadata asscociated with a workflow	Read	workflow*		
GetWorkflowStep	Grants permission to get details of step associated with a workflow and a step group	Read	workflow*		
GetWorkflowStepGroup	Grants permission to get details of a step group associated with a workflow	Read	workflow*		
ListPlugins	Grants permission to get a list all registered Plugins	List			
ListTagsForResource		Read	template*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	Grants permission to get a list of all the tags tied to a resource		workflow*		
ListTemplateStepGroups	Grants permission to lists step groups of a template	List	template*		
ListTemplateSteps	Grants permission to get a list of steps in a step group	List	template*		
ListTemplates	Grants permission to get a list of all Templates available to customer	List			
ListWorkflowStepGroups	Grants permission to get list of step groups associated with a workflow	List	workflow*		
ListWorkflowSteps	Grants permission to get a list of steps within step group associated with a workflow	List	workflow*		
ListWorkflows	Grants permission to list all workflows	List			
RegisterPlugin	Grants permission to register the plugin to receive an ID and to start receiving messages from the service	Write			
RetryWorkflowStep	Grants permission to retry a failed step within a workflow	Write	workflow*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SendMessage	Grants permission to the plugin to send information to the service	Write			
StartWorkflow	Grants permission to start a workflow or resume a stopped workflow	Write	workflow*		
StopWorkflow	Grants permission to stop a workflow	Write	workflow*		
TagResource	Grants permission to add tags to a resource	Tagging	template		
			workflow		
				aws:TagKeys	
				aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove tags from a resource	Tagging	template		
			workflow		
				aws:TagKeys	
UpdateTemplate	Grants permission to update a custom template	Write	template*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateWorkflow	Grants permission to update the metadata associated with the workflow	Write	workflow*		
UpdateWorkflowStep	Grants permission to update metadata and status of a custom step within a workflow	Write	workflow*		
UpdateWorkflowStepGroup	Grants permission to update metadata associated with a step group in a given workflow	Write	workflow*		

Resource types defined by AWS Migration Hub Orchestrator

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
workflow	`arn:${Partition}:migrationhub-orchestrator:${Region}:${Account}:workflow/${ResourceId}`	aws:ResourceTag/${TagKey}
template	`arn:${Partition}:migrationhub-orchestrator:${Region}:${Account}:template/${ResourceId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Migration Hub Orchestrator

AWS Migration Hub Orchestrator defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Resource types defined by AWS Migration Hub Refactor Spaces

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
environment	`arn:${Partition}:refactor-spaces:${Region}:${Account}:environment/${EnvironmentId}`	aws:ResourceTag/${TagKey}
application	`arn:${Partition}:refactor-spaces:${Region}:${Account}:environment/${EnvironmentId}/application/${ApplicationId}`	aws:ResourceTag/${TagKey} refactor-spaces:ApplicationCreatedByAccount refactor-spaces:CreatedByAccountIds
service	`arn:${Partition}:refactor-spaces:${Region}:${Account}:environment/${EnvironmentId}/application/${ApplicationId}/service/${ServiceId}`	aws:ResourceTag/${TagKey} refactor-spaces:ApplicationCreatedByAccount refactor-spaces:CreatedByAccountIds refactor-spaces:ServiceCreatedByAccount

Resource types	ARN	Condition keys
route	arn:${Partition}:refactor-spaces:${Region}:${Account}:environment/${EnvironmentId}/application/${ApplicationId}/route/${RouteId}	aws:ResourceTag/${TagKey} refactor-spaces:ApplicationCreatedByAccount refactor-spaces:CreatedByAccountIds refactor-spaces:RouteCreatedByAccount refactor-spaces:ServiceCreatedByAccount refactor-spaces:SourcePath

Condition keys for AWS Migration Hub Refactor Spaces

AWS Migration Hub Refactor Spaces defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
refactor-spaces:ApplicationCreatedByAccount	Filters access by restricting the action to only those accounts that created the application within an environment	String
refactor-spaces:CreatedByAccountIds	Filters access by the accounts that created the resource	ArrayOfString
refactor-spaces:RouteCreatedByAccount	Filters access by restricting the action to only those accounts that created the route within an application	String
refactor-spaces:ServiceCreatedByAccount	Filters access by restricting the action to only those accounts that created the service within an application	String
refactor-spaces:SourcePath	Filters access by the path of the route	String

Actions, resources, and condition keys for AWS Migration Hub Strategy Recommendations

AWS Migration Hub Strategy Recommendations (service prefix: `migrationhub-strategy`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Topics

Actions defined by AWS Migration Hub Strategy Recommendations

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit

resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAntiPattern	Grants permission to get details of each anti pattern that collector should look at in a customer's environment	Read			
GetApplicationComponentDetails	Grants permission to get details of an application	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetApplicationComponentStrategies	Grants permission to get a list of all recommended strategies and tools for an application running in a server	Read			
GetAssessment	Grants permission to retrieve status of an on-going assessment	Read			
GetImportFileTask	Grants permission to get details of a specific import task	Read			
GetLatestAssessmentId	Grants permission to retrieve the latest assessment id	Read			
GetMessage	Grants permission to the collector to receive information from the service	Read			
GetPortfolioPreferences	Grants permission to retrieve customer migration/Modernization preferences	Read			
GetPortfolioSummary	Grants permission to retrieve overall summary (number-of servers to rehost etc as well as overall number of anti patterns)	Read			
GetRecommendationReportDetails	Grants permission to retrieve detailed information about a recommendation report	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetServerDetails	Grants permission to get info about a specific server	Read			
GetServerStrategies	Grants permission to get recommended strategies and tools for a specific server	Read			
ListAnalyzableServers	Grants permission to get a list of all analyzable servers in a customer's vcenter environment	List			
ListAntiPatterns	Grants permission to get a list of all anti patterns that collector should look for in a customer's environment	List			
ListApplicationComponents	Grants permission to get a list of all applications running on servers on customer's servers	List			
ListCollectors	Grants permission to get a list of all collectors installed by the customer	List			
ListImportFileTask	Grants permission to get list of all imports performed by the customer	List			
ListJarArtifacts	Grants permission to get a list of binaries that collector should assess	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListServers	Grants permission to get a list of all servers in a customer's environment	List			
PutLogData	Grants permission to the collector to send logs to the service	Write			
PutMetricData	Grants permission to the collector to send metrics to the service	Write			
PutPortfolioPreferences	Grants permission to save customer's Migration/ Modernization preferences	Write			
RegisterCollector	Grants permission to register the collector to receive an ID and to start receiving messages from the service	Write			
SendMessage	Grants permission to the collector to send information to the service	Write			
StartAssessment	Grants permission to start assessment in a customer's environment (collect data from all servers and provide recommendations)	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartImportFileTask	Grants permission to start importing data from a file provided by customer	Write			
StartRecommendationReportGeneration	Grants permission to start generating a recommendation report	Write			
StopAssessment	Grants permission to stop an on-going assessment	Write			
UpdateApplicationComponentConfig	Grants permission to update details for an application	Write			
UpdateCollectorConfiguration	Grants permission to the collector to send configuration information to the service	Write			
UpdateServerConfig	Grants permission to update info on a server along with the recommended strategy	Write			

Resource types defined by AWS Migration Hub Strategy Recommendations

AWS Migration Hub Strategy Recommendations does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Migration Hub Strategy Recommendations, specify `"Resource": "*"` in your policy.

Condition keys for AWS Migration Hub Strategy Recommendations

Migration Hub Strategy Recommendations has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Mobile Analytics

Amazon Mobile Analytics (service prefix: `mobileanalytics`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon Mobile Analytics

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a

resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetFinancialReports	Grant access to financial metrics for an app	Read			
GetReports	Grant access to standard metrics for an app	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutEvents	The PutEvents operation records one or more events	Write			

Resource types defined by Amazon Mobile Analytics

Amazon Mobile Analytics does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon Mobile Analytics, specify `"Resource": "*"` in your policy.

Condition keys for Amazon Mobile Analytics

Mobile Analytics has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Monitron

Amazon Monitron (service prefix: `monitron`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Multi-party approval

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which

the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelSession	Grants permission to cancel an approval session	Write	session*		
				aws:ResourceTag/

ListSessions	Grants permission to list approval sessions	List			
ListTagsForResource	Grants permission to list tags for a resource	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutResourcePolicy [permission only]	Grants permission to create or update policies for a resource	Permissions management			
StartActiveApprovalTeamDeletion	Grants permission to start the deletion process for an active approval team	Write	approval-team*		
				aws:ResourceTag/${TagKey}	
StartApprovalTeamBaseline	Grants permission to start a baseline for an active approval team	Write	approval-team*		
				aws:ResourceTag/${TagKey}	
StartSession [permission only]	Grants permission to start an approval session	Write	session*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} mpa:RequestedOperation mpa:ProtectedResourceAccount	
TagResource	Grants permission to tag a resource	Tagging		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UntagResource	Grants permission to untag a resource	Tagging		aws:ResourceTag/${TagKey} aws:TagKeys	
UpdateApprovalTeam	Grants permission to update approval team	Write	approval-team*		
				aws:ResourceTag/${TagKey}	

Resource types defined by Multi-party approval

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
approval-team	`arn:${Partition}:mpa:${Region}:${Account}:approval-team/${ApprovalTeamId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
identity-source	arn:${Partition}:mpa:${Region}:${Account}:identity-source/${IdentitySourceId}	aws:ResourceTag/${TagKey}
session	arn:${Partition}:mpa:${Region}:${Account}:session/${SessionId}	aws:ResourceTag/${TagKey}

Condition keys for Multi-party approval

Multi-party approval defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString
mpa:ProtectedResourceAccount	Filters access by the account that owns the resource that is the target of the operation that requires approval	String
mpa:RequestedOperation	Filters access by a requested operation that requires team approval before it can be executed	String

Actions, resources, and condition keys for AWS MWAA Serverless

AWS MWAA Serverless (service prefix: `airflow-serverless`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS MWAA Serverless

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateWorkflow	Grants permission to create a new workflow	Write		aws:TagKeys aws:RequestTag/${TagKey}	
DeleteWorkflow	Grants permission to delete a workflow	Write	Workflow*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTaskInstance	Grants permission to retrieve the task details for a workflow run	Read	Workflow*		
GetWorkflow	Grants permission to retrieve details about a workflow	Read	Workflow*		
GetWorkflowRun	Grants permission to retrieve details about a workflow run	Read	Workflow*		
ListTagsForResource	Grants permission to list the tags for the specified resource	Read	Workflow*		
				aws:ResourceTag/${TagKey}	
ListTaskInstances	Grants permission to list the tasks for a workflow run	List	Workflow*		
ListWorkflowRuns	Grants permission to list the workflow runs of a workflow	List	Workflow*		
ListWorkflowVersions	Grants permission to list the workflow versions	List	Workflow*		
ListWorkflows	Grants permission to list the workflows	List			
StartWorkflowRun	Grants permission to start an on-demand workflow run for the workflow	Write	Workflow*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StopWorkflowRun	Grants permission to stop a workflow run	Write	Workflow*		
TagResource	Grants permission to tag the specified resource	Tagging	Workflow*		
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
UntagResource	Grants permission to untag the specified resource	Tagging	Workflow*		
				aws:TagKeys aws:ResourceTag/${TagKey}	
UpdateWorkflow	Grants permission to update an existing workflow	Write	Workflow*		

Resource types defined by AWS MWAA Serverless

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Workflow	`arn:${Partition}:airflow-serverless:${Region}:${Account}:workflow/${WorkflowId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS MWAA Serverless

AWS MWAA Serverless defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs that are attached to the resource	String
aws:TagKeys	Filters access by tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Neptune

Amazon Neptune (service prefix: `neptune-db`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Neptune

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelLoaderJob	Grants permission to cancel a loader job	Write	database*		
CancelMLDataProcessingJob	Grants permission to cancel an ML data processing job	Write	database*		
CancelMLModelTrainingJob	Grants permission to cancel an ML model training job	Write	database*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelMLModelTransformJob	Grants permission to cancel an ML model transform job	Write	database*		
CancelQuery	Grants permission to cancel a query	Write	database*		
CreateMLEndpoint	Grants permission to create an ML endpoint	Write	database*		
DeleteDataViaQuery	Grants permission to run delete data via query APIs on database	Write	database*		
				neptune-db:QueryLanguage	
DeleteMLEndpoint	Grants permission to delete an ML endpoint	Write	database*		
DeleteStatistics	Grants permission to delete all the statistics in the database	Write	database*		
GetEngineStatus	Grants permission to check the status of the Neptune engine	Read	database*		
GetGraphSummary	Grants permission to get the graph summary from the database	Read	database*		
GetLoaderJobStatus	Grants permission to check the status of a loader job	Read	database*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetMLDataProcessingJobStatus	Grants permission to check the status of an ML data processing job	Read	database*		
GetMLEndpointStatus	Grants permission to check the status of an ML endpoint	Read	database*		
GetMLModelTrainingJobStatus	Grants permission to check the status of an ML model training job	Read	database*

GetQueryStatus	Grants permission to check the status of all active queries	Read	database*		
				neptune-db:QueryLanguage	
GetStatisticsStatus	Grants permission to check the status of statistics of the database	Read	database*		
GetStreamRecords	Grants permission to fetch stream records from Neptune	Read	database*		
				neptune-db:QueryLanguage	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListLoaderJobs	Grants permission to list all the loader jobs	List	database*		
ListMLDataProcessingJobs	Grants permission to list all the ML data processing jobs	List	database*		
ListMLEndpoints	Grants permission to list all the ML endpoints	List	database*		
ListMLModelTrainingJobs	Grants permission to list all the ML model training jobs	List	database*		
ListMLModelTransformJobs	Grants permission to list all the ML model transform jobs	List	database*		
ManageStatistics	Grants permission to manage statistics in the database	Write	database*		
ReadDataViaQuery	Grants permission to run read data via query APIs on database	Read	database*		
				neptune-db:QueryLanguage	
ResetDatabase	Grants permission to get the token needed for reset and resets the Neptune database	Write	database*		
StartLoaderJob	Grants permission to start a loader job	Write	database*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartMLDataProcessingJob	Grants permission to start an ML data processing job	Write	database*		
StartMLModelTrainingJob	Grants permission to start an ML model training job	Write	database*		
StartMLModelTransformJob	Grants permission to start an ML model transform job	Write	database*		
WriteDataViaQuery	Grants permission to run write data via query APIs on database	Write	database*		
				neptune-db:QueryLanguage	
connect	Grants permission to all data-access actions in engine versions prior to 1.2.0.0	Write	database*		

Resource types defined by Amazon Neptune

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
database	`arn:${Partition}:neptune-db:${Region}:${Account}:${ClusterResourceId}/*`	

Condition keys for Amazon Neptune

Amazon Neptune defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
neptune-db:QueryLanguage	Filters access by graph model	String

Actions, resources, and condition keys for Amazon Neptune Analytics

Amazon Neptune Analytics (service prefix: `neptune-graph`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Neptune Analytics

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Note

All IAM actions except 'ReadDataViaQuery', 'WriteDataViaQuery' and 'DeleteDataViaQuery' have a corresponding API operation

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelExportTask	Grants permission to cancel an ongoing export task	Write	export-task*

Resource types defined by Amazon Neptune Analytics

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
graph	`arn:${Partition}:neptune-graph:${Region}:${Account}:graph/${ResourceId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
graph-snapshot	arn:${Partition}:neptune-graph:${Region}:${Account}:graph-snapshot/${ResourceId}	aws:ResourceTag/${TagKey}
import-task	arn:${Partition}:neptune-graph:${Region}:${Account}:import-task/${ResourceId}	
export-task	arn:${Partition}:neptune-graph:${Region}:${Account}:export-task/${ResourceId}	

Condition keys for Amazon Neptune Analytics

Amazon Neptune Analytics defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag's key and value in a request	String
aws:ResourceTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:TagKeys	Filters access by the tag keys in a request	ArrayOfString

Condition keys	Description	Type
neptune-graph:PublicConnectivity	Filters access by the value of the public connectivity parameter provided in the request or its default value, if unspecified. All access to graphs is IAM authenticated	Bool

Actions, resources, and condition keys for AWS Network Firewall

AWS Network Firewall (service prefix: `network-firewall`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Network Firewall

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptNetworkFirew	Grants permission to accept pending Network Firewall	Write	Firewall*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
allTransitGatewayAttachment	attachments on a transit gateway				
AssociateAvailabilityZones	Grants permission to associate availability zones to a firewall	Write	Firewall*		
AssociateFirewallPolicy	Grants permission to create an association between a firewall policy and a firewall	Write	Firewall*		
			FirewallPolicy*		
				aws:RequestTag/${TagKey} aws:TagKeys	
AssociateSubnets	Grants permission to associate VPC subnets to a firewall	Write	Firewall*		
AttachRuleGroupsToProxyConfiguration	Grants permission to attach proxy rule groups to a proxy configuration	Write	ProxyConfiguration*		
			ProxyRuleGroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateFirewall	Grants permission to create an AWS Network Firewall firewall	Write	Firewall*		iam:CreateServiceLinkedRole
			FirewallPolicy*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateFirewallPolicy	Grants permission to create an AWS Network Firewall firewall policy	Write	FirewallPolicy*		
			StatefulRuleGroup		
			StatelessRuleGroup		
			TLSInspectionConfiguration		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateProxy	Grants permission to create an AWS Network Firewall proxy	Write	Proxy*		ec2:AttachApplianceToNatGateway
			ProxyConfiguration*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateProxyConfiguration	Grants permission to create an AWS Network Firewall proxy configuration	Write	ProxyConfiguration*		
			ProxyRuleGroup		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateProxyRuleGroup	Grants permission to create an AWS Network Firewall proxy rule group	Write	ProxyRuleGroup*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateProxyRules	Grants permission to add proxy rules to a proxy rule group	Write	ProxyRuleGroup*		
CreateRuleGroup	Grants permission to create an AWS Network Firewall rule group	Write	StatefulRuleGroup		
			StatelessRuleGroup		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateTLSInspectionConfiguration	Grants permission to create an AWS Network Firewall tls inspection configuration	Write	TLSInspectionConfiguration*		iam:CreateServiceLinkedRole
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateVpcEndpointAssociation	Grants permission to create an AWS Network Firewall vpc endpoint association	Write	Firewall*		iam:CreateServiceLinkedRole
			VpcEndpointAssociation*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteFirewall	Grants permission to delete a firewall	Write	Firewall*		
DeleteFirewallPolicy	Grants permission to delete a firewall policy	Write	FirewallPolicy*		
DeleteNetworkFirewallTransitGatewayAttachment	Grants permission to delete Network Firewall attachments on a transit gateway	Write	Firewall*		
DeleteProxy	Grants permission to delete a proxy	Write	Proxy*		ec2:DetachApplianceFromNatGateway
DeleteProxyConfiguration	Grants permission to delete a proxy configuration	Write	ProxyConfiguration*		
DeleteProxyRuleGroup	Grants permission to delete a proxy rule group	Write	ProxyRuleGroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteProxyRules	Grants permission to remove proxy rules from a proxy rule group	Write	ProxyRuleGroup*		
DeleteResourcePolicy	Grants permission to delete a resource policy for a firewall policy or rule group or firewall	Write	Firewall		
			FirewallPolicy		
			StatefulRuleGroup		
			StatelessRuleGroup		
DeleteRuleGroup	Grants permission to delete a rule group	Write	StatefulRuleGroup*		
			StatelessRuleGroup*		
DeleteTLSInspectionConfiguration	Grants permission to delete a tls inspection configuration	Write	TLSInspectionConfiguration*		
DeleteVpcEndpointAssociation	Grants permission to delete a vpc endpoint association	Write	VpcEndpointAssociation*		
DescribeFirewall	Grants permission to retrieve the data objects that define a firewall	Read	Firewall*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeFirewallMetadata	Grants permission to retrieve the high-level information about a firewall	Read	Firewall*		
DescribeFirewallPolicy	Grants permission to retrieve the data objects that define a firewall policy	Read	FirewallPolicy*		
			StatefulRuleGroup		
			StatelessRuleGroup		
			TLSInspectionConfiguration		
DescribeFlowOperation	Grants permission to describe a flow operation performed on a firewall	Read	Firewall*		
DescribeLoggingConfiguration	Grants permission to describe the logging configuration of a firewall	Read	Firewall*		logs:GetLogDelivery logs:ListLogDeliveries
DescribeProxy	Grants permission to retrieve the data objects that define a proxy	Read	Proxy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeProxyConfiguration	Grants permission to retrieve the data objects that define a proxy configuration	Read	ProxyConfiguration*		
DescribeProxyRule	Grants permission to retrieve the data objects that define a proxy rule	Read	ProxyRuleGroup*		
DescribeProxyRuleGroup	Grants permission to retrieve the data objects that define a proxy rule group	Read	ProxyRuleGroup*		
DescribeResourcePolicy	Grants permission to describe a resource policy for a firewall policy or rule group or firewall	Read	Firewall		
			FirewallPolicy		
			StatefulRuleGroup		
			StatelessRuleGroup		
DescribeRuleGroup	Grants permission to retrieve the data objects that define a rule group	Read	StatefulRuleGroup		
			StatelessRuleGroup		
DescribeRuleGroupMetadata	Grants permission to retrieve the high-level information about a rule group	Read	StatefulRuleGroup		
			StatelessRuleGroup		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeRuleGroupSummary	Grants permission to retrieve the summary information about a rule group	Read	StatefulRuleGroup		
			StatelessRuleGroup		
DescribeTLSInspectionConfiguration	Grants permission to retrieve the data objects that define a tls inspection configuration	Read	TLSInspectionConfiguration*		
DescribeVpcEndpointAssociation	Grants permission to retrieve the data objects that define a vpc endpoint association	Read	VpcEndpointAssociation*		
DetachRuleGroupsFromProxyConfiguration	Grants permission to detach proxy rule groups from a proxy configuration	Write	ProxyConfiguration*		
			ProxyRuleGroup*		
DisassociateAvailabilityZones	Grants permission to disassociate availability zones to a firewall	Write	Firewall*		
DisassociateSubnets	Grants permission to disassociate VPC subnets from a firewall	Write	Firewall*		
GetAnalysisReportResults	Grants permission to retrieve analysis report results of a firewall	Read	Firewall*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAnalysisReports	Grants permission to list firewall analysis reports	List	Firewall*		
ListFirewallPolicies	Grants permission to retrieve the metadata for firewall policies	List	FirewallPolicy*		
ListFirewalls	Grants permission to retrieve the metadata for firewalls	List	Firewall*		
ListFlowOperationResults	Grants permission to list results from a flow operation performed on a firewall	Read	Firewall*		
ListFlowOperations	Grants permission to list flow operations performed on a firewall	List	Firewall*		
ListProxies	Grants permission to retrieve the metadata for proxies	List	Proxy*		
ListProxyConfigurations	Grants permission to retrieve the metadata for proxy configurations	List	ProxyConfiguration*		
ListProxyRuleGroups	Grants permission to retrieve the metadata for proxy rule groups	List	ProxyRuleGroup*		
ListRuleGroups	Grants permission to retrieve the metadata for rule groups	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTLSInspectionConfigurations	Grants permission to retrieve the metadata for tls inspection configurations	List	TLSInspectionConfiguration*		
ListTagsForResource	Grants permission to retrieve the tags for a resource	List	Firewall*		
			FirewallPolicy*		
			StatefulRuleGroup		
			StatelessRuleGroup		
			TLSInspectionConfiguration		
			VpcEndpointAssociation		
ListVpcEndpointAssociations	Grants permission to retrieve the metadata for vpc endpoint associations	List	VpcEndpointAssociation*		
PutResourcePolicy	Grants permission to put a resource policy for a firewall policy or rule group or firewall	Write	Firewall		
			FirewallPolicy		
			StatefulRuleGroup		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			Stateless RuleGroup		
RejectNetworkFirewallTransitGatewayAttachment	Grants permission to reject pending Network Firewall attachments on a transit gateway	Write	Firewall*		
StartAnalysisReport	Grants permission to start an analysis report on a firewall	Write	Firewall*		
StartFlowCapture	Grants permission to start capture operation on a firewall	Write	Firewall*		
StartFlowFlush	Grants permission to start flush operation on a firewall	Write	Firewall*		
TagResource	Grants permission to attach tags to a resource	Tagging	Firewall		
			FirewallPolicy		
			Proxy		
			ProxyConfiguration		
			ProxyRuleGroup		
			StatefulRuleGroup		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			Stateless RuleGroup		
			TLSInspectionConfiguration		
			VpcEndpointAssociation		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from a resource	Tagging	Firewall		
			FirewallPolicy		
			Proxy		
			ProxyConfiguration		
			ProxyRuleGroup		
			StatefulRuleGroup		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			Stateless RuleGroup		
			TLSInspectionConfiguration		
			VpcEndpointAssociation		
				aws:TagKeys	
UpdateAvailabilityZoneChangeProtection	Grants permission to add or remove availability zone change protection for a firewall	Write	Firewall*		
UpdateFirewallAnalysisSettings	Grants permission to modify firewall analysis settings of a firewall	Write	Firewall*		
UpdateFirewallDeleteProtection	Grants permission to add or remove delete protection for a firewall	Write	Firewall*		
UpdateFirewallDescription	Grants permission to modify the description for a firewall	Write	Firewall*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateFirewallEncryptionConfiguration	Grants permission to modify the encryption configuration of a firewall	Write	Firewall*		
UpdateFirewallPolicy	Grants permission to modify a firewall policy	Write	FirewallPolicy*		
			StatefulRuleGroup		
			StatelessRuleGroup		
			TLSInspectionConfiguration		
UpdateFirewallPolicyChangeProtection	Grants permission to add or remove firewall policy change protection for a firewall	Write	Firewall*		
UpdateLoggingConfiguration	Grants permission to modify the logging configuration of a firewall	Write	Firewall*		
UpdateProxy	Grants permission to modify a proxy	Write	Proxy*		
UpdateProxyConfiguration	Grants permission to modify a proxy configuration	Write	ProxyConfiguration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateProxyRule	Grants permission to update an existing proxy rule on a proxy rule group	Write	ProxyRuleGroup*		
UpdateProxyRuleGroupPriorities	Grants permission to modify rule group priorities on a proxy configuration	Write	ProxyConfiguration*		
UpdateProxyRulePriorities	Grants permission to update proxy rule priorities within a proxy rule group	Write	ProxyRuleGroup*		
UpdateRuleGroup	Grants permission to modify a rule group	Write	StatefulRuleGroup		
			StatelessRuleGroup		
UpdateSubnetChangeProtection	Grants permission to add or remove subnet change protection for a firewall	Write	Firewall*		
UpdateTLSInspectionConfiguration	Grants permission to modify a tls inspection configuration	Write	TLSInspectionConfiguration*		

Resource types defined by AWS Network Firewall

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Firewall	arn:${Partition}:network-firewall:${Region}:${Account}:firewall/${Name}	aws:ResourceTag/${TagKey}
FirewallPolicy	arn:${Partition}:network-firewall:${Region}:${Account}:firewall-policy/${Name}	aws:ResourceTag/${TagKey}
StatefulRuleGroup	arn:${Partition}:network-firewall:${Region}:${Account}:stateful-rulegroup/${Name}	aws:ResourceTag/${TagKey}
StatelessRuleGroup	arn:${Partition}:network-firewall:${Region}:${Account}:stateless-rulegroup/${Name}	aws:ResourceTag/${TagKey}
TLSInspectionConfiguration	arn:${Partition}:network-firewall:${Region}:${Account}:tls-configuration/${Name}	aws:ResourceTag/${TagKey}
VpcEndpointAssociation	arn:${Partition}:network-firewall:${Region}:${Account}:vpc-endpoint-association/${Name}	aws:ResourceTag/${TagKey}
ProxyRuleGroup	arn:${Partition}:network-firewall:${Region}:${Account}:proxy-rule-group/${Name}	aws:ResourceTag/${TagKey}
ProxyConfiguration	arn:${Partition}:network-firewall:${Region}:${Account}:proxy-configuration/${Name}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
Proxy	`arn:${Partition}:network-firewall:${Region}:${Account}:proxy/${Name}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Network Firewall

AWS Network Firewall defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by on the allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters access by the tag value associated with the resource	String
aws:TagKeys	Filters access by the presence of mandatory tags in the request	ArrayOfString

Actions, resources, and condition keys for Network Flow Monitor

Network Flow Monitor (service prefix: `networkflowmonitor`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- View a list of the API operations available for this service.

- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Network Flow Monitor

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateMonitor	Grants permission to create a monitor	Write	monitor*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateScope	Grants permission to create a scope	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteMonitor	Grants permission to delete a monitor	Write	monitor*		
DeleteScope	Grants permission to delete a scope	Write	scope*		
GetMonitor	Grants permission to get information about a monitor	Read	monitor*		
GetQueryResultsMonitorTopContributors	Grants permission to get the results of a query that retrieves top contributors data for a monitor	Read	monitor*		
GetQueryResultsWorkloadInsightsTopContributors	Grants permission to get the results of a query that retrieves top contributors for workload insights	Read	scope*		
GetQueryResultsWorkloadInsightsTopContributorsData	Grants permission to get the results of a query that retrieves top contributors data points for workload insights	Read	scope*		
GetQueryStatusMonitorTopContributors	Grants permission to get the status of a query that retrieves top contributors data for a monitor	Read	monitor*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetQueryStatusWorkloadInsightsTopContributors	Grants permission to get the status of a query that retrieves top contributors for workload insights	Read	scope*		
GetQueryStatusWorkloadInsightsTopContributorsData	Grants permission to get the status of a query that retrieves top contributors data points for workload insights	Read	scope*		
GetScope	Grants permission to get information about a scope	Read	scope*		
ListMonitors	Grants permission to list all monitors in an account and their statuses	List			
ListScopes	Grants permission to get all scopes for an account	List			
ListTagsForResource	Grants permission to list the tags for a resource	Read	monitor scope		
Publish	Grants permission to publish a report	Write			
StartQueryMonitorTopContributors	Grants permission to start a query for retrieving top contributors data for a monitor	Write	monitor*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartQueryWorkloadInsightsTopContributors	Grants permission to start a query for retrieving top contributors data for workload insights	Write	scope*		
StartQueryWorkloadInsightsTopContributorsData	Grants permission to start a query for retrieving top contributors data points for workload insights	Write	scope*		
StopQueryMonitorTopContributors	Grants permission to stop a query for retrieving top contributors data for a monitor	Write	monitor*		
StopQueryWorkloadInsightsTopContributors	Grants permission to stop a query for retrieving top contributors for workload insights	Write	scope*		
StopQueryWorkloadInsightsTopContributorsData	Grants permission to stop a query for retrieving top contributors data points for workload insights	Write	scope*		
TagResource	Grants permission to add tags to a resource	Tagging	monitor scope		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from a resource	Tagging	monitor		
			scope		
				aws:TagKeys	
UpdateMonitor	Grants permission to update a monitor	Write	monitor*		
UpdateScope	Grants permission to update a scope	Write	scope*		

Resource types defined by Network Flow Monitor

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
monitor	arn:${Partition}:networkflowmonitor:${Region}:${Account}:monitor/${MonitorName}	aws:ResourceTag/${TagKey}
scope	arn:${Partition}:networkflowmonitor:${Region}:${Account}:scope/${ScopeId}	aws:ResourceTag/${TagKey}

Condition keys for Network Flow Monitor

Network Flow Monitor defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS Network Manager

AWS Network Manager (service prefix: networkmanager) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Topics

Actions defined by AWS Network Manager

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptAttachment	Grants permission to accept creation of an attachment between a source and destination in a core network	Write	attachment*		ec2:DescribeRegions
AssociateConnectPeer	Grants permission to associate a Connect Peer	Write	device*		
			global-network*		
AssociateCustomerGateway	Grants permission to associate a customer gateway to a device	Write	device*		
			global-network*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			link		
				networkmanager:cgwArn	
Associate Link	Grants permission to associate a link to a device	Write	device*		
			global-network*		
			link*		
Associate TransitGatewayConnectPeer	Grants permission to associate a transit gateway connect peer to a device	Write	device*		
			global-network*		
			link		
				networkmanager:tgwConnectPeerArn	
CreateConnectAttachment	Grants permission to create a Connect attachment	Write	attachment*		ec2:DescribeRegions networkmanager:TagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			core-network*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateConnectPeer	Grants permission to create a Connect Peer connection	Write	attachment*		ec2:DescribeRegions networkmanager:TagResource
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateConnection	Grants permission to create a new connection	Write	global-network*		networkmanager:TagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys

Resource types defined by AWS Network Manager

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
global-network	`arn:${Partition}:networkmanager::${Account}:global-network/${ResourceId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
site	arn:${Partition}:networkmanager::${Account}:site/${GlobalNetworkId}/${ResourceId}	aws:ResourceTag/${TagKey}
link	arn:${Partition}:networkmanager::${Account}:link/${GlobalNetworkId}/${ResourceId}	aws:ResourceTag/${TagKey}
device	arn:${Partition}:networkmanager::${Account}:device/${GlobalNetworkId}/${ResourceId}	aws:ResourceTag/${TagKey}
connection	arn:${Partition}:networkmanager::${Account}:connection/${GlobalNetworkId}/${ResourceId}	aws:ResourceTag/${TagKey}
core-network	arn:${Partition}:networkmanager::${Account}:core-network/${ResourceId}	aws:ResourceTag/${TagKey}
attachment	arn:${Partition}:networkmanager::${Account}:attachment/${ResourceId}	aws:ResourceTag/${TagKey}
connect-peer	arn:${Partition}:networkmanager::${Account}:connect-peer/${ResourceId}	aws:ResourceTag/${TagKey}
peering	arn:${Partition}:networkmanager::${Account}:peering/${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Network Manager

AWS Network Manager defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
networkmanager:cgwArn	Filters access by which customer gateways can be associated or disassociated	ARN
networkmanager:directConnectGatewayArn	Filters access by which Direct Connect gateway can be used to a create/update attachment	ARN
networkmanager:edgeLocations	Filters access by which edge locations can be added or removed from a Direct Connect gateway attachment	ArrayOfString
networkmanager:subnetArns	Filters access by which VPC subnets can be added or removed from a VPC attachment	ArrayOfARN
networkmanager:tgwArn	Filters access by which transit gateways can be registered, deregistered, or peered	ARN
networkmanager:tgwConnectPeerArn	Filters access by which transit gateway connect peers can be associated or disassociated	ARN

Condition keys	Description	Type
networkmanager:tgwRtbArn	Filters access by which Transit Gateway Route Table can be used to create an attachment	ARN
networkmanager:vpcArn	Filters access by which VPC can be used to a create/update attachment	ARN
networkmanager:vpnConnectionArn	Filters access by which Site-to-Site VPN can be used to a create/update attachment	ARN

Actions, resources, and condition keys for AWS Network Manager Chat

AWS Network Manager Chat (service prefix: `networkmanager-chat`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

- Resource types defined by AWS Network Manager Chat
- Condition keys for AWS Network Manager Chat

Actions defined by AWS Network Manager Chat

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelMessageResponse [permission only]	Grants permission to cancel a response to a message	Write			
CreateConversation [permission only]	Grants permission to create a conversation	Write			
DeleteConversation [permission only]	Grants permission to delete a conversation	Write			
ListConversationMessages [permission only]	Grants permission to list conversation messages	List			
ListConversations [permission only]	Grants permission to list conversations	List			
NotifyConversationIsActive [permission only]	Grants permission to notify whether there is activity in a conversation	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SendConversationMessage [permission only]	Grants permission to send a conversation message	Write			

Resource types defined by AWS Network Manager Chat

AWS Network Manager Chat does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Network Manager Chat, specify `"Resource": "*"` in your policy.

Condition keys for AWS Network Manager Chat

Network Manager Chat has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Nimble Studio

Amazon Nimble Studio (service prefix: `nimble`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.

Actions defined by Amazon Nimble Studio

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

Resource types defined by Amazon Nimble Studio

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
studio	`arn:${Partition}:nimble:${Region}:${Account}:studio/${StudioId}`	aws:RequestTag/${TagKey}

Resource types	ARN	Condition keys
		aws:ResourceTag/${TagKey} aws:TagKeys nimble:studioId
streaming-image	arn:${Partition}:nimble:${Region}:${Account}:streaming-image/${StreamingImageId}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys nimble:studioId
studio-component	arn:${Partition}:nimble:${Region}:${Account}:studio-component/${StudioComponentId}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys nimble:studioId

Resource types	ARN	Condition keys
streaming-session	arn:${Partition}:nimble:${Region}:${Account}:streaming-session/${StreamingSessionId}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys nimble:createdBy nimble:ownedBy
streaming-session-backup	arn:${Partition}:nimble:${Region}:${Account}:streaming-session-backup/${StreamingSessionBackupId}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys nimble:ownedBy
eula	arn:${Partition}:nimble:${Region}:${Account}:eula/${EulaId}	
eula-acceptance	arn:${Partition}:nimble:${Region}:${Account}:eula-acceptance/${EulaAcceptanceId}	nimble:studioId

Condition keys for Amazon Nimble Studio

Amazon Nimble Studio defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString
nimble:createdBy	Filters access by the createdBy request parameter or the ID of the creator of the resource	String
nimble:ownedBy	Filters access by the ownedBy request parameter or the ID of the owner of the resource	String
nimble:principalId	Filters access by the principalId request parameter	String
nimble:requesterPrincipalId	Filters access by the ID of the logged in user	String
nimble:studioId	Filters access by a specific studio	ARN

Actions, resources, and condition keys for Amazon Nova Act

Amazon Nova Act (service prefix: `nova-act`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Topics

Actions defined by Amazon Nova Act

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAct	Grants permission to create a new AI task (act) within a session that can interact with tools and perform specific actions	Write	workflow-definition*		
			workflow-run*		
CreateSession	Grants permission to create a new session context within a workflow run to manage conversation state and acts	Write	workflow-definition*		
			workflow-run*		
CreateWorkflowDefinition	Grants permission to create a new workflow definition template that can be used to execute multiple workflow runs	Write	workflow-definition*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateWorkflowRun	Grants permission to create a new execution instance of a workflow definition with specified parameters	Write	workflow-definition*		
DeleteWorkflowDefinition	Grants permission to delete a workflow definition and all associated resources	Write	workflow-definition*		
DeleteWorkflowRun	Grants permission to terminate and clean up a workflow run, stopping all associated acts and sessions	Write	workflow-definition*		
			workflow-run*		
GetWorkflowDefinition	Grants permission to retrieve details and configuration of a specific workflow definition	Read	workflow-definition*		
GetWorkflowRun	Grants permission to retrieve the current state, configuration, and execution details of a workflow run	Read	workflow-definition*		
			workflow-run*		
InvokeActStep	Grants permission to execute the next step of an act, processing tool call results and returning new tool calls if needed	Write	workflow-definition*		
			workflow-run*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListActs	Grants permission to list all acts within a specific session with their current status and execution details	Read	workflow-definition*		
ListModels	Grants permission to list all available AI models that can be used for workflow execution, including their status and compatibility information	Read			
ListSessions	Grants permission to list all sessions within a specific workflow run	Read	workflow-definition*		
			workflow-run*		
ListWorkflowDefinitions	Grants permission to list all workflow definitions in your account with optional filtering and pagination	List			
ListWorkflowRuns	Grants permission to list all workflow runs for a specific workflow definition with optional filtering and pagination	List	workflow-definition*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAct	Grants permission to update an existing act's configuration, status, or error information	Write	workflow-definition*		
			workflow-run*		
UpdateWorkflowRun	Grants permission to update the configuration or state of an active workflow run	Write	workflow-definition*		
			workflow-run*		

Resource types defined by Amazon Nova Act

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
workflow-definition	`arn:${Partition}:nova-act:${Region}:${Account}:workflow-definition/${WorkflowDefinitionName}`	
workflow-run	`arn:${Partition}:nova-act:${Region}:${Account}:workflow-definition/${Wor`	

Resource types	ARN	Condition keys
	kflowDefinitionName}/workflow-run/${ WorkflowRunId}	

Condition keys for Amazon Nova Act

Nova Act has no service-specific context keys that can be used in the Condition element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon One Enterprise

Amazon One Enterprise (service prefix: one) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon One Enterprise

You can specify the following actions in the Action element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateDeviceActivationQrCode	Grants permission to create a QR code for a Device Instance	Write	device-instance*		
				aws:ResourceTag/${TagKey}	
CreateDeviceConfigurationTemplate	Grants permission to create a Device Configuration Template	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateDeviceInstance	Grants permission to create a Device Instance	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateDeviceInstanceConfiguration	Grants permission to create a Device Instance Configuration	Write	device-instance*		
				aws:ResourceTag/${TagKey}	
CreateSite	Grants permission to create a Site	Write		aws:RequestTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} aws:TagKeys	
DeleteAssociatedDevice	Grants permission to disassociate Device from a Device Instance	Write	device-instance*		
				aws:ResourceTag/${TagKey}	
DeleteDeviceConfigurationTemplate	Grants permission to delete a Device Configuration Template	Write	device-configuration-template*		
				aws:ResourceTag/${TagKey}	
DeleteDeviceInstance	Grants permission to delete a Device Instance	Write	device-instance*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteSite	Grants permission to delete a Site	Write	site*		
				aws:ResourceTag/${TagKey}	
DeleteUserV1	Grants permission to delete a User	Write	user*		
GetDeviceConfigurationTemplate	Grants permission to view a Device Configuration Template	Read	device-configuration-template*		
				aws:ResourceTag/${TagKey}	
GetDeviceInstance	Grants permission to view a Device Instance	Read	device-instance*		
				aws:ResourceTag/${TagKey}	
GetDeviceInstanceConfiguration	Grants permission to view a Device Instance Configuration	Read	configuration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
GetSite	Grants permission to view a Site	Read	site*		
				aws:ResourceTag/${TagKey}	
GetSiteAddress	Grants permission to view address of a Site	Read	site*		
				aws:ResourceTag/${TagKey}	
ListDeviceConfigurationTemplates	Grants permission to retrieve list of Device Configuration Templates	List			
ListDeviceInstances	Grants permission to retrieve list of Device Instances	List			
ListSites	Grants permission to view list of Sites	List			
ListTagsForResource	Grants permission to list tags for an Amazon One Enterprise resource	Read	device-configuration-template		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			device-instance		
			site		
				aws:ResourceTag/${TagKey}	
ListUsers	Grants permission to view list of Users	List			
ListUsersV1	Grants permission to view list of Users	List			
RebootDevice	Grants permission to reboot Device associated with a Device Instance	Write	device-instance*		
				aws:ResourceTag/${TagKey}	
TagResource	Grants permission to add tags to an Amazon One Enterprise resource	Tagging	device-configuration-template		
			device-instance		
			site		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from an Amazon One Enterprise resource	Tagging	device-configuration-template		
			device-instance		
			site		
				aws:TagKeys	
UpdateDeviceConfigurationTemplate	Grants permission to update a Device Configuration Template	Write	device-configuration-template*		
				aws:ResourceTag/${TagKey}	
UpdateDeviceInstance	Grants permission to update a Device Instance	Write	device-instance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
UpdateSite	Grants permission to update a Site	Write	site*		
				aws:ResourceTag/${TagKey}	
UpdateSiteAddress	Grants permission to update address of a Site	Write	site*		
				aws:ResourceTag/${TagKey}	

Resource types defined by Amazon One Enterprise

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
device-instance	arn:${Partition}:one:${Region}:${Account}:device-instance/${DeviceInstanceId}	aws:ResourceTag/${TagKey}
configuration	arn:${Partition}:one:${Region}:${Account}:device-instance/${DeviceInstanceId}/configuration/${Version}	
device-configuration-template	arn:${Partition}:one:${Region}:${Account}:device-configuration-template/${TemplateId}	aws:ResourceTag/${TagKey}
site	arn:${Partition}:one:${Region}:${Account}:site/${SiteId}	aws:ResourceTag/${TagKey}
user	arn:${Partition}:one:${Region}:${Account}:user/${UserId}	

Condition keys for Amazon One Enterprise

Amazon One Enterprise defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by using tag key-value pairs in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by using tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon OpenSearch

Amazon OpenSearch (service prefix: `opensearch`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon OpenSearch

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of

access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ApplicationAccessAll [permission only]	Grants permission to access OpenSearch Application	Permissions management	application*		
CancelAutoOptimizeJob	Grants permission to cancel submitted Auto Optimize Job	Write			
CancelDirectQuery	Grants permission to cancel the query that is submitted on the OpenSearch DataSource resource	Write	datasource*		
DeleteAutoOptimizeJob	Grants permission to delete Auto Optimize Job	Write			
GetAutoOptimizeJob	Grants permission to get the Auto Optimize Job details	Read			
GetDirectQuery	Grants permission to get the query status that are performed on the OpenSearch DataSource resource	Read	datasource*		
GetDirectQueryResult	Grants permission to get the results of a query that is performed on the OpenSearch DataSource resource	Read	datasource*		
ListAutoOptimizeJobs	Grants permission to retrieve a list of Auto Optimize Jobs	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartDirectQuery	Grants permission to start a direct query on the provided OpenSearch DataSource arns	Write	datasource*		
SubmitAutoOptimizeJob	Grants permission to create new Auto Optimize Job	Write			

Resource types defined by Amazon OpenSearch

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
application	`arn:${Partition}:opensearch:${Region}:${Account}:application/${AppId}`	
datasource	`arn:${Partition}:opensearch:${Region}:${Account}:datasource/${DataSourceName}`	

Condition keys for Amazon OpenSearch

OpenSearch has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon OpenSearch Ingestion

Amazon OpenSearch Ingestion (service prefix: `osis`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreatePipeline	Grants permission to create an OpenSearch Ingestion pipeline	Write		aws:TagKeys aws:RequestTag/${TagKey}	iam:CreateServiceLinkedRole iam:PassRole kms:DescribeKey

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					kms:GenerateDataKeyWithoutPlaintext logs:CreateLogDelivery
CreatePipelineEndpoint	Grants permission to create an OpenSearch Ingestion pipeline endpoint	Write	pipeline*		iam:CreateServiceLinkedRole
				aws:TagKeys aws:RequestTag/${TagKey}	
DeletePipeline	Grants permission to delete an OpenSearch Ingestion pipeline	Write	pipeline*		logs:DeleteLogDelivery logs:GetLogDelivery logs:ListLogDeliveries

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeletePipelineEndpoint	Grants permission to delete an OpenSearch Ingestion pipeline endpoint in the current account	Write	pipeline-endpoint*		
DeleteResourcePolicy	Grants permission to delete a resource policy for an OpenSearch Ingestion resource	Write	pipeline*		
GetPipeline	Grants permission to retrieve configuration information for an OpenSearch Ingestion pipeline	Read	pipeline*		
GetPipelineBlueprint	Grants permission to get the contents of an OpenSearch Ingestion pipeline blueprint	Read	pipeline-blueprint*		
GetPipelineChangeProgress	Grants permission to get granular information about the status of an OpenSearch Ingestion pipeline	Read	pipeline*		
GetResourcePolicy	Grants permission to get a resource policy for an OpenSearch Ingestion resource	Read	pipeline*		
Ingest	Grants permission to ingest data through an OpenSearch Ingestion pipeline	Write	pipeline*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListPipelineBlueprints	Grants permission to list the names of available blueprints for an OpenSearch Ingestion pipeline configuration	List			
ListPipelineEndpointConnections	Grants permission to list OpenSearch Ingestion pipeline endpoint connections to pipelines in the current account	List			
ListPipelineEndpoints	Grants permission to list OpenSearch Ingestion pipeline endpoints in the current account	List			
ListPipelines	Grants permission to list basic configuration for each OpenSearch Ingestion pipeline in the current account and Region	List			
ListTagsForResource	Grants permission to list all resource tags associated with an OpenSearch Ingestion pipeline	Read	pipeline*		
PutResourcePolicy	Grants permission to put a resource policy for an OpenSearch Ingestion resource	Write	pipeline*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RevokePipelineEndpointConnections	Grants permission to revoke an OpenSearch Ingestion pipeline endpoint connection from a pipeline in the current account	Write	pipeline*		
StartPipeline	Grants permission to start an OpenSearch Ingestion pipeline	Write	pipeline*		
StopPipeline	Grants permission to stop an OpenSearch Ingestion pipeline	Write	pipeline*		
TagResource	Grants permission to attach resource tags to an OpenSearch Ingestion pipeline	Tagging	pipeline*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove resource tags from an OpenSearch Ingestion Service pipeline	Tagging	pipeline*		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdatePipeline	Grants permission to modify the configuration of an OpenSearch Ingestion pipeline	Write	pipeline*		iam:PassRole kms:DescribeKey kms:GenerateDataKeyWithoutPlaintext logs:GetLogDelivery logs:ListLogDeliveries logs:UpdateLogDelivery
ValidatePipeline	Grants permission to validate the configuration of an OpenSearch Ingestion pipeline	Read			

Resource types defined by Amazon OpenSearch Ingestion

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
pipeline	`arn:${Partition}:osis:${Region}:${Account}:pipeline/${PipelineName}`	aws:ResourceTag/${TagKey}
pipeline-endpoint	`arn:${Partition}:osis:${Region}:${Account}:endpoint/${EndpointId}`	aws:ResourceTag/${TagKey}
pipeline-blueprint	`arn:${Partition}:osis:${Region}:${Account}:blueprint/${BlueprintName}`	

Condition keys for Amazon OpenSearch Ingestion

Amazon OpenSearch Ingestion defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon OpenSearch Serverless

Amazon OpenSearch Serverless (service prefix: `aoss`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Resource types defined by Amazon OpenSearch Serverless

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Collection	`arn:${Partition}:aoss:${Region}:${Account}:collection/${CollectionId}`	aws:ResourceTag/${TagKey}
CollectionGroup	`arn:${Partition}:aoss:${Region}:${Account}:collection-group/${CollectionGroupId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
Dashboards	`arn:${Partition}:aoss:${Region}:${Account}:dashboards/default`	

Condition keys for Amazon OpenSearch Serverless

Amazon OpenSearch Serverless defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aoss:CollectionId	Filters access by the identifier of the collection	String
aoss:collection	Filters access by the collection name	String
aoss:collection-group	Filters access by the collection group name	String
aoss:index	Filters access by the index	String
aws:RequestTag/${TagKey}	Filters access based on the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access based on the tags associated with the resource	String
aws:TagKeys	Filters access based on the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon OpenSearch Service

Amazon OpenSearch Service (service prefix: `es`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon OpenSearch Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptInboundConnection	Grants permission to the destination domain owner to accept an inbound cross-cluster search connection request	Write			
AcceptInboundCrossClusterSe	Grants permission to the destination domain owner to accept an inbound cross-cluster search connection	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
archConnection	request. This permission is deprecated. Use AcceptInboundConnection instead				
AddDataSource	Grants permission to add the data source for the OpenSearch Service domain	Write	domain*		
AddDirectQueryDataSource	Grants permission to add the data source for the provided OpenSearch arns	Write	datasource*		
				aws:RequestTag/${TagKey} aws:TagKeys	
AddTags	Grants permission to attach resource tags to an OpenSearch Service domain, data source, or application	Tagging	application*		
			datasource*		
			domain*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociatePackage	Grants permission to associate a package with an OpenSearch Service domain	Write	domain*		
AssociatePackages	Grants permission to associate multiple packages with an OpenSearch Service domain	Write	domain*		
AuthorizeVpcEndpointAccess	Grants permission to provide access to an Amazon OpenSearch Service domain through the use of an interface VPC endpoint	Write			
CancelDomainConfigChange	Grants permission to cancel a change on an OpenSearch Service domain	Write	domain*		
CancelElasticsearchServiceSoftwareUpdate	Grants permission to cancel a service software update of a domain. This permission is deprecated. Use CancelServiceSoftwareUpdate instead	Write	domain*		
CancelServiceSoftwareUpdate	Grants permission to cancel a service software update of a domain	Write	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateApplication	Grants permission to create an OpenSearch Application	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateDomain	Grants permission to create an Amazon OpenSearch Service domain	Write	domain		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateElasticsearchDomain	Grants permission to create an OpenSearch Service domain. This permission is deprecated. Use CreateDomain instead	Write	domain		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateElasticsearchServiceRole	Grants permission to create the service-linked role required for OpenSearch Service domains that use VPC access. This permission is deprecated. OpenSearch Service creates the service-linked role for you	Write			
CreateIndex	Grants permission to create index for the OpenSearch Service domain	Write	domain*		
CreateOutboundConnection	Grants permission to create a new cross-cluster search connection from a source domain to a destination domain	Write	domain*		
CreateOutboundCrossClusterSearchConnection	Grants permission to create a new cross-cluster search connection from a source domain to a destination domain. This permission is deprecated. Use CreateOutboundConnection instead	Write	domain*		
CreatePackage	Grants permission to add a package for use with OpenSearch Service domains	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateServiceRole	Grants permission to create the service-linked role required for Amazon OpenSearch Service domains that use VPC access	Write			
CreateVpcEndpoint	Grants permission to create an Amazon OpenSearch Service-managed VPC endpoint	Write			
DeleteApplication	Grants permission to delete an OpenSearch Application	Write	application*		
DeleteDataSource	Grants permission to delete the data source for the OpenSearch Service domain	Write	domain*		
DeleteDirectQueryDataSource	Grants permission to delete the data source for the provided OpenSearch arns	Write	datasource*		
DeleteDomain	Grants permission to delete an Amazon OpenSearch Service domain and all of its data	Write	domain*		
DeleteElasticsearchDomain	Grants permission to delete an OpenSearch Service domain and all of its data. This permission is deprecated. Use DeleteDomain instead	Write	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteElasticsearchServiceRole	Grants permission to delete the service-linked role required for OpenSearch Service domains that use VPC access. This permission is deprecated. Use the IAM API to delete service-linked roles	Write			
DeleteInboundConnection	Grants permission to the destination domain owner to delete an existing inbound cross-cluster search connection	Write			
DeleteInboundCrossClusterSearchConnection	Grants permission to the destination domain owner to delete an existing inbound cross-cluster search connection. This permission is deprecated. Use DeleteInboundConnection instead	Write			
DeleteIndex	Grants permission to delete Index for the OpenSearch Service domain	Write	domain*		
DeleteOutboundConnection	Grants permission to the source domain owner to delete an existing outbound cross-cluster search connection	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteOutboundCrossClusterSearchConnection	Grants permission to the source domain owner to delete an existing outbound cross-cluster search connection. This permission is deprecated. Use DeleteOutboundConnection instead	Write			
DeletePackage	Grants permission to delete a package from OpenSearch Service. The package cannot be associated with any domains	Write			
DeleteVpcEndpoint	Grants permission to delete an Amazon OpenSearch Service-managed interface VPC endpoint	Write			
DescribeDomain	Grants permission to view a description of the domain configuration for the specified OpenSearch Service domain, including the domain ID, service endpoint, and ARN	Read	domain*		
DescribeDomainAutoTunes	Grants permission to view the Auto-Tune configuration of the domain for the specified OpenSearch Service domain, including the Auto-Tune state and maintenance schedules	Read	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeDomainChangeProgress	Grants permission to view detail stage progress of an OpenSearch Service domain	Read	domain*		
DescribeDomainConfig	Grants permission to view a description of the configuration options and status of an OpenSearch Service domain	Read	domain*		
DescribeDomainHealth	Grants permission to view information about domain and node health, the standby Availability Zone, number of nodes per Availability Zone, and shard count per node	Read	domain*		
DescribeDomainNodes	Grants permission to view information about nodes configured for the domain and their configurations- the node id, type of node, status of node, Availability Zone, instance type and storage	Read	domain*		
DescribeDomains	Grants permission to view a description of the domain configuration for up to five specified OpenSearch Service domains	List	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeDryRunProgress	Grants permission to describe the status of a pre-update validation check on an OpenSearch Service domain	Read	domain*		
DescribeElasticsearchDomain	Grants permission to view a description of the domain configuration for the specified OpenSearch Service domain, including the domain ID, service endpoint, and ARN. This permission is deprecated. Use DescribeDomain instead	Read	domain*		
DescribeElasticsearchDomainConfig	Grants permission to view a description of the configuration and status of an OpenSearch Service domain. This permission is deprecated. Use DescribeDomainConfig instead	Read	domain*		
DescribeElasticsearchDomains	Grants permission to view a description of the domain configuration for up to five specified Amazon OpenSearch domains. This permission is deprecated. Use DescribeDomains instead	List	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeElasticsearchInstanceTypeLimits	Grants permission to view the instance count, storage, and master node limits for a given OpenSearch version and instance type. This permission is deprecated. Use DescribeInstanceTypeLimits instead	List			
DescribeInboundConnections	Grants permission to list all the inbound cross-cluster search connections for a destination domain	List			
DescribeInboundCrossClusterSearchConnections	Grants permission to list all the inbound cross-cluster search connections for a destination domain. This permission is deprecated. Use DescribeInboundConnections instead	List			
DescribeInsightDetails	Grants permission to view detailed information about insights for an OpenSearch Service domain	Read	domain*		
DescribeInstanceTypeLimits	Grants permission to view the instance count, storage, and master node limits for a given engine version and instance type	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeOutboundConnections	Grants permission to list all the outbound cross-cluster search connections for a source domain	List			
DescribeOutboundCrossClusterSearchConnections	Grants permission to list all the outbound cross-cluster search connections for a source domain. This permission is deprecated. Use DescribeOutboundConnections instead	List			
DescribePackages	Grants permission to describe all packages available to OpenSearch Service domains	Read			
DescribeReservedElasticsearchInstanceOfferings	Grants permission to fetch Reserved Instance offerings for Amazon OpenSearch Service. This permission is deprecated. Use DescribeReservedInstanceOfferings instead	List			
DescribeReservedElasticsearchInstances	Grants permission to fetch OpenSearch Service Reserved Instances that have already been purchased. This permission is deprecated. Use DescribeReservedInstances instead	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeReservedInstanceOfferings	Grants permission to fetch Reserved Instance offerings for OpenSearch Service	List			
DescribeReservedInstances	Grants permission to fetch OpenSearch Service Reserved Instances that have already been purchased	List			
DescribeVpcEndpoints	Grants permission to describe one or more Amazon OpenSearch Service-managed VPC endpoints	List			
DissociatePackage	Grants permission to disassociate a package from the specified OpenSearch Service domain	Write	domain*		
DissociatePackages	Grants permission to disassociate multiple packages from the specified OpenSearch Service domain	Write	domain*		
ESCrossClusterGet	Grants permission to send cross-cluster requests to a destination domain	Read	domain		
ESHttpDelete	Grants permission to send HTTP DELETE requests to the OpenSearch APIs	Write	domain		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ESHttpGet	Grants permission to send HTTP GET requests to the OpenSearch APIs	Read	domain		
ESHttpHead	Grants permission to send HTTP HEAD requests to the OpenSearch APIs	Read	domain		
ESHttpPatch	Grants permission to send HTTP PATCH requests to the OpenSearch APIs	Write	domain		
ESHttpPost	Grants permission to send HTTP POST requests to the OpenSearch APIs	Write	domain		
ESHttpPut	Grants permission to send HTTP PUT requests to the OpenSearch APIs	Write	domain		
GetApplication	Grants permission to get information about an OpenSearch Application	Read	application*		
GetCompatibleElasticsearchVersions	Grants permission to fetch a list of compatible OpenSearch and Elasticsearch versions to which an OpenSearch Service domain can be upgraded. This permission is deprecated. Use GetCompatibleVersions instead	List	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCompatibleVersions	Grants permission to fetch list of compatible engine versions to which an OpenSearch Service domain can be upgraded	List	domain*		
GetDataSource	Grants permission to get the data source for the OpenSearch Service domain	Read	domain*		
GetDefaultApplicationSetting	Grants permission to get the default application setting for OpenSearch Service	Read	application*		
GetDirectQueryDataSource	Grants permission to get the data source for the provided OpenSearch arns	Read	datasource*		
GetDomainMaintenanceStatus	Grants permission to retrieve the status of maintenance action for the node	Read	domain*		
GetIndex	Grants permission to get index for the OpenSearch Service domain	Read	domain*		
GetPackageVersionHistory	Grants permission to fetch the version history for a package	Read			
GetUpgradeHistory	Grants permission to fetch the upgrade history of a given OpenSearch Service domain	Read	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetUpgradeStatus	Grants permission to fetch the upgrade status of a given OpenSearch Service domain	Read	domain*		
ListApplications	Grants permission to list OpenSearch Applications	List	application*		
ListDataSources	Grants permission to retrieve a list of data source for the OpenSearch Service domain	List	domain*		
ListDirectQueryDataSources	Grants permission to retrieve a list of data source for the provided OpenSearch arns	List	datasource*		
ListDomainMaintenances	Grants permission to retrieve a list of maintenance actions for the OpenSearch Service domain	List	domain*		
ListDomainNames	Grants permission to display the names of all OpenSearch Service domains that the current user owns	List			
ListDomainsForPackage	Grants permission to list all OpenSearch Service domains that a package is associated with	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListElasticsearchInstanceTypeDetails	Grants permission to list all instance types and available features for a given OpenSearch version. This permission is deprecated. Use ListInstanceTypeDetails instead	List			
ListElasticsearchInstanceTypes	Grants permission to list all EC2 instance types that are supported for a given OpenSearch version	List			
ListElasticsearchVersions	Grants permission to list all supported OpenSearch versions on Amazon OpenSearch Service. This permission is deprecated. Use ListVersions instead	List			
ListInsights	Grants permission to list insights for OpenSearch Service domains in the account	List	domain		
ListInstanceTypeDetails	Grants permission to list all instance types and available features for a given OpenSearch or Elasticsearch version	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListPackagesForDomain	Grants permission to list all packages associated with the OpenSearch Service domain	List	domain*		
ListScheduledActions	Grants permission to retrieve a list of configuration changes that are scheduled for a OpenSearch Service domain	List	domain*		
ListTags	Grants permission to display all resource tags for an OpenSearch Service domain, data source, or application	Read	application*		
			datasource*		
			domain*		
ListVersions	Grants permission to list all supported OpenSearch and Elasticsearch versions in Amazon OpenSearch Service	List			
ListVpcEndpointAccess	Grants permission to retrieve information about each AWS principal that is allowed to access a given Amazon OpenSearch Service domain through the use of an interface VPC endpoint	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListVpcEndpoints	Grants permission to retrieve all Amazon OpenSearch Service-managed VPC endpoints in the current AWS account and Region	List			
ListVpcEndpointsForDomain	Grants permission to retrieve all Amazon OpenSearch Service-managed VPC endpoints associated with a particular domain	List			
PurchaseReservedElasticsearchInstanceOffering	Grants permission to purchase OpenSearch Service Reserved Instances. This permission is deprecated. Use PurchaseReservedInstanceOffering instead	Write			
PurchaseReservedInstanceOffering	Grants permission to purchase OpenSearch reserved instances	Write			
PutDefaultApplicationSetting	Grants permission to set or remove the default application setting for OpenSearch Service	Write	application*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RejectInboundConnection	Grants permission to the destination domain owner to reject an inbound cross-cluster search connection request	Write			
RejectInboundCrossClusterSearchConnection	Grants permission to the destination domain owner to reject an inbound cross-cluster search connection request. This permission is deprecated. Use RejectInboundConnection instead	Write			
RemoveTags	Grants permission to remove resource tags from an OpenSearch Service domain, data source, or application	Tagging	application*		
			datasource*		
			domain*		
				aws:TagKeys	
RevokeVpcEndpointAccess	Grants permission to revoke access to an Amazon OpenSearch Service domain that was provided through an interface VPC endpoint	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RollbackElasticsearchServiceSoftwareUpdate	Grants permission to rollback a service software update of an elasticsearch domain to its previous version	Write	domain*		
RollbackServiceSoftwareUpdate	Grants permission to rollback a service software update of an opensearch domain to its previous version	Write	domain*		
StartDomainMaintenance	Grants permission to initiate the maintenance on the node	Write	domain*		
StartElasticsearchServiceSoftwareUpdate	Grants permission to start a service software update of a domain. This permission is deprecated. Use StartServiceSoftwareUpdate instead	Write	domain*		
StartServiceSoftwareUpdate	Grants permission to start a service software update of a domain	Write	domain*		
UpdateApplication	Grants permission to update an OpenSearch Application	Write	application*		
UpdateDataSource	Grants permission to update the data source for the OpenSearch Service domain	Write	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateDirectQueryDataSource	Grants permission to update the data source for the provided OpenSearch arns	Write	datasource*		
UpdateDomainConfig	Grants permission to modify the configuration of an OpenSearch Service domain, such as the instance type or number of instances	Write	domain*		
UpdateElasticsearchDomainConfig	Grants permission to modify the configuration of an OpenSearch Service domain, such as the instance type or number of instances. This permission is deprecated. Use UpdateDomainConfig instead	Write	domain*		
UpdateIndex	Grants permission to update index for the OpenSearch Service domain	Write	domain*		
UpdatePackage	Grants permission to update a package for use with OpenSearch Service domains	Write			
UpdatePackageScope	Grants permission to update scope a package	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateScheduledAction	Grants permission to reschedule a planned OpenSearch Service domain configuration change for a later time	Write	domain*		
UpdateVpcEndpoint	Grants permission to modify an Amazon OpenSearch Service-managed interface VPC endpoint	Write			
UpgradeDomain	Grants permission to initiate upgrade of an OpenSearch Service domain to a given version	Write	domain*		
UpgradeElasticsearchDomain	Grants permission to initiate upgrade of an OpenSearch Service domain to a specified version. This permission is deprecated. Use UpgradeDomain instead	Write	domain*		

Resource types defined by Amazon OpenSearch Service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
domain	arn:${Partition}:es:${Region}:${Account}:domain/${DomainName}	aws:ResourceTag/${TagKey}
application	arn:${Partition}:opensearch:${Region}:${Account}:application/${AppId}	aws:ResourceTag/${TagKey}
es_role	arn:${Partition}:iam::${Account}:role/aws-service-role/es.amazonaws.com/AWSServiceRoleForAmazonOpenSearchService	aws:ResourceTag/${TagKey}
opensearchservice_role	arn:${Partition}:iam::${Account}:role/aws-service-role/opensearchservice.amazonaws.com/AWSServiceRoleForAmazonOpenSearchService	aws:ResourceTag/${TagKey}
datasource	arn:${Partition}:opensearch:${Region}:${Account}:datasource/${DataSourceName}	aws:ResourceTag/${TagKey}

Condition keys for Amazon OpenSearch Service

Amazon OpenSearch Service defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access based on the tags that are passed in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access based on the tags associated with the resource	String
aws:TagKeys	Filters access based on the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS OpsWorks

AWS OpsWorks (service prefix: `opsworks`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Resource types defined by AWS OpsWorks
- Condition keys for AWS OpsWorks

Actions defined by AWS OpsWorks

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of

access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssignInstance	Grants permission to assign a registered instance to a layer	Write	stack		
AssignVolume	Grants permission to assign one of the stack's registered Amazon EBS volumes to a specified instance	Write	stack		
AssociateElasticIp	Grants permission to associate one of the stack's registered Elastic IP addresses with a specified instance	Write	stack		
AttachElasticLoadBalancer	Grants permission to attach an Elastic Load Balancing load balancer to a specified layer	Write	stack		
CloneStack	Grants permission to create a clone of a specified stack	Write	stack		
CreateApp	Grants permission to create an app for a specified stack	Write	stack		
CreateDeployment	Grants permission to run deployment or stack commands	Write	stack		
CreateInstance	Grants permission to create an instance in a specified stack	Write	stack		
CreateLayer	Grants permission to create a layer	Write	stack		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateStack	Grants permission to create a new stack	Write			
CreateUserProfile	Grants permission to create a new user profile	Write			
DeleteApp	Grants permission to delete a specified app	Write	stack		
DeleteInstance	Grants permission to delete a specified instance, which terminates the associated Amazon EC2 instance	Write	stack		
DeleteLayer	Grants permission to delete a specified layer	Write	stack		
DeleteStack	Grants permission to delete a specified stack	Write	stack		
DeleteUserProfile	Grants permission to delete a user profile	Write			
DeregisterEcsCluster	Grants permission to delete a user profile	Write	stack		
DeregisterElasticIp	Grants permission to deregister a specified Elastic IP address	Write	stack		
DeregisterInstance	Grants permission to deregister a registered Amazon EC2 or on-premises instance	Write	stack		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeregisterRdsDbInstance	Grants permission to deregister an Amazon RDS instance	Write	stack		
DeregisterVolume	Grants permission to deregister an Amazon EBS volume	Write	stack		
DescribeAgentVersions	Grants permission to describe the available AWS OpsWorks agent versions	List	stack		
DescribeApps	Grants permission to request a description of a specified set of apps	List	stack		
DescribeCommands	Grants permission to describe the results of specified commands	List	stack		
DescribeDeployments	Grants permission to request a description of a specified set of deployments	List	stack		
DescribeEcsClusters	Grants permission to describe Amazon ECS clusters that are registered with a stack	List	stack		
DescribeElasticIps	Grants permission to describe Elastic IP addresses	List	stack		
DescribeElasticLoadBalancers	Grants permission to describe a stack's Elastic Load Balancing instances	List	stack		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeInstances	Grants permission to request a description of a set of instances	List	stack		
DescribeLayers	Grants permission to request a description of one or more layers in a specified stack	List	stack		
DescribeLoadBasedAutoScaling	Grants permission to describe load-based auto scaling configurations for specified layers	List	stack		
DescribeMyUserProfile	Grants permission to describe a user's SSH information	List			
DescribeOperatingSystems	Grants permission to describe the operating systems that are supported by AWS OpsWorks Stacks	List			
DescribePermissions	Grants permission to describe the permissions for a specified stack	List	stack		
DescribeRaidArrays	Grants permission to describe an instance's RAID arrays	List	stack		
DescribeRdsDbInstances	Grants permission to describe Amazon RDS instances	List	stack		
DescribeServiceErrors	Grants permission to describe AWS OpsWorks service errors	List	stack		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeStackProvisioningParameters	Grants permission to request a description of a stack's provisioning parameters	List	stack		
DescribeStackSummary	Grants permission to describe the number of layers and apps in a specified stack, and the number of instances in each state, such as running_setup or online	List	stack		
DescribeStacks	Grants permission to request a description of one or more stacks	List	stack		
DescribeTimeBasedAutoScaling	Grants permission to describe time-based auto scaling configurations for specified instances	List	stack		
DescribeUserProfiles	Grants permission to describe specified users	List			
DescribeVolumes	Grants permission to describe an instance's Amazon EBS volumes	List	stack		
DetachElasticLoadBalancer	Grants permission to detache a specified Elastic Load Balancing instance from its layer	Write	stack		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateElasticIp	Grants permission to disassociate an Elastic IP address from its instance	Write	stack		
GetHostnameSuggestion	Grants permission to get a generated host name for the specified layer, based on the current host name theme	Read	stack		
GrantAccess	Grants permission to grant RDP access to a Windows instance for a specified time period	Write	stack		
ListTags	Grants permission to return a list of tags that are applied to the specified stack or layer	List	stack		
RebootInstance	Grants permission to reboot a specified instance	Write	stack		
RegisterEcsCluster	Grants permission to register a specified Amazon ECS cluster with a stack	Write	stack		
RegisterElasticIp	Grants permission to register an Elastic IP address with a specified stack	Write	stack		
RegisterInstance	Grants permission to register instances with a specified stack that were created outside of AWS OpsWorks	Write	stack		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RegisterRdsDbInstance	Grants permission to register an Amazon RDS instance with a stack	Write	stack		
RegisterVolume	Grants permission to register an Amazon EBS volume with a specified stack	Write	stack		
SetLoadBasedAutoScaling	Grants permission to specify the load-based auto scaling configuration for a specified layer	Write	stack		
SetPermission	Grants permission to specify a user's permissions	Permissions management	stack		
SetTimeBasedAutoScaling	Grants permission to specify the time-based auto scaling configuration for a specified instance	Write	stack		
StartInstance	Grants permission to start a specified instance	Write	stack		
StartStack	Grants permission to start a stack's instances	Write	stack		
StopInstance	Grants permission to stop a specified instance	Write	stack		
StopStack	Grants permission to stop a specified stack	Write	stack		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to apply tags to a specified stack or layer	Tagging	stack		
UnassignInstance	Grants permission to unassign a registered instance from all of it's layers	Write	stack		
UnassignVolume	Grants permission to unassign an assigned Amazon EBS volume	Write	stack		
UntagResource	Grants permission to remove tags from a specified stack or layer	Tagging	stack		
UpdateApp	Grants permission to update a specified app	Write	stack		
UpdateElasticIp	Grants permission to update a registered Elastic IP address's name	Write	stack		
UpdateInstance	Grants permission to update a specified instance	Write	stack		
UpdateLayer	Grants permission to update a specified layer	Write	stack		
UpdateMyUserProfile	Grants permission to update a user's SSH public key	Write			
UpdateRdsDbInstance	Grants permission to update an Amazon RDS instance	Write	stack		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateStack	Grants permission to update a specified stack	Write	stack		
UpdateUserProfile	Grants permission to update a specified user profile	Permissions management			
UpdateVolume	Grants permission to update an Amazon EBS volume's name or mount point	Write	stack		

Resource types defined by AWS OpsWorks

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
stack	`arn:${Partition}:opsworks:${Region}:${Account}:stack/${StackId}/`	

Condition keys for AWS OpsWorks

OpsWorks has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS OpsWorks Configuration Management

AWS OpsWorks Configuration Management (service prefix: `opsworks-cm`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Topics

Actions defined by AWS OpsWorks Configuration Management

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateNode	Grants permission to associate a node to a configuration management server	Write			
CreateBackup	Grants permission to create a backup for the specified server	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateServer	Grants permission to create a new server	Write			
DeleteBackup	Grants permission to delete the specified backup and possibly its S3 bucket	Write			
DeleteServer	Grants permission to delete the specified server with its corresponding CloudFormation stack and possibly the S3 bucket	Write			
DescribeAccountAttributes	Grants permission to describe the service limits for the user's account	List			
DescribeBackups	Grants permission to describe a single backup, all backups of a specified server or all backups of the user's account	List			
DescribeEvents	Grants permission to describe all events of the specified server	List			
DescribeNodeAssociationStatus	Grants permission to describe the association status for the specified node token and the specified server	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeServers	Grants permission to describe the specified server or all servers of the user's account	List			
DisassociateNode	Grants permission to disassociate a specified node from a server	Write			
ExportServerEngineAttribute	Grants permission to export an engine attribute from a server	Read			
ListTagsForResource	Grants permission to list the tags that are applied to the specified server or backup	Read			
RestoreServer	Grants permission to apply a backup to specified server. Possibly swaps out the ec2-instance if specified	Write			
StartMaintenance	Grants permission to start the server maintenance immediately	Write			
TagResource	Grants permission to apply tags to the specified server or backup	Tagging			
UntagResource	Grants permission to remove tags from the specified server or backup	Tagging			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateServer	Grants permission to update general server settings	Write			
UpdateServerEngineAttributes	Grants permission to update server settings specific to the configuration management type	Write			

Resource types defined by AWS OpsWorks Configuration Management

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
server	`arn:${Partition}:opsworks-cm::${Account}:server/${ServerName}/${UniqueId}`	
backup	`arn:${Partition}:opsworks-cm::${Account}:backup/${ServerName}-{Date-and-Time-Stamp-of-Backup}`	

Condition keys for AWS OpsWorks Configuration Management

OpsworksCM has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Organizations

AWS Organizations (service prefix: `organizations`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Organizations

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a

resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptHandshake	Grants permission to send a response to the originator of a handshake agreeing to the action proposed by the handshake request	Write	handshake*		iam:CreateServiceLinkedRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AttachPolicy	Grants permission to attach a policy to a root, an organizational unit, or an individual account	Write	policy*		
			account		
			organizationalunit		
			root		
				organizations:PolicyType	
CancelHandshake	Grants permission to cancel a handshake	Write	handshake*		
CloseAccount	Grants permission to close an AWS account that is now a part of an Organizations, either created within the organization, or invited to join the organization	Write	account*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAccount	Grants permission to create an AWS account that is automatically a member of the organization with the credentials that made the request	Write		aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	
CreateGovCloudAccount	Grants permission to create an AWS GovCloud (US) account	Write		aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateOrganization	Grants permission to create an organization. The account with the credentials that calls the CreateOrganization operation automatically becomes the management account of the new organization	Write			iam:CreateServiceLinkedRole
CreateOrganizationalUnit	Grants permission to create an organizational unit (OU) within a root or parent OU	Write	organizationalunit		
			root		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreatePolicy	Grants permission to create a policy that you can attach to a root, an organizational unit (OU), or an individual AWS account	Write		organizations:PolicyType aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	
DeclineHandshake	Grants permission to decline a handshake request. This sets the handshake state to DECLINED and effectively deactivates the request	Write	handshake*		
DeleteOrganization	Grants permission to delete the organization	Write			
DeleteOrganizationalUnit	Grants permission to delete an organizational unit from a root or another OU	Write	organizationalunit*		
DeletePolicy	Grants permission to delete a policy from your organization	Write	policy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				organizations:PolicyType	
DeleteResourcePolicy	Grants permission to delete a resource policy from your organization	Write			
DeregisterDelegatedAdministrator	Grants permission to deregister the specified member AWS account as a delegated administrator for the AWS service that is specified by ServicePrincipal	Write	account*		
				organizations:ServicePrincipal	
DescribeAccount	Grants permission to retrieve Organizations-related details about the specified account	Read	account*		
DescribeCreateAccountStatus	Grants permission to retrieve the current status of an asynchronous request to create an account	Read			
DescribeEffectivePolicy	Grants permission to retrieve the effective policy for an account	Read	account*		
				organizations:PolicyType	
DescribeHandshake	Grants permission to retrieve details about a previously requested handshake	Read	handshake*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeOrganization	Grants permission to retrieve details about the organization that the calling credentials belong to	Read			
DescribeOrganizationalUnit	Grants permission to retrieve details about an organizational unit (OU)	Read	organizationalunit*		
DescribePolicy	Grants permission to retrieve details about a policy	Read	policy*		
				organizations:PolicyType	
DescribeResourcePolicy	Grants permission to retrieve information about a resource policy	Read			
DescribeResponsibilityTransfer	Grants permission to retrieve details about a previously responsibility transfer	Read	responsibilitytransfer*		
				organizations:TransferType organizations:TransferDirection	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DetachPolicy	Grants permission to detach a policy from a target root, organizational unit, or account	Write	policy*		
			account		
			organizationalunit		
			root		
				organizations:PolicyType	
DisableAWSServiceAccess	Grants permission to disable integration of an AWS service (the service that is specified by ServicePrincipal) with AWS Organizations	Write		organizations:ServicePrincipal	
DisablePolicyType	Grants permission to disable an organization policy type in a root	Write	root*		
				organizations:PolicyType	
EnableAWSServiceAccess	Grants permission to enable integration of an AWS service (the service that is specified by ServicePrincipal) with AWS Organizations	Write		organizations:ServicePrincipal	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableAllFeatures	Grants permission to start the process to enable all features in an organization, upgrading it from supporting only Consolidated Billing features	Write			
EnablePolicyType	Grants permission to enable a policy type in a root	Write	root*		
				organizations:PolicyType	
InviteAccountToOrganization	Grants permission to send an invitation to another AWS account, asking it to join your organization as a member account	Write	account		
				aws:RequestTag/${TagKey} aws:TagKeys	
InviteOrganizationToTransferResponsibility	Grants permission to send an invitation to another AWS account, asking it to transfer a particular responsibility to your organization	Write	account		
				organizations:TransferType organizations:TransferDirection	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
LeaveOrganization	Grants permission to remove a member account from its parent organization	Write			
ListAWSServiceAccessForOrganization	Grants permission to retrieve the list of the AWS services for which you enabled integration with your organization	List			
ListAccounts	Grants permission to list all of the accounts in the organization	List			
ListAccountsForParent	Grants permission to list the accounts in an organization that are contained by a root or organizational unit (OU)	List	organizationalunit		
			root		
ListAccountsWithInvalidEffectivePolicy	Grants permission to list accounts that have invalid effective policies for a specified policy type	List		organizations:PolicyType	
ListChildren	Grants permission to list all of the OUs or accounts that are contained in a parent OU or root	List	organizationalunit		
			root		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListCreateAccountStatus	Grants permission to list the asynchronous account creation requests that are currently being tracked for the organization	List			
ListDelegatedAdministrators	Grants permission to list the AWS accounts that are designated as delegated administrators in this organization	List		organizations:ServicePrincipal	
ListDelegatedServicesForAccount	Grants permission to list the AWS services for which the specified account is a delegated administrator in this organization	List	account*		
ListEffectivePolicyValidationErrors	Grants permission to list validation errors found in the effective policy for a specific account and policy type	List	account*		
				organizations:PolicyType	
ListHandshakesForAccount	Grants permission to list all of the handshakes that are associated with an account	List			
ListHandshakesForOrganization	Grants permission to list the handshakes that are associated with the organization	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListInboundResponsibilityTransfers	Grants permission to list all responsibilities of a particular type transfered to your organization	List		organizations:TransferType organizations:TransferDirection	
ListOrganizationalUnitsForParent	Grants permission to list all of the organizational units (OUs) in a parent organizational unit or root	List	organizationalunit		
			root		
ListOutboundResponsibilityTransfers	Grants permission to list all responsibilities of a particular type transfered to another organization	List		organizations:TransferType organizations:TransferDirection	
ListParents	Grants permission to list the root or organizational units (OUs) that serve as the immediate parent of a child OU or account	List	account		
			organizationalunit		
ListPolicies	Grants permission to list all of the policies in an organization	List		organizations:PolicyType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListPoliciesForTarget	Grants permission to list all of the policies that are directly attached to a root, organizational unit (OU), or account	List	account		
			organizationalunit		
			root		
				organizations:PolicyType	
ListRoots	Grants permission to list all of the roots that are defined in the organization	List			
ListTagsForResource	Grants permission to list all tags for the specified resource	List	account		
			organizationalunit		
			policy		
			resourcepolicy		
			responsibilitytransfer	organizations:TransferType	
				organizations:TransferDirection	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			root

UpdatePolicy	Grants permission to update an existing policy with a new name, description, or content	Write	policy*		
				organizations:PolicyType	
UpdateResponsibilityTransfer	Grants permission to rename a responsibility transfer to or from your organization	Write	responsibilitytransfer*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				organizations:TransferType organizations:TransferDirection	

Resource types defined by AWS Organizations

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
account	`arn:${Partition}:organizations::${Account}:account/o-${OrganizationId}/${AccountId}`	aws:ResourceTag/${TagKey}
handshake	`arn:${Partition}:organizations::${Account}:handshake/o-${OrganizationId}/${HandshakeType}/h-${HandshakeId}`	
organization	`arn:${Partition}:organizations::${Account}:organization/o-${OrganizationId}`	

Resource types	ARN	Condition keys
organizationalunit	arn:${Partition}:organizations::${Account}:ou/o-${OrganizationId}/ou-${OrganizationalUnitId}	aws:ResourceTag/${TagKey}
policy	arn:${Partition}:organizations::${Account}:policy/o-${OrganizationId}/${PolicyType}/p-${PolicyId}	aws:ResourceTag/${TagKey}
resourcepolicy	arn:${Partition}:organizations::${Account}:resourcepolicy/o-${OrganizationId}/rp-${ResourcePolicyId}	aws:ResourceTag/${TagKey}
awspolicy	arn:${Partition}:organizations::aws:policy/${PolicyType}/p-${PolicyId}	
root	arn:${Partition}:organizations::${Account}:root/o-${OrganizationId}/r-${RootId}	aws:ResourceTag/${TagKey}
responsibilitytransfer	arn:${Partition}:organizations::${Account}:transfer/o-${OrganizationId}/${TransferType}/${TransferDirection}/rt-${ResponsibilityTransferId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Organizations

AWS Organizations defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
organizations:PolicyType	Filters access by the specified policy type names	String
organizations:ServicePrincipal	Filters access by the specified service principal names	String
organizations:TransferDirection	Filters access by the specified responsibility transfer by the direction	String
organizations:TransferType	Filters access by the specified responsibility transfer type names	String

Actions, resources, and condition keys for AWS Outposts

AWS Outposts (service prefix: `outposts`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS Outposts

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelCapacityTask	Grants permission to cancel a capacity task	Write	outpost*		
CancelOrder	Grants permission to cancel an order	Write			
CreateOrder	Grants permission to create an order	Write	outpost*		
CreateOutpost	Grants permission to create an Outpost	Write	site*		
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreatePrivateConnectivityConfig	Grants permission to create a private connectivity configuration	Write	outpost*		
CreateSite	Grants permission to create a site	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
DeleteOutpost	Grants permission to delete an Outpost	Write	outpost*		
DeleteSite	Grants permission to delete a site	Write	site*		
GetCapacityTask	Grants permission to get information about the specified capacity task	Read	outpost*		
GetCatalogItem	Grants permission to get a catalog item	Read			
GetConnection	Grants permission to get information about the connection for your Outpost server	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetOrder	Grants permission to get information about an order	Read

GetOutpostBillingInformation	Grants permission to get Outpost billing information for the specified Outpost	Read	outpost*		
GetOutpostInstanceTypes	Grants permission to get the instance types for the specified Outpost	Read	outpost*		
GetOutpostSupportedInstanceTypes	Grants permission to get the supported instance types for the specified Outpost	Read	outpost*		
GetPrivateConnectivityConfig	Grants permission to get a private connectivity configuration	Read	outpost*		
GetSite	Grants permission to get a site	Read	site*		
GetSiteAddress	Grants permission to get a site address	Read	site*		
ListAssetInstances	Grants permission to list all running instances for the specified Outpost	List	outpost*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAssets	Grants permission to list the assets for your Outpost	List	outpost*		
ListBlockingInstancesForCapacityTask	Grants permission to list all running instances that are blocking the capacity task from running for the specified Outpost	List	outpost*		
ListCapacityTasks	Grants permission to list the capacity tasks for your AWS account	List			
ListCatalogItems	Grants permission to list all catalog items	List			
ListOrders	Grants permission to list the orders for your AWS account	List			
ListOutposts	Grants permission to list the Outposts for your AWS account	List			
ListSites	Grants permission to list the sites for your AWS account	List			
ListTagsForResource	Grants permission to list tags for a resource	Read			
StartCapacityTask	Grants permission to create a capacity task	Write	outpost*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartConnection	Grants permission to start a connection for your Outpost server	Write			
TagResource	Grants permission to tag a resource	Tagging	outpost		
			site		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag a resource	Tagging	outpost		
			site		
				aws:TagKeys	
UpdateOutpost	Grants permission to update an Outpost	Write	outpost*		
UpdateSite	Grants permission to update a site	Write	site*		
UpdateSiteAddress	Grants permission to update the site address	Write	site*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateSiteRackPhysicalProperties	Grants permission to update the physical properties of a rack at a site	Write	site*		

Resource types defined by AWS Outposts

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
outpost	`arn:${Partition}:outposts:${Region}:${Account}:outpost/${OutpostId}`	aws:ResourceTag/${TagKey}
site	`arn:${Partition}:outposts:${Region}:${Account}:site/${SiteId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Outposts

AWS Outposts defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Panorama

AWS Panorama (service prefix: `panorama`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Panorama

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateApplicationInstance	Grants permission to create an AWS Panorama Application Instance	Write		aws:TagKeys aws:RequestTag/${TagKey}	
CreateJobForDevices	Grants permission to create a job for an AWS Panorama Appliance	Write			
CreateNodeFromTemplateJob	Grants permission to create an AWS Panorama Node	Write			
CreatePackage	Grants permission to create an AWS Panorama Package	Write		aws:TagKeys aws:RequestTag/${TagKey}	
CreatePackageImportJob	Grants permission to create an AWS Panorama Package	Write			
DeleteDevice	Grants permission to deregister an AWS Panorama Appliance	Write	device*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeletePackage	Grants permission to delete an AWS Panorama Package	Write	package*		
DeregisterPackageVersion	Grants permission to deregister an AWS Panorama package version	Write	package*		
DescribeApplicationInstance	Grants permission to view details about an AWS Panorama application instance	Read	applicationInstance*		
DescribeApplicationInstanceDetails	Grants permission to view details about an AWS Panorama application instance	Read	applicationInstance*		
DescribeDevice	Grants permission to view details about an AWS Panorama Appliance	Read	device*

ListDevicesJobs	Grants permission to retrieve a list of jobs for an AWS Panorama Appliance	List	device		
ListNodeFromTemplateJobs	Grants permission to retrieve a list of Nodes for an AWS Panorama Appliance	List			
ListNodes	Grants permission to retrieve a list of nodes in AWS Panorama	List			
ListPackageImportJobs	Grants permission to retrieve a list of packages in AWS Panorama	List			
ListPackages	Grants permission to retrieve a list of packages in AWS Panorama	List			
ListTagsForResource	Grants permission to retrieve a list of tags for a resource in AWS Panorama	Read	applicationInstance		
			device		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			package		
ProvisionDevice	Grants permission to register an AWS Panorama Appliance	Write		aws:TagKeys aws:RequestTag/${TagKey}	
RegisterPackageVersion	Grants permission to register an AWS Panorama package version	Write	package*		
RemoveApplicationInstance	Grants permission to remove an AWS Panorama application instance	Write	applicationInstance*		
SignalApplicationInstanceNodeInstances	Grants permission to signal camera nodes in an application instance to pause or resume	Write	applicationInstance*		
TagResource	Grants permission to add tags to a resource in AWS Panorama	Tagging	applicationInstance		
			device		
			package		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove tags from a resource in AWS Panorama	Tagging	applicationInstance		
			device		
			package		
				aws:TagKeys	
UpdateDeviceMetadata	Grants permission to modify basic settings for an AWS Panorama Appliance	Write	device*		

Resource types defined by AWS Panorama

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
device	arn:${Partition}:panorama:${Region}:${Account}:device/${DeviceId}	aws:ResourceTag/${TagKey}
package	arn:${Partition}:panorama:${Region}:${Account}:package/${PackageId}	aws:ResourceTag/${TagKey}
applicationInstance	arn:${Partition}:panorama:${Region}:${Account}:applicationInstance/${ApplicationInstanceId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Panorama

AWS Panorama defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Parallel Computing Service

AWS Parallel Computing Service (service prefix: `pcs`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS Parallel Computing Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit

resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AllowVendedLogDeliveryForResource [permission only]	Grants permission to configure vended log delivery for AWS PCS cluster logs	Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCluster	Grants permission to create clusters	Write		aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateNetworkInterface ec2:CreateNetworkInterfacePermission ec2:DescribeNetworkInterfaces ec2:DescribeSecurityGroups ec2:DescribeSubnets ec2:DescribeVpcs ec2:GetSecurityGroupsForVpc iam:CreateServiceLinkedRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					secretsmanager:CreateSecret secretsmanager:TagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateComputeNodeGroup	Grants permission to create compute node groups	Write	cluster*		ec2:CreateFleet ec2:CreateLaunchTemplate ec2:CreateLaunchTemplateVersion ec2:CreateTags ec2:DescribeImages ec2:DescribeInstanceStatus ec2:DescribeInstanceTypes ec2:DescribeInstances ec2:DescribeLaunchTemplateVersions

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					ec2:DescribeLaunchTemplates ec2:DescribeSecurityGroups ec2:DescribeSubnets ec2:DescribeVpcs ec2:RunInstances iam:GetInstanceProfile iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys	
CreateQueue	Grants permission to create queues	Write	cluster*		
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteCluster	Grants permission to delete clusters	Write	cluster*		ec2:DeleteNetworkInterface secretsmanager:DeleteSecret
DeleteComputeNodeGroup	Grants permission to delete compute node groups	Write	cluster*		ec2:DeleteLaunchTemplate ec2:TerminateInstances
			computenodegroup*		
DeleteQueue	Grants permission to delete queues	Write	cluster*		
			queue*		
GetCluster	Grants permission to get cluster properties	Read	cluster*

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					ec2:DescribeLaunchTemplates ec2:DescribeSecurityGroups ec2:DescribeSubnets ec2:DescribeVpcs ec2:RunInstances iam:GetInstanceProfile iam:PassRole
			computenodegroup*		
UpdateQueue	Grants permission to update queue properties	Write	cluster*		
			queue*		

Resource types defined by AWS Parallel Computing Service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
cluster	`arn:${Partition}:pcs:${Region}:${Account}:cluster/${ClusterIdentifier}`	aws:ResourceTag/${TagKey}
computenodegroup	`arn:${Partition}:pcs:${Region}:${Account}:cluster/${ClusterIdentifier}/computenodegroup/${ComputeNodeGroupIdentifier}`	aws:ResourceTag/${TagKey}
queue	`arn:${Partition}:pcs:${Region}:${Account}:cluster/${ClusterIdentifier}/queue/${QueueIdentifier}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Parallel Computing Service

AWS Parallel Computing Service defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Partner Central

AWS Partner Central (service prefix: `partnercentral`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Partner Central

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of

access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptChannelHandshake	Grants permission to accept channel handshakes in AWS Partner Central	Write	ChannelHandshake*		
				partnercentral:Catalog partnercentral:ChannelHandshakeType	
AcceptConnectionInvitation	Grants permission to accept connection invitations in AWS Partner Central	Write	ConnectionInvitation*		
				partnercentral:Catalog	
AcceptEngagementInvitation	Grants permission to accept Engagement Invitations on AWS Partner Central	Write	engagement-invitation*		
				partnercentral:Catalog	
AmendBenefitApplication	Grants permission to amend benefit applications in AWS Partner Central	Write	BenefitApplication*		
				aws:ResourceTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} partnercentral:Catalog partnercentral:FulfillmentTypes partnercentral:Programs	
AssignOpportunity	Grants permission to assign Opportunities on AWS Partner Central	Write	Opportunity*		
				partnercentral:Catalog	
AssociateAwsTrainingCertificationEmailDomain	Grants permission to associate AWS Training and Certification email domains in AWS Partner Central	Write	Partner*		
				aws:ResourceTag/${TagKey} partnercentral:Catalog	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Associate BenefitApplication Resource	Grants permission to associate benefit application resources in AWS Partner Central	Write	BenefitAllocation*		
			BenefitApplication*		
			Opportunity*		
				aws:ResourceTag/${TagKey} partnercentral:Catalog partnercentral:FulfillmentTypes partnercentral:Programs	
Associate Opportunity	Grants permission to associate Opportunities on AWS Partner Central with other entities	Write	Opportunity*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				partnercentral:Catalog partnercentral:RelatedEntityType	
CancelBenefitApplication	Grants permission to cancel benefit applications in AWS Partner Central	Write	BenefitApplication*		
				aws:ResourceTag/${TagKey} partnercentral:Catalog partnercentral:FulfillmentTypes partnercentral:Programs

				aws:ResourceTag/${TagKey} partnercentral:Catalog	
GetPartnerDashboard	Grants permission to retrieve partner dashboard information in AWS Partner Central	Read	Dashboard*		
				partnercentral:Catalog	
GetPartnerProfile [permission only]	Grants permission to retrieve public partner profile details in AWS Partner Central	Read			
GetProfileUpdateTask	Grants permission to retrieve profile update task details in AWS Partner Central	Read	Partner*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} partnercentral:Catalog	
GetProfileVisibility	Grants permission to retrieve profile visibility settings in AWS Partner Central	Read	Partner*		
				aws:ResourceTag/${TagKey} partnercentral:Catalog	
GetProgramManagementAccount [permission only]	Grants permission to retrieve program management account details in AWS Partner Central	Read		partnercentral:Catalog	
GetRelationship	Grants permission to retrieve relationship details in AWS Partner Central	Read	Relationship*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} partnercentral:Catalog	
GetResourceSnapshot	Grants permission to retrieving resource snapshot details in AWS Partner Central	Read	ResourceSnapshot*		
				partnercentral:Catalog	
GetResourceSnapshotJob	Grants permission to retrieving resource snapshot job details in AWS Partner Central	Read	resource-snapshot-job*		
				partnercentral:Catalog	
GetSellingSystemSettings	Grants permission to retrieving selling system settings in AWS Partner Central	Read		partnercentral:Catalog	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetVerification	Grants permission to retrieve verification details in AWS Partner Central	Read		partnercentral:Catalog partnercentral:VerificationType	
ListBenefitAllocations	Grants permission to list benefit allocations in AWS Partner Central	List	BenefitAllocation*		
				partnercentral:Catalog partnercentral:FulfillmentTypes	
ListBenefitApplications	Grants permission to list benefit applications in AWS Partner Central	List	BenefitApplication*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				partnercentral:Catalog partnercentral:FulfillmentTypes partnercentral:Programs	
ListBenefits	Grants permission to list benefits in AWS Partner Central	List	Benefit*		
				partnercentral:Catalog partnercentral:FulfillmentTypes partnercentral:Programs	
ListBusinessPlans [permission only]	Grants permission to list business plans in AWS Partner Central	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListChannelHandshakes	Grants permission to list channel handshakes in AWS Partner Central	List	ChannelHandshake*		
				partnercentral:Catalog partnercentral:ChannelHandshakeType	
ListCollaborationChannels [permission only]	Grants permission to list collaboration channels in AWS Partner Central	List			
ListConnectionInvitations	Grants permission to list connection invitations in AWS Partner Central	List		partnercentral:Catalog	
ListConnections	Grants permission to list connections in AWS Partner Central	List		partnercentral:Catalog	
ListEngagementByAcceptingInvitationTasks	Grants permission to listing engagements by accepting invitation tasks in AWS Partner Central	List		partnercentral:Catalog	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListEngagementFromOpportunityTasks	Grants permission to listing engagements from opportunity tasks in AWS Partner Central	List		partnercentral:Catalog	
ListEngagementInvitations	Grants permission to list Engagement Invitations on AWS Partner Central	List		partnercentral:Catalog	
ListEngagementMembers	Grants permission to listing engagement members in AWS Partner Central	Read	Engagement*		
				partnercentral:Catalog	
ListEngagementResourceAssociations	Grants permission to listing engagement resource associations in AWS Partner Central	Read	ResourceSnapshot*		
				partnercentral:Catalog	
ListEngagements	Grants permission to listing engagements in AWS Partner Central	List		partnercentral:Catalog	
ListOpportunities	Grants permission to list Opportunities on AWS Partner Central	List		partnercentral:Catalog	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListOpportunityFromEngagementTasks	Grants permission to list opportunity from engagement tasks in AWS Partner Central	List		partnercentral:Catalog	
ListPartnerPaths [permission only]	Grants permission to list partner paths in AWS Partner Central	List			
ListPartners	Grants permission to list partners in AWS Partner Central	List		partnercentral:Catalog	
ListProgramManagementAccounts	Grants permission to list program management accounts in AWS Partner Central	List	ProgramManagementAccount*		
				partnercentral:Catalog	
ListRelationships	Grants permission to list relationships in AWS Partner Central	List	Relationship*		
				partnercentral:Catalog	
ListResourceSnapshotJobs	Grants permission to listing resource snapshot jobs in AWS Partner Central	List		partnercentral:Catalog	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListResourceSnapshots	Grants permission to listing resource snapshots in AWS Partner Central	List	ResourceSnapshot*		
				partnercentral:Catalog	
ListSolutions	Grants permission to list Solutions on AWS Partner Central	List		partnercentral:Catalog	
ListTagsForResource	Grants permission to add lists tags to a resource. Supported resource: ResourceSnapshotJob	Read		aws:ResourceTag/${TagKey} aws:TagKeys partnercentral:Catalog partnercentral:FulfillmentTypes partnercentral:Programs	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutAllianceLeadContact	Grants permission to set alliance lead contact information in AWS Partner Central	Write	Partner*		
				aws:ResourceTag/${TagKey} partnercentral:Catalog	
PutBusinessPlan [permission only]	Grants permission to update business plans in AWS Partner Central	Write			
PutProfileVisibility	Grants permission to set profile visibility in AWS Partner Central	Write	Partner*		
				aws:ResourceTag/${TagKey} partnercentral:Catalog	
PutSellingSystemSettings	Grants permission to put selling system settings in AWS Partner Central	Write			
RecallBenefitApplication	Grants permission to recall benefit applications in AWS Partner Central	Write	BenefitApplication*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} partnercentral:Catalog partnercentral:FulfillmentTypes partnercentral:Programs	
RejectChannelHandshake	Grants permission to reject channel handshakes in AWS Partner Central	Write	ChannelHandshake*		
				partnercentral:Catalog partnercentral:ChannelHandshakeType	
RejectConnectionInvitation	Grants permission to reject connection invitations in AWS Partner Central	Write	ConnectionInvitation*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				partnercentral:Catalog	
RejectEngagementInvitation	Grants permission to reject Engagement Invitations on AWS Partner Central	Write	engagement-invitation*		
				partnercentral:Catalog	
SearchPartnerProfiles [permission only]	Grants permission to search public partner profiles in AWS Partner Central	List			
SendEmailVerificationCode	Grants permission to send email verification codes in AWS Partner Central	Write		partnercentral:Catalog	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartEngagementByAcceptingInvitationTask	Grants permission to initiate tasks that start Engagements on AWS Partner Central by accepting an Engagement Invitation	Write	engagement-by-accepting-invitation-task*		partnercentral:AcceptEngagementInvitation partnercentral:CreateOpportunity partnercentral:CreateResourceSnapshotJob partnercentral:GetEngagementInvitation partnercentral:StartResourceSnapshotJob partnercentral:SubmitOpportunity

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys partnercentral:Catalog	
StartProfileUpdateTask	Grants permission to start profile update tasks in AWS Partner Central	Write	Partner*		
				aws:ResourceTag/${TagKey} partnercentral:Catalog	
StartResourceSnapshotJob	Grants permission to starting resource snapshot jobs in AWS Partner Central	Write	resource-snapshot-job*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				partnercentral:Catalog	
StartVerification	Grants permission to start verification processes in AWS Partner Central	Write		partnercentral:Catalog partnercentral:VerificationType	
StopResourceSnapshotJob	Grants permission to stopping resource snapshot jobs in AWS Partner Central	Write	resource-snapshot-job*		
				partnercentral:Catalog	
SubmitBenefitApplication	Grants permission to submit benefit applications in AWS Partner Central	Write	BenefitApplication*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} partnercentral:Catalog partnercentral:FulfillmentTypes partnercentral:Programs	
SubmitOpportunity	Grants permission to submit Opportunities on AWS Partner Central	Write	Opportunity*		
				partnercentral:Catalog	
TagResource	Grants permission to add new tags to a resource. Supported resource: ResourceSnapshotJob	Tagging	BenefitApplication		
			ChannelHandshake		
			Opportunity		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			Partner		
			ProgramManagementAccount		
			Relationship		
			resource-snapshot-job		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys partnercentral:Catalog partnercentral:FulfillmentTypes partnercentral:Programs	
UntagResource	Grants permission to remove tags from a resource. Supported resource: ResourceSnapshotJob	Tagging	BenefitApplication		
			ChannelHandshake		
			Opportunity		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			Partner		
			ProgramManagementAccount		
			Relationship		
			resource-snapshot-job		
				aws:ResourceTag/${TagKey} aws:TagKeys partnercentral:Catalog partnercentral:FulfillmentTypes partnercentral:Programs	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateBenefitApplication	Grants permission to update benefit applications in AWS Partner Central	Write	BenefitApplication*		
				aws:ResourceTag/${TagKey} partnercentral:Catalog partnercentral:FulfillmentTypes partnercentral:Programs	
UpdateConnectionPreferences	Grants permission to update connection preferences in AWS Partner Central	Write		partnercentral:Catalog	
UpdateEngagementContext	Grants permission to update engagement contexts in AWS Partner Central	Write	Engagement*		
				partnercentral:Catalog	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateOpportunity	Grants permission to update Opportunities on AWS Partner Central	Write	Opportunity*		
				partnercentral:Catalog	
UpdateProgramManagementAccount	Grants permission to update program management accounts in AWS Partner Central	Write	ProgramManagementAccount*		
				aws:ResourceTag/${TagKey} partnercentral:Catalog	
UpdateRelationship	Grants permission to update relationships in AWS Partner Central	Write	Relationship*		
				aws:ResourceTag/${TagKey} partnercentral:Catalog	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UseSession [permission only]	Grants permission to use Partner Central Agents sessions in AWS Partner Central	Write		partnercentral:Catalog	

Resource types defined by AWS Partner Central

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Engagement	`arn:${Partition}:partnercentral:${Region}::catalog/${Catalog}/engagement/${Identifier}`	
engagement-by-accepting-invitation-task	`arn:${Partition}:partnercentral:${Region}::catalog/${Catalog}/engagement-by-accepting-invitation-task/${TaskId}`	
engagement-from-opportunity-task	`arn:${Partition}:partnercentral:${Region}::catalog/${Catalog}/engagement-from-opportunity-task/${TaskId}`	

Resource types	ARN	Condition keys
engagement-invitation	arn:${Partition}:partnercentral:${Region}::catalog/${Catalog}/engagement-invitation/${Identifier}	
Opportunity	arn:${Partition}:partnercentral:${Region}:${Account}:catalog/${Catalog}/opportunity/${Identifier}	aws:ResourceTag/${TagKey}
resource-snapshot-job	arn:${Partition}:partnercentral:${Region}:${Account}:catalog/${Catalog}/resource-snapshot-job/${Identifier}	aws:ResourceTag/${TagKey}
ResourceSnapshot	arn:${Partition}:partnercentral:${Region}:${Account}:catalog/${Catalog}/engagement/${EngagementIdentifier}/resource/${ResourceType}/${ResourceIdentifier}/template/${TemplateIdentifier}/resource-snapshot/${SnapshotRevision}	
Solution	arn:${Partition}:partnercentral:${Region}:${Account}:catalog/${Catalog}/solution/${Identifier}	
Partner	arn:${Partition}:partnercentral:${Region}:${Account}:catalog/${Catalog}/partner/${Identifier}	aws:ResourceTag/${TagKey}
Connection	arn:${Partition}:partnercentral:${Region}::catalog/${Catalog}/connection/${Identifier}	
ConnectionInvitation	arn:${Partition}:partnercentral:${Region}::catalog/${Catalog}/connection-invitation/${Identifier}	

Resource types	ARN	Condition keys
ConnectionPreferences	arn:${Partition}:partnercentral:${Region}:${Account}:catalog/${Catalog}/connection-preferences	
OpportunityFromEngagementTask	arn:${Partition}:partnercentral:${Region}::catalog/${Catalog}/opportunity-from-engagement-task/${TaskId}	
Benefit	arn:${Partition}:partnercentral:${Region}::catalog/${Catalog}/benefit/${Identifier}	
BenefitAllocation	arn:${Partition}:partnercentral:${Region}:${Account}:catalog/${Catalog}/benefit-allocation/${Identifier}	
BenefitApplication	arn:${Partition}:partnercentral:${Region}:${Account}:catalog/${Catalog}/benefit-application/${Identifier}	aws:ResourceTag/${TagKey}
ProgramManagementAccount	arn:${Partition}:partnercentral:${Region}:${Account}:catalog/${Catalog}/program-management-account/${Identifier}	aws:ResourceTag/${TagKey}
Relationship	arn:${Partition}:partnercentral:${Region}:${Account}:catalog/${Catalog}/program-management-account/${ProgramManagementAccountId}/relationship/${RelationshipId}	aws:ResourceTag/${TagKey}
ChannelHandshake	arn:${Partition}:partnercentral:${Region}:${Account}:catalog/${Catalog}/channel-handshake/${Identifier}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
Dashboard	arn:${Partition}:partnercentral::${Account}:catalog/${Catalog}/ReportingData/${TableId}/Dashboard/${DashboardId}	

Condition keys for AWS Partner Central

AWS Partner Central defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
partnercentral:Catalog	Filters access by a specific Catalog	String
partnercentral:ChannelHandshakeType	Filters access by channel handshake types	String

Condition keys	Description	Type
partnercentral:FulfillmentTypes	Filters access by benefit fulfillment types	ArrayOfString
partnercentral:Programs	Filters access by program	ArrayOfString
partnercentral:RelatedEntityType	Filters access by entity types for Opportunity association	String
partnercentral:VerificationType	Filters access by the type of verification being performed	String

Actions, resources, and condition keys for AWS Partner central account management

AWS Partner central account management (service prefix: `partnercentral-account-management`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

- Resource types defined by AWS Partner central account management
- Condition keys for AWS Partner central account management

Actions defined by AWS Partner central account management

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AccessLegacyPartnerCentral [permission only]	Grants permission to Single Sign-On from AWS Partner Central into Legacy Partner Central	Write		partnercentral-account-management:LegacyPartnerCentralRole	
AccessMarketingCentral [permission only]	Grants permission to Single Sign-On from AWS Partner Central into Marketing Central	Write		partnercentral-account-management:MarketingCentralRole	
AccessProServeTools [permission only]	Grants permission to Single Sign-On from AWS Partner Central into ProServe Tools	Write		partnercentral-account-management:ProServeRole	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociatePartnerAccount [permission only]	Grants permission to associate Partner account to AWS account	Write			
AssociatePartnerUser	Grants permission to associate Partner user to IAM role	Write			
DisassociatePartnerUser	Grants permission to disassociate Partner user to IAM role	Write			

Resource types defined by AWS Partner central account management

AWS Partner central account management does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Partner central account management, specify `"Resource": "*"` in your policy.

Condition keys for AWS Partner central account management

AWS Partner central account management defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
partnercentral-account-management:LegacyPartnerCentralRole	Filters access by the Legacy Partner Central role	ArrayOfString
partnercentral-account-management:MarketingCentralRole	Filters access by Marketing Central role	ArrayOfString
partnercentral-account-management:ProServeRole	Filters access by ProServe Tools role	ArrayOfString

Actions, resources, and condition keys for AWS Payment Cryptography

AWS Payment Cryptography (service prefix: `payment-cryptography`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS Payment Cryptography

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddKeyReplicationRegions	Grants permission to add replication regions to an existing AWS Payment Cryptography key	Write	alias*		
			key*		
				payment-cryptography:RequestAlias	
CreateAlias	Grants permission to create a user-friendly name for a Key	Write	alias*		
			key*		
CreateKey	Grants permission to create a unique customer managed key in the caller's AWS account and region	Write		aws:RequestTag/${TagKey} aws:TagKeys payment-cryptography:KeyClass	payment-cryptography:TagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				payment-cryptography:KeyUsage payment-cryptography:KeyAlgorithm	
DecryptData	Grants permission to decrypt ciphertext data to plaintext using symmetric, asymmetric or DUKPT data encryption key	Write	alias*		
			key*		
				payment-cryptography:RequestAlias	
DeleteAlias	Grants permission to delete the specified alias	Write	alias*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteKey	Grants permission to schedule the deletion of a Key	Write	key*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				payment-cryptography:RequestAlias	
DisableDefaultKeyReplicationRegions	Grants permission to disable default key replication regions for account-level replication	Write			
EnableDefaultKeyReplicationRegions	Grants permission to enable default key replication regions for account-level replication	Write			
EncryptData	Grants permission to encrypt plaintext data to ciphertext using symmetric, asymmetric or DUKPT data encryption key	Write	alias*		
			key*		
				payment-cryptography:RequestAlias	
ExportKey	Grants permission to export a key from the service	Write	key*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				payment-cryptography:RequestAlias payment-cryptography:CertificateAuthorityPublicKeyIdentifier payment-cryptography:WrappingKeyIdentifier	
GenerateAs2805KekValidation	Grants permission to generate a KekValidationRequest or a KekValidationResponse for node-to-node initialization between payment processing nodes using Australian Standard 2805 (AS2805)	Write	alias*		
			key*		
				payment-cryptography:RequestAlias	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GenerateCardValidationData	Grants permission to generate card-related data using algorithms such as Card Verification Values (CVV/CVV2), Dynamic Card Verification Values (dCVV/dCVV2) or Card Security Codes (CSC) that check the validity of a magnetic stripe card	Write	alias*		
			key*		
				payment-cryptography:RequestAlias	
GenerateMac	Grants permission to generate a MAC (Message Authentication Code) cryptogram	Write	alias*		
			key*		
				payment-cryptography:RequestAlias	
GenerateMacEmvPinChange	Grants permission to generate a MAC (Message Authentication Code) cryptogram	Write	alias*		
			key*		
				payment-cryptography:RequestAlias	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GeneratePinData	Grants permission to generate pin-related data such as PIN, PIN Verification Value (PVV), PIN Block and PIN Offset during new card issuance or card re-issuance	Write	alias*		
			key*		
				payment-cryptography:RequestAlias	
GetAlias	Grants permission to return the keyArn associated with an aliasName	Read	alias*		
			key*		
				aws:RequestTag/${TagKey} aws:TagKeys	
GetCertificateSigningRequest	Grants permission to return the Certificate Signing Request for a public key from a key of class PUBLIC_KEY	Read	alias*		
			key*		
				payment-cryptography:RequestAlias	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDefaultKeyReplicationRegions	Grants permission to retrieve the default key replication regions configured at the account level	Read			
GetKey	Grants permission to return the detailed information about the specified key	Read	key*		
				payment-cryptography:RequestAlias	
GetParametersForExport	Grants permission to get the export token and the signing key certificate to initiate a TR-34 key export	Read			
GetParametersForImport	Grants permission to get the import token and the wrapping key certificate to initiate a TR-34 key import	Read			
GetPublicKeyCertificate	Grants permission to return the public key from a key of class PUBLIC_KEY	Read	key*		
				payment-cryptography:RequestAlias	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ImportKey	Grants permission to imports keys and public key certificates	Write		aws:RequestTag/${TagKey} aws:TagKeys payment-cryptography:ImportKeyMaterial payment-cryptography:CertificateAuthorityPublicKeyIdentifier payment-cryptography:WrappingKeyIdentifier	payment-cryptography:TagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAliases	Grants permission to return a list of aliases created for all keys in the caller's AWS account and Region	List			
ListKeys	Grants permission to return a list of keys created in the caller's AWS account and Region	List			
ListTagsForResource	Grants permission to return a list of tags created in the caller's AWS account and Region	Read	key		
ReEncryptData	Grants permission to re-encrypt ciphertext using DUKPT, Symmetric and Asymmetric Data Encryption Keys	Write	alias*		
			key*		
				payment-cryptography:RequestAlias	
RemoveKeyReplicationRegions	Grants permission to remove replication regions from an existing AWS Payment Cryptography key	Write	alias*		
			key*		
				payment-cryptography:RequestAlias	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RestoreKey	Grants permission to cancel a scheduled key deletion if at any point during the waiting period a Key needs to be revived	Write	key*		
				payment-cryptography:RequestAlias	
StartKeyUsage	Grants permission to enable a disabled Key	Write	key*		
				payment-cryptography:RequestAlias	
StopKeyUsage	Grants permission to disable an enabled Key	Write	key*		
				payment-cryptography:RequestAlias	
TagResource	Grants permission to add or overwrites one or more tags for the specified resource	Tagging	key*		
				aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TranslateKeyMaterial	Grants permission to translate wrapping key type for a wrapped key	Write	alias*		
			key*		
				payment-cryptography:RequestAlias	
TranslatePinData	Grants permission to translate encrypted PIN block from and to ISO 9564 formats 0,1,3,4	Write	alias*		
			key*		
				payment-cryptography:RequestAlias	
UntagResource	Grants permission to remove the specified tag or tags from the specified resource	Tagging	key*		
				aws:TagKeys	
UpdateAlias	Grants permission to change the key to which an alias is assigned, or unassign it from its current key	Write	alias*		
			key*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
VerifyAuthRequestCryptogram	Grants permission to verify Authorization Request Cryptogram (ARQC) for a EMV chip payment card authorization	Write	alias*		
			key*		
				payment-cryptography:RequestAlias	
VerifyCardValidationData	Grants permission to verify card-related validation data using algorithms such as Card Verification Values (CVV/CVV2), Dynamic Card Verification Values (dCVV/dCVV2) and Card Security Codes (CSC)	Write	alias*		
			key*		
				payment-cryptography:RequestAlias	
VerifyMac	Grants permission to verify MAC (Message Authentication Code) of input data against a provided MAC	Write	alias*		
			key*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				payment-cryptography:RequestAlias	
VerifyPinData	Grants permission to verify pin-related data such as PIN and PIN Offset using algorithms including VISA PVV and IBM3624	Write	alias*		
			key*		
				payment-cryptography:RequestAlias	

Resource types defined by AWS Payment Cryptography

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
key	`arn:${Partition}:payment-cryptography:${Region}:${Account}:key/${KeyId}`	aws:ResourceTag/${TagKey} payment-cryptography:ResourceAliases

Resource types	ARN	Condition keys
alias	arn:${Partition}:payment-cryptography:${Region}:${Account}:alias/${Alias}	payment-cryptography:ResourceAliases

Condition keys for AWS Payment Cryptography

AWS Payment Cryptography defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by both the key and value of the tag in the request for the specified operation	String
aws:ResourceTag/${TagKey}	Filters access by tags assigned to a key for the specified operation	String
aws:TagKeys	Filters access by the tag keys in the request for the specified operation	ArrayOfString
payment-cryptography:CertificateAuthorityPublicKeyIdentifier	Filters access by the CertificateAuthorityPublicKeyIdentifier specified in the request or the ImportKey, and ExportKey operations	String
payment-cryptograp	Filters access by the type of key material being imported [RootCertificatePublicKey, TrustedCertificatePublicKey	String

Condition keys	Description	Type
hy:Import KeyMaterial	, Tr34KeyBlock, Tr31KeyBlock, DiffieHellmanTr31K eyBlock, As2805KeyCryptogram] for the ImportKey operation	
payment-cryptograp hy:KeyAlgorithm	Filters access by KeyAlgorithm specified in the request for the CreateKey operation	String
payment-cryptograp hy:KeyClass	Filters access by KeyClass specified in the request for the CreateKey operation	String
payment-cryptograp hy:KeyUsage	Filters access by KeyClass specified in the request or associated with a key for the CreateKey operation	String
payment-cryptograp hy:RequestAlias	Filters access by aliases in the request for the specified operation	String
payment-cryptograp hy:Resour ceAliases	Filters access by aliases associated with a key for the specified operation	ArrayOfString
payment-cryptograp hy:Wrappi ngKeyIdentifier	Filters access by the WrappingKeyIdentifier specified in the request for the ImportKey, and ExportKey operation s	String

Actions, resources, and condition keys for AWS Payments

AWS Payments (service prefix: `payments`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS Payments

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptFinancingApplicationTerms	Grants permission to accept financing application terms provided by a lender	Write			
CreateFinancingApplication	Grants permission to create a financing application	Write			
CreatePaymentInstrument	Grants permission to create a payment instrument	Write		aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeletePaymentInstrument [permission only]	Grants permission to delete a payment instrument	Write			
GetFinancingApplication	Grants permission to get information about a financing application	Read			
GetFinancingLine	Grants permission to get information about a financing line	Read			
GetFinancingLineWithdrawal	Grants permission to get information about a financing line withdrawal	Read			
GetFinancingOption	Grants permission to get information about a financing option	Read			
GetPaymentInstrument	Grants permission to get information about a payment instrument	List	payment-instrument		
GetPaymentStatus [permission only]	Grants permission to get payment status of invoices	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListFinancingApplications	Grants permission to list financing application metadata	List			
ListFinancingLineWithdrawals	Grants permission to list financing line withdrawals metadata	List			
ListFinancingLines	Grants permission to list financing line metadata	List			
ListPaymentInstruments [permission only]	Grants permission to list payment instrument metadata	List			
ListPaymentPreferences [permission only]	Grants permission to get payment preferences (preferred payment currency, preferred payment method, etc.)	List			
ListPaymentProgramOptions	Grants permission to list information about payment options	List			
ListPaymentProgramStatus	Grants permission to list information about payment program eligibility and enrolment status	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTagsForResource	Grants permission to list tags on a payment resource	List	payment-instrument		
MakePayment [permission only]	Grants permission to make a payment, authenticate a payment, verify a payment method, and generate a funding request document for Advance Pay	Write			
TagResource	Grants permission to tag a payment resource	Tagging	payment-instrument		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to untag a payment resource	Tagging	payment-instrument		
				aws:TagKeys	
UpdateFinancingApplication	Grants permission to update a financing application	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdatePaymentInstrument [permission only]	Grants permission to update a payment instrument	Write			
UpdatePaymentPreferences [permission only]	Grants permission to update payment preferences (preferred payment currency, preferred payment method, etc.)	Write			

Resource types defined by AWS Payments

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
payment-instrument	`arn:${Partition}:payments::${Account}:payment-instrument:${ResourceId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Payments

AWS Payments defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Performance Insights

AWS Performance Insights (service prefix: `pi`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Performance Insights

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreatePerformanceAnalysisReport	Grants permission to call CreatePerformanceAnalysisReport API to create a Performance Analysis Report for a specified DB instance	Write	perf-reports-resource*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeletePerformanceAnalysisReport	Grants permission to call DeletePerformanceAnalysisReport API to delete a Performance Analysis Report for a specified DB instance	Write	perf-reports-resource*		
DescribeDimensionKeys	Grants permission to call DescribeDimensionKeys API to retrieve the top N dimension keys for a metric for a specific time period	Read	metric-resource*		
				pi:Dimensions	
GetDimensionKeyDetails	Grants permission to call GetDimensionKeyDetails API to retrieve the attributes of the specified dimension group	Read	metric-resource*		
				pi:Dimensions	
GetPerformanceAnalysisReport	Grants permission to call GetPerformanceAnalysisReport API to retrieve a	Read	perf-reports-resource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	Performance Analysis Report for a specified DB instance				
GetResourceMetadata	Grants permission to call GetResourceMetadata API to retrieve the metadata for different features	Read	metric-resource*		
GetResourceMetrics	Grants permission to call GetResourceMetrics API to retrieve PI metrics for a set of data sources, over a time period	Read	metric-resource*		
				pi:Dimensions	
ListAvailableResourceDimensions	Grants permission to call ListAvailableResourceDimensions API to retrieve the dimensions that can be queried for each specified metric type on a specified DB instance	Read	metric-resource*		
ListAvailableResourceMetrics	Grants permission to call ListAvailableResourceMetrics API to retrieve metrics of the specified types that can be queried for a specified DB instance	Read	metric-resource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListPerformanceAnalysisReports	Grants permission to call ListPerformanceAnalysisReports API to list Performance Analysis Reports for a specified DB instance	List	perf-reports-resource*		
ListTagsForResource	Grants permission to call ListTagsForResource API to list tags for a resource	List	metric-resource*		
			perf-reports-resource*		
TagResource	Grants permission to call TagResource API to tag a resource	Tagging	perf-reports-resource*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to call UntagResource API to untag a resource	Tagging	perf-reports-resource*		
				aws:TagKeys	

Resource types defined by AWS Performance Insights

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
metric-resource	`arn:${Partition}:pi:${Region}:${Account}:metrics/${ServiceType}/${Identifier}`	aws:ResourceTag/${TagKey}
perf-reports-resource	`arn:${Partition}:pi:${Region}:${Account}:perf-reports/${ServiceType}/${Identifier}/${ReportId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Performance Insights

AWS Performance Insights defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String

Condition keys	Description	Type
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
pi:Dimensions	Filters access by the requested dimensions	ArrayOfString

Actions, resources, and condition keys for Amazon Personalize

Amazon Personalize (service prefix: `personalize`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Personalize

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateBatchInferenceJob	Grants permission to create a batch inference job	Write	batchInferenceJob*		
CreateBatchSegmentJob	Grants permission to create a batch segment job	Write	batchSegmentJob*		
CreateCampaign	Grants permission to create a campaign	Write	campaign*		
CreateDataDeletionJob	Grants permission to create a data deletion job	Write	dataDeletionJob*		
CreateDataInsightsJob	Grants permission to create a data insights job	Write	dataInsightsJob*		
CreateDataset	Grants permission to create a dataset	Write	dataset*		
CreateDatasetExportJob	Grants permission to create a dataset export job	Write	datasetExportJob*		
CreateDatasetGroup	Grants permission to create a dataset group	Write	datasetGroup*		
CreateDatasetImportJob	Grants permission to create a dataset import job	Write	datasetImportJob*		
CreateEventTracker	Grants permission to create an event tracker	Write	eventTracker*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateFilter	Grants permission to create a filter	Write	filter*		
CreateMetricAttribution	Grants permission to create a metric attribution	Write	metricAttribution*		
CreateRecommender	Grants permission to create a recommender	Write	recommender*		
CreateSchema	Grants permission to create a schema	Write	schema*		
CreateSolution	Grants permission to create a solution	Write	solution*		
CreateSolutionVersion	Grants permission to create a solution version	Write	solution*		
DeleteCampaign	Grants permission to delete a campaign	Write	campaign*		
DeleteDataset	Grants permission to delete a dataset	Write	dataset*		
DeleteDatasetGroup	Grants permission to delete a dataset group	Write	datasetGroup*		
DeleteEventTracker	Grants permission to delete an event tracker	Write	eventTracker*		
DeleteFilter	Grants permission to delete a filter	Write	filter*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteMetricAttribution	Grants permission to delete a metric attribution	Write	metricAttribution*		
DeleteRecommender	Grants permission to delete a recommender	Write	recommender*		
DeleteSchema	Grants permission to delete a schema	Write	schema*		
DeleteSolution	Grants permission to delete a solution including all versions of the solution	Write	solution*		
DescribeAlgorithm	Grants permission to describe an algorithm	Read	algorithm*		
DescribeBatchInferenceJob	Grants permission to describe a batch inference job	Read	batchInferenceJob*		
DescribeBatchSegmentJob	Grants permission to describe a batch segment job	Read	batchSegmentJob*		
DescribeCampaign	Grants permission to describe a campaign	Read	campaign*		
DescribeDataDeletionJob	Grants permission to describe a data deletion job	Read	dataDeletionJob*		
DescribeDataInsightsJob	Grants permission to describe a data insights job	Read	dataInsightsJob*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeDataset	Grants permission to describe a dataset	Read	dataset*		
DescribeDatasetExportJob	Grants permission to describe a dataset export job	Read	datasetExportJob*		
DescribeDatasetGroup	Grants permission to describe a dataset group	Read	datasetGroup*		
DescribeDatasetImportJob	Grants permission to describe a dataset import job	Read	datasetImportJob*		
DescribeEventTracker	Grants permission to describe an event tracker	Read	eventTracker*		
DescribeFeatureTransformation	Grants permission to describe a feature transformation	Read	featureTransformation*		
DescribeFilter	Grants permission to describe a filter	Read	filter*		
DescribeMetricAttribution	Grants permission to describe a metric attribution	Read	metricAttribution*		
DescribeRecipe	Grants permission to describe a recipe	Read	recipe*		
DescribeRecommender	Grants permission to describe a recommender	Read	recommender*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeSchema	Grants permission to describe a schema	Read	schema*		
DescribeSolution	Grants permission to describe a solution	Read	solution*		
DescribeSolutionVersion	Grants permission to describe a version of a solution	Read	solution*		
GetActionRecommendations	Grants permission to get a list of recommended actions	Read	campaign*		
GetDataInsights	Grants permission to get data insights from a data insights job	Read	dataInsightsJob*		
GetPersonalizedRanking	Grants permission to get a re-ranked list of recommendations	Read	campaign*		
GetRecommendations	Grants permission to get a list of recommendations from a campaign	Read	campaign*		
GetSolutionMetrics	Grants permission to get metrics for a solution version	Read	solution*		
ListBatchInferenceJobs	Grants permission to list batch inference jobs	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListBatchSegmentJobs	Grants permission to list batch segment jobs	List			
ListCampaigns	Grants permission to list campaigns	List			
ListDataDeletionJobs	Grants permission to list data deletion jobs	List			
ListDataInsightsJobs	Grants permission to list data insights jobs	List			
ListDatasetExportJobs	Grants permission to list dataset export jobs	List			
ListDatasetGroups	Grants permission to list dataset groups	List			
ListDatasetImportJobs	Grants permission to list dataset import jobs	List			
ListDatasets	Grants permission to list datasets	List			
ListEventTrackers	Grants permission to list event trackers	List			
ListFilters	Grants permission to list filters	List			
ListMetricAttributionMetrics	Grants permission to list metric attribution metrics	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListMetricAttributions	Grants permission to list metric attributions	List			
ListRecipes	Grants permission to list recipes	List			
ListRecommenders	Grants permission to list recommenders	List			
ListSchemas	Grants permission to list schemas	List			
ListSolutionVersions	Grants permission to list versions of a solution	List			
ListSolutions	Grants permission to list solutions	List			
ListTagsForResource	Grants permission to list tags for a resource	List			
PutActionInteractions	Grants permission to put real time action interaction data	Write			
PutActions	Grants permission to ingest Actions data	Write	dataset*		
PutEvents	Grants permission to put real time event data	Write			
PutItems	Grants permission to ingest Items data	Write	dataset*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutUsers	Grants permission to ingest Users data	Write	dataset*		
StartRecommender	Grants permission to start a recommender	Write	recommender*		
StopRecommender	Grants permission to stop a recommender	Write	recommender*		
StopSolutionVersionCreation	Grants permission to stop a solution version creation	Write	solution*		
TagResource	Grants permission to tag a resource	Tagging			
UntagResource	Grants permission to untag a resource	Tagging			
UpdateCampaign	Grants permission to update a campaign	Write	campaign*		
UpdateDataset	Grants permission to update a dataset	Write	dataset*		
UpdateMetricAttribution	Grants permission to update a metric attribution	Write	metricAttribution*		
UpdateRecommender	Grants permission to update a recommender	Write	recommender*		
UpdateSolution	Grants permission to update a solution	Write	solution*		

Resource types defined by Amazon Personalize

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
schema	`arn:${Partition}:personalize:${Region}:${Account}:schema/${ResourceId}`	
featureTransformation	`arn:${Partition}:personalize:::feature-transformation/${ResourceId}`	
dataset	`arn:${Partition}:personalize:${Region}:${Account}:dataset/${ResourceId}`	
datasetGroup	`arn:${Partition}:personalize:${Region}:${Account}:dataset-group/${ResourceId}`	
datasetImportJob	`arn:${Partition}:personalize:${Region}:${Account}:dataset-import-job/${ResourceId}`	
dataInsightsJob	`arn:${Partition}:personalize:${Region}:${Account}:data-insights-job/${ResourceId}`	
datasetExportJob	`arn:${Partition}:personalize:${Region}:${Account}:dataset-export-job/${ResourceId}`	

Resource types	ARN	Condition keys
dataDeletionJob	arn:${Partition}:personalize:${Region}:${Account}:data-deletion-job/${ResourceId}	
solution	arn:${Partition}:personalize:${Region}:${Account}:solution/${ResourceId}	
campaign	arn:${Partition}:personalize:${Region}:${Account}:campaign/${ResourceId}	
eventTracker	arn:${Partition}:personalize:${Region}:${Account}:event-tracker/${ResourceId}	
recipe	arn:${Partition}:personalize:::recipe/${ResourceId}	
algorithm	arn:${Partition}:personalize:::algorithm/${ResourceId}	
batchInferenceJob	arn:${Partition}:personalize:${Region}:${Account}:batch-inference-job/${ResourceId}	
filter	arn:${Partition}:personalize:${Region}:${Account}:filter/${ResourceId}	
recommender	arn:${Partition}:personalize:${Region}:${Account}:recommender/${ResourceId}	
batchSegmentJob	arn:${Partition}:personalize:${Region}:${Account}:batch-segment-job/${ResourceId}	

Resource types	ARN	Condition keys
metricAttribution	arn:${Partition}:personalize:${Region}:${Account}:metric-attribution/${ResourceId}	

Condition keys for Amazon Personalize

Personalize has no service-specific context keys that can be used in the Condition element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Pinpoint

Amazon Pinpoint (service prefix: mobiletargeting) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Pinpoint

You can specify the following actions in the Action element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateApp	Grants permission to create an app	Write	apps*		
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	
CreateCampaign	Grants permission to create a campaign for an app	Write	app*		
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	
CreateEmailTemplate	Grants permission to create an email template	Write	template*		
				aws:RequestTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	
CreateExportJob	Grants permission to create an export job that exports endpoint definitions to Amazon S3	Write	app*		
CreateImportJob	Grants permission to import endpoint definitions from to create a segment	Write	app*		
CreateInAppTemplate	Grants permission to create an in-app message template	Write	template*		
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateJourney	Grants permission to create a Journey for an app	Write	journeys*		
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	
CreatePushTemplate	Grants permission to create a push notification template	Write	template*		
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	
CreateRecommenderConfiguration	Grants permission to create an Amazon Pinpoint configuration for a recommender model	Write	recommenders*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSegment	Grants permission to create a segment that is based on endpoint data reported to Pinpoint by your app. To allow a user to create a segment by importing endpoint data from outside of Pinpoint, allow the mobiletargeting:CreateImportJob action	Write	app*		
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	
CreateSmsTemplate	Grants permission to create an sms message template	Write	template*		
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	
CreateVoiceTemplate	Grants permission to create a voice message template	Write	template*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	
DeleteAdmChannel	Grants permission to delete the ADM channel for an app	Write	channel*		
DeleteApnsChannel	Grants permission to delete the APNs channel for an app	Write	channel*		
DeleteApnsSandboxChannel	Grants permission to delete the APNs sandbox channel for an app	Write	channel*		
DeleteApnsVoipChannel	Grants permission to delete the APNs VoIP channel for an app	Write	channel*		
DeleteApnsVoipSandboxChannel	Grants permission to delete the APNs VoIP sandbox channel for an app	Write	channel*		
DeleteApp	Grants permission to delete a specific campaign	Write	app*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteBaiduChannel	Grants permission to delete the Baidu channel for an app	Write	channel*		
DeleteCampaign	Grants permission to delete a specific campaign	Write	campaign*		
DeleteEmailChannel	Grants permission to delete the email channel for an app	Write	channel*		
DeleteEmailTemplate	Grants permission to delete an email template or an email template version	Write	template*		
DeleteEndpoint	Grants permission to delete an endpoint	Write	endpoint*		
DeleteEventStream	Grants permission to delete the event stream for an app	Write	event-stream*		
DeleteGcmChannel	Grants permission to delete the GCM channel for an app	Write	channel*		
DeleteInAppTemplate	Grants permission to delete an in-app message template or an in-app message template version	Write	template*		
DeleteJourney	Grants permission to delete a specific journey	Write	journey*		
DeletePushTemplate	Grants permission to delete a push notification template or a push notification template version	Write	template*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteRecommenderConfiguration	Grants permission to delete an Amazon Pinpoint configuration for a recommender model	Write	recommender*		
DeleteSegment	Grants permission to delete a specific segment	Write	segment*		
DeleteSmsChannel	Grants permission to delete the SMS channel for an app	Write	channel*		
DeleteSmsTemplate	Grants permission to delete an sms message template or an sms message template version	Write	template*		
DeleteUserEndpoints	Grants permission to delete all of the endpoints that are associated with a user ID	Write	user*		
DeleteVoiceChannel	Grants permission to delete the Voice channel for an app	Write	channel*		
DeleteVoiceTemplate	Grants permission to delete a voice message template or a voice message template version	Write	template*		
GetAdmChannel	Grants permission to retrieve information about the Amazon Device Messaging (ADM) channel for an app	Read	channel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetApnsChannel	Grants permission to retrieve information about the APNs channel for an app	Read	channel*		
GetApnsSandboxChannel	Grants permission to retrieve information about the APNs sandbox channel for an app	Read	channel*		
GetApnsVoipChannel	Grants permission to retrieve information about the APNs VoIP channel for an app	Read	channel*		
GetApnsVoipSandboxChannel	Grants permission to retrieve information about the APNs VoIP sandbox channel for an app	Read	channel*		
GetApp	Grants permission to retrieve information about a specific app in your Amazon Pinpoint account	Read	app*		
GetApplicationDateRangeKpi	Grants permission to retrieve (queries) pre-aggregated data for a standard metric that applies to an application	Read	application-metrics*		
GetApplicationSettings	Grants permission to retrieve the default settings for an app	List	app*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetApps	Grants permission to retrieve a list of apps in your Amazon Pinpoint account	Read	apps*		
GetBaiduChannel	Grants permission to retrieve information about the Baidu channel for an app	Read	channel*		
GetCampaign	Grants permission to retrieve information about a specific campaign	Read	campaign*		
GetCampaignActivities	Grants permission to retrieve information about the activities performed by a campaign	List	campaign*		
GetCampaignDateRangeKpi	Grants permission to retrieve (queries) pre-aggregated data for a standard metric that applies to a campaign	Read	campaign-metrics*		
GetCampaignVersion	Grants permission to retrieve information about a specific campaign version	Read	campaign*		
GetCampaignVersions	Grants permission to retrieve information about the current and prior versions of a campaign	List	campaign*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCampaigns	Grants permission to retrieve information about all campaigns for an app	List	app*		
GetChannels	Grants permission to get all channels information for your app	List	channels*		
GetEmailChannel	Grants permission to obtain information about the email channel in an app	Read	channel*		
GetEmailTemplate	Grants permission to retrieve information about a specific or the active version of an email template	Read	template*		
GetEndpoint	Grants permission to retrieve information about a specific endpoint	Read	endpoint*		
GetEventStream	Grants permission to retrieve information about the event stream for an app	Read	event-stream*		
GetExportJob	Grants permission to obtain information about a specific export job	Read	export-job*		
GetExportJobs	Grants permission to retrieve a list of all of the export jobs for an app	List	app*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetGcmChannel	Grants permission to retrieve information about the GCM channel for an app	Read	channel*		
GetImportJob	Grants permission to retrieve information about a specific import job	Read	import-job*		
GetImportJobs	Grants permission to retrieve information about all import jobs for an app	List	app*		
GetInAppMessages	Grants permission to retrive in-app messages for the given endpoint id	Read	app*		
GetInAppTemplate	Grants permission to retrieve information about a specific or the active version of an in-app message template	Read	template*		
GetJourney	Grants permission to retrieve information about a specific journey	Read	journey*		
GetJourneyDateRangeKpi	Grants permission to retrieve (queries) pre-aggregated data for a standard engagement metric that applies to a journey	Read	journey-metrics*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetJourneyExecutionActivityMetrics	Grants permission to retrieve (queries) pre-aggregated data for a standard execution metric that applies to a journey activity	Read	journey-execution-activity-metrics*		
GetJourneyExecutionMetrics	Grants permission to retrieve (queries) pre-aggregated data for a standard execution metric that applies to a journey	Read	journey-execution-metrics*		
GetJourneyRunExecutionActivityMetrics	Grants permission to retrieve (queries) pre-aggregated data for a standard execution metric that applies to a journey activity for a single journey run	Read	journey*		
GetJourneyRunExecutionMetrics	Grants permission to retrieve (queries) pre-aggregated data for a standard execution metric that applies to a journey for a single journey run	Read	journey*		
GetJourneyRuns	Grants permission to retrieve information about all journey runs for a journey	List	journey*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetPushTemplate	Grants permission to retrieve information about a specific or the active version of an push notification template	Read	template*		
GetRecommenderConfiguration	Grants permission to retrieve information about an Amazon Pinpoint configuration for a recommender model	Read	recommender*		
GetRecommenderConfigurations	Grants permission to retrieve information about all the recommender model configurations that are associated with an Amazon Pinpoint account	List	recommenders*		
GetReports [permission only]	Grants permission to mobiletargeting:GetReports	Read	reports*		
GetSegment	Grants permission to retrieve information about a specific segment	Read	segment*		
GetSegmentExportJobs	Grants permission to retrieve information about jobs that export endpoint definitions from segments to Amazon S3	List	segment*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSegmentImportJobs	Grants permission to retrieve information about jobs that create segments by importing endpoint definitions from	List	segment*		
GetSegmentVersion	Grants permission to retrieve information about a specific segment version	Read	segment*		
GetSegmentVersions	Grants permission to retrieve information about the current and prior versions of a segment	List	segment*		
GetSegments	Grants permission to retrieve information about the segments for an app	List	app*		
GetSmsChannel	Grants permission to obtain information about the SMS channel in an app	Read	channel*		
GetSmsTemplate	Grants permission to retrieve information about a specific or the active version of an sms message template	Read	template*		
GetUserEndpoints	Grants permission to retrieve information about the endpoints that are associated with a user ID	Read	user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetVoiceChannel	Grants permission to obtain information about the Voice channel in an app	Read	channel*		
GetVoiceTemplate	Grants permission to retrieve information about a specific or the active version of a voice message template	Read	template*		
ListJourneys	Grants permission to retrieve information about all journeys for an app	List	app*		
ListTagsForResource	Grants permission to list tags for a resource	Read	app		
			campaign		
			journey		
			segment		
			template		
ListTemplateVersions	Grants permission to retrieve all versions about a specific template	List	template*		
ListTemplates	Grants permission to retrieve metadata about the queried templates	List	templates*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PhoneNumberValidate	Grants permission to obtain metadata for a phone number, such as the number type (mobile, landline, or VoIP), location, and provider	Read	phone-number-validate*		
PutEventStream	Grants permission to create or update an event stream for an app	Write	event-stream*		
PutEvents	Grants permission to create or update events for an app	Write	events*		
RemoveAttributes	Grants permission to remove the attributes for an app	Write	attribute*		
SendMessages	Grants permission to send an SMS message or push notification to specific endpoints	Write	messages*		
SendOTPMessage	Grants permission to send an OTP code to a user of your application	Write	otp*		
SendUsersMessages	Grants permission to send an SMS message or push notification to all endpoints that are associated with a specific user ID	Write	messages*		
TagResource	Grants permission to add tags to a resource	Tagging	app campaign		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			journey		
			segment		
			template		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from a resource	Tagging	app		
			campaign		
			journey		
			segment		
			template		
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateAdmChannel	Grants permission to update the Amazon Device Messaging (ADM) channel for an app	Write	channel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateApnsChannel	Grants permission to update the Apple Push Notification service (APNs) channel for an app	Write	channel*		
UpdateApnsSandboxChannel	Grants permission to update the Apple Push Notification service (APNs) sandbox channel for an app	Write	channel*		
UpdateApnsVoipChannel	Grants permission to update the Apple Push Notification service (APNs) VoIP channel for an app	Write	channel*		
UpdateApnsVoipSandboxChannel	Grants permission to update the Apple Push Notification service (APNs) VoIP sandbox channel for an app	Write	channel*		
UpdateApplicationSettings	Grants permission to update the default settings for an app	Write	app*		
UpdateBaiduChannel	Grants permission to update the Baidu channel for an app	Write	channel*		
UpdateCampaign	Grants permission to update a specific campaign	Write	campaign*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateEmailChannel	Grants permission to update the email channel for an app	Write	channel*		
UpdateEmailTemplate	Grants permission to update a specific email template under the same version or generate a new version	Write	template*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateEndpoint	Grants permission to create an endpoint or update the information for an endpoint	Write	endpoint*		
UpdateEndpointsBatch	Grants permission to create or update endpoints as a batch operation	Write	app*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateGcmChannel	Grants permission to update the Firebase Cloud Messaging (FCM) or Google Cloud Messaging (GCM) API key that allows to send push notifications to your Android app	Write	channel*		
UpdateInAppTemplate	Grants permission to update a specific in-app message template under the same version or generate a new version	Write	template*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateJourney	Grants permission to update a specific journey	Write	journey*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateJourneyState	Grants permission to update a specific journey state	Write	journey*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdatePushTemplate	Grants permission to update a specific push notification template under the same version or generate a new version	Write	template*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateRecommenderConfiguration	Grants permission to update an Amazon Pinpoint configuration for a recommender model	Write	recommender*		
UpdateSegment	Grants permission to update a specific segment	Write	segment*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateSmsChannel	Grants permission to update the SMS channel for an app	Write	channel*		
UpdateSmsTemplate	Grants permission to update a specific sms message template under the same version or generate a new version	Write	template*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateTemplateActiveVersion	Grants permission to update the active version parameter of a specific template	Write	template*		
UpdateVoiceChannel	Grants permission to update the Voice channel for an app	Write	channel*		
UpdateVoiceTemplate	Grants permission to update a specific voice message template under the same version or generate a new version	Write	template*		
				aws:RequestTag/${TagKey} aws:TagKeys	
VerifyOTPMessage	Grants permission to check the validity of One-Time Passwords (OTPs)	Write	verify-otp*		

Resource types defined by Amazon Pinpoint

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
app	`arn:${Partition}:mobiletargeting:${Region}:${Account}:apps/${AppId}`	aws:ResourceTag/${TagKey}
apps	`arn:${Partition}:mobiletargeting:${Region}:${Account}:apps/*`	
campaign	`arn:${Partition}:mobiletargeting:${Region}:${Account}:apps/${AppId}/campaigns/${CampaignId}`	aws:ResourceTag/${TagKey}
journey	`arn:${Partition}:mobiletargeting:${Region}:${Account}:apps/${AppId}/journeys/${JourneyId}`	aws:ResourceTag/${TagKey}
journeys	`arn:${Partition}:mobiletargeting:${Region}:${Account}:apps/${AppId}/journeys`	
segment	`arn:${Partition}:mobiletargeting:${Region}:${Account}:apps/${AppId}/segments/${SegmentId}`	aws:ResourceTag/${TagKey}
template	`arn:${Partition}:mobiletargeting:${Region}:${Account}:templates/${TemplateName}/${TemplateType}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
templates	arn:${Partition}:mobiletargeting:${Region}:${Account}:templates	
recommender	arn:${Partition}:mobiletargeting:${Region}:${Account}:recommenders/${RecommenderId}	
recommenders	arn:${Partition}:mobiletargeting:${Region}:${Account}:recommenders/*	
phone-number-validate	arn:${Partition}:mobiletargeting:${Region}:${Account}:phone/number/validate	
channels	arn:${Partition}:mobiletargeting:${Region}:${Account}:apps/${AppId}/channels	
channel	arn:${Partition}:mobiletargeting:${Region}:${Account}:apps/${AppId}/channels/${ChannelType}	
event-stream	arn:${Partition}:mobiletargeting:${Region}:${Account}:apps/${AppId}/eventstream

Condition keys for Amazon Pinpoint

Amazon Pinpoint defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a key that is present in the request the user makes to the pinpoint service	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair	String

Condition keys	Description	Type
aws:TagKeys	Filters access by the list of all the tag key names present in the request the user makes to the pinpoint service	ArrayOfString

Actions, resources, and condition keys for Amazon Pinpoint Email Service

Amazon Pinpoint Email Service (service prefix: `ses`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon Pinpoint Email Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateConfigurationSet	Grants permission to create a configuration set	Write		ses:ApiVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateConfigurationSetEventDestination	Grants permission to create a configuration set event destination	Write	configuration-set*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
CreateDedicatedIpPool	Grants permission to create a new pool of dedicated IP addresses	Write		ses:ApiVersion aws:TagKeys aws:RequestTag/${TagKey}	
CreateDeliverabilityTestReport	Grants permission to create a new predictive inbox placement test	Write	identity*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ses:ApiVersion aws:TagKeys aws:RequestTag/${TagKey}	
CreateEmailIdentity	Grants permission to start the process of verifying an email identity	Write		ses:ApiVersion aws:TagKeys aws:RequestTag/${TagKey}	
DeleteConfigurationSet	Grants permission to delete an existing configuration set	Write	configuration-set*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteConfigurationSetEventDestination	Grants permission to delete an event destination	Write	configuration-set*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
DeleteDedicatedIpPool	Grants permission to delete a dedicated IP pool	Write	dedicated-ip-pool*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
DeleteEmailIdentity	Grants permission to delete an email identity that you previously verified	Write	identity*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAccount	Grants permission to get information about the email-sending status and capabilities	Read		ses:ApiVersion	
GetBlacklistReports	Grants permission to retrieve a list of the deny lists on which your dedicated IP addresses appear	Read		ses:ApiVersion	
GetConfigurationSet	Grants permission to get information about an existing configuration set	Read	configuration-set*		
				ses:ApiVersion aws:ResourceTag/${TagKey}

Resource types defined by Amazon Pinpoint Email Service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
configuration-set	`arn:${Partition}:ses:${Region}:${Account}:configuration-set/${ConfigurationSetName}`	aws:ResourceTag/${TagKey}
dedicated-ip-pool	`arn:${Partition}:ses:${Region}:${Account}:dedicated-ip-pool/${DedicatedIPPool}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
deliverability-test-report	arn:${Partition}:ses:${Region}:${Account}:deliverability-test-report/${ReportId}	aws:ResourceTag/${TagKey}
identity	arn:${Partition}:ses:${Region}:${Account}:identity/${IdentityName}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Pinpoint Email Service

Amazon Pinpoint Email Service defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters actions based on the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters actions based on tag key-value pairs attached to the resource	String
aws:TagKeys	Filters actions based on the presence of tag keys in the request	ArrayOfString
ses:ApiVersion	Filters actions based on the SES API version	String
ses:FeedbackAddress	Filters actions based on the "Return-Path" address, which specifies where bounces and complaints are sent by email feedback forwarding	String

Condition keys	Description	Type
ses:FromAddress	Filters actions based on the "From" address of a message	String
ses:FromDisplayName	Filters actions based on the "From" address that is used as the display name of a message	String
ses:Recipients	Filters actions based on the recipient addresses of a message, which include the "To", "CC", and "BCC" addresses	ArrayOfString

Actions, resources, and condition keys for Amazon Pinpoint SMS and Voice Service

Amazon Pinpoint SMS and Voice Service (service prefix: `sms-voice`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Pinpoint SMS and Voice Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateConfigurationSet	Create a new configuration set. After you create the configuration set, you can add one or more event destinations to it.	Write			
CreateConfigurationSetEventDestination	Create a new event destination in a configuration set.	Write			iam:PassRole
DeleteConfigurationSet	Deletes an existing configuration set.	Write			
DeleteConfigurationSetEventDestination	Deletes an event destination in a configuration set.	Write			
GetConfigurationSetEventDestinations	Obtain information about an event destination, including the types of events it reports, the Amazon Resource Name (ARN) of the destination, and the name of the event destination.	Read			
ListConfigurationSets	Return a list of configuration sets. This operation only returns the configuration sets that are associated with your	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	account in the current AWS Region.				
SendVoiceMessage	Create a new voice message and send it to a recipient's phone number.	Write			
UpdateConfigurationSetEventDestination	Update an event destination in a configuration set. An event destination is a location that you publish information about your voice calls to. For example, you can log an event to an Amazon CloudWatch destination when a call fails.	Write			iam:PassRole

Resource types defined by Amazon Pinpoint SMS and Voice Service

Amazon Pinpoint SMS and Voice Service does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon Pinpoint SMS and Voice Service, specify `"Resource": "*"` in your policy.

Condition keys for Amazon Pinpoint SMS and Voice Service

Pinpoint SMS Voice has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Polly

Amazon Polly (service prefix: `polly`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Polly

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteLexicon	Grants permission to delete the specified pronunciation lexicon stored in an AWS Region	Write	lexicon*		
DescribeVoices	Grants permission to describe the list of voices that are available for use when requesting speech synthesis	List			
GetLexicon	Grants permission to retrieve the content of the specified	Read	lexicon*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	pronunciation lexicon stored in an AWS Region				
GetSpeechSynthesisTask	Grants permission to get information about specific speech synthesis task	Read			
ListLexicons	Grants permission to list the pronunciation lexicons stored in an AWS Region	List			
ListSpeechSynthesisTasks	Grants permission to list requested speech synthesis tasks	List			
PutLexicon	Grants permission to store a pronunciation lexicon in an AWS Region	Write	lexicon*		
StartSpeechSynthesisStream	Grants permission to perform synthesis with bidirectional streaming	Read	lexicon		
StartSpeechSynthesisTask	Grants permission to synthesize long inputs to the provided S3 location	Write	lexicon		s3:PutObject
SynthesizeSpeech	Grants permission to synthesize speech	Read	lexicon		

Resource types defined by Amazon Polly

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types

that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
lexicon	`arn:${Partition}:polly:${Region}:${Account}:lexicon/${LexiconName}`	

Condition keys for Amazon Polly

Polly has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Price List

AWS Price List (service prefix: `pricing`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Price List

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy,

you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeServices	Grants permission to retrieve service details for all (paginated) services (if serviceCode is not set) or service detail for a particular service (if given serviceCode)	Read			
GetAttributeValues	Grants permission to retrieve all (paginated) possible values for a given attribute	Read			
GetPriceListFileUrl	Grants permission to retrieve the price list file URL for the given parameters	Read			
GetProducts	Grants permission to retrieve all matching products with given search criteria	Read			
ListPriceLists	Grants permission to list all (paginated) eligible price lists for the given parameters	Read			

Resource types defined by AWS Price List

AWS Price List does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Price List, specify `"Resource": "*"` in your policy.

Condition keys for AWS Price List

Price List has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS PricingPlanManager Service

AWS PricingPlanManager Service (service prefix: `pricingplanmanager`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS PricingPlanManager Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit

resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateResourcesToSubscription	Grants permission to associate resources with a subscription	Write			
CancelSubscription	Grants permission to cancel a subscription	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelSubscriptionChange	Grants permission to cancel a pending a change for a subscription	Write			
CreateSubscription	Grants permission to create a subscription	Write			
DisassociateResourcesFromSubscription	Grants permission to disassociate resources from a subscription	Write			
GetSubscription	Grants permission to get the details for a subscription	Read			
ListSubscriptions	Grants permission to list subscriptions in your account	Read			
UpdateSubscription	Grants permission to update a subscription	Write			

Resource types defined by AWS PricingPlanManager Service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
subscription	arn:${Partition}:pricingplanmanager::${Account}:subscription/${SubscriptionId}	

Condition keys for AWS PricingPlanManager Service

PricingPlanManager has no service-specific context keys that can be used in the Condition element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Private CA Connector for Active Directory

AWS Private CA Connector for Active Directory (service prefix: pca-connector-ad) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Private CA Connector for Active Directory

You can specify the following actions in the Action element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy,

you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateConnector	Grants permission to create a Connector in your account	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	acm-pca:DescribeCertificateAuthority acm-pca:GetCertificate acm-pca:GetCertificateAuthorityCertificate acm-pca:IssueCertificate ec2:CreateTags ec2:CreateVpcEndpoint ec2:DescribeVpcEndpoints

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateDirectoryRegistration	Grants permission to create a DirectoryRegistration in your account	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	ds:AuthorizeApplication ds:DescribeDirectories
CreateServicePrincipalName	Grants permission to create a ServicePrincipalName for a DirectoryRegistration	Write	Directory Registration*		ds:UpdateAuthorizedApplication
CreateTemplate	Grants permission to create a Template for a Connector	Write	Connector*		
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTemplateGroupAccessControlEntry	Grants permission to create a TemplateGroupAccessControlEntry for a Template	Write	Template*		
DeleteConnector	Grants permission to delete a Connector in your account	Write	Connector*		ec2:DeleteVpcEndpoints ec2:DescribeVpcEndpoints
DeleteDirectoryRegistration	Grants permission to delete a DirectoryRegistration in your account	Write	DirectoryRegistration*		ds:UnauthorizeApplication ds:UpdateAuthorizedApplication
DeleteServicePrincipalName	Grants permission to delete a ServicePrincipalName for a DirectoryRegistration	Write	DirectoryRegistration*		ds:UpdateAuthorizedApplication
DeleteTemplate	Grants permission to delete a Template for a Connector	Write	Template*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteTemplateGroupAccessControlEntry	Grants permission to delete a TemplateGroupAccessControlEntry for a Template	Write	Template*		
GetConnector	Grants permission to get a Connector in your account	Read	Connector*		
GetDirectoryRegistration	Grants permission to get a DirectoryRegistration in your account	Read	DirectoryRegistration*		
GetServicePrincipalName	Grants permission to get a ServicePrincipalName for a DirectoryRegistration	Read	DirectoryRegistration*

ListServicePrincipalNames	Grants permission to list the ServicePrincipalNames for a DirectoryRegistration	List	DirectoryRegistration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTagsForResource	Grants permission to list the tags for a pca-connector-ad resource in your account	Read			
ListTemplateGroupAccessControlEntries	Grants permission to list the TemplateGroupAccessControlEntries for a Template	List	Template*		
ListTemplates	Grants permission to list the Templates for a Connector	List	Connector*		
TagResource	Grants permission to tag a pca-connector-ad resource in your account	Tagging	Connector		
			Directory Registration		
			Template		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag a pca-connector-ad resource in your account	Tagging	Connector		
			Directory Registration		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			Template		
				aws:TagKeys	
UpdateTemplate	Grants permission to update a Template for a Connector	Write	Template*		
UpdateTemplateGroupAccessControlEntry	Grants permission to update a TemplateGroupAccessControlEntry for a Template	Write	Template*		

Resource types defined by AWS Private CA Connector for Active Directory

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Connector	`arn:${Partition}:pca-connector-ad:${Region}:${Account}:connector/${ConnectorId}`	aws:ResourceTag/${TagKey}
Directory Registration	`arn:${Partition}:pca-connector-ad:${Region}:${Account}:directory-registration/${DirectoryId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
Template	arn:${Partition}:pca-connector-ad:${Region}:${Account}:connector/${ConnectorId}/template/${TemplateId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Private CA Connector for Active Directory

AWS Private CA Connector for Active Directory defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by on the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by on the tags associated with the resource	String
aws:TagKeys	Filters access by on the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Private CA Connector for SCEP

AWS Private CA Connector for SCEP (service prefix: pca-connector-scep) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Private Certificate Authority

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCertificateAuthority	Grants permission to create an AWS Private CA and its associated private key and configuration	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
CreateCertificateAuthorityAuditReport	Grants permission to create an audit report for an AWS Private CA	Write	certificate-authority*		
CreatePermission	Grants permission to create a permission for an AWS Private CA	Permissions management	certificate-authority*		
DeleteCertificateAuthority	Grants permission to delete an AWS Private CA and its associated private key and configuration	Write	certificate-authority*		
DeletePermission	Grants permission to delete a permission for an AWS Private CA	Permissions management	certificate-authority*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeletePolicy	Grants permission to delete the policy for an AWS Private CA	Permissions management	certificate-authority*		
DescribeCertificateAuthority	Grants permission to return a list of the configuration and status fields contained in the specified AWS Private CA	Read	certificate-authority*		
DescribeCertificateAuthorityAuditReport	Grants permission to return the status and information about an AWS Private CA audit report	Read	certificate-authority*		
GetCertificate	Grants permission to retrieve an AWS Private CA certificate and certificate chain for the certificate authority specified by an ARN	Read	certificate-authority*		
GetCertificateAuthorityCertificate	Grants permission to retrieve an AWS Private CA certificate and certificate chain for the certificate authority specified by an ARN	Read	certificate-authority*		
GetCertificateAuthorityCsr	Grants permission to retrieve an AWS Private CA certificate signing request (CSR) for the certificate-authority specified by an ARN	Read	certificate-authority*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetPolicy	Grants permission to retrieve the policy on an AWS Private CA	Read	certificate-authority*		
ImportCertificateAuthorityCertificate	Grants permission to import an SSL/TLS certificate into AWS Private CA for use as the CA certificate of an AWS Private CA	Write	certificate-authority*		
IssueCertificate	Grants permission to issue an AWS Private CA certificate	Write	certificate-authority*		
				acm-pca:TemplateArn	
ListCertificateAuthorities	Grants permission to retrieve a list of the AWS Private CA certificate authority ARNs, and a summary of the status of each CA in the calling account	List

Actions defined by AWS PrivateLink

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AllowMultiRegion [permission only]	Grants permission to manage multi-region VPC endpoints and VPC endpoint service configurations	Write	vpc-endpoint		
			vpc-endpoint-service		

Resource types defined by AWS PrivateLink

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
vpc-endpoint	`arn:${Partition}:ec2:${Region}:${Account}:vpc-endpoint/${VpcEndpointId}`	
vpc-endpoint-service	`arn:${Partition}:ec2:${Region}:${Account}:vpc-endpoint-service/${VpcEndpointServiceId}`	

Condition keys for AWS PrivateLink

VPC Endpoints has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Proton

AWS Proton (service prefix: `proton`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

UpdateTemplateSyncConfig	Grants permission to update a TemplateSyncConfig	Write			

Resource types defined by AWS Proton

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
environment-template	arn:${Partition}:proton:${Region}:${Account}:environment-template/${Name}	aws:ResourceTag/${TagKey}
environment-template-version	arn:${Partition}:proton:${Region}:${Account}:environment-template/${TemplateName}:${MajorVersion}.${MinorVersion}	aws:ResourceTag/${TagKey}
environment-template-major-version	arn:${Partition}:proton:${Region}:${Account}:environment-template/${TemplateName}:${MajorVersionId}	aws:ResourceTag/${TagKey}
environment-template-minor-version	arn:${Partition}:proton:${Region}:${Account}:environment-template/${TemplateName}:${MajorVersionId}.${MinorVersionId}	aws:ResourceTag/${TagKey}
service-template	arn:${Partition}:proton:${Region}:${Account}:service-template/${Name}	aws:ResourceTag/${TagKey}
service-template-version	arn:${Partition}:proton:${Region}:${Account}:service-template/${TemplateName}:${MajorVersion}.${MinorVersion}	aws:ResourceTag/${TagKey}
service-template-major-version	arn:${Partition}:proton:${Region}:${Account}:service-template/${TemplateName}:${MajorVersionId}	aws:ResourceTag/${TagKey}
service-template-minor-version	arn:${Partition}:proton:${Region}:${Account}:service-template/${TemplateName}:${MajorVersionId}.${MinorVersionId}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
environment	arn:${Partition}:proton:${Region}:${Account}:environment/${Name}	aws:ResourceTag/${TagKey}
service	arn:${Partition}:proton:${Region}:${Account}:service/${Name}	aws:ResourceTag/${TagKey}
service-instance	arn:${Partition}:proton:${Region}:${Account}:service/${ServiceName}/service-instance/${Name}	aws:ResourceTag/${TagKey}
environment-account-connection	arn:${Partition}:proton:${Region}:${Account}:environment-account-connection/${Id}	aws:ResourceTag/${TagKey}
repository	arn:${Partition}:proton:${Region}:${Account}:repository/${Provider}:${Name}	aws:ResourceTag/${TagKey}
component	arn:${Partition}:proton:${Region}:${Account}:component/${Id}	aws:ResourceTag/${TagKey}
deployment	arn:${Partition}:proton:${Region}:${Account}:deployment/${Id}	aws:ResourceTag/${TagKey}

Condition keys for AWS Proton

AWS Proton defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by tag keys in the request	ArrayOfString
proton:EnvironmentTemplate	Filters access by specified environment template related to resource	String
proton:ServiceTemplate	Filters access by specified service template related to resource	String

Actions, resources, and condition keys for AWS Purchase Orders Console

AWS Purchase Orders Console (service prefix: `purchase-orders`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Purchase Orders Console

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddPurchaseOrder [permission only]	Grants permission to add a new purchase order	Write	purchase-order*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeletePurchaseOrder [permission only]	Grants permission to delete a purchase order	Write	purchase-order*		
				aws:ResourceTag/${TagKey}	
GetConsoleActionSetEnforced [permission only]	Grants permission to view whether existing or fine-grained IAM actions are being used to control authorization to Billing, Cost Management, and Account consoles	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetPurchaseOrder [permission only]	Grants permission to get a purchase order	Read	purchase-order*		
				aws:ResourceTag/${TagKey}	
ListPurchaseOrderInvoices [permission only]	Grants permission to list purchase order invoices	List	purchase-order*		
				aws:ResourceTag/${TagKey}	
ListPurchaseOrders [permission only]	Grants permission to list all purchase orders for an account	List			
ListTagsForResource [permission only]	Grants permission to list tags for a purchase order	Read	purchase-order		
				aws:ResourceTag/${TagKey}	
ModifyPurchaseOrders [permission only]	Grants permission to modify purchase orders and details	Write	purchase-order*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys	
TagResource [permission only]	Grants permission to tag purchase orders with given key value pairs	Tagging	purchase-order*		
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
UntagResource [permission only]	Grants permission to remove tags from a purchase order	Tagging	purchase-order*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:ResourceTag/${TagKey}	
UpdateConsoleActionSetEnforced [permission only]	Grants permission to change whether existing or fine-grained IAM actions will be used to control authorization to Billing, Cost Management, and Account consoles	Write			
UpdatePurchaseOrder [permission only]	Grants permission to update an existing purchase order	Write	purchase-order*		
				aws:ResourceTag/${TagKey}	
UpdatePurchaseOrderStatus [permission only]	Grants permission to set purchase order status	Write	purchase-order*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ViewPurchaseOrders [permission only]	Grants permission to view purchase orders and details	Read	purchase-order		
				aws:ResourceTag/${TagKey}	

Resource types defined by AWS Purchase Orders Console

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
purchase-order	`arn:${Partition}:purchase-orders::${Account}:purchase-order/${ResourceName}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Purchase Orders Console

AWS Purchase Orders Console defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag's key and value in a request	String
aws:ResourceTag/${TagKey}	Filters access by the set of tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the tag keys in a request	ArrayOfString

Actions, resources, and condition keys for Amazon Q

Amazon Q (service prefix: q) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon Q

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Associate Connector Resource [permission only]	Grants permission to associate an AWS resource with an Amazon Q connector	Write			
CreateAssignment [permission only]	Grants permission to create a user or group assignment for an Amazon Q Developer Profile	Write	profile*		
				identitystore:UserId identitystore:GroupId	
CreateAuthGrant [permission only]	Grants permission to create OAuth user in Amazon Q	Write			kms:Decrypt kms:GenerateDataKeyWithoutPlaintext kms:ReEncryptFrom kms:ReEncryptTo
CreateOAuthAppConnection	Grants permission to register an OAuth application in Amazon Q	Write			kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
[permission only]					kms:GenerateDataKeyWithoutPlaintext kms:ReEncryptFrom kms:ReEncryptTo
CreatePlugin [permission only]	Grants permission to create and configure a third party plugin in Amazon Q	Write	plugin*		
				aws:TagKeys aws:RequestTag/${TagKey}	
DeleteAssignment [permission only]	Grants permission to delete a user or group assignment for an Amazon Q Developer Profile	Write	profile*		
				identitystore:UserId identitystore:GroupId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteConversation [permission only]	Grants permission to delete a conversation with Amazon Q	Write			
DeleteOAuthAppConnection [permission only]	Grants permission to delete an OAuth application in Amazon Q	Write			kms:Decrypt kms:GenerateDataKeyWithoutPlaintext kms:ReEncryptFrom kms:ReEncryptTo
DeletePlugin [permission only]	Grants permission to delete a configured plugin in Amazon Q	Write	plugin*		
				aws:ResourceTag/${TagKey}	
GenerateCodeFromCommands [permission only]	Grants permission to generate code from CLI commands in Amazon Q	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GenerateCodeRecommendations [permission only]	Grants permission to generate code recommendations in Amazon Q	Read			
GetConnector [permission only]	Grants permission to view information about a specific Amazon Q connector	Read			
GetConversation [permission only]	Grants permission to get individual messages associated with a specific conversation with Amazon Q	Read			
GetIdentityMetadata [permission only]	Grants permission to Amazon Q to get the identity metadata	Read			
GetPlugin [permission only]	Grants permission to view information about a specific configured Amazon Q plugin	Read	plugin*		
				aws:ResourceTag/${TagKey}	
GetTroubleshootingResults [permission only]	Grants permission to get troubleshooting results with Amazon Q	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListConversations [permission only]	Grants permission to list individual conversations associated with a specific Amazon Q user	Read			
ListDashboardMetrics [permission only]	Grants permission to read metrics to populate Amazon Q dashboard	List			
ListPluginProviders [permission only]	Grants permission to list available plugins in Amazon Q	List			
ListPlugins [permission only]	Grants permission to list configured plugins in Amazon Q	List	plugin*		
ListTagsForResource [permission only]	Grants permission to list all tags associated with an Amazon Q resource	List	plugin		
				aws:ResourceTag/${TagKey}	
PassRequest [permission only]	Grants permission to allow Amazon Q to perform actions on your behalf	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RejectConnector [permission only]	Grants permission to reject a connection request for an Amazon Q connector	Write			
SendEvent [permission only]	Grants permission to trigger asynchronous Amazon Q actions	Write			kms:Decrypt kms:GenerateDataKeyWithoutPlaintext kms:ReEncryptFrom kms:ReEncryptTo
SendMessage [permission only]	Grants permission to send a message to Amazon Q	Write			
StartConversation [permission only]	Grants permission to start a conversation with Amazon Q	Write			
StartTroubleshootingAnalysis [permission only]	Grants permission to start a troubleshooting analysis with Amazon Q	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartTroubleshootingResolutionExplanation [permission only]	Grants permission to start a troubleshooting resolution explanation with Amazon Q	Write			
TagResource [permission only]	Grants permission to associate tags with an Amazon Q resource	Tagging	plugin		
				aws:ResourceTag/${TagKey} aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource [permission only]	Grants permission to remove tags associated with an Amazon Q resource	Tagging	plugin		
				aws:ResourceTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAuthGrant [permission only]	Grants permission to update OAuth user in Amazon Q	Write			kms:Decrypt kms:GenerateDataKeyWithoutPlaintext kms:ReEncryptFrom kms:ReEncryptTo
UpdateConversation [permission only]	Grants permission to update a conversation with Amazon Q	Write			
UpdateOAuthAppConnection [permission only]	Grants permission to update an OAuth application in Amazon Q	Write			kms:Decrypt kms:GenerateDataKeyWithoutPlaintext kms:ReEncryptFrom kms:ReEncryptTo

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdatePlugin [permission only]	Grants permission to update a third party plugin in Amazon Q	Write	plugin*		
				aws:TagKeys aws:RequestTag/${TagKey}	
UpdateTroubleshootingCommandResult [permission only]	Grants permission to update a troubleshooting command result with Amazon Q	Write			
UsePlugin [permission only]	Grants permission to use Amazon Q plugins	Write	plugin*		
VerifyOAuthAppConnection [permission only]	Grants permission to verify an OAuth application in Amazon Q	Write			kms:Decrypt kms:GenerateDataKeyWithoutPlaintext kms:ReEncryptFrom kms:ReEncryptTo

Resource types defined by Amazon Q

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
profile	`arn:${Partition}:codewhisperer:${Region}:${Account}:profile/${Identifier}`	
plugin	`arn:${Partition}:qdeveloper:${Region}:${Account}:plugin/${Identifier}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Q

Amazon Q defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the Amazon Q resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Condition keys	Description	Type
identitystore:GroupId	Filters access by IAM Identity Center Group ID	ArrayOfString
identitystore:UserId	Filters access by IAM Identity Center User ID	ArrayOfString

Actions, resources, and condition keys for Amazon Q Business

Amazon Q Business (service prefix: `qbusiness`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Q Business

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AllowVendedLogDeli	Grants permission to configure vended log delivery	Permissions	application*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
veryForResource [permission only]	for Amazon Q Business application resource	management		aws:ResourceTag/${TagKey}	
AssociatePermission	Grants permission to associate resource based policy statement to the application	Write	application*		qbusiness:PutResourcePolicy
BatchDeleteDocument	Grants permission to batch delete document	Write	application*		
			index*		
BatchPutDocument	Grants permission to batch put document	Write	application*		
			index*		
CancelSubscription	Grants permission to cancel a subscription	Write	application*		
			subscription*		
Chat	Grants permission to chat using an application	Read	application*		
ChatSync	Grants permission to chat synchronously using an application	Read	application*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CheckDocumentAccess	Grants permission to check if a user has access to a document	Read	application*		
			index*		
CreateAnonymousWebExperienceUrl	Grants permission to create a unique URL for anonymous Amazon Q Business web experience	Write	application*		
			web-experience*		
CreateApplication	Grants permission to create an application	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateChatResponseConfiguration	Grants permission to create a chat response configuration to the application	Write	application*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateDataAccessor	Grants permission to create DataAccessor to the application	Write	application*		qbusiness:CreateDataAccessorWithTti
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDataAccessorWithTti [permission only]	Grants permission to create AWS IAM Identity center Trusted Token Issuer based DataAccessor to the application	Write	application*		
CreateDataSource	Grants permission to create a data source for a given application and index	Write	application*		
			index*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateIndex	Grants permission to create an index for a given application	Write	application*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateIntegration	Grants permission to create a new integration for a Q Business application	Write	application*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreatePlugin	Grants permission to create a plugin for a given application	Write	application*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateRetriever	Grants permission to create a retriever for a given application	Write	application*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSubscription	Grants permission to create a subscription	Write	application*		
				identitystore:UserId identitystore:GroupId	
CreateUser	Grants permission to create a user	Write	application*		
CreateWebExperience	Grants permission to create a web experience for a given application	Write	application*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteApplication	Grants permission to delete an application	Write	application*		
DeleteAttachment	Grants permission to delete an attachment in the current chat context	Write	application*		
DeleteChatControlsConfiguration	Grants permission to delete chat controls configuration for an application	Write	application*		
DeleteChatResponseConfiguration	Grants permission to delete a chat response configuration	Write	application*		
			chat-response-configuration*		
DeleteConversation	Grants permission to delete a conversation	Write	application*		
DeleteDataAccessor	Grants permission to delete DataAccessor	Write	application*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

Resource types defined by Amazon Q Business

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
application	`arn:${Partition}:qbusiness:${Region}:${Account}:application/${ApplicationId}`	aws:ResourceTag/${TagKey}
integration	`arn:${Partition}:qbusiness:${Region}:${Account}:application/${ApplicationId}/integration/${IntegrationId}`	aws:ResourceTag/${TagKey}
retriever	`arn:${Partition}:qbusiness:${Region}:${Account}:application/${ApplicationId}/retriever/${RetrieverId}`	aws:ResourceTag/${TagKey}
index	`arn:${Partition}:qbusiness:${Region}:${Account}:application/${ApplicationId}/index/${IndexId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
data-source	arn:${Partition}:qbusiness:${Region}:${Account}:application/${ApplicationId}/index/${IndexId}/data-source/${DataSourceId}	aws:ResourceTag/${TagKey}
plugin	arn:${Partition}:qbusiness:${Region}:${Account}:application/${ApplicationId}/plugin/${PluginId}	aws:ResourceTag/${TagKey}
web-experience	arn:${Partition}:qbusiness:${Region}:${Account}:application/${ApplicationId}/web-experience/${WebExperienceId}	aws:ResourceTag/${TagKey}
subscription	arn:${Partition}:qbusiness:${Region}:${Account}:application/${ApplicationId}/subscription/${SubscriptionId}	
data-accessor	arn:${Partition}:qbusiness:${Region}:${Account}:application/${ApplicationId}/data-accessor/${DataAccessorId}	aws:ResourceTag/${TagKey}
chat-response-configuration	arn:${Partition}:qbusiness:${Region}:${Account}:application/${ApplicationId}/chat-response-configuration/${ChatResponseConfigurationId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Q Business

Amazon Q Business defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
identitystore:GroupId	Filters access by IAM Identity Center Group ID	ArrayOfString
identitystore:UserId	Filters access by IAM Identity Center User ID	ArrayOfString

Actions, resources, and condition keys for Amazon Q Business Q Apps

Amazon Q Business Q Apps (service prefix: qapps) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Q Business Q Apps

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateLibraryItemReview	Grants permission to associate a library item review in the Q Business application environment	Write	qapp*		
				qapps:UserIsAppOwner qapps:AppIsPublished	
AssociateQAppWithUser	Grants permission to associate Q App with a user in the Q Business application environment	Write	application		
			qapp		
				qapps:UserIsAppOwner qapps:AppIsPublished

Resource types defined by Amazon Q Business Q Apps

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
application	`arn:${Partition}:qbusiness:${Region}:${Account}:application/${ApplicationId}`	
qapp	`arn:${Partition}:qapps:${Region}:${Account}:application/${ApplicationId}/qapp/${AppId}`	aws:ResourceTag/${TagKey}
qapp-session	`arn:${Partition}:qapps:${Region}:${Account}:application/${ApplicationId}/qapp/${AppId}/session/${SessionId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Q Business Q Apps

Amazon Q Business Q Apps defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
qapps:AppIsPublished	Filters access by whether Q App is published	String
qapps:SessionIsShared	Filters access by whether Q App Session is shared	String
qapps:UserIsAppOwner	Filters access by whether requester is Q App owner	String
qapps:UserIsSessionModerator	Filters access by whether requester is Q App Session moderator	String

Actions, resources, and condition keys for Amazon Q Developer

Amazon Q Developer (service prefix: `qdeveloper`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon Q Developer

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ExportArtifact	Grants permission to export artifacts from Amazon Q Developer	Write	codeTransformation		
ImportArtifact	Grants permission to import artifacts to Amazon Q Developer	Write	codeTransformation		
ListTagsForResource [permission only]	Grants permission to list all tags associated with an Amazon Q Developer resource	List	codeTransformation		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartAgentSession	Grants permission to start an agent session with Amazon Q Developer	Write		aws:TagKeys aws:RequestTag/${TagKey}	
TagResource [permission only]	Grants permission to associate tags with an Amazon Q Developer resource	Tagging	codeTransformation		
				aws:TagKeys aws:RequestTag/${TagKey}	
TransformCode	Grants permission to transform code with Amazon Q Developer Transform Agent	Write	codeTransformation		
UntagResource [permission only]	Grants permission to remove tags associated with an Amazon Q Developer resource	Tagging	codeTransformation		
				aws:TagKeys	

Resource types defined by Amazon Q Developer

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types

that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
codeTransformation	`arn:${Partition}:qdeveloper:${Region}:${Account}:codeTransformation/${Identifier}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Q Developer

Amazon Q Developer defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the Amazon Q Developer resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Q in Connect

Amazon Q in Connect (service prefix: `wisdom`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon Q in Connect

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ActivateMessageTemplate	Grants permission to activate a message template	Write	KnowledgeBase*		
			MessageTemplate*		
AllowVendedLogDeliveryForResource [permission only]	Grants permission to configure vended log delivery for an assistant	Permissions management	Assistant		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAIAgent	Grants permission to create an ai agent	Write		aws:TagKeys aws:RequestTag/${TagKey}	
CreateAIAgentVersion	Grants permission to create an ai agent version	Write	AIAgent*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateAIGuardrail	Grants permission to create an ai guardrail	Write		aws:TagKeys aws:RequestTag/${TagKey}	
CreateAIGuardrailVersion	Grants permission to create an ai guardrail version	Write	AIGuardrail*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateAIPrompt	Grants permission to create an ai prompt	Write		aws:TagKeys aws:RequestTag/${TagKey}	
CreateAIPromptVersion	Grants permission to create an ai prompt version	Write	AIPrompt*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateAssistant	Grants permission to create an assistant	Write		aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAssistantAssociation	Grants permission to create an association between an assistant and another resource	Write		aws:TagKeys aws:RequestTag/${TagKey}	
CreateContent	Grants permission to create content	Write	KnowledgeBase*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateContentAssociation	Grants permission to create a content association	Write	Content*		
			KnowledgeBase*		
				aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateKnowledgeBase	Grants permission to create a knowledge base	Write		aws:TagKeys aws:RequestTag/${TagKey}	
CreateMessageTemplate	Grants permission to create a message template	Write	KnowledgeBase*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateMessageTemplateAttachment	Grants permission to create an attachment to a message template	Write	KnowledgeBase*		
			MessageTemplate*		
CreateMessageTemplateVersion	Grants permission to create a version of a message template	Write	KnowledgeBase*		
			MessageTemplate*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateQuickResponse	Grants permission to create quick response	Write		aws:TagKeys aws:RequestTag/${TagKey}	
CreateSession	Grants permission to create a session	Write		aws:TagKeys aws:RequestTag/${TagKey}	
DeactivateMessageTemplate	Grants permission to deactivate a message template	Write	KnowledgeBase*		
			MessageTemplate*		
DeleteAIAgent	Grants permission to delete an ai agent	Write	AIAgent*		
DeleteAIAgentVersion	Grants permission to delete an ai agent version	Write	AIAgent*		
DeleteAIGuardrail	Grants permission to delete an ai guardrail	Write	AIGuardrail*		
DeleteAIGuardrailVersion	Grants permission to delete an ai guardrail version	Write	AIGuardrail*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAIPrompt	Grants permission to delete an ai prompt	Write	AIPrompt*		
DeleteAIPromptVersion	Grants permission to delete an ai prompt version	Write	AIPrompt*		
DeleteAssistant	Grants permission to delete an assistant	Write	Assistant*		
DeleteAssistantAssociation	Grants permission to delete an assistant association	Write	AssistantAssociation*		
DeleteContent	Grants permission to delete content	Write	Content*		
			KnowledgeBase*		
DeleteContentAssociation	Grants permission to delete a content association	Write	Content*		
			ContentAssociation*		
			KnowledgeBase*		
DeleteImportJob	Grants permission to delete a import job of a knowledge base	Write	KnowledgeBase*		
DeleteKnowledgeBase	Grants permission to delete a knowledge base	Write	KnowledgeBase*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteMessageTemplate	Grants permission to delete a message template	Write	KnowledgeBase*		
			MessageTemplate*		
DeleteMessageTemplateAttachment	Grants permission to delete an attachment from a message template	Write	KnowledgeBase*		
			MessageTemplate*		
DeleteQuickResponse	Grants permission to delete quick response	Write	KnowledgeBase*		
			QuickResponse*		
GetAIAgent	Grants permission to retrieve information about an ai agent	Read	AIAgent*		
GetAIGuardrail	Grants permission to retrieve information about an ai guardrail	Read	AIGuardrail*		
GetAIPrompt	Grants permission to retrieve information about an ai prompt	Read	AIPrompt*		
GetAssistant	Grants permission to retrieve information about an assistant	Read	Assistant*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAssistantAssociation	Grants permission to retrieve information about an assistant association	Read	AssistantAssociation*		
GetContent	Grants permission to retrieve content, including a pre-signed URL to download the content	Read	Content*		
			KnowledgeBase*		
GetContentAssociation	Grants permission to retrieve information about a content association	Read	Content*		
			ContentAssociation*		
			KnowledgeBase*		
GetContentSummary	Grants permission to retrieve summary information about the content	Read	Content*		
			KnowledgeBase*		
GetImportJob	Grants permission to retrieve information about the import job	Read	KnowledgeBase*		
GetKnowledgeBase	Grants permission to retrieve information about the knowledge base	Read	KnowledgeBase*		
GetMessageTemplate	Grants permission to retrieve a message template	Read	KnowledgeBase*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			MessageTemplate*		
				wisdom:MessageTemplate/RoutingProfileArn	
GetNextMessage	Grants permission to retrieve for next message in a session	Read	Session*		
GetQuickResponse	Grants permission to retrieve content	Read	KnowledgeBase*		
			QuickResponse*		
GetRecommendations	Grants permission to retrieve recommendations for the specified session	Read	Session*		
GetSession	Grants permission to retrieve information for a specified session	Read	Session*		
ListAIAgentVersions	Grants permission to list information about ai agent versions	List	AIAgent*		
ListAIAgents	Grants permission to list information about ai agents	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAIGuardrailVersions	Grants permission to list information about ai guardrail versions	List	AIGuardrail*

UpdateAIAgent	Grants permission to update information about an ai agent	Write	AIAgent*		
UpdateAIGuardrail	Grants permission to update information about an ai guardrail	Write	AIGuardrail*		
UpdateAIPrompt	Grants permission to update information about an ai prompt	Write	AIPrompt*		
UpdateAssistantAIAgent	Grants permission to update assistant information about an ai agent	Write	Assistant*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateContent	Grants permission to update information about the content	Write	Content*		
			KnowledgeBase*		
UpdateKnowledgeBaseTemplateUri	Grants permission to update the template URI of a knowledge base	Write	KnowledgeBase*		
UpdateMessageTemplate	Grants permission to update content of the message template	Write	KnowledgeBase*		
			MessageTemplate*		
UpdateMessageTemplateMetadata	Grants permission to update metadata of the message template	Write	KnowledgeBase*		
			MessageTemplate*		
UpdateQuickResponse	Grants permission to update information or content of the quick response	Write	KnowledgeBase*		
			QuickResponse*		
UpdateSession	Grants permission to update a session	Write	Session*		
UpdateSessionData	Grants permission to update data stored in a session	Write	Session*		

Resource types defined by Amazon Q in Connect

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
AIAgent	`arn:${Partition}:wisdom:${Region}:${Account}:ai-agent/${AssistantId}/${AIAgentId}`	aws:ResourceTag/${TagKey}
AIPrompt	`arn:${Partition}:wisdom:${Region}:${Account}:ai-prompt/${AssistantId}/${AIPromptId}`	aws:ResourceTag/${TagKey}
AIGuardrail	`arn:${Partition}:wisdom:${Region}:${Account}:ai-guardrail/${AssistantId}/${AIGuardrailId}`	aws:ResourceTag/${TagKey}
Assistant	`arn:${Partition}:wisdom:${Region}:${Account}:assistant/${AssistantId}`	aws:ResourceTag/${TagKey}
Assistant Association	`arn:${Partition}:wisdom:${Region}:${Account}:association/${AssistantId}/${AssistantAssociationId}`	aws:ResourceTag/${TagKey}
Content	`arn:${Partition}:wisdom:${Region}:${Account}:content/${KnowledgeBaseId}/${ContentId}`	aws:ResourceTag/${TagKey}
ContentAssociation	`arn:${Partition}:wisdom:${Region}:${Account}:content-association/${KnowledgeBaseId}/${ContentId}/${ContentAssociationId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
Knowledge Base	arn:${Partition}:wisdom:${Region}:${Account}:knowledge-base/${KnowledgeBaseId}	aws:ResourceTag/${TagKey}
MessageTemplate	arn:${Partition}:wisdom:${Region}:${Account}:message-template/${KnowledgeBaseId}/${MessageTemplateId}	aws:ResourceTag/${TagKey} wisdom:MessageTemplate/RoutingProfileArn
Session	arn:${Partition}:wisdom:${Region}:${Account}:session/${AssistantId}/${SessionId}	aws:ResourceTag/${TagKey}
QuickResponse	arn:${Partition}:wisdom:${Region}:${Account}:quick-response/${KnowledgeBaseId}/${QuickResponseId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Q in Connect

Amazon Q in Connect defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
wisdom:MessageTemplate/RoutingProfileArn	Filters access by the connect routing profile arns associated with the resource	ArrayOfARN
wisdom:SearchFilter/Qualifier	Filters access by the qualifiers that are passed in the request	ArrayOfString
wisdom:SearchFilter/RoutingProfileArn	Filters access by the connect routing profile arn that is passed in the request	ARN

Actions, resources, and condition keys for Amazon QLDB

Amazon QLDB (service prefix: `qldb`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon QLDB

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelJournalKinesisStream	Grants permission to cancel a journal kinesis stream	Write	stream*		
CreateLedger	Grants permission to create a ledger	Write	ledger*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteLedger	Grants permission to delete a ledger	Write	ledger*		
DescribeJournalKinesisStream	Grants permission to describe information about a journal kinesis stream	Read	stream*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeJournalS3Export	Grants permission to describe information about a journal export job	Read	ledger*		
DescribeLedger	Grants permission to describe a ledger	Read	ledger*		
ExecuteStatement [permission only]	Grants permission to send commands to a ledger via the console	Write	ledger*		
ExportJournalToS3	Grants permission to export journal contents to an Amazon S3 bucket	Write	ledger*		
GetBlock	Grants permission to retrieve a block from a ledger for a given BlockAddress	Read	ledger*		
GetDigest	Grants permission to retrieve a digest from a ledger for a given BlockAddress	Read	ledger*		
GetRevision	Grants permission to retrieve a revision for a given document ID and a given BlockAddress	Read	ledger*		
InsertSampleData [permission only]	Grants permission to insert sample application data via the console	Write	ledger*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListJournalKinesisStreamsForLedger	Grants permission to list journal kinesis streams for a specified ledger	List	stream*

			ledger		
			stream		
			table		
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateLedger	Grants permission to update properties on a ledger	Write	ledger*		
UpdateLedgerPermissionsMode	Grants permission to update the permissions mode on a ledger	Write	ledger*		

Resource types defined by Amazon QLDB

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
ledger	`arn:${Partition}:qldb:${Region}:${Account}:ledger/${LedgerName}`	aws:ResourceTag/${TagKey}
stream	`arn:${Partition}:qldb:${Region}:${Account}:stream/${LedgerName}/${StreamId}`	aws:ResourceTag/${TagKey}
table	`arn:${Partition}:qldb:${Region}:${Account}:ledger/${LedgerName}/table/${TableId}`	aws:ResourceTag/${TagKey}
catalog	`arn:${Partition}:qldb:${Region}:${Account}:ledger/${LedgerName}/information_schema/user_tables`	aws:ResourceTag/${TagKey}

Condition keys for Amazon QLDB

Amazon QLDB defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString
qldb:Purge	Filters access by the value of purge that is specified in a PartiQL DROP statement	String

Actions, resources, and condition keys for Amazon QuickSight

Amazon QuickSight (service prefix: `quicksight`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon QuickSight

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AccountConfigurations [permission only]	Grants permission to enable setting default access to AWS resources	Write			
AllowVendedLogDeliveryForResource [permission only]	Grants permission to configure log delivery for QuickSuite instance	Permissions management			
BatchCreateTopicReviewedAnswer	Grants permission to create reviewed answers for a topic	Write	topic*		
				aws:RequestTag/${TagKey} aws:TagKeys	
BatchDeleteTopicReviewedAnswer	Grants permission to delete reviewed answers for a topic	Write	topic*		
				aws:RequestTag/${TagKey} aws:TagKeys	
BatchGetPreferences	Grants permission to get user preferences	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
[permission only]					
BatchUpdatePreferences [permission only]	Grants permission to update user preferences	Write			
CancelIngestion	Grants permission to cancel a SPICE ingestions on a dataset	Write	ingestion*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateAccountCustomization	Grants permission to create an account customization for QuickSight account or namespace	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateAccountSubscription	Grants permission to subscribe to QuickSight	Write		quicksight:Edition quicksight:DirectoryType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateActionConnector	Grants permission to create an action connector	Write	actionconnector*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateAdmin [permission only]	Grants permission to provision Amazon QuickSight administrators, authors, and readers	Write	user*		
CreateAnalysis	Grants permission to create an analysis from a template	Write	analysis*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateBrand	Grants permission to create an Amazon QuickSight brand	Write	brand*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateCustomPermissions	Grants permission to create a QuickSight custom permissions resource	Write	custompermissions*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDashboard	Grants permission to create a QuickSight Dashboard	Write	dashboard*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDataSet	Grants permission to create a dataset	Write	datasource*		quicksight:PassDataSource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDataSource	Grants permission to create a data source	Write		aws:RequestTag/${TagKey} aws:TagKeys	iam:PassRole
CreateEmailCustomizationTemplate [permission only]	Grants permission to create a QuickSight email customization template	Write	emailCustomizationTemplate*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateExtensionAccess [permission only]	Grants permission to create an extension access	Write	extensionaccess*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateFolder	Grants permission to create a QuickSight folder	Write	folder*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateFolderMembership	Grants permission to add a QuickSight Dashboard, Analysis or Dataset to a QuickSight Folder	Write	folder*		
			analysis		
			dashboard		
			dataset		
CreateGroup	Grants permission to create a QuickSight group	Write	group*		
CreateGroupMembership	Grants permission to add a QuickSight user to a QuickSight group	Write	group*	quicksight:UserName	
				aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateIAMPolicyAssignment	Grants permission to create an assignment with one specified IAM Policy ARN that will be assigned to specified groups or users of QuickSight	Write	assignment*		
CreateIngestion	Grants permission to start a SPICE ingestion on a dataset	Write	ingestion*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateNamespace	Grants permission to create an QuickSight namespace	Write	namespace*		ds:CreateIdentityPoolDirectory
CreateReader [permission only]	Grants permission to provision Amazon QuickSight readers	Write	user*		
CreateRefreshSchedule	Grants permission to create a refresh schedule for a dataset	Write	refreshschedule*		
CreateRoleMembership	Grants permission to add a group member to a role	Write		quicksight:Group	
CreateTemplate	Grants permission to create a template	Write	template*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateTemplateAlias	Grants permission to create a template alias	Write	template*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateTheme	Grants permission to create a theme	Write	theme*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateThemeAlias	Grants permission to create an alias for a theme version	Write	theme*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateTopic	Grants permission to create a topic	Write	dataset*		quicksight:PassDataSet
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateTopicRefreshSchedule	Grants permission to create a refresh schedule for a topic	Write	topic*		
CreateUser [permission only]	Grants permission to provision Amazon QuickSight authors and readers	Write	user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateVPCConnection	Grants permission to create a vpc connection	Write		aws:RequestTag/${TagKey} aws:TagKeys	iam:PassRole
DeleteAccountCustomPermission	Grants permission to remove the custom permission associated with an account	Write			
DeleteAccountCustomization	Grants permission to delete an account customization for QuickSight account or namespace	Write	customization*		
DeleteAccountSubscription	Grants permission to delete a QuickSight account	Write	account*		
DeleteActionConnector	Grants permission to delete an action connector	Write	actionconnector*		
DeleteAnalysis	Grants permission to delete an analysis	Write	analysis*		
DeleteBrand	Grants permission to delete an Amazon QuickSight brand	Write	brand*		
DeleteBrandAssignment	Grants permission to delete a brand assignment	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteCustomPermissions	Grants permission to delete a QuickSight custom permissions resource	Write			
DeleteDashboard	Grants permission to delete a QuickSight Dashboard	Write	dashboard*		
DeleteDataSet	Grants permission to delete a dataset	Write	dataset*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteDataSetRefreshProperties	Grants permission to delete dataset refresh properties for a dataset	Write	dataset*		
DeleteDataSource	Grants permission to delete a data source	Write	datasource*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteDefaultQBusinessApplication	Grants permission to delete linked QBusiness application for QuickSight account	Write			
DeleteEmailCustomizationTemplate [permission only]	Grants permission to delete a QuickSight email customization template	Write	emailCustomizationTemplate*		
DeleteExtensionAccess [permission only]	Grants permission to delete an extension access	Write	extensionaccess*		
DeleteFolder	Grants permission to delete a QuickSight Folder	Write	folder*		
DeleteFolderMembership	Grants permission to remove a QuickSight Dashboard, Analysis or Dataset from a QuickSight Folder	Write	folder*		
			analysis		
			dashboard		
			dataset		
DeleteGroup	Grants permission to remove a user group from QuickSight	Write	group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteGroupMembership	Grants permission to remove a user from a group so that he/she is no longer a member of the group	Write	group*	quicksight:UserName	
DeleteIAMPolicyAssignment	Grants permission to update an existing assignment	Write	assignment*		
DeleteIdentityPropagationConfig	Grants permission to remove AWS services for trusted identity propagation in QuickSight	Write			
DeleteNamespace	Grants permission to delete a QuickSight namespace	Write	namespace*		ds:DeleteDirectory
DeleteRefreshSchedule	Grants permission to delete a refresh schedule for a dataset	Write	refreshschedule*		
DeleteRoleCustomPermission	Grants permission to remove the custom permission associated with a role	Write			
DeleteRoleMembership	Grants permission to remove a group member from a role	Write		quicksight:Group	
DeleteTemplate	Grants permission to delete a template	Write	template*		
DeleteTemplateAlias	Grants permission to delete a template alias	Write	template*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteTheme	Grants permission to delete a theme	Write	theme*		
DeleteThemeAlias	Grants permission to delete the alias of a theme	Write	theme*		
DeleteTopic	Grants permission to delete a topic	Write	topic*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteTopicRefreshSchedule	Grants permission to delete a refresh schedule for a topic	Write	topic*		
DeleteUser	Grants permission to delete a QuickSight user, given the user name	Write	user*		
DeleteUserByPrincipalId	Grants permission to delete a user identified by its principal ID	Write	user*		
DeleteUserCustomPermission	Grants permission to remove the custom permission associated with a user	Write	user*		
DeleteVPCConnection	Grants permission to delete a vpc connection	Write	vpcconnection*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
DescribeAccountCustomPermission	Grants permission to describe the custom permission associated with an account	Read			
DescribeAccountCustomization	Grants permission to describe an account customization for QuickSight account or namespace	Read	customization*		
DescribeAccountSettings	Grants permission to describe the administrative account settings for QuickSight account	Read			
DescribeAccountSubscription	Grants permission to describe a QuickSight account	Read	account*		
DescribeActionConnector	Grants permission to describe an action connector	Read	actionconnector*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeActionConnectorPermissions	Grants permission to describe permissions for an action connector	Read	actionconnector*		
DescribeAgent [permission only]	Grants permission to describe an agent	Read	agent*		
DescribeAgentPermissions [permission only]	Grants permission to describe agent's permissions	Read	agent*		
DescribeAnalysis	Grants permission to describe an analysis	Read	analysis*		
DescribeAnalysisPermissions	Grants permission to describe permissions for an analysis	Read	analysis*		
DescribeAssetBundleExportJob	Grants permission to describe an asset bundle export job	Read	assetBundleExportJob*		
DescribeAssetBundleImportJob	Grants permission to describe an asset bundle import job	Read	assetBundleImportJob*		
DescribeBrand	Grants permission to describe a brand	Read	brand*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeBrandAssignment	Grants permission to describe a brand assignment	Read			
DescribeBrandPublishedVersion	Grants permission to describes the published version of the brand	Read	brand*		
DescribeChatConfiguration [permission only]	Grants permission to describe chat configuration	Read			
DescribeCustomPermissions	Grants permission to describe a custom permissions resource in a QuickSight account	Read	custompermissions*		
DescribeDashboard	Grants permission to describe a QuickSight Dashboard	Read	dashboard*		
DescribeDashboardPermissions	Grants permission to describe permissions for a QuickSight Dashboard	Read	dashboard*		
DescribeDashboardSnapshotJob	Grants permission to describe a dashboard snapshot job	Read	dashboardSnapshotJob*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeDashboardSnapshotJobResult	Grants permission to describe result of a dashboard snapshot job	Read	dashboardSnapshotJob*		
DescribeDashboardsQAConfiguration	Grants permission to describe dashboards qa configuration	Read			
DescribeDataSet	Grants permission to describe a dataset	Read	dataset*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DescribeDataSetPermissions	Grants permission to describe the resource policy of a dataset	Permissions management	dataset*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DescribeDataSetRefreshProperties	Grants permission to describe refresh properties for a dataset	Read	dataset*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeDataSource	Grants permission to describe a data source	Read	datasource*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DescribeDataSourcePermissions	Grants permission to describe the resource policy of a data source	Permissions management	datasource*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DescribeDefaultQBusinessApplication	Grants permission to describe linked QBusiness application Id for QuickSight account	Read			
DescribeEmailCustomizationTemplate [permission only]	Grants permission to describe a QuickSight email customization template	Read	emailCustomizationTemplate*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeExtensionAccess [permission only]	Grants permission to describe an extension access	Read	extensionaccess*		
DescribeFolder	Grants permission to describe a QuickSight Folder	Read	folder*		
DescribeFolderPermissions	Grants permission to describe permissions for a QuickSight Folder	Read	folder*		
DescribeFolderResolvedPermissions	Grants permission to describe resolved permissions for a QuickSight Folder	Read	folder*		
DescribeGroup	Grants permission to describe a QuickSight group	Read	group*		
DescribeGroupMembership	Grants permission to describe a QuickSight group member	Read	group*	quicksight:UserName	
DescribeIAMPolicyAssignment	Grants permission to describe an existing assignment	Read	assignment*		
DescribeIngestion	Grants permission to describe a SPICE ingestion on a dataset	Read	ingestion*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
DescribeIpRestriction	Grants permission to describe the IP restrictions for QuickSight account	Read			
DescribeKeyRegistration	Grants permission to describe QuickSight key registration	Read			
DescribeNamespace	Grants permission to describe a QuickSight namespace	Read	namespace*		
DescribeQPersonalizationConfiguration	Grants permission to describe a personalization configuration	Read			
DescribeQuickIndexCapacity [permission only]	Grants permission to describe index capacity	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeQuickSightQSearchConfiguration	Grants permission to describe QuickSight Q Search configuration	Read			
DescribeRefreshSchedule	Grants permission to describe a refresh schedule for a dataset	Read	refreshschedule*		
DescribeRoleCustomPermission	Grants permission to describe the custom permission associated with a role	Read			
DescribeSelfUpgradeConfiguration	Grants permission to describe the administrative self upgrade configuration associated with an account	Read			
DescribeTemplate	Grants permission to describe a template	Read	template*		
DescribeTemplateAlias	Grants permission to describe a template alias	Read	template*		
DescribeTemplatePermissions	Grants permission to describe permissions for a template	Read	template*		
DescribeTheme	Grants permission to describe a theme	Read	theme*		
DescribeThemeAlias	Grants permission to describe a theme alias	Read	theme*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeThemePermissions	Grants permission to describe permissions for a theme	Read	theme*		
DescribeTopic	Grants permission to describe a topic	Read	topic*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DescribeTopicPermissions	Grants permission to describe the resource policy of a topic	Permissions management	topic*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DescribeTopicRefresh	Grants permission to describe the refresh status of a topic	Read	topic*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeTopicRefreshSchedule	Grants permission to describe a refresh schedule for a topic	Read	topic*		
DescribeUser	Grants permission to describe a QuickSight user given the user name	Read	user*		
DescribeVPCConnection	Grants permission to describe a vpc connection	Read	vpcconnection*		
				aws:RequestTag/${TagKey} aws:TagKeys	
GenerateEmbedUrlForAnonymousUser	Grants permission to generate a URL used to embed a QuickSight Dashboard or Q Topic for a user not registered with QuickSight	Write	namespace*		
			dashboard		
			theme		
			topic		
				quicksight:AllowedEmbeddingDomains	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GenerateEmbedUrlForRegisteredUser	Grants permission to generate a URL used to embed a QuickSight Dashboard for a user registered with QuickSight	Write	user*		
				quicksight:AllowedEmbeddingDomains	
GenerateEmbedUrlForRegisteredUserWithIdentity	Grants permission to generate a URL used to embed a QuickSight Experience for a user registered with QuickSight using Identity-enhanced role session	Write		quicksight:AllowedEmbeddingDomains	
GetAnonymousUserEmbedUrl [permission only]	Grants permission to get a URL used to embed a QuickSight Dashboard for a user not registered with QuickSight	Read			
GetAuthCode [permission only]	Grants permission to get an auth code representing a QuickSight user	Read	user*		
GetCustomPermissionsSummary [permission only]	Grants permission to get information about the custom permissions in an account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDashboardEmbedUrl	Grants permission to get a URL used to embed a QuickSight Dashboard	Read	dashboard*		
GetFlowMetadata	Grants permission to get metadata for a flow	Read	flow*		
GetFlowPermissions	Grants permission to get permissions for a flow	Read	flow*		
GetGroupMapping [permission only]	Grants permission to use Amazon QuickSight, in Enterprise edition, to identify and display the Microsoft Active Directory (Microsoft Active Directory) directory groups that are mapped to roles in Amazon QuickSight	Read			
GetIdentityContext	Grants permission to get identity context for a user	Read	user*		
GetSessionEmbedUrl	Grants permission to get a URL to embed QuickSight console experience	Read			
ListActionConnectors	Grants permission to list action connectors	List			
ListAgents [permission only]	Grants permission to list agents	List	agent*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAnalyses	Grants permission to list all analyses in an account	List	analysis*		
ListAssetBundleExportJobs	Grants permission to list all asset bundle export jobs	List	assetBundleExportJob*		
ListAssetBundleImportJobs	Grants permission to list all asset bundle import jobs	List	assetBundleImportJob*		
ListBrands	Grants permission to lists all brands in an Amazon QuickSight account	List			
ListCustomPermissions	Grants permission to list custom permissions resources in QuickSight account	List			
ListCustomerManagedKeys [permission only]	Grants permission to list all registered customer managed keys	List			
ListDashboardVersions	Grants permission to list all versions of a QuickSight Dashboard	List	dashboard*		
ListDashboards	Grants permission to list all Dashboards in a QuickSight Account	List	dashboard*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDataSets	Grants permission to list all datasets	List		aws:RequestTag/${TagKey} aws:TagKeys	
ListDataSources	Grants permission to list all data sources	List		aws:RequestTag/${TagKey} aws:TagKeys	
ListExtensionAccesses [permission only]	Grants permission to list extension accesses	List			
ListFlows	Grants permission to list all flows in an Amazon QuickSight account	List			
ListFolderMembers	Grants permission to list all members in a folder	Read	folder*		
ListFolders	Grants permission to list all Folders in a QuickSight Account	List	folder*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListFoldersForResource	Grants permission to list all Folders in which a QuickSight resource is a member	List	analysis		
			dashboard		
			dataset		
			datasource		
			topic		
ListGroupMemberships	Grants permission to list member users in a group	List	group*		
ListGroups	Grants permission to list all user groups in QuickSight	List	group*		
ListIAMPolicyAssignments	Grants permission to list all assignments in the current Amazon QuickSight account	List	assignment*		
ListIAMPolicyAssignmentsForUser	Grants permission to list all assignments assigned to a user and the groups it belongs	List	assignment*		
ListIdentityPropagationConfigs	Grants permission to list AWS services enabled for trusted identity propagation in QuickSight	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListIngestions	Grants permission to list all SPICE ingestions on a dataset	List		aws:RequestTag/${TagKey} aws:TagKeys	
ListKMSKeysForUser [permission only]	Grants permission to list a user's KMS keys	List			
ListNamespaces	Grants permission to lists all namespaces in a QuickSight account	List			
ListRefreshSchedules	Grants permission to list all refresh schedules on a dataset	List			
ListRoleMemberships	Grants permission to list the members of a role	List			
ListSelfUpgrades	Grants permission to list all of the pending self upgrade requests associated with an account	List	user*		
ListTagsForResource	Grants permission to list tags of a QuickSight resource	Read	actionconnector analysis		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			brand		
			customization		
			custompermissions		
			dashboard		
			dataset		
			datasource		
			emailCustomizationTemplate		
			flow		
			folder		
			template		
			theme		
			topic		
			vpcconnection		
ListTemplateAliases	Grants permission to list all aliases for a template	List	template*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTemplateVersions	Grants permission to list all versions of a template	List	template*		
ListTemplates	Grants permission to list all templates in a QuickSight account	List	template*		
ListThemeAliases	Grants permission to list all aliases of a theme	List	theme*		
ListThemeVersions	Grants permission to list all versions of a theme	List	theme*		
ListThemes	Grants permission to list all themes in an account	List	theme*		
ListTopicRefreshSchedules	Grants permission to list all refresh schedules on a topic	List			
ListTopicReviewedAnswers	Grants permission to list all reviewed answers for topic	List		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTopics	Grants permission to list all topics	List		aws:RequestTag/${TagKey} aws:TagKeys	
ListUserGroups	Grants permission to list groups that a given user is a member of	List	user*		
ListUsers	Grants permission to list all of the QuickSight users belonging to this account	List	user*		
ListVPCConnections	Grants permission to list all vpc connections	List		aws:RequestTag/${TagKey} aws:TagKeys	
PassDataSet [permission only]	Grants permission to use a dataset for a template	Read	dataset*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PassDataSource [permission only]	Grants permission to use a data source for a data set	Read	datasource*		
				aws:RequestTag/${TagKey} aws:TagKeys	
PredictQAResults	Grants permission to predict QA results	Read	dashboard		
			topic		
PutDataSetRefreshProperties	Grants permission to put dataset refresh properties for a dataset	Write	dataset*		
QuickSuiteUsageMetrics [permission only]	Grants permission to get QuickSuite usage metrics	Read			
RegisterCustomerManagedKey [permission only]	Grants permission to register a customer managed key	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RegisterUser	Grants permission to create a QuickSight user, whose identity is associated with the IAM identity/role specified in the request	Write	user*	quicksight:IamArn quicksight:SessionName	
RemoveCustomerManagedKey [permission only]	Grants permission to remove a customer managed key	Write			
RestoreAnalysis	Grants permission to restore a deleted analysis	Write	analysis*		
ScopeDownPolicy [permission only]	Grants permission to manage scoping policies for permissions to AWS resources	Write			
SearchActionConnectors	Grants permission to search action connectors	List	actionconnector*		
SearchAgents [permission only]	Grants permission to search agents	List	agent*		
SearchAnalyses	Grants permission to search for a sub-set of analyses	List	analysis*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SearchDashboards	Grants permission to search for a sub-set of QuickSight Dashboards	List	dashboard*		
SearchDataSets	Grants permission to search for a sub-set of QuickSight DatSets	List	dataset*		
SearchDataSources	Grants permission to search for a sub-set of QuickSight Data Sources	List	datasource*		
SearchDirectoryGroups [permission only]	Grants permission to use Amazon QuickSight, in Enterprise edition, to display your Microsoft Active Directory directory groups so that you can choose which ones to map to roles in Amazon QuickSight	List			
SearchFlows	Grants permission to search flows in an Amazon QuickSight account	List			
SearchFolders	Grants permission to search for a sub-set of QuickSight Folders	Read	folder*		
SearchGroups	Grants permission to search for a sub-set of QuickSight groups	List	group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SearchTopics	Grants permission to search for a sub-set of topics	List	topic*		
SearchUsers [permission only]	Grants permission to search the QuickSight users belonging to this account	List	user*		
SetGroupMapping [permission only]	Grants permission to use Amazon QuickSight, in Enterprise edition, to display your Microsoft Active Directory directory groups so that you can choose which ones to map to roles in Amazon QuickSight	Write			
StartAssetBundleExportJob	Grants permission to start an asset bundle export job	Write	assetBundleExportJob*		
StartAssetBundleImportJob	Grants permission to start an asset bundle import job	Write	assetBundleImportJob*		
StartDashboardSnapshotJob	Grants permission to start a dashboard snapshot job	Write	dashboardSnapshotJob*		
StartDashboardSnapshotJobSchedule	Grants permission to start a dashboard snapshot job schedule	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Subscribe [permission only]	Grants permission to subscribe to Amazon QuickSight, and also to allow the user to upgrade the subscription to Enterprise edition	Write		quicksight:Edition quicksight:DirectoryType	
TagResource	Grants permission to add tags to a QuickSight resource	Tagging	actionconnector		
			analysis		
			brand		
			customization		
			custompermissions		
			dashboard		
			dataset		
			datasource		
			emailCustomizationTemplate		
			flow		
			folder		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ingestion		
			template		
			theme		
			topic		
			vpcconnection		
				aws:TagKeys aws:RequestTag/${TagKey}	
Unpublish Flow [permission only]	Grants permission to unpublish a flow	Write	flow*		
Unsubscribe [permission only]	Grants permission to unsubscribe from Amazon QuickSight, which permanently deletes all users and their resources from Amazon QuickSight	Write			
UntagResource	Grants permission to remove tags from a QuickSight resource	Tagging	actionconnector		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			analysis		
			brand		
			customization		
			custompermissions		
			dashboard		
			dataset		
			datasource		
			emailCustomizationTemplate		
			flow		
			folder		
			ingestion		
			template		
			theme		
			topic		
			vpcconnection		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
UpdateAccountCustomPermission	Grants permission to update the custom permission associated with an account	Write			
UpdateAccountCustomization	Grants permission to update an account customization for QuickSight account or namespace	Write	customization*		
UpdateAccountSettings	Grants permission to update the administrative account settings for QuickSight account	Write			
UpdateActionConnector	Grants permission to update an action connector	Write	actionconnector*		
UpdateActionConnectorPermissions	Grants permission to update permissions for an action connector	Permissions management	actionconnector*		
UpdateAgentPermissions [permission only]	Grants permission to update agent permissions	Permissions management	agent*		
UpdateAnalysis	Grants permission to update an analysis	Write	analysis*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAnalysisPermissions	Grants permission to update permissions for an analysis	Permissions management	analysis*		
UpdateApplicationWithTokenExchangeGrant	Grants permission to update QuickSight IAM Identity Center application with Token Exchange grant	Write			
UpdateBrand	Grants permission to update a brand	Write	brand*		
UpdateBrandAssignment	Grants permission to update a brand assignment	Write			
UpdateBrandPublishedVersion	Grants permission to update the published version of a brand	Write	brand*		
UpdateChatConfiguration [permission only]	Grants permission to update chat configuration	Write			
UpdateCustomPermissions	Grants permission to update a QuickSight custom permissions resource	Write	custompermissions*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateDashboard	Grants permission to update a QuickSight Dashboard	Write	dashboard*		
UpdateDashboardLinks	Grants permission to update a QuickSight Dashboard's links	Write	dashboard*		
UpdateDashboardPermissions	Grants permission to update permissions for a QuickSight Dashboard	Permissions management	dashboard*		
UpdateDashboardPublishedVersion	Grants permission to update a QuickSight Dashboard's Published Version	Write	dashboard*		
UpdateDashboardsQAConfiguration	Grants permission to update dashboards qa configuration	Write			
UpdateDataSet	Grants permission to update a dataset	Write	dataset*		quicksight:PassDataSource
			datasource		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateDataSetPermissions	Grants permission to update the resource policy of a dataset	Permissions management	dataset*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateDataSource	Grants permission to update a data source	Write	datasource*		iam:PassRole
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateDataSourcePermissions	Grants permission to update the resource policy of a data source	Permissions management	datasource*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateDefaultQBusinessApplication	Grants permission to update linked QBusiness application Id for QuickSight account	Write			
UpdateEmailCustomizationTemplate [permission only]	Grants permission to update a QuickSight email customization template	Write	emailCustomizationTemplate*		
UpdateExtensionAccess [permission only]	Grants permission to update an extension access	Write	extensionaccess*		
UpdateFlowPermissions	Grants permission to update permissions for a flow	Permissions management	flow*		
UpdateFolder	Grants permission to update a QuickSight Folder	Write	folder*		
UpdateFolderPermissions	Grants permission to update permissions for a QuickSight Folder	Permissions management	folder*		
UpdateGroup	Grants permission to change group description	Write	group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateIAMPolicyAssignment	Grants permission to update an existing assignment	Write	assignment*		
UpdateIdentityPropagationConfig	Grants permission to add and update AWS services for trusted identity propagation in QuickSight	Write			
UpdateIpRestriction	Grants permission to update the IP restrictions for QuickSight account	Write			
UpdateKeyRegistration	Grants permission to update QuickSight key registration	Write			
UpdatePublicSharingSettings	Grants permission to enable or disable public sharing on an account	Write			
UpdateQPersonalizationConfiguration	Grants permission to update a personalization configuration	Write			
UpdateQuickIndexCapacity [permission only]	Grants permission to update index capacity	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateQuickSightQSearchConfiguration	Grants permission to update QuickSight Q Search configuration	Write			
UpdateRefreshSchedule	Grants permission to update a refresh schedule for a dataset	Write	refreshschedule*		
UpdateResourcePermissions [permission only]	Grants permission to update resource-level permissions in QuickSight	Write			
UpdateRoleCustomPermission	Grants permission to update the custom permission associated with a role	Write			
UpdateSPICECapacityConfiguration	Grants permission to update QuickSight SPICE capacity configuration	Write			
UpdateSelfUpgrade	Grants permission to take action on pending self upgrade requests associated with an account	Write	user*		
UpdateSelfUpgradeConfiguration	Grants permission to update the administrative self upgrade configuration associated with an account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateTemplate	Grants permission to update a template	Write	template*		
UpdateTemplateAlias	Grants permission to update a template alias	Write	template*		
UpdateTemplatePermissions	Grants permission to update permissions for a template	Permissions management	template*		
UpdateTheme	Grants permission to update a theme	Write	theme*		
UpdateThemeAlias	Grants permission to update the alias of a theme	Write	theme*		
UpdateThemePermissions	Grants permission to update permissions for a theme	Permissions management	theme*		
UpdateTopic	Grants permission to update a topic	Write	topic*		quicksight:PassDataSet
			dataset		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateTopicPermissions	Grants permission to update the resource policy of a topic	Permissions management	topic*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateTopicRefreshSchedule	Grants permission to update a refresh schedule for a topic	Write	topic*		
UpdateUser	Grants permission to update an Amazon QuickSight user	Write	user*		
UpdateUserCustomPermission	Grants permission to update the custom permission associated with a user	Write	user*		
UpdateVPCConnection	Grants permission to update a vpc connection	Write	vpcconnection*		iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	

Resource types defined by Amazon QuickSight

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
account	`arn:${Partition}:quicksight:${Region}:${Account}:account/${ResourceId}`	
user	`arn:${Partition}:quicksight:${Region}:${Account}:user/${ResourceId}`	
group	`arn:${Partition}:quicksight:${Region}:${Account}:group/${ResourceId}`	
analysis	`arn:${Partition}:quicksight:${Region}:${Account}:analysis/${ResourceId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
dashboard	arn:${Partition}:quicksight:${Region}:${Account}:dashboard/${ResourceId}	aws:ResourceTag/${TagKey}
template	arn:${Partition}:quicksight:${Region}:${Account}:template/${ResourceId}	aws:ResourceTag/${TagKey}
vpcconnection	arn:${Partition}:quicksight:${Region}:${Account}:vpcConnection/${ResourceId}	aws:ResourceTag/${TagKey}
assetBundleExportJob	arn:${Partition}:quicksight:${Region}:${Account}:asset-bundle-export-job/${ResourceId}	
assetBundleImportJob	arn:${Partition}:quicksight:${Region}:${Account}:asset-bundle-import-job/${ResourceId}	
datasource	arn:${Partition}:quicksight:${Region}:${Account}:datasource/${ResourceId}	aws:ResourceTag/${TagKey}
dataset	arn:${Partition}:quicksight:${Region}:${Account}:dataset/${ResourceId}	aws:ResourceTag/${TagKey}
ingestion	arn:${Partition}:quicksight:${Region}:${Account}:dataset/${DatasetId}/ingestion/${ResourceId}	aws:ResourceTag/${TagKey}
refreshschedule	arn:${Partition}:quicksight:${Region}:${Account}:dataset/${DatasetId}/refresh-schedule/${ResourceId}	
theme	arn:${Partition}:quicksight:${Region}:${Account}:theme/${ResourceId}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
assignment	arn:${Partition}:quicksight::${Account}:assignment/${ResourceId}	
customization	arn:${Partition}:quicksight:${Region}:${Account}:customization/${ResourceId}	aws:ResourceTag/${TagKey}
namespace	arn:${Partition}:quicksight:${Region}:${Account}:namespace/${ResourceId}	
folder	arn:${Partition}:quicksight:${Region}:${Account}:folder/${ResourceId}	aws:ResourceTag/${TagKey}
emailCustomizationTemplate	arn:${Partition}:quicksight:${Region}:${Account}:email-customization-template/${ResourceId}	aws:ResourceTag/${TagKey}
topic	arn:${Partition}:quicksight:${Region}:${Account}:topic/${ResourceId}	aws:ResourceTag/${TagKey}
dashboardSnapshotJob	arn:${Partition}:quicksight:${Region}:${Account}:dashboard/${DashboardId}/snapshot-job/${ResourceId}	aws:ResourceTag/${TagKey}
brand	arn:${Partition}:quicksight:${Region}:${Account}:brand/${ResourceId}	aws:ResourceTag/${TagKey}
custompermissions	arn:${Partition}:quicksight:${Region}:${Account}:custompermissions/${ResourceId}	aws:ResourceTag/${TagKey}
actionconnector	arn:${Partition}:quicksight:${Region}:${Account}:action-connector/${ResourceId}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
agent	arn:${Partition}:quicksight:${Region}:${Account}:agent/${ResourceId}	
extension access	arn:${Partition}:quicksight:${Region}:${Account}:extension-access/${ResourceId}	
flow	arn:${Partition}:quicksight:${Region}:${Account}:flow/${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon QuickSight

Amazon QuickSight defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by tag keys	ArrayOfString
quicksight:AllowedEmbeddingDomains	Filters access by the allowed embedding domains	ArrayOfString

Condition keys	Description	Type
quicksight:DirectoryType	Filters access by the user management options	String
quicksight:Edition	Filters access by the edition of QuickSight	String
quicksight:Group	Filters access by QuickSight group ARN	ARN
quicksight:IamArn	Filters access by IAM user or role ARN	ARN
quicksight:KmsKeyArns	Filters access by KMS key ARNs	ArrayOfARN
quicksight:SessionName	Filters access by session name	String
quicksight:UserName	Filters access by user name	String

Actions, resources, and condition keys for Amazon RDS

Amazon RDS (service prefix: `rds`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Condition keys for Amazon RDS

Actions defined by Amazon RDS

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddRoleToDBCluster	Grants permission to associate an Identity and Access Management (IAM) role from an Aurora DB cluster	Write	cluster*		iam:PassRole
AddRoleToDBInstance	Grants permission to associate an AWS Identity and Access Management (IAM) role with a DB instance	Write	db*		iam:PassRole
AddSourceIdentifierToSubscription	Grants permission to add a source identifier to an existing RDS event notification subscription	Write	es*		
AddTagsToResource	Grants permission to add metadata tags to an Amazon RDS resource	Tagging	auto-backup		
			cev		
			cluster		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

DescribeDBRecommendations	Grants permission to list recommendation details	List			
DescribeDBSecurityGroups	Grants permission to return a list of DBSecurityGroup descriptions	List	secgrp		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeDBShardGroups	Grants permission to return information about all Aurora Limitless Database DB shard groups for this account. You can filter by shard group(s)	List	shardgrp		
DescribeDBSnapshotAttributes	Grants permission to return a list of DB snapshot attribute names and values for a manual DB snapshot	List	snapshot*		
DescribeDBSnapshotTenantDatabases	Grants permission to return information about tenant databases in DB snapshots. You can filter by Region or snapshot	List	db		
			snapshot		
			snapshot-tenant-database		
DescribeDBSnapshots	Grants permission to return information about DB snapshots	List	db		
			snapshot		
DescribeDBSubnetGroups	Grants permission to return a list of DBSubnetGroup descriptions	List	subgrp		
DescribeEngineDefaultClusterParameters	Grants permission to return the default engine and system parameter information for the cluster database engine	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeEngineDefaultParameters	Grants permission to return the default engine and system parameter information for the specified database engine	List			
DescribeEventCategories	Grants permission to display a list of categories for all event source types, or, if specified, for a specified source type	List			
DescribeEventSubscriptions	Grants permission to list all the subscription descriptions for a customer account	List	es		
DescribeEvents	Grants permission to return events related to DB instances, DB security groups, DB snapshots, and DB parameter groups for the past 14 days	List			
DescribeExportTasks	Grants permission to return information about the export tasks	List	cluster		
			cluster-snapshot		
			snapshot		
DescribeGlobalClusters	Grants permission to return information about Aurora global database clusters or DocumentDB global database clusters	List	global-cluster		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeIntegrations	Grants permission to describe an Aurora zero-ETL integration with Redshift	List	integration		
				aws:ResourceTag/${TagKey}	
DescribeOptionGroupOptions	Grants permission to describe all available options	List			
DescribeOptionGroups	Grants permission to describe the available option groups	List	og		
DescribeOrderableDBInstanceOptions	Grants permission to return a list of orderable DB instance options for the specified engine	List			
DescribePendingMaintenanceActions	Grants permission to return a list of resources (for example, DB instances) that have at least one pending maintenance action	List	cluster		
			db		
DescribeRecommendationGroups [permission only]	Grants permission to return information about recommendation groups	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeRecommendations [permission only]	Grants permission to return information about recommendations	Read			
DescribeReservedDBInstances	Grants permission to return information about reserved DB instances for this account, or about a specified reserved DB instance	List	ri		
DescribeReservedDBInstancesOfferings	Grants permission to list available reserved DB instance offerings	List			
DescribeSourceRegions	Grants permission to return a list of the source AWS Regions where the current AWS Region can create a Read Replica or copy a DB snapshot from	List			
DescribeTenantDatabases	Grants permission to return information about provisioned tenant databases. You can filter by Region or snapshot	List	db tenant-database		
DescribeValidDBInstanceModifications	Grants permission to list available modifications you can make to your DB instance	List	db*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableHttpEndpoint	Grants permission to disable http endpoint for a DB cluster	Write	cluster*		
DownloadCompleteDBLogFile	Grants permission to download specified log file	Read	db*		
DownloadDBLogFilePortion	Grants permission to download all or a portion of the specified log file, up to 1 MB in size	Read	db*		
EnableHttpEndpoint	Grants permission to enable http endpoint for a DB cluster	Write	cluster*		
FailoverDBCluster	Grants permission to force a failover for a DB cluster	Write	cluster*		
FailoverGlobalCluster	Grants permission to failover a global cluster	Write	cluster*		
			global-cluster*		
ListTagsForResource	Grants permission to list all tags on an Amazon RDS resource	Read	auto-backup		
			cev		
			cluster		
			cluster-auto-backup

SwitchoverGlobalCluster	Grants permission to switchover a global cluster	Write	cluster*		
			global-cluster*		
SwitchoverReadReplica	Grants permission to switch over a read replica, making it the new primary database	Write	db*		

Resource types defined by Amazon RDS

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
cluster	`arn:${Partition}:rds:${Region}:${Account}:cluster:${DbClusterInstanceName}`	aws:ResourceTag/${TagKey} rds:cluster-tag/${TagKey}
shardgrp	`arn:${Partition}:rds:${Region}:${Account}:shard-group:${DbShardGroupResourceId}`	aws:ResourceTag/${TagKey}
cluster-auto-backup	`arn:${Partition}:rds:${Region}:${Account}:cluster-auto-backup:${DbClusterAutomatedBackupId}`	aws:ResourceTag/${TagKey}
auto-backup	`arn:${Partition}:rds:${Region}:${Account}:auto-backup:${DbInstanceAutomatedBackupId}`	aws:ResourceTag/${TagKey}
cluster-endpoint	`arn:${Partition}:rds:${Region}:${Account}:cluster-endpoint:${DbClusterEndpoint}`	aws:ResourceTag/${TagKey}
cluster-pg	`arn:${Partition}:rds:${Region}:${Account}:cluster-pg:${ClusterParameterGroupName}`	aws:ResourceTag/${TagKey} rds:cluster-pg-tag/${TagKey}

Resource types	ARN	Condition keys
cluster-snapshot	arn:${Partition}:rds:${Region}:${Account}:cluster-snapshot:${ClusterSnapshotName}	aws:ResourceTag/${TagKey} rds:cluster-snapshot-tag/${TagKey}
db	arn:${Partition}:rds:${Region}:${Account}:db:${DbInstanceName}	aws:ResourceTag/${TagKey} rds:DatabaseClass rds:DatabaseEngine rds:DatabaseName rds:MultiAz rds:Piops rds:StorageEncrypted rds:StorageSize rds:Vpc rds:db-tag/${TagKey}

Condition keys for Amazon RDS

Amazon RDS defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the set of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the set of tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the set of tag keys in the request	ArrayOfString
rds:BackupTarget	Filters access by the type of backup target. One of: region, outposts	String
rds:CopyOptionGroup	Filters access by the value that specifies whether the CopyDBSnapshot action requires copying the DB option group	Bool
rds:DatabaseClass	Filters access by the type of DB instance class	String
rds:DatabaseEngine	Filters access by the database engine. For possible values refer to the engine parameter in CreateDBInstance API	String
rds:DatabaseName	Filters access by the user-defined name of the database on the DB instance	String
rds:EndpointType	Filters access by the type of the endpoint. One of: READER, WRITER, CUSTOM	String
rds:ManageMasterUserPassword	Filters access by the value that specifies whether RDS manages master user password in AWS Secrets Manager for the DB instance or cluster	Bool

Condition keys	Description	Type
rds:MultiAz	Filters access by the value that specifies whether the DB instance runs in multiple Availability Zones. To indicate that the DB instance is using Multi-AZ, specify true	Bool
rds:Piops	Filters access by the value that contains the number of Provisioned IOPS (PIOPS) that the instance supports. To indicate a DB instance that does not have PIOPS enabled, specify 0	Numeric
rds:PubliclyAccessible	Filters access by the value that specifies whether the DB Instance or DB ShardGroup is publicly accessible	Bool
rds:StorageEncrypted	Filters access by the value that specifies whether the DB instance storage should be encrypted. To enforce storage encryption, specify true	Bool
rds:StorageSize	Filters access by the storage volume size (in GB)	Numeric
rds:TagsFromRequest	Filters access for rds:AddTagsToResource based on whether tags are explicitly specified in the Tags or TagSpecification request parameters. Evaluates to true when tags are provided in these parameters. Evaluates as false when tags are implicitly inherited from source resources	Bool
rds:TenantDatabaseName	Filters access by the tenant database name in CreateTenantDatabase and by the new tenant database name in ModifyTenantDatabase	String
rds:Vpc	Filters access by the value that specifies whether the DB instance runs in an Amazon Virtual Private Cloud (Amazon VPC). To indicate that the DB instance runs in an Amazon VPC, specify true	Bool
rds:cluster-pg-tag/${TagKey}	Filters access by the tag attached to a DB cluster parameter group	String

Condition keys	Description	Type
rds:cluster-snapshot-tag/${TagKey}	Filters access by the tag attached to a DB cluster snapshot	String
rds:cluster-tag/${TagKey}	Filters access by the tag attached to a DB cluster	String
rds:db-tag/${TagKey}	Filters access by the tag attached to a DB instance	String
rds:es-tag/${TagKey}	Filters access by the tag attached to an event subscription	String
rds:og-tag/${TagKey}	Filters access by the tag attached to a DB option group	String
rds:pg-tag/${TagKey}	Filters access by the tag attached to a DB parameter group	String
rds:req-tag/${TagKey}	Filters access by the set of tag keys and values that can be used to tag a resource	String
rds:ri-tag/${TagKey}	Filters access by the tag attached to a reserved DB instance	String
rds:secgrp-tag/${TagKey}	Filters access by the tag attached to a DB security group	String
rds:snapshot-tag/${TagKey}	Filters access by the tag attached to a DB snapshot	String
rds:subgrp-tag/${TagKey}	Filters access by the tag attached to a DB subnet group	String

Actions, resources, and condition keys for Amazon RDS Data API

Amazon RDS Data API (service prefix: `rds-data`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon RDS Data API

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchExecuteStatement	Grants permission to run a batch SQL statement over an array of data	Write	cluster*		
				aws:ResourceTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BeginTransaction	Grants permission to start a SQL transaction	Write	cluster*		
				aws:ResourceTag/${TagKey} aws:TagKeys	
CommitTransaction	Grants permission to end a SQL transaction started with the BeginTransaction operation and commits the changes	Write	cluster*		rds-data:BeginTransaction
				aws:ResourceTag/${TagKey} aws:TagKeys	
ExecuteSql	Grants permission to run one or more SQL statements. This operation is deprecated. Use the BatchExecuteStatement or ExecuteStatement operation	Write	cluster*		
				aws:ResourceTag/${TagKey} aws:TagKeys	
ExecuteStatement		Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	Grants permission to run a SQL statement against a database			aws:ResourceTag/${TagKey} aws:TagKeys	
RollbackTransaction	Grants permission to perform a rollback of a transaction. Rolling back a transaction cancels its changes	Write	cluster*		rds-data:BeginTransaction
				aws:ResourceTag/${TagKey} aws:TagKeys	

Resource types defined by Amazon RDS Data API

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
cluster	arn:${Partition}:rds:${Region}:${Account}:cluster:${DbClusterInstanceName}	aws:ResourceTag/${TagKey} aws:TagKeys

Condition keys for Amazon RDS Data API

Amazon RDS Data API defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys associated with the resource	ArrayOfString

Actions, resources, and condition keys for Amazon RDS IAM Authentication

Amazon RDS IAM Authentication (service prefix: rds-db) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon RDS IAM Authentication

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
connect	Allows IAM role or user to connect to RDS database	Permissions management	db-user*		

Resource types defined by Amazon RDS IAM Authentication

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
db-user	`arn:${Partition}:rds-db:${Region}:${Account}:dbuser:${DbiResourceId}/${DbUserName}`	

Condition keys for Amazon RDS IAM Authentication

RDS IAM Authentication has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Recycle Bin

AWS Recycle Bin (service prefix: `rbin`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Recycle Bin

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateRule	Grants permission to create a Recycle Bin retention rule	Write	rule*		
				aws:RequestTag/${TagKey} aws:TagKeys rbin:Request/ResourceType	
DeleteRule	Grants permission to delete a Recycle Bin retention rule	Write	rule*		
				aws:ResourceTag/${TagKey} rbin:Attribute/ResourceType	
GetRule	Grants permission to get detailed information about a Recycle Bin retention rule	Read	rule*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				rbin:Attribute/ResourceType	
ListRules	Grants permission to list the Recycle Bin retention rules in the Region	Read		rbin:Request/ResourceType	
ListTagsForResource	Grants permission to list the tags associated with a resource	Read	rule*		
				aws:ResourceTag/${TagKey} rbin:Attribute/ResourceType	
LockRule	Grants permission to lock an existing Recycle Bin retention rule	Write	rule*		
				aws:ResourceTag/${TagKey} rbin:Attribute/ResourceType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to add or update tags of a resource	Tagging	rule*		
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys rbin:Attribute/ResourceType	
UnlockRule	Grants permission to unlock an existing Recycle Bin retention rule	Write	rule*		
				aws:ResourceTag/${TagKey} rbin:Attribute/ResourceType	
UntagResource		Tagging	rule*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	Grants permission to remove tags associated with a resource			aws:ResourceTag/${TagKey} aws:TagKeys rbin:Attribute/ResourceType	
UpdateRule	Grants permission to update an existing Recycle Bin retention rule	Write	rule*		
				aws:ResourceTag/${TagKey} rbin:Attribute/ResourceType	

Resource types defined by AWS Recycle Bin

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
rule	`arn:${Partition}:rbin:${Region}:${Account}:rule/${ResourceName}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Recycle Bin

AWS Recycle Bin defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag's key and value in a request	String
aws:ResourceTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:TagKeys	Filters access by the tag keys in a request	ArrayOfString
rbin:Attribute/ResourceType	Filters access by the resource type of the existing rule	String
rbin:Request/ResourceType	Filters access by the resource type in a request	String

Actions, resources, and condition keys for Amazon Redshift

Amazon Redshift (service prefix: `redshift`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon Redshift

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptReservedNodeExchange	Grants permission to exchange a DC1 reserved node for a DC2 reserved node with no changes to the configuration	Write			
AddPartner	Grants permission to add a partner integration to a cluster	Write			
AssociateDataShareConsumer	Grants permission to associate a consumer to a datashare	Write	datashare *		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				redshift:ConsumerArn redshift:AllowWrites	
AuthorizeClusterSecurityGroupIngress	Grants permission to add an inbound (ingress) rule to an Amazon Redshift security group	Write	securitygroup*		
			securitygroupingress-ec2securitygroup*		
AuthorizeDataShare	Grants permission to authorize the specified datashare consumer to consume a datashare	Permissions management	datashare*		
				redshift:ConsumerIdentifier redshift:AllowWrites	
AuthorizeEndpointAccess	Grants permission to authorize endpoint related activities for redshift-managed vpc endpoint	Permissions management			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AuthorizeInboundIntegration [permission only]	Grants permission to Amazon Redshift to continuously validate that the target data warehouse can receive data replicated from the source ARN	Write	integration*		
AuthorizeSnapshotAccess	Grants permission to the specified AWS account to restore a snapshot	Permissions management	snapshot*		
BatchDeleteClusterSnapshots	Grants permission to delete snapshots in a batch of size upto 100	Write	snapshot*		
BatchModifyClusterSnapshots	Grants permission to modify settings for a list of snapshots	Write	snapshot*		
CancelQuery [permission only]	Grants permission to cancel a query through the Amazon Redshift console	Write			
CancelQuerySession [permission only]	Grants permission to see queries in the Amazon Redshift console	Write			
CancelResize	Grants permission to cancel a resize operation	Write	cluster*		
CopyClusterSnapshot	Grants permission to copy a cluster snapshot	Write	snapshot*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateAuthenticationProfile	Grants permission to create an Amazon Redshift authentication profile	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCluster	Grants permission to create a cluster	Write	cluster*		kms:CreateGrant kms:Decrypt kms:DescribeKey kms:GenerateDataKey kms:RetireGrant secretsmanager:CreateSecret secretsmanager:DeleteSecret secretsmanager:DescribeSecret secretsmanager:GetRandomPassword

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					secretsmanager:RotateSecret secretsmanager:TagResource secretsmanager:UpdateSecret
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateClusterParameterGroup	Grants permission to create an Amazon Redshift parameter group	Write	parametergroup*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateClusterSecurityGroup	Grants permission to create an Amazon Redshift security group	Write	securitygroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateClusterSnapshot	Grants permission to create a manual snapshot of the specified cluster	Write	snapshot*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateClusterSubnetGroup	Grants permission to create an Amazon Redshift subnet group	Write	subnetgroup*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateClusterUser	Grants permission to automatically create the specified Amazon Redshift user if it does not exist	Permissions management	dbuser*		
				redshift:DbUser	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCustomDomainAssociation	Grants permission to create a custom domain name for a cluster	Write	cluster*		acm:DescribeCertificate
CreateEndpointAccess	Grants permission to create a redshift-managed vpc endpoint	Write			
CreateEventSubscription	Grants permission to create an Amazon Redshift event notification subscription	Write	eventsubscription*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateHsmClientCertificate	Grants permission to create an HSM client certificate that a cluster uses to connect to an HSM	Write	hsmclientcertificate*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateHsmConfiguration	Grants permission to create an HSM configuration that contains information required by a cluster to store and use database encryption keys in a hardware security module (HSM)	Write	hsmconfiguration*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateInboundIntegration [permission only]	Grants permission to the source principal to create an inbound integration for data to be replicated from the source into the target data warehouse	Write			
CreateIntegration	Grants permission to create an Amazon Redshift zero-ETL integration	Write	integration*		kms:CreateGrant kms:DescribeKey

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys redshift:IntegrationSourceArn redshift:IntegrationTargetArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateQev2IdcApplication [permission only]	Grants permission to create a qev2 idc application	Write			sso:CreateApplication sso:PutApplicationAccessScope sso:PutApplicationAuthenticationMethod sso:PutApplicationGrant

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateRedshiftIdcApplication	Grants permission to create a redshift idc application	Write			sso:CreateApplication sso:PutApplicationAccessScope sso:PutApplicationAuthenticationMethod sso:PutApplicationGrant
CreateSavedQuery [permission only]	Grants permission to create saved SQL queries through the Amazon Redshift console	Write			
CreateScheduledAction	Grants permission to create an Amazon Redshift scheduled action	Write			
CreateSnapshotCopyGrant	Grants permission to create a snapshot copy grant and encrypt copied snapshots in a destination AWS Region	Permissions management	snapshotcopygrant*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSnapshotSchedule	Grants permission to create a snapshot schedule	Write	snapshotschedule*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateTags	Grants permission to add one or more tags to a specified resource	Tagging	cluster		
			eventsubscription		
			hsmclientcertificate		
			hsmconfiguration		
			integration		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			parameter group		
			securitygroup		
			securitygroupingress-cidr		
			securitygroupingress-ec2securitygroup		
			snapshot		
			snapshotcopygrant		
			snapshotschedule		
			subnetgroup		
			usagelimit		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateUsageLimit	Grants permission to create a usage limit	Write	usagelimit*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeauthorizeDataShare	Grants permission to remove permission from the specified datashare consumer to consume a datashare	Permissions management	datashare*		
				redshift:ConsumerIdentifier	
DeleteAuthenticationProfile	Grants permission to delete an Amazon Redshift authentication profile	Write			
DeleteCluster	Grants permission to delete a previously provisioned cluster	Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteClusterParameterGroup	Grants permission to delete an Amazon Redshift parameter group	Write	parametergroup*		
DeleteClusterSecurityGroup	Grants permission to delete an Amazon Redshift security group	Write	securitygroup*		
DeleteClusterSnapshot	Grants permission to delete a manual snapshot	Write	snapshot*		
DeleteClusterSubnetGroup	Grants permission to delete a cluster subnet group	Write	subnetgroup*		
DeleteCustomDomainAssociation	Grants permission to delete a custom domain name for a cluster	Write	cluster*		
DeleteEndpointAccess	Grants permission to delete a redshift-managed vpc endpoint	Write			
DeleteEventSubscription	Grants permission to delete an Amazon Redshift event notification subscription	Write	eventsubscription*		
DeleteHsmClientCertificate	Grants permission to delete an HSM client certificate	Write	hsmclientcertificate*		
DeleteHsmConfiguration	Grants permission to delete an Amazon Redshift HSM configuration	Write	hsmconfiguration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteIntegration	Grants permission to delete an Amazon Redshift zero-ETL integration	Write	integration*		
				aws:ResourceTag/${TagKey}	
DeletePartner	Grants permission to delete a partner integration from a cluster	Write			
DeleteQev2IdcApplication [permission only]	Grants permission to delete a qev2 idc application	Write	qev2idcapplication*		sso:DeleteApplication
DeleteRedshiftIdcApplication	Grants permission to delete a redshift idc application	Write	redshiftidcapplication*		sso:DeleteApplication
DeleteResourcePolicy	Grants permission to delete the resource policy for a specified resource	Permissions management	namespace*		
DeleteSavedQueries [permission only]	Grants permission to delete saved SQL queries through the Amazon Redshift console	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteScheduledAction	Grants permission to delete an Amazon Redshift scheduled action	Write			
DeleteSnapshotCopyGrant	Grants permission to delete a snapshot copy grant	Write	snapshotcopygrant*		
DeleteSnapshotSchedule	Grants permission to delete a snapshot schedule	Write	snapshotschedule*		
DeleteTags	Grants permission to delete a tag or tags from a resource	Tagging	cluster		
			eventsubscription		
			hsmclientcertificate		
			hsmconfiguration		
			integration		
			parametergroup		
			securitygroup		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			securitygroupingress-cidr		
			securitygroupingress-ec2securitygroup		
			snapshot		
			snapshotcopygrant		
			snapshotschedule		
			subnetgroup		
			usagelimit		
				aws:TagKeys	
DeleteUsageLimit	Grants permission to delete a usage limit	Write	usagelimit*		
DeregisterNamespace	Grants permission to deregister the specified namespace from a consumer	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeAccountAttributes	Grants permission to describe attributes attached to the specified AWS account	Read			
DescribeAuthenticationProfiles	Grants permission to describe created Amazon Redshift authentication profiles	Read			
DescribeAutonomicsDenylist [permission only]	Grants permission to describe the list of resources that are denylisted from global autonomics decisions for a specified cluster	Read	cluster*		
DescribeClusterDbRevisions	Grants permission to describe database revisions for a cluster	List			
DescribeClusterParameterGroups	Grants permission to describe Amazon Redshift parameter groups, including parameter groups you created and the default parameter group	Read			
DescribeClusterParameters	Grants permission to describe parameters contained within an Amazon Redshift parameter group	Read	parameter group*		
DescribeClusterSecurityGroups	Grants permission to describe Amazon Redshift security groups	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeClusterSnapshots	Grants permission to describe one or more snapshot objects, which contain metadata about your cluster snapshots	Read			
DescribeClusterSubnetGroups	Grants permission to describe one or more cluster subnet group objects, which contain metadata about your cluster subnet groups	Read			
DescribeClusterTracks	Grants permission to describe available maintenance tracks	List			
DescribeClusterVersions	Grants permission to describe available Amazon Redshift cluster versions	Read			
DescribeClusters	Grants permission to describe properties of provisioned clusters	List	cluster		
DescribeCustomDomainAssociations	Grants permission to describe custom domain names for a cluster	List			
DescribeDataShares	Grants permission to describe datashares created and consumed by your clusters	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeDataSharesForConsumer	Grants permission to describe only datashares consumed by your clusters	Read			
DescribeDataSharesForProducer	Grants permission to describe only datashares created by your clusters	Read			
DescribeDefaultClusterParameters	Grants permission to describe parameter settings for a parameter group family	Read			
DescribeEndpointAccess	Grants permission to describe redshift-managed vpc endpoints	Read			
DescribeEndpointAuthorization	Grants permission to authorize describe activity for redshift-managed vpc endpoint	List			
DescribeEventCategories	Grants permission to describe event categories for all event source types, or for a specified source type	Read			
DescribeEventSubscriptions	Grants permission to describe Amazon Redshift event notification subscriptions for the specified AWS account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeEvents	Grants permission to describe events related to clusters, security groups, snapshots, and parameter groups for the past 14 days	List			
DescribeHsmClientCertificates	Grants permission to describe HSM client certificates	Read			
DescribeHsmConfigurations	Grants permission to describe Amazon Redshift HSM configurations	Read			
DescribeInboundIntegrations	Grants permission to list the inbound integrations	List		redshift:InboundIntegrationArn	
DescribeIntegrations	Grants permission to describe an Amazon Redshift zero-ETL integration	List	integration*		
				aws:ResourceTag/${TagKey}	
DescribeLoggingStatus	Grants permission to describe whether information, such as queries and connection attempts, is being logged for a cluster	Read	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeNodeConfigurationOptions	Grants permission to describe properties of possible node configurations such as node type, number of nodes, and disk usage for the specified action type	List			
DescribeOrderableClusterOptions	Grants permission to describe orderable cluster options	Read			
DescribePartners	Grants permission to retrieve information about the partner integrations defined for a cluster	Read			
DescribeQev2IdcApplications [permission only]	Grants permission to describe qev2 idc applications	List			
DescribeQuery [permission only]	Grants permission to describe a query through the Amazon Redshift console	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeRedshiftIdcApplications	Grants permission to describe redshift idc applications	List			sso:GetApplicationGrant sso:ListApplicationAccessScopes
DescribeReservedNodeExchangeStatus	Grants permission to describe exchange status details and associated metadata for a reserved-node exchange. Statuses include such values as in progress and requested	Read			
DescribeReservedNodeOfferings	Grants permission to describe available reserved node offerings by Amazon Redshift	Read			
DescribeReservedNodes	Grants permission to describe the reserved nodes	Read			
DescribeResize	Grants permission to describe the last resize operation for a cluster	Read	cluster*		
DescribeSavedQueries [permission only]	Grants permission to describe saved queries through the Amazon Redshift console	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeScheduledActions	Grants permission to describe created Amazon Redshift scheduled actions	Read			
DescribeSnapshotCopyGrants	Grants permission to describe snapshot copy grants owned by the specified AWS account in the destination AWS Region	Read			
DescribeSnapshotSchedules	Grants permission to describe snapshot schedules	Read	snapshotschedule*		
DescribeStorage	Grants permission to describe account level backups storage size and provisional storage	Read			
DescribeTable [permission only]	Grants permission to describe a table through the Amazon Redshift console	Read			
DescribeTableRestoreStatus	Grants permission to describe status of one or more table restore requests made using the RestoreTableFromClusterSnapshot API action	Read			
DescribeTags	Grants permission to describe tags	Read	cluster		
			eventsubscription		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			hsmclientcertificate		
			hsmconfiguration		
			integration		
			parametergroup		
			securitygroup		
			securitygroupingress-cidr		
			securitygroupingress-ec2securitygroup		
			snapshot		
			snapshotcopygrant		
			snapshotschedule		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			subnetgroup		
			usagelimit		
DescribeUsageLimits	Grants permission to describe usage limits	Read	usagelimit*		
DisableLogging	Grants permission to disable logging information, such as queries and connection attempts, for a cluster	Write	cluster*		
DisableSnapshotCopy	Grants permission to disable the automatic copy of snapshots for a cluster	Write	cluster*		
DisassociateDataShareConsumer	Grants permission to disassociate a consumer from a datashare	Write	datashare*		
				redshift:ConsumerArn	
EnableLogging	Grants permission to enable logging information, such as queries and connection attempts, for a cluster	Write	cluster*		
EnableSnapshotCopy	Grants permission to enable the automatic copy of snapshots for a cluster	Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ExecuteQuery [permission only]	Grants permission to execute a query through the Amazon Redshift console	Write			
FailoverPrimaryCompute	Grants permission to failover the primary compute of an Multi-AZ cluster to another AZ	Write	cluster*		
FetchResults [permission only]	Grants permission to fetch query results through the Amazon Redshift console	Read			
GetClusterCredentials	Grants permission to get temporary credentials to access an Amazon Redshift database by the specified AWS account	Write	dbuser*		
			dbname		
				redshift:DbName redshift:DbUser redshift:DurationSeconds	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetClusterCredentialsWithIAM	Grants permission to get enhanced temporary credentials to access an Amazon Redshift database by the specified AWS account	Write	dbname		
				redshift:DbName redshift:DurationSeconds	
GetIdentityCenterAuthToken	Grants permission to get an authorized token for Identity Center users to access Redshift clusters	Read	cluster*		
GetReservedNodeExchangeConfigurationOptions	Grants permission to get the configuration options for the reserved-node exchange	Read			
GetReservedNodeExchangeOfferings	Grants permission to get an array of DC2 ReservedNodeOfferings that matches the payment type, term, and usage price of the given DC1 reserved node	Read			
GetResourcePolicy	Grants permission to get the resource policy for a specified resource	Read	namespace*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
JoinGroup	Grants permission to join the specified Amazon Redshift group	Permissions management	dbgroup*		
ListDatabases [permission only]	Grants permission to list databases through the Amazon Redshift console	List			
ListRecommendations	Grants permission to list Advisor recommendations	List			
ListSavedQueries [permission only]	Grants permission to list saved queries through the Amazon Redshift console	List			
ListSchemas [permission only]	Grants permission to list schemas through the Amazon Redshift console	List			
ListTables [permission only]	Grants permission to list tables through the Amazon Redshift console	List			
ModifyAquaConfiguration	Grants permission to modify the AQUA configuration of a cluster	Write	cluster*		
ModifyAuthenticationProfile	Grants permission to modify an existing Amazon Redshift authentication profile	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyAutonomicsDenylist [permission only]	Grants permission to add or remove resources from the global autonomics denylist for a specified cluster	Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyCluster	Grants permission to modify the settings of a cluster	Write	cluster*		acm:DescribeCertificate kms:CreateGrant kms:Decrypt kms:DescribeKey kms:GenerateDataKey kms:RetireGrant secretsmanager:CreateSecret secretsmanager:DeleteSecret secretsmanager:DescribeSecret

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					secretsmanager:GetRandomPassword secretsmanager:RotateSecret secretsmanager:TagResource secretsmanager:UpdateSecret
ModifyClusterDbRevision	Grants permission to modify the database revision of a cluster	Write	cluster*		
ModifyClusterIamRoles	Grants permission to modify the list of AWS Identity and Access Management (IAM) roles that can be used by a cluster to access other AWS services	Permissions management	cluster*		
ModifyClusterMaintenance	Grants permission to modify the maintenance settings of a cluster	Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyClusterParameterGroup	Grants permission to modify the parameters of a parameter group	Write	parameter group*		
ModifyClusterSnapshot	Grants permission to modify the settings of a snapshot	Write	snapshot*		
ModifyClusterSnapshotSchedule	Grants permission to modify a snapshot schedule for a cluster	Write	cluster*		
ModifyClusterSubnetGroup	Grants permission to modify a cluster subnet group to include the specified list of VPC subnets	Write	subnetgroup*		
ModifyCustomDomainAssociation	Grants permission to modify a custom domain name for a cluster	Write	cluster*		acm:DescribeCertificate
ModifyEndpointAccess	Grants permission to modify a redshift-managed vpc endpoint	Write			
ModifyEventSubscription	Grants permission to modify an existing Amazon Redshift event notification subscription	Write	eventsubscription*		
ModifyIntegration	Grants permission to modify an Amazon Redshift zero-ETL integration	Write	integration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
ModifyQev2IdcApplication [permission only]	Grants permission to modify a qev2 idc application	Write	qev2idcapplication*		sso:UpdateApplication

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyRedshiftIdcApplication	Grants permission to modify a redshift idc application	Write	redshiftidcapplication*		sso:DeleteApplicationAccessScope sso:DeleteApplicationGrant sso:GetApplicationGrant sso:ListApplicationAccessScopes sso:PutApplicationAccessScope sso:PutApplicationGrant sso:UpdateApplication

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifySavedQuery [permission only]	Grants permission to modify an existing saved query through the Amazon Redshift console	Write			
ModifyScheduledAction	Grants permission to modify an existing Amazon Redshift scheduled action	Write			
ModifySnapshotCopyRetentionPeriod	Grants permission to modify the number of days to retain snapshots in the destination AWS Region after they are copied from the source AWS Region	Write	cluster*		
ModifySnapshotSchedule	Grants permission to modify a snapshot schedule	Write	snapshotschedule*		
ModifyUsageLimit	Grants permission to modify a usage limit	Write	usagelimit*		
PauseCluster	Grants permission to pause a cluster	Write	cluster*		
PurchaseReservedNodeOffering	Grants permission to purchase a reserved node	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutResourcePolicy	Grants permission to update the resource policy for a specified resource	Permissions management	namespace*		
RebootCluster	Grants permission to reboot a cluster	Write	cluster*		
RegisterNamespace	Grants permission to register the specified namespace to a consumer	Write			
RejectDataShare	Grants permission to decline a datashare shared from another account	Permissions management	datashare*		
ResetClusterParameterGroup	Grants permission to set one or more parameters of a parameter group to their default values and set the source values of the parameters to "engine-default"	Write	parametergroup*		
ResizeCluster	Grants permission to change the size of a cluster	Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RestoreFromClusterSnapshot	Grants permission to create a cluster from a snapshot	Write	cluster*		kms:CreateGrant kms:Decrypt kms:DescribeKey kms:GenerateDataKey kms:RetireGrant secretsmanager:CreateSecret secretsmanager:DeleteSecret secretsmanager:DescribeSecret secretsmanager:GetRandomPassword

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					secretsmanager:RotateSecret secretsmanager:TagResource secretsmanager:UpdateSecret
			snapshot*		
				aws:TagKeys	
RestoreTableFromClusterSnapshot	Grants permission to create a table from a table in an Amazon Redshift cluster snapshot	Write	cluster*		
			snapshot*		
ResumeCluster	Grants permission to resume a cluster	Write	cluster*		
RevokeClusterSecurityGroupIngress	Grants permission to revoke an ingress rule in an Amazon Redshift security group for a previously authorized IP range or Amazon EC2 security group	Write	securitygroup*		
			securitygroupingress-ec2securitygroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RevokeEndpointAccess	Grants permission to revoke access for endpoint related activities for redshift-managed vpc endpoint	Permissions management			
RevokeSnapshotAccess	Grants permission to revoke access from the specified AWS account to restore a snapshot	Permissions management	snapshot*		
RotateEncryptionKey	Grants permission to rotate an encryption key for a cluster	Write	cluster*		
UpdatePartnerStatus	Grants permission to update the status of a partner integration	Write			
ViewQueriesFromConsole [permission only]	Grants permission to view query results through the Amazon Redshift console	List			
ViewQueriesInConsole [permission only]	Grants permission to terminate running queries and loads through the Amazon Redshift console	List			

Resource types defined by Amazon Redshift

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
cluster	arn:${Partition}:redshift:${Region}:${Account}:cluster:${ClusterName}	aws:ResourceTag/${TagKey}
datashare	arn:${Partition}:redshift:${Region}:${Account}:datashare:${ProducerClusterNamespace}/${DataShareName}	aws:ResourceTag/${TagKey}
dbgroup	arn:${Partition}:redshift:${Region}:${Account}:dbgroup:${ClusterName}/${DbGroup}	
dbname	arn:${Partition}:redshift:${Region}:${Account}:dbname:${ClusterName}/${DbName}	
dbuser	arn:${Partition}:redshift:${Region}:${Account}:dbuser:${ClusterName}/${DbUser}	
eventsubscription	arn:${Partition}:redshift:${Region}:${Account}:eventsubscription:${EventSubscriptionName}	aws:ResourceTag/${TagKey}
hsmclientcertificate	arn:${Partition}:redshift:${Region}:${Account}:hsmclientcertificate:${HSMClientCertificateId}	aws:ResourceTag/${TagKey}
hsmconfiguration	arn:${Partition}:redshift:${Region}:${Account}:hsmconfiguration:${HSMConfigurationId}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
integration	arn:${Partition}:redshift:${Region}:${Account}:integration:${IntegrationIdentifier}	aws:ResourceTag/${TagKey}
namespace	arn:${Partition}:redshift:${Region}:${Account}:namespace:${ClusterNamespace}	
parametergroup	arn:${Partition}:redshift:${Region}:${Account}:parametergroup:${ParameterGroupName}	aws:ResourceTag/${TagKey}
securitygroup	arn:${Partition}:redshift:${Region}:${Account}:securitygroup:${SecurityGroupName}/ec2securitygroup/${Owner}/${Ec2SecurityGroupId}	aws:ResourceTag/${TagKey}
securitygroupingress-cidr	arn:${Partition}:redshift:${Region}:${Account}:securitygroupingress:${SecurityGroupName}/cidrip/${IpRange}	aws:ResourceTag/${TagKey}
securitygroupingress-ec2securitygroup	arn:${Partition}:redshift:${Region}:${Account}:securitygroupingress:${SecurityGroupName}/ec2securitygroup/${Owner}/${Ece2SecuritygroupId}	aws:ResourceTag/${TagKey}
snapshot	arn:${Partition}:redshift:${Region}:${Account}:snapshot:${ClusterName}/${SnapshotName}	aws:ResourceTag/${TagKey}
snapshotcopygrant	arn:${Partition}:redshift:${Region}:${Account}:snapshotcopygrant:${SnapshotCopyGrantName}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
snapshotschedule	arn:${Partition}:redshift:${Region}:${Account}:snapshotschedule:${ScheduleIdentifier}	aws:ResourceTag/${TagKey}
subnetgroup	arn:${Partition}:redshift:${Region}:${Account}:subnetgroup:${SubnetGroupName}	aws:ResourceTag/${TagKey}
usagelimit	arn:${Partition}:redshift:${Region}:${Account}:usagelimit:${UsageLimitId}	aws:ResourceTag/${TagKey}
redshiftidcapplication	arn:${Partition}:redshift:${Region}:${Account}:redshiftidcapplication:${RedshiftIdcApplicationId}	
qev2idcapplication	arn:${Partition}:redshift:${Region}:${Account}:qev2idcapplication:${Qev2IdcApplicationId}	

Condition keys for Amazon Redshift

Amazon Redshift defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by actions based on the allowed set of values for each of the tags	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by actions based on tag-value associated with the resource	String
aws:TagKeys	Filters access by actions based on the presence of mandatory tags in the request	ArrayOfString
redshift:AllowWrites	Filters access by the allowWrites input parameter	Bool
redshift:ConsumerArn	Filters access by the datashare consumer arn	ARN
redshift:ConsumerIdentifier	Filters access by the datashare consumer	String
redshift:DbName	Filters access by the database name	String
redshift:DbUser	Filters access by the database user name	String
redshift:DurationSeconds	Filters access by the number of seconds until a temporary credential set expires	String
redshift:InboundIntegrationArn	Filters access by the ARN of an inbound zero-ETL Integration resource	ARN
redshift:IntegrationSourceArn	Filters access by the ARN of a zero-ETL Integration source	ARN
redshift:IntegrationTargetArn	Filters access by the ARN of a zero-ETL Integration target	ARN

Actions, resources, and condition keys for Amazon Redshift Data API

Amazon Redshift Data API (service prefix: `redshift-data`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon Redshift Data API

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchExecuteStatement	Grants permission to execute multiple queries under a single connection	Write	cluster		
			workgroup		
				redshift-data:session-owner-iam-userid	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				redshift-data:glue-catalog-arn	
CancelStatement	Grants permission to cancel a running query	Write		redshift-data:statement-owner-iam-userid	
DescribeStatement	Grants permission to retrieve detailed information about a statement execution	Read		redshift-data:statement-owner-iam-userid	
DescribeTable	Grants permission to retrieve metadata about a particular table	Read	cluster*		
			workgroup*		
ExecuteStatement	Grants permission to execute a query	Write	cluster		
			workgroup		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				redshift-data:session-owner-iam-userid redshift-data:glue-catalog-arn	
GetStagingBucketLocation	Grants permission to get staging bucket location for a given managed workgroup	Read	managed-workgroup*		
GetStatementResult	Grants permission to fetch the result of a query	Read		redshift-data:statement-owner-iam-userid	
ListDatabases	Grants permission to list databases for a given cluster	Read	cluster*		
			workgroup*		
ListSchemas	Grants permission to list schemas for a given cluster	Read	cluster*		
			workgroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListStatements	Grants permission to list queries for a given principal	List		redshift-data:statement-owner-iam-userid	
ListTables	Grants permission to list tables for a given cluster	List	cluster*		
			workgroup*		

Resource types defined by Amazon Redshift Data API

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
cluster	`arn:${Partition}:redshift:${Region}:${Account}:cluster:${ClusterName}`	aws:ResourceTag/${TagKey}
workgroup	`arn:${Partition}:redshift-serverless:${Region}:${Account}:workgroup/${WorkgroupId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
managed-workgroup	arn:${Partition}:redshift-serverless:${Region}:${Account}:managed-workgroup/${ManagedWorkgroupId}	

Condition keys for Amazon Redshift Data API

Amazon Redshift Data API defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by tag-value associated with the resource	String
redshift-data:glue-catalog-arn	Filters access by glue catalog arn	ARN
redshift-data:session-owner-iam-userid	Filters access by session owner iam userid	String
redshift-data:statement-owner-iam-userid	Filters access by statement owner iam userid	String

Actions, resources, and condition keys for Amazon Redshift Serverless

Amazon Redshift Serverless (service prefix: `redshift-serverless`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Redshift Serverless

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ConvertRecoveryPointToSnapshot	Grants permission to convert a recovery point to a snapshot	Write	recoveryPoint*		
			snapshot*		
				aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
CreateCustomDomainAssociation	Grants permission to create a custom domain association in Amazon Redshift Serverless	Write	workgroup*		acm:DescribeCertificate
CreateEndpointAccess	Grants permission to create an Amazon Redshift Serverless managed VPC endpoint	Write	endpointAccess*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateNamespace	Grants permission to create an Amazon Redshift Serverless namespace	Write	namespace*		kms:CreateGrant kms:Decrypt kms:DescribeKey kms:GenerateDataKey kms:RetireGrant secretsmanager:CreateSecret secretsmanager:DeleteSecret secretsmanager:DescribeSecret secretsmanager:GetRandomPassword

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					secretsmanager:RotateSecret secretsmanager:TagResource secretsmanager:UpdateSecret
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateReservation	Grants permission to purchase a capacity reservation according to a specific reservation offering, for a specified number of RPUs	Write			
CreateScheduledAction	Grants permission to create a scheduled action for a specified Amazon Redshift Serverless namespace	Write	namespace*		
CreateSnapshot	Grants permission to create a snapshot of all databases in a namespace	Write	namespace*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			snapshot*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSnapshotCopyConfiguration	Grants permission to create a snapshot copy configuration for a specified Amazon Redshift Serverless namespace	Write	namespace*		
CreateUsageLimit	Grants permission to create a usage limit for a specified Amazon Redshift Serverless usage type	Write			
CreateWorkgroup	Grants permission to create a workgroup in Amazon Redshift Serverless	Write	workgroup*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteCustomDomainAssociation	Grants permission to delete a custom domain association	Write	workgroup*		
DeleteEndpointAccess	Grants permission to delete an Amazon Redshift Serverless managed VPC endpoint	Write	endpointAccess*		
DeleteNamespace	Grants permission to delete a namespace from Amazon Redshift Serverless	Write	namespace*		kms:DescribeKey kms:RetireGrant secretsmanager:DeleteSecret secretsmanager:DescribeSecret
DeleteResourcePolicy	Grants permission to delete the specified resource policy	Write			
DeleteScheduledAction	Grants permission to delete a scheduled action from Amazon Redshift Serverless	Write			
DeleteSnapshot	Grants permission to delete a snapshot from Amazon Redshift Serverless	Write	snapshot*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteSnapshotCopyConfiguration	Grants permission to delete a snapshot copy configuration for a Amazon Redshift Serverless namespace	Write			
DeleteUsageLimit	Grants permission to delete a usage limit from Amazon Redshift Serverless	Write			
DeleteWorkgroup	Grants permission to delete a workgroup	Write	workgroup*		
DescribeOneTimeCredit [permission only]	Grants permission to see on the Amazon Redshift Serverless console the remaining number of free trial credits and their expiration date	Read			
GetCredentials	Grants permission to get a database user name and temporary password with temporary authorization to log on to Amazon Redshift Serverless	Write	workgroup*		
GetCustomDomainAssociation	Grants permission to get information about a specific custom domain association	Read	workgroup*		
GetEndpointAccess	Grants permission to create an Amazon Redshift Serverless managed VPC endpoint	Read	endpointAccess*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetIdentityCenterAuthToken	Grants permission to get an authorized token for Identity Center users to access Redshift Serverless workgroups	Read	workgroup*		
GetManagedWorkgroup	Grants permission to create a Amazon Redshift Managed Serverless workgroup with the specified configuration settings	Read	managed-workgroup*		
GetNamespace	Grants permission to get information about a namespace in Amazon Redshift Serverless	Read	namespace*		
GetRecoveryPoint	Grants permission to get information about a recovery point	Read	recoveryPoint*		
GetReservation	Grants permission to get a particular reservation object	Read			
GetReservationOffering	Grants permission to get a particular reservation offering	Read			
GetResourcePolicy	Grants permission to get a resource policy	Read			
GetScheduledAction	Grants permission to get information about a specific scheduled action	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSnapshot	Grants permission to get information about a specific snapshot	Read	snapshot*		
GetTableRestoreStatus	Grants permission to get table restore status about a specific snapshot	Read			
GetTrack	Grants permission to get information about a track in Amazon Redshift Serverless	Read			
GetUsageLimit	Grants permission to get information about a usage limit in Amazon Redshift Serverless	Read			
GetWorkgroup	Grants permission to get information about a specific workgroup	Read	workgroup*		
ListAutonomicsDenylist [permission only]	Grants permission to list the resources that are denylisted from global autonomics decisions for a specified workgroup	Read	workgroup*		
ListCustomDomainAssociations	Grants permission to list custom domain associations in Amazon Redshift Serverless	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListEndpointAccess	Grants permission to list EndpointAccess objects and relevant information	List	endpointAccess*		
ListManagedWorkgroups	Grants permission to list managed workgroups in Amazon Redshift Serverless	List			
ListNamespaces	Grants permission to list namespaces in Amazon Redshift Serverless	List			
ListRecoveryPoints	Grants permission to list an array of recovery points	List	recoveryPoint*		
ListReservationOfferings	Grants permission to list all available capacity reservation offerings	List			
ListReservations	Grants permission to list all reservations	List			
ListScheduledActions	Grants permission to list scheduled actions	List			
ListSnapshotCopyConfigurations	Grants permission to list SnapshotCopyConfiguration objects and relevant information	List	namespace		
ListSnapshots	Grants permission to list snapshots	List	snapshot*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTableRestoreStatus	Grants permission to list table restore status	List			
ListTagsForResource	Grants permission to list the tags assigned to a resource	List	namespace		
			workgroup		
				aws:ResourceTag/${TagKey}	
ListTracks	Grants permission to list tracks available in Amazon Redshift Serverless	List			
ListUsageLimits	Grants permission to list all usage limits within Amazon Redshift Serverless	List			
ListWorkgroups	Grants permission to list workgroups in Amazon Redshift Serverless	List			
PutResourcePolicy	Grants permission to create or update a resource policy	Write			
RestoreFromRecoveryPoint	Grants permission to restore the data from a recovery point	Write	recoveryPoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RestoreFromSnapshot	Grants permission to restore a namespace from a snapshot	Write	snapshot*		kms:CreateGrant kms:Decrypt kms:DescribeKey kms:GenerateDataKey kms:RetireGrant secretsmanager:CreateSecret secretsmanager:DeleteSecret secretsmanager:DescribeSecret secretsmanager:GetRandomPassword

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					secretsmanager:RotateSecret secretsmanager:TagResource secretsmanager:UpdateSecret
RestoreTableFromRecoveryPoint	Grants permission to restore a table from a recovery point	Write	namespace*		
			recoveryPoint*		
RestoreTableFromSnapshot	Grants permission to restore a table from a snapshot	Write	namespace*		
			snapshot*		
TagResource	Grants permission to assign one or more tags to a resource	Tagging	namespace		
			recoveryPoint		
			snapshot		
			workgroup		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
UntagResource	Grants permission to remove a tag or set of tags from a resource	Tagging	namespace		
			recoveryPoint		
			snapshot		
			workgroup		
				aws:TagKeys	
UpdateAutonomicsDenylist [permission only]	Grants permission to add or remove resources from the global autonomics denylist for a specified workgroup	Write	workgroup *		
UpdateCustomDomainAssociation	Grants permission to update a certificate associated with a custom domain	Write	workgroup *		acm:DescribeCertificate

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateEndpointAccess	Grants permission to update an Amazon Redshift Serverless managed VPC endpoint	Write	endpointAccess*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateNamespace	Grants permission to update a namespace with the specified configuration settings	Write	namespace*		kms:CreateGrant kms:Decrypt kms:DescribeKey kms:GenerateDataKey kms:RetireGrant secretsmanager:CreateSecret secretsmanager:DeleteSecret secretsmanager:DescribeSecret secretsmanager:GetRandomPassword

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					secretsmanager:RotateSecret secretsmanager:TagResource secretsmanager:UpdateSecret
UpdateScheduledAction	Grants permission to update a scheduled action	Write			
UpdateSnapshot	Grants permission to update a snapshot	Write	snapshot*		
UpdateSnapshotCopyConfiguration	Grants permission to update a snapshot copy configuration for a Amazon Redshift Serverless namespace	Write			
UpdateUsageLimit	Grants permission to update a usage limit in Amazon Redshift Serverless	Write			
UpdateWorkgroup	Grants permission to update an Amazon Redshift Serverless workgroup with the specified configuration settings	Write	workgroup*		

Resource types defined by Amazon Redshift Serverless

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
namespace	`arn:${Partition}:redshift-serverless:${Region}:${Account}:namespace/${NamespaceId}`	aws:ResourceTag/${TagKey}
snapshot	`arn:${Partition}:redshift-serverless:${Region}:${Account}:snapshot/${SnapshotId}`	aws:ResourceTag/${TagKey}
workgroup	`arn:${Partition}:redshift-serverless:${Region}:${Account}:workgroup/${WorkgroupId}`	aws:ResourceTag/${TagKey}
managed-workgroup	`arn:${Partition}:redshift-serverless:${Region}:${Account}:managed-workgroup/${ManagedWorkgroupName}`	
recoveryPoint	`arn:${Partition}:redshift-serverless:${Region}:${Account}:recoverypoint/${RecoveryPointId}`	aws:ResourceTag/${TagKey}
endpointAccess	`arn:${Partition}:redshift-serverless:${Region}:${Account}:managedvpcendpoint/${EndpointAccessId}`	

Condition keys for Amazon Redshift Serverless

Amazon Redshift Serverless defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
redshift-serverless:endpointAccessId	Filters access by the endpoint access identifier	String
redshift-serverless:managedWorkgroupName	Filters access by the managed workgroup identifier	String
redshift-serverless:namespaceId	Filters access by the namespace identifier	String
redshift-serverles	Filters access by the recovery point identifier	String

Condition keys	Description	Type
s:recoveryPointId		
redshift-serverless:snapshotId	Filters access by the snapshot identifier	String
redshift-serverless:tableRestoreRequestId	Filters access by the table restore request identifier	String
redshift-serverless:workgroupId	Filters access by the workgroup identifier	String

Actions, resources, and condition keys for Amazon Rekognition

Amazon Rekognition (service prefix: `rekognition`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Actions defined by Amazon Rekognition

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateFaces	Grants permission to associate multiple individual faces with a single user	Write	collection*		
CompareFaces	Grants permission to compare faces in the source input image with each face detected in the target input image	Read			
CopyProjectVersion	Grants permission to copy an existing model version to a new model version	Write	project*		
			projectversion*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateCollection	Grants permission to create a collection in an AWS Region	Write		aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
CreateDataset	Grants permission to create a new Amazon Rekognition Custom Labels dataset	Write	project*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateFaceLivenessSession	Grants permission to create a face liveness session	Write			
CreateProject	Grants permission to create an Amazon Rekognition Custom Labels project	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateProjectVersion	Grants permission to begin training a new version of a model	Write	project*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateStreamProcessor	Grants permission to create an Amazon Rekognition stream processor	Write	collection*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateUser	Grants permission to create a new user in a collection using a unique user ID you provide	Write	collection*		
DeleteCollection	Grants permission to delete the specified collection	Write	collection*		
DeleteDataset	Grants permission to delete an existing Amazon Rekognition Custom Labels dataset	Write	dataset*		
DeleteFaces	Grants permission to delete faces from a collection	Write	collection*		
DeleteProject	Grants permission to delete a project	Write	project*		
DeleteProjectPolicy	Grants permission to delete a resource policy attached to a project	Write	project*		
DeleteProjectVersion	Grants permission to delete a model	Write	projectversion*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteStreamProcessor	Grants permission to delete the specified stream processor	Write	streamprocessor*		
DeleteUser	Grants permission to delete a user from a collection based on the provided user ID	Write	collection*		
DescribeCollection	Grants permission to read details about a collection	Read	collection*		
DescribeDataset	Grants permission to describe an Amazon Rekognition Custom Labels dataset	Read	dataset*		
DescribeProjectVersions	Grants permission to list the versions of a model in an Amazon Rekognition Custom Labels project	Read	project*		
DescribeProjects	Grants permission to list Amazon Rekognition Custom Labels projects	Read			
DescribeStreamProcessor	Grants permission to get information about the specified stream processor	Read	streamprocessor*		
DetectCustomLabels	Grants permission to detect custom labels in a supplied image	Read	projectversion*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DetectFaces	Grants permission to detect human faces within an image provided as input	Read			
DetectLabels	Grants permission to detect instances of real-world labels within an image provided as input	Read			
DetectModerationLabels	Grants permission to detect moderation labels within the input image	Read	projectversion		
DetectProtectiveEquipment	Grants permission to detect Personal Protective Equipment in the input image	Read			
DetectText	Grants permission to detect text in the input image and convert it into machine-readable text	Read			
DisassociateFaces	Grants permission to remove the association between a user ID and a face ID	Write	collection*		
DistributeDatasetEntries	Grants permission to distribute the entries in a training dataset across the training dataset and the test dataset for a project	Write	dataset*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCelebrityInfo	Grants permission to read the name, and additional information, of a celebrity	Read			
GetCelebrityRecognition	Grants permission to read the celebrity recognition results found in a stored video by an asynchronous celebrity recognition job	Read			
GetContentModeration	Grants permission to read the content moderation analysis results found in a stored video by an asynchronous content moderation job	Read			
GetFaceDetection	Grants permission to read the faces detection results found in a stored video by an asynchronous face detection job	Read			
GetFaceLivenessSessionResults	Grants permission to get results of a face liveness session	Read			
GetFaceSearch	Grants permission to read the matching collection faces found in a stored video by an asynchronous face search job	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetLabelDetection	Grants permission to read the label detected resuls found in a stored video by an asynchronous label detection job	Read			
GetMediaAnalysisJob	Grants permission to read the reference to job results in S3 and additional information about a media analysis job	Read			
GetPersonTracking	Grants permission to read the list of persons detected in a stored video by an asynchronous person tracking job	Read			
GetSegmentDetection	Grants permission to get the vdeo segments found in a stored video by an asynchronous segment detection job	Read			
GetTextDetection	Grants permission to get the text found in a stored video by an asynchronous text detection job	Read			
IndexFaces	Grants permission to update an existing collection with faces detected in the input image	Write	collection*		
ListCollections	Grants permission to read the collection Id's in your account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDatasetEntries	Grants permission to list the dataset entries in an existing Amazon Rekognition Custom Labels dataset	Read	dataset*		
ListDatasetLabels	Grants permission to list the labels in a dataset	Read	dataset*		
ListFaces	Grants permission to read metadata for faces in the specificed collection	Read	collection*		
ListMediaAnalysisJobs	Grants permission to read the list of media analysis jobs	Read			
ListProjectPolicies	Grants permission to list the resource policies attached to a project	Read	project*		
ListStreamProcessors	Grants permission to get a list of your stream processors	List			
ListTagsForResource	Grants permission to return a list of tags associated with a resource	Read	collection		
			dataset		
			project		
			projectversion		
			streamprocessor		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListUsers	Grants permission to list UserIds and the UserStatus	Read	collection*		
PutProjectPolicy	Grants permission to attach a resource policy to a project	Write	project*		
RecognizeCelebrities	Grants permission to detect celebrities in the input image	Read			
SearchFaces	Grants permission to search the specificed collection for the supplied face ID	Read	collection*		
SearchFacesByImage	Grants permission to search the specificed collection for the largest face in the input image	Read	collection*		
SearchUsers	Grants permission to search the specificed collection for user match result with given either face ID or user ID	Read	collection*		
SearchUsersByImage	Grants permission to search the specificed collection for user match result by using the largest face in the input image	Read	collection*		
StartCelebrityRecognition	Grants permission to start the asynchronous recognition of celebrities in a stored video	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartContentModeration	Grants permission to start asynchronous detection of explicit or suggestive adult content in a stored video	Write			
StartFaceDetection	Grants permission to start asynchronous detection of faces in a stored video	Write			
StartFaceLivenessSession	Grants permission to start streaming video for a face liveness session	Write			
StartFaceSearch	Grants permission to start an asynchronous search for faces in a collection that match the faces of persons detected in a stored video	Write	collection*		
StartLabelDetection	Grants permission to start asynchronous detection of labels in a stored video	Write			
StartMediaAnalysisJob	Grants permission to start a media analysis job	Write	projectversion		
StartPersonTracking	Grants permission to start the asynchronous tracking of persons in a stored video	Write			
StartProjectVersion	Grants permission to start running a model version	Write	projectversion*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartSegmentDetection	Grants permission to start the asynchronous detection of segments in a stored video	Write			
StartStreamProcessor	Grants permission to start running a stream processor	Write	streamprocessor*		
StartTextDetection	Grants permission to start the asynchronous detection of text in a stored video	Write			
StopProjectVersion	Grants permission to stop a running model version	Write	projectversion*		
StopStreamProcessor	Grants permission to stop a running stream processor	Write	streamprocessor*		
TagResource	Grants permission to add one or more tags to a resource	Tagging	collection		
			dataset		
			project		
			projectversion		
			streamprocessor		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove one or more tags from a resource	Tagging	collection		
			dataset		
			project		
			projectversion		
			streamprocessor		
				aws:TagKeys	
UpdateDatasetEntries	Grants permission to add or update one or more JSON Lines (entries) in a dataset	Write	dataset*		
UpdateStreamProcessor	Grants permission to modify properties for a stream processor	Write	streamprocessor*		

Resource types defined by Amazon Rekognition

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
collection	`arn:${Partition}:rekognition:${Region}:${Account}:collection/${CollectionId}`	aws:ResourceTag/${TagKey}
streamprocessor	`arn:${Partition}:rekognition:${Region}:${Account}:streamprocessor/${StreamprocessorId}`	aws:ResourceTag/${TagKey}
project	`arn:${Partition}:rekognition:${Region}:${Account}:project/${ProjectName}/${CreationTimestamp}`	aws:ResourceTag/${TagKey}
projectversion	`arn:${Partition}:rekognition:${Region}:${Account}:project/${ProjectName}/version/${VersionName}/${CreationTimestamp}`	aws:ResourceTag/${TagKey}
dataset	`arn:${Partition}:rekognition:${Region}:${Account}:project/${ProjectName}/dataset/${DatasetType}/${CreationTimestamp}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Rekognition

Amazon Rekognition defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the

policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by tags associated with the resource	String
aws:TagKeys	Filters access by tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS rePost Private

AWS rePost Private (service prefix: `repostspace`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- Resource types defined by AWS rePost Private
- Condition keys for AWS rePost Private

Actions defined by AWS rePost Private

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy,

you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchAddChannelRoleToAccessors	Grants permission to add a role to users and groups in a private re:Post channel in your account	Write	space*		
BatchAddRole	Grants permission to add a role to users and groups in a private re:Post in your account	Write	space*		
BatchRemoveChannelRoleFromAccessors	Grants permission to remove a role from users and groups in a private re:Post channel in your account	Write	space*		
BatchRemoveRole	Grants permission to remove a role from users and groups in a private re:Post in your account	Write	space*		
CreateChannel	Grants permission to create a new channel in private re:Post in your account	Write	space*		
CreateSpace	Grants permission to create a new private re:Post in your account	Write		aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteSpace	Grants permission to delete a private re:Post from your account	Write	space*		
DeregisterAdmin	Grants permission to remove an administrator to a private re:Post in your account	Write	space*		
GetChannel	Grants permission to get the description for a channel in private re:Post in your account	Read	space*		
GetSpace	Grants permission to get the description for a private re:Post in your account	Read	space*		
ListChannels	Grants permission to list all channels in a private re:Post in your account	Read	space*		
ListSpaces	Grants permission to list all private re:Posts in your account	Read			
ListTagsForResource	Grants permission to list the tags associated with a resource	Read	space*		
				aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RegisterAdmin	Grants permission to add an administrator to a private re:Post in your account	Write	space*		
SendInvites	Grants permission to send invites to users of a private re:Post in your account	Write	space*		
TagResource	Grants permission to tag a resource	Tagging	space*		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to untag a resource	Tagging	space*		
				aws:TagKeys	
UpdateChannel	Grants permission to update a channel in private re:Post in your account	Write	space*		
UpdateSpace	Grants permission to update a private re:Post in your account	Write	space*		

Resource types defined by AWS rePost Private

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
space	`arn:${Partition}:repostspace:${Region}:${Account}:space/${ResourceId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS rePost Private

AWS rePost Private defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS Resilience Hub

AWS Resilience Hub (service prefix: `resiliencehub`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.

Topics

Actions defined by AWS Resilience Hub

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptResourceGroupingRecommendations	Grants permission to accept resource grouping recommendations	Write	application*		
AddDraftAppVersionResourceMappings	Grants permission to add draft application version resource mappings	Write	application*		cloudformation:DescribeStacks

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					cloudformation:ListStackResources resource-groups:GetGroup resource-groups:ListGroupResources servicecatalog:GetApplication servicecatalog:ListAssociatedResources

Resource types defined by AWS Resilience Hub

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
resiliency-policy	`arn:${Partition}:resiliencehub:${Region}:${Account}:resiliency-policy/${ResiliencyPolicyId}`	aws:ResourceTag/${TagKey}
application	`arn:${Partition}:resiliencehub:${Region}:${Account}:app/${AppId}`	aws:ResourceTag/${TagKey}
app-assessment	`arn:${Partition}:resiliencehub:${Region}:${Account}:app-assessment/${AppAssessmentId}`	aws:ResourceTag/${TagKey}
recommendation-template	`arn:${Partition}:resiliencehub:${Region}:${Account}:recommendation-template/${RecommendationTemplateId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Resilience Hub

AWS Resilience Hub defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Resource Access Manager (RAM)

AWS Resource Access Manager (RAM) (service prefix: `ram`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Resource Access Manager (RAM)

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptResourceShareInvitation	Grants permission to accept the specified resource share invitation	Write	resource-share-invitation*		
				ram:ShareOwnerAccountId ram:ResourceShareName	
AssociateResourceShare	Grants permission to associate resource(s) and/or principal(s) to a resource share	Write	resource-share*		
				aws:ResourceTag/${TagKey} ram:ResourceTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} ram:ResourceShareName ram:AllowsExternalPrincipals ram:Principal ram:RequestedResourceType ram:ResourceArn ram:RetainSharingOnAccountLeaveOrganization

ListResources	Grants permission to list the resources that you added to resource shares or the resources that are shared with you	List			
ListSourceAssociations	Grants permission to list source associations for resource shares	List			
PromotePermissionCreatedFromPolicy	Grants permission to create a separate, fully manageable customer managed permission	Write	customer-managed-permission*		
				ram:PermissionArn ram:PermissionResourceType	
PromoteResourceShareCreatedFromPolicy	Grants permission to promote the specified resource share	Write	resource-share*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RejectResourceShareInvitation	Grants permission to reject the specified resource share invitation	Write	resource-share-invitation*		
				ram:ShareOwnerAccountId ram:ResourceShareName	
ReplacePermissionAssociations	Grants permission to update all resource shares to a new permission	Write	customer-managed-permission*		
			permission*		
				ram:PermissionArn ram:PermissionResourceType	
SetDefaultPermissionVersion	Grants permission to specify a version number as the default version for the respective customer managed permission	Write	customer-managed-permission*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ram:PermissionArn ram:PermissionResourceType	
TagResource	Grants permission to tag the specified resource share or permission	Tagging	customer-managed-permission		
			resource-share		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag the specified resource share or permission	Tagging	customer-managed-permission		
			resource-share		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateResourceShare	Grants permission to update attributes of the resource share	Write	resource-share*		
				aws:ResourceTag/${TagKey} ram:ResourceTag/${TagKey} ram:ResourceShareName ram:AllowsExternalPrincipals ram:RequestedAllowsExternalPrincipals ram:RetainSharingOnAccountLeaveOrganization	

Resource types defined by AWS Resource Access Manager (RAM)

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
resource-share	`arn:${Partition}:ram:${Region}:${Account}:resource-share/${ResourcePath}`	aws:ResourceTag/${TagKey} ram:AllowsExternalPrincipals ram:ResourceShareName
resource-share-invitation	`arn:${Partition}:ram:${Region}:${Account}:resource-share-invitation/${ResourcePath}`	ram:ShareOwnerAccountId
permission	`arn:${Partition}:ram::${Account}:permission/${ResourcePath}`	ram:PermissionArn ram:PermissionResourceType
customer-managed-permission	`arn:${Partition}:ram:${Region}:${Account}:permission/${ResourcePath}`	aws:ResourceTag/${TagKey} ram:PermissionArn ram:PermissionResourceType

Condition keys for AWS Resource Access Manager (RAM)

AWS Resource Access Manager (RAM) defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request when creating or tagging a resource share. If users don't pass these specific tags, or if they don't specify tags at all, the request fails	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed when creating or tagging a resource share	ArrayOfString
ram:AllowsExternalPrincipals	Filters access by resource shares that allow or deny sharing with external principals. For example, specify true if the action can only be performed on resource shares that allow sharing with external principals. External principals are AWS accounts that are outside of its AWS organization	Bool
ram:PermissionArn	Filters access by the specified Permission ARN	ARN
ram:PermissionResourceType	Filters access by permissions of specified resource type	String
ram:Principal	Filters access by format of the specified principal	String

Condition keys	Description	Type
ram:RequestedAllowsExternalPrincipals	Filters access by the specified value for 'allowExternalPrincipals'. External principals are AWS accounts that are outside of its AWS Organization	Bool
ram:RequestedResourceType	Filters access by the specified resource type	String
ram:ResourceArn	Filters access by the specified ARN	ARN
ram:ResourceShareName	Filters access by a resource share with the specified name	String
ram:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
ram:RetainSharingOnAccountLeaveOrganization	Filters access by RetainSharingOnAccountLeaveOrganization value within ResourceShareConfiguration that is set on resource share	Bool
ram:ShareOwnerAccountId	Filters access by resource shares owned by a specific account. For example, you can use this condition key to specify which resource share invitations can be accepted or rejected based on the resource share owner's account ID	String

Actions, resources, and condition keys for AWS Resource Explorer

AWS Resource Explorer (service prefix: `resource-explorer-2`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS Resource Explorer

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateDefaultView	Grants permission to set the specified view as the default for this AWS Region in this AWS account	Write			
BatchGetView	Grants permission to retrieve details about views that you specify by a list of ARNs	Read			resource-explorer-2:GetView
CreateIndex	Grants permission to turn on Resource Explorer in the AWS Region in which you called	Write		aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	this operation by creating an index			aws:TagKeys	
CreateManagedView [permission only]	Grants permission to create managed view	Write			
CreateResourceExplorerSetup	Grants permission to create resource explorer setup	Write			
CreateStreamingAccessForService [permission only]	Grants permission to create resource explorer streaming access	Write			
CreateView	Grants permission to create a view that users can query	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteIndex	Grants permission to turn off Resource Explorer in the specified AWS Region by deleting the index	Write	index*		
DeleteResourceExplorerSetup	Grants permission to delete resource explorer setup	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteResourcePolicy [permission only]	Grants permission to delete the specified view's resource policy	Permissions management	view*		
DeleteStreamingAccessForService [permission only]	Grants permission to delete resource explorer streaming access	Write			
DeleteView	Grants permission to delete a view	Write	view*		
DisassociateDefaultView	Grants permission to remove the default view for the AWS Region in which you call this operation	Write			
GetAccountLevelServiceConfiguration	Grants permission to Resource Explorer to access account level data within your AWS Organization	Read			
GetDefaultView	Grants permission to retrieve the Amazon resource name (ARN) of the view that is the default for the AWS Region in which you call this operation	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetIndex	Grants permission to retrieve information about the index in the AWS Region in which you call this operation	Read			
GetManagedView	Grants permission to get managed view	Read	managed-view*		
GetResourceExplorerSetup	Grants permission to get resource explorer setup	Read			
GetResourcePolicy [permission only]	Grants permission to retrieve information about the specified view's resource policy	Read	view*		
GetServiceIndex	Grants permission to get service index	Read			
GetServiceView	Grants permission to get service view	Read			
GetView	Grants permission to retrieve information about the specified view	Read	view*		
ListIndexes	Grants permission to list the indexes in all AWS Regions	List			
ListIndexesForMembers	Grants permission to list the organization member account's indexes in all AWS Regions	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListManagedViews	Grants permission to list managed views	List			
ListServiceIndexes	Grants permission to list service indexes in all AWS Regions	List			
ListServiceViews	Grants permission to list service views in all AWS Regions	List			
ListStreamingAccessForServices	Grants permission to list streaming access for services	List			
ListSupportedResourceTypes	Grants permission to retrieve a list of all resource types currently supported by Resource Explorer	List			
ListTagsForResource	Grants permission to list the tags that are attached to the specified resource	Read	index view		
ListViews	Grants permission to list the Amazon resource names (ARNs) of all of the views available in the AWS Region in which you call this operation	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutResourcePolicy [permission only]	Grants permission to update the specified view's resource policy	Permissions management	view*		
Search	Grants permission to search for resources and display details about all resources that match the specified criteria	Read	view*		
				resource-explorer-2:Operation	
TagResource	Grants permission to add one or more tag key and value pairs to the specified resource	Tagging	index		
			view		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove one or more tag key and value pairs from the specified resource	Tagging	index		
			view		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateIndexType	Grants permission to change the type of the index from LOCAL to AGGREGATOR or back	Write	index*		
UpdateView	Grants permission to modify some of the details of a view	Write	view*		

Resource types defined by AWS Resource Explorer

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
view	`arn:${Partition}:resource-explorer-2:${Region}:${Account}:view/${ViewName}/${ViewUuid}`	aws:ResourceTag/${TagKey}
index	`arn:${Partition}:resource-explorer-2:${Region}:${Account}:index/${IndexUuid}`	aws:ResourceTag/${TagKey}
managed-view	`arn:${Partition}:resource-explorer-2:${Region}:${Account}:managed-view/${ManagedViewName}/${ManagedViewUuid}`	

Condition keys for AWS Resource Explorer

AWS Resource Explorer defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tag keys that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tag keyss attached to the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
resource-explorer-2:Operation	Filters access by the actual operation that is being invoked, available values: Search, ListResources	String

Actions, resources, and condition keys for Amazon Resource Group Tagging API

Amazon Resource Group Tagging API (service prefix: `tag`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Topics

Actions defined by Amazon Resource Group Tagging API

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeReportCreation	Grants permission to describe the status of the StartReportCreation operation	Read			
GetComplianceSummary	Grants permission to retrieve a summary of how many resources are noncompliant with their effective tag policies	Read			
GetResources	Grants permission to return tagged or previously tagged resources in the specified AWS Region for the calling account	Read			
GetTagKeys	Grants permission to returns tag keys currently in use in the specified AWS Region for the calling account	Read			
GetTagValues	Grants permission to return tag values for the specified	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	key that are used in the specified AWS Region for the calling account				
ListRequiredTags	Grants permission to list required tags for supported resource types in the calling account	List			
StartReportCreation	Grants permission to start generating a report listing all tagged resources in accounts across your organization, and whether each resource is compliant with the effective tag policy	Write			
TagResources	Grants permission to apply one or more tags to the specified resources	Tagging			
UntagResources	Grants permission to remove the specified tags from the specified resources	Tagging			

Resource types defined by Amazon Resource Group Tagging API

Amazon Resource Group Tagging API does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon Resource Group Tagging API, specify `"Resource": "*"` in your policy.

Condition keys for Amazon Resource Group Tagging API

Resource Group Tagging has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Resource Groups

AWS Resource Groups (service prefix: `resource-groups`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Resource Groups

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which

the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Associate Resource [permission only]	Grants permission to associate a resource to an Application	Write	group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelTagSyncTask	Grants permission to cancel a tag-sync task for an application group	Write	group*		resource-groups:DeleteGroup
CreateGroup	Grants permission to create a resource group with a specified name, description, and resource query	Write		aws:RequestTag/${TagKey} aws:TagKeys	cloudformation:DescribeStacks
DeleteGroup	Grants permission to delete a specified resource group	Write	group*		tag:GetResources
DeleteGroupPolicy [permission only]	Grants permission to delete a resource-based policy for the specified group	Write	group*		
DisassociateResource [permission only]	Grants permission to disassociate a resource from an Application	Write	group*		
GetAccountSettings	Grants permission to get the current status of optional features in Resource Groups	Read			
GetGroup	Grants permission to get information of a specified resource group	Read	group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetGroupConfiguration	Grants permission to get the service configuration associated with the specified resource group	Read	group*		
GetGroupPolicy [permission only]	Grants permission to get a resource-based policy for the specified group	Read	group*		
GetGroupQuery	Grants permission to get the query associated with a specified resource group	Read	group*		
GetTagSyncTask	Grants permission to get information of a specified tag-sync task	Read	group*		
GetTags	Grants permission to get the tags associated with a specified resource group	Read	group*		
GroupResources	Grants permission to add the specified resources to the specified group	Write	group*		resource-groups:Tag tag:TagResources

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListGroupResources	Grants permission to list the resources that are members of a specified resource group	List	group*		cloudformation:DescribeStacks cloudformation:ListStackResources tag:GetResources
ListGroupingStatuses	Grants permission to list grouping statuses for a specified application group	List	group*		
ListGroups	Grants permission to list all resource groups in your account	List			
ListResourceTypes [permission only]	Grants permission to list supported resource types	List			
ListTagSyncTasks	Grants permission to list all tag-sync tasks in your account	List	group*		
PutGroupConfiguration	Grants permission to put the service configuration associated with the specified resource group	Write	group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutGroupPolicy [permission only]	Grants permission to add a resource-based policy for the specified group	Write	group*		
SearchResources	Grants permission to search for AWS resources matching the given query	List			cloudformation:DescribeStacks cloudformation:ListStackResources tag:GetResources
StartTagSyncTask	Grants permission to create a tag-sync task for an application group	Write	group*		iam:PassRole resource-groups:CreateGroup
Tag	Grants permission to tag a specified resource group	Tagging	group*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UngroupResources	Grants permission to remove the specified resources from the specified group	Write	group*		resource-groups:Untag tag:UntagResources
Untag	Grants permission to remove tags associated with a specified resource group	Tagging	group*		
				aws:TagKeys	
UpdateAccountSettings	Grants permission to update optional features in Resource Groups	Write			
UpdateGroup	Grants permission to update a specified resource group	Write	group*		
UpdateGroupQuery	Grants permission to update the query associated with a specified resource group	Write	group*		cloudformation:DescribeStacks

Resource types defined by AWS Resource Groups

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
group	arn:${Partition}:resource-groups:${Region}:${Account}:group/${GroupName}	aws:ResourceTag/${TagKey}
tagSyncTask	arn:${Partition}:resource-groups:${Region}:${Account}:group/${GroupName}/tag-sync-task/${TaskId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Resource Groups

AWS Resource Groups defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon RHEL Knowledgebase Portal

Amazon RHEL Knowledgebase Portal (service prefix: rhelkb) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

UpdateRobotDeployment [permission only]	Report the deployment status for an individual robot	Write			
UpdateSimulationApplication	Update a simulation application	Write	simulationApplication*		
UpdateWorldTemplate	Update a world template	Write	worldTemplate*		

Resource types defined by AWS RoboMaker

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
robotApplication	arn:${Partition}:robomaker:${Region}:${Account}:robot-application/${ApplicationName}/${CreatedOnEpoch}	aws:ResourceTag/${TagKey}
simulationApplication	arn:${Partition}:robomaker:${Region}:${Account}:simulation-application/${ApplicationName}/${CreatedOnEpoch}	aws:ResourceTag/${TagKey}
simulationJob	arn:${Partition}:robomaker:${Region}:${Account}:simulation-job/${SimulationJobId}	aws:ResourceTag/${TagKey}
simulationJobBatch	arn:${Partition}:robomaker:${Region}:${Account}:simulation-job-batch/${SimulationJobBatchId}	aws:ResourceTag/${TagKey}
deploymentJob	arn:${Partition}:robomaker:${Region}:${Account}:deployment-job/${DeploymentJobId}	aws:ResourceTag/${TagKey}
robot	arn:${Partition}:robomaker:${Region}:${Account}:robot/${RobotName}/${CreatedOnEpoch}	aws:ResourceTag/${TagKey}
deploymentFleet	arn:${Partition}:robomaker:${Region}:${Account}:deployment-fleet/${FleetName}/${CreatedOnEpoch}	aws:ResourceTag/${TagKey}
worldGenerationJob	arn:${Partition}:robomaker:${Region}:${Account}:world-generation-job/${WorldGenerationJobId}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
worldExportJob	arn:${Partition}:robomaker:${Region}:${Account}:world-export-job/${WorldExportJobId}	aws:ResourceTag/${TagKey}
worldTemplate	arn:${Partition}:robomaker:${Region}:${Account}:world-template/${WorldTemplateJobId}	aws:ResourceTag/${TagKey}
world	arn:${Partition}:robomaker:${Region}:${Account}:world/${WorldId}	aws:ResourceTag/${TagKey}

Condition keys for AWS RoboMaker

AWS RoboMaker defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access based on the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access based on the tags associated with the resource	String
aws:TagKeys	Filters access based on the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Route 53

Amazon Route 53 (service prefix: `route53`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon Route 53

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ActivateKeySigningKey	Grants permission to activate a key-signing key so that it can be used for signing by DNSSEC	Write	hostedzone*		
AssociateVPCWithHostedZone	Grants permission to associate an additional Amazon VPC with a private hosted zone	Write	hostedzone		ec2:DescribeVpcs
				route53:VPCs	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ChangeCidrCollection	Grants permission to create or delete CIDR blocks within a CIDR collection	Write	cidrcollection*		
ChangeResourceRecordSets	Grants permission to create, update, or delete a record, which contains authoritative DNS information for a specified domain or subdomain name	Write	hostedzone*		
				route53:ChangeResourceRecordSetsNormalizedRecordNames route53:ChangeResourceRecordSetsRecordTypes route53:ChangeResourceRecordSetsActions	
ChangeTagsForResource	Grants permission to add, edit, or delete tags for a health check or a hosted zone	Tagging	healthcheck*		
			hostedzone*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCidrCollection	Grants permission to create a new CIDR collection	Write			
CreateHealthCheck	Grants permission to create a new health check, which monitors the health and performance of your web applications, web servers, and other resources	Write			
CreateHostedZone	Grants permission to create a public hosted zone, which you use to specify how the Domain Name System (DNS) routes traffic on the Internet for a domain, such as example.com, and its subdomains	Write		route53:VPCs	ec2:DescribeVpcs
CreateKeySigningKey	Grants permission to create a new key-signing key associated with a hosted zone	Write	hostedzone*		
CreateQueryLoggingConfig	Grants permission to create a configuration for DNS query logging	Write	hostedzone*		
CreateReusableDelegationSet	Grants permission to create a delegation set (a group of four name servers) that can be reused by multiple hosted zones	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTrafficPolicy	Grants permission to create a traffic policy, which you use to create multiple DNS records for one domain name (such as example.com) or one subdomain name (such as www.example.com)	Write			
CreateTrafficPolicyInstance	Grants permission to create records in a specified hosted zone based on the settings in a specified traffic policy version	Write	hostedzone* trafficpolicy*		
CreateTrafficPolicyVersion	Grants permission to create a new version of an existing traffic policy	Write	trafficpolicy*		
CreateVPCAssociationAuthorization	Grants permission to authorize the AWS account that created a specified VPC to submit an Associate VPCWithHostedZone request, which associates the VPC with a specified hosted zone that was created by a different account	Write	hostedzone* 	 route53:VPCs	
DeactivateKeySigningKey	Grants permission to deactivate a key-signing key so that it will not be used for signing by DNSSEC	Write	hostedzone*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteCidrCollection	Grants permission to delete a CIDR collection	Write	cidrcollection*		
DeleteHealthCheck	Grants permission to delete a health check	Write	healthcheck*		
DeleteHostedZone	Grants permission to delete a hosted zone	Write	hostedzone*		
DeleteKeySigningKey	Grants permission to delete a key-signing key	Write	hostedzone*		
DeleteQueryLoggingConfig	Grants permission to delete a configuration for DNS query logging	Write	queryloggingconfig*		
DeleteReusableDelegationSet	Grants permission to delete a reusable delegation set	Write	delegationset*		
DeleteTrafficPolicy	Grants permission to delete a traffic policy	Write	trafficpolicy*		
DeleteTrafficPolicyInstance	Grants permission to delete a traffic policy instance and all the records that Route 53 created when you created the instance	Write	trafficpolicyinstance*		
DeleteVPCAssociationAuthorization	Grants permission to remove authorization for associating an Amazon Virtual Private Cloud with a Route 53 private hosted zone	Write	hostedzone*		
				route53:VPCs	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableHostedZoneDNSSEC	Grants permission to disable DNSSEC signing in a specific hosted zone	Write	hostedzone*		
DisassociateVPCFromHostedZone	Grants permission to disassociate an Amazon Virtual Private Cloud from a Route 53 private hosted zone	Write	hostedzone		ec2:DescribeVpcs
				route53:VPCs	
EnableHostedZoneDNSSEC	Grants permission to enable DNSSEC signing in a specific hosted zone	Write	hostedzone*		
GetAccountLimit	Grants permission to get the specified limit for the current account, for example, the maximum number of health checks that you can create using the account	Read			
GetChange	Grants permission to get the current status of a request to create, update, or delete one or more records	List	change*		
GetCheckerIpRanges	Grants permission to get a list of the IP ranges that are used by Route 53 health checkers to check the health of your resources	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDNSSEC	Grants permission to get information about DNSSEC for a specific hosted zone, including the key-signing keys in the hosted zone	Read	hostedzone*		
GetGeoLocation	Grants permission to get information about whether a specified geographic location is supported for Route 53 geolocation records	List			
GetHealthCheck	Grants permission to get information about a specified health check	Read	healthcheck*		
GetHealthCheckCount	Grants permission to get the number of health checks that are associated with the current AWS account	List			
GetHealthCheckLastFailureReason	Grants permission to get the reason that a specified health check failed most recently	List	healthcheck*		
GetHealthCheckStatus	Grants permission to get the status of a specified health check	List	healthcheck*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetHostedZone	Grants permission to get information about a specified hosted zone including the four name servers that Route 53 assigned to the hosted zone	List	hostedzone*		
GetHostedZoneCount	Grants permission to get the number of hosted zones that are associated with the current AWS account	List			
GetHostedZoneLimit	Grants permission to get the specified limit for a specified hosted zone	Read	hostedzone*		
GetQueryLoggingConfig	Grants permission to get information about a specified configuration for DNS query logging	Read	queryloggingconfig*		
GetReusableDelegationSet	Grants permission to get information about a specified reusable delegation set, including the four name servers that are assigned to the delegation set	List	delegationset*		
GetReusableDelegationSetLimit	Grants permission to get the maximum number of hosted zones that you can associate with the specified reusable delegation set	Read	delegationset*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTrafficPolicy	Grants permission to get information about a specified traffic policy version	Read	trafficpolicy*		
GetTrafficPolicyInstance	Grants permission to get information about a specified traffic policy instance	Read	trafficpolicyinstance*		
GetTrafficPolicyInstanceCount	Grants permission to get the number of traffic policy instances that are associated with the current AWS account	Read			
ListCidrBlocks	Grants permission to get a list of the CIDR blocks within a specified CIDR collection	List	cidrcollection*		
ListCidrCollections	Grants permission to get a list of the CIDR collections that are associated with the current AWS account	List			
ListCidrLocations	Grants permission to get a list of the CIDR locations that belong to a specified CIDR collection	List	cidrcollection*		
ListGeoLocations	Grants permission to get a list of geographic locations that Route 53 supports for geolocation	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListHealthChecks	Grants permission to get a list of the health checks that are associated with the current AWS account	Read			
ListHostedZones	Grants permission to get a list of the public and private hosted zones that are associated with the current AWS account	List			
ListHostedZonesByName	Grants permission to get a list of your hosted zones in lexicographic order. Hosted zones are sorted by name with the labels reversed, for example, com.example.www	List			
ListHostedZonesByVPC	Grants permission to get a list of all the private hosted zones that a specified VPC is associated with	List		route53:VPCs	ec2:DescribeVpcs
ListQueryLoggingConfigs	Grants permission to list the configurations for DNS query logging that are associated with the current AWS account or the configuration that is associated with a specified hosted zone	List	hostedzone		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListResourceRecordSets	Grants permission to list the records in a specified hosted zone	List	hostedzone*		
ListReusableDelegationSets	Grants permission to list the reusable delegation sets that are associated with the current AWS account.	Read			
ListTagsForResource	Grants permission to list tags for one health check or hosted zone	Read	healthcheck		
			hostedzone		
ListTagsForResources	Grants permission to list tags for up to 10 health checks or hosted zones	Read	healthcheck		
			hostedzone		
ListTrafficPolicies	Grants permission to get information about the latest version for every traffic policy that is associated with the current AWS account. Policies are listed in the order in which they were created	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTrafficPolicyInstances	Grants permission to get information about the traffic policy instances that you created by using the current AWS account	Read			
ListTrafficPolicyInstancesByHostedZone	Grants permission to get information about the traffic policy instances that you created in a specified hosted zone	List	hostedzone*		
ListTrafficPolicyInstancesByPolicy	Grants permission to get information about the traffic policy instances that you created using a specified traffic policy version	List	trafficpolicy*		
ListTrafficPolicyVersions	Grants permission to get information about all the versions for a specified traffic policy	List	trafficpolicy*		
ListVPCAssociationAuthorizations	Grants permission to get a list of the VPCs that were created by other accounts and that can be associated with a specified hosted zone	List	hostedzone*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TestDNSAnswer	Grants permission to get the value that Route 53 returns in response to a DNS query for a specified record name and type	Read			
UpdateHealthCheck	Grants permission to update an existing health check	Write	healthcheck*		
UpdateHostedZoneComment	Grants permission to update the comment for a specified hosted zone	Write	hostedzone*		
UpdateHostedZoneFeatures	Grants permission to update features for a specified hosted zone	Write	hostedzone*		
UpdateTrafficPolicyComment	Grants permission to update the comment for a specified traffic policy version	Write	trafficpolicy*		
UpdateTrafficPolicyInstance	Grants permission to update the records in a specified hosted zone that were created based on the settings in a specified traffic policy version	Write	trafficpolicyinstance*		

Resource types defined by Amazon Route 53

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
cidrcollection	arn:${Partition}:route53:::cidrcollection/${Id}	
change	arn:${Partition}:route53:::change/${Id}	
delegationset	arn:${Partition}:route53:::delegationset/${Id}	
healthcheck	arn:${Partition}:route53:::healthcheck/${Id}	
hostedzone	arn:${Partition}:route53:::hostedzone/${Id}	
trafficpolicy	arn:${Partition}:route53:::trafficpolicy/${Id}	
trafficpolicyinstance	arn:${Partition}:route53:::trafficpolicyinstance/${Id}	
queryloggingconfig	arn:${Partition}:route53:::queryloggingconfig/${Id}	
vpc	arn:${Partition}:ec2:${Region}:${Account}:vpc/${VpcId}	

Condition keys for Amazon Route 53

Amazon Route 53 defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
route53:ChangeResourceRecordSetsActions	Filters access by the change actions, CREATE, UPSERT, or DELETE, in a ChangeResourceRecordSets request	ArrayOfString
route53:ChangeResourceRecordSetsNormalizedRecordNames	Filters access by the normalized DNS record names in a ChangeResourceRecordSets request	ArrayOfString
route53:ChangeResourceRecordSetsRecordTypes	Filters access by the DNS record types in a ChangeResourceRecordSets request	ArrayOfString
route53:VPCs	Filters access by VPCs in request	String

Actions, resources, and condition keys for Amazon Route 53 Domains

Amazon Route 53 Domains (service prefix: `route53domains`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon Route 53 Domains

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptDomainTransferFromAnotherAwsAccount	Grants permission to accept the transfer of a domain from another AWS account to the current AWS account	Write			
AssociateDelegationSignerToDomain	Grants permission to associate a new delegation signer to a domain	Write			
CancelDomainTransferToAnotherAwsAccount	Grants permission to cancel the transfer of a domain from the current AWS account to another AWS account	Write			
CheckDomainAvailability	Grants permission to check the availability of one domain name	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CheckDomainTransferability	Grants permission to check whether a domain name can be transferred to Amazon Route 53	Read			
DeleteDomain	Grants permission to delete domains	Write			
DeleteTagsForDomain	Grants permission to delete the specified tags for a domain	Tagging			
DisableDomainAutoRenew	Grants permission to configure Amazon Route 53 to automatically renew the specified domain before the domain registration expires	Write			
DisableDomainTransferLock	Grants permission to remove the transfer lock on the domain (specifically the clientTransferProhibited status) to allow domain transfers	Write			
DisassociateDelegationSignerFromDomain	Grants permission to disassociate an existing delegation signer from a domain	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableDomainAutoRenew	Grants permission to configure Amazon Route 53 to automatically renew the specified domain before the domain registration expires	Write			
EnableDomainTransferLock	Grants permission to set the transfer lock on the domain (specifically the clientTransferProhibited status) to prevent domain transfers	Write			
GetContactReachabilityStatus	Grants permission to get information about whether the registrant contact has responded for operations that require confirmation that the email address for the registrant contact is valid, such as registering a new domain	Read			
GetDomainDetail	Grants permission to get detailed information about a domain	Read			
GetDomainSuggestions	Grants permission to get a list of suggested domain names given a string, which can either be a domain name or simply a word or phrase (without spaces)	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetOperationDetail	Grants permission to get the current status of an operation that is not completed	Read			
ListDomains	Grants permission to list all the domain names registered with Amazon Route 53 for the current AWS account	List			
ListOperations	Grants permission to list the operation IDs of operations that are not yet complete	List			
ListPrices	Grants permission to list the prices of operations for TLDs	List			
ListTagsForDomain	Grants permission to list all the tags that are associated with the specified domain	Read			
PushDomain	Grants permission to change the IPS tag of .uk domain to initiate a transfer process from Route 53 to another registrar	Write			
RegisterDomain	Grants permission to register domains	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RejectDomainTransferFromAnotherAwsAccount	Grants permission to reject the transfer of a domain from another AWS account to the current AWS account	Write			
RenewDomain	Grants permission to renew domains for the specified number of years	Write			
ResendContactReachabilityEmail	Grants permission to resend the confirmation email to the current email address for the registrant contact for operations that require confirmation that the email address for the registrant contact is valid, such as registering a new domain	Write			
ResendOperationAuthorization	Grants permission to resend the operation authorization	Write			
RetrieveDomainAuthCode	Grants permission to get the AuthCode for the domain	Write			
TransferDomain	Grants permission to transfer a domain from another registrar to Amazon Route 53	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TransferDomainToAnotherAwsAccount	Grants permission to transfer a domain from the current AWS account to another AWS account	Write			
UpdateDomainContact	Grants permission to update the contact information for domain	Write			
UpdateDomainContactPrivacy	Grants permission to update the domain contact privacy setting	Write			
UpdateDomainNameservers	Grants permission to replace the current set of name servers for a domain with the specified set of name servers	Write			
UpdateTagsForDomain	Grants permission to add or update tags for a specified domain	Tagging			
ViewBilling	Grants permission to get all the domain-related billing records for the current AWS account for a specified period	Read			

Resource types defined by Amazon Route 53 Domains

Amazon Route 53 Domains does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon Route 53 Domains, specify `"Resource": "*"` in your policy.

Condition keys for Amazon Route 53 Domains

Route 53 Domains has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Route 53 Profiles

Amazon Route 53 Profiles (service prefix: `route53profiles`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Actions defined by Amazon Route 53 Profiles

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a

resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Associate Profile	Grants permission to associates a Profile to the customer VPC	Write		aws:RequestTag/${TagKey}	ec2:DescribeVpcs

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys route53profiles:ResourceIds	
AssociateResourceToProfile	Grants permission to associates a resource, such as DNS Firewall rule group, private hosted zone, resolver rule, etc. to a specified Profile	Write		route53profiles:ResourceTypes route53profiles:HostedZoneDomains route53profiles:ResolverRuleDomains route53profiles:FirewallRuleGroupPriority route53profiles:ResourceArns	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateProfile	Grants permission to create a new Profile resource	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteProfile	Grants permission to delete a Profile specified by the ProfileId	Write			
DisassociateProfile	Grants permission to delete an association between a customer VPC and the specified Profile	Write		route53profiles:ResourceIds	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateResourceFromProfile	Grants permission to delete the asoociation between the resource. such as DNS Firewall rule group, private hosted zone, resolver rule, etc. and the specified Profile	Write		route53profiles:ResourceTypes route53profiles:HostedZoneDomains route53profiles:ResolverRuleDomains route53profiles:FirewallRuleGroupPriority route53profiles:ResourceArns	
GetProfile	Grants permission to get a Profile	Read			
GetProfileAssociation	Grants permission to get a Profile to a VPC association specified by the Profile association ID	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetProfilePolicy [permission only]	Grants permission to read the RAM access control policy for a Profile	Read	profile*		
GetProfileResourceAssociation	Grants permission to get a Profile resource association based on the ProfileResourceAssociationId	Read			
ListProfileAssociations	Grants permission to list all VPCs the specified Profile is associated to	List			
ListProfileResourceAssociations	Grants permission to list all the associations between the resources, such as DNS Firewall rule groups, private hosted zones, resolver rules, etc. for the given Profile ID	List			
ListProfiles	Grants permission to list all the Profiles created by, and shared to the customer	List			
ListTagsForResource	Grants permission to list all tags associated with the resource	List			
PutProfilePolicy [permission only]	Grants permission to define the RAM access control policy for a Profile	Write	profile*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to add a tag to the given resource	Tagging	profile		
			profile-association		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to delete a tag from the given resource	Tagging	profile		
			profile-association		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateProfileResourceAssociation	Grants permission to update the Profile resource association name or the resource properties or both, if both name and resource properties are null, the api returns the existing Profile resource association	Write		route53profiles:ResourceTypes route53profiles:HostedZoneDomains route53profiles:ResolverRuleDomains route53profiles:FirewallRuleGroupPriority	

Resource types defined by Amazon Route 53 Profiles

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
profile	arn:${Partition}:route53profiles:${Region}:${Account}:profile/${ResourceId}	aws:ResourceTag/${TagKey}
profile-association	arn:${Partition}:route53profiles:${Region}:${Account}:profile-association/${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Route 53 Profiles

Amazon Route 53 Profiles defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the presence of tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
route53profiles:FirewallRuleGroupPriority	Filters access by priority range of a Firewall Rule Group	Numeric
route53profiles:Ho	Filters access by Hosted Zone domains	String

Condition keys	Description	Type
stedZoneDomains		
route53profiles:ResolverRuleDomains	Filters access by Resolver Rule domains	String
route53profiles:ResourceArns	Filters access by specific resource ARNs	ARN
route53profiles:ResourceIds	Filters access by given VPCs	String
route53profiles:ResourceTypes	Filters access by specific resource type. Possible options include 'HostedZone', 'FirewallRuleGroup', 'Resolver QueryLoggingConfig', 'ResolverRule', and 'VpcEndpoint'	String

Actions, resources, and condition keys for Amazon Route 53 Recovery Cluster

Amazon Route 53 Recovery Cluster (service prefix: `route53-recovery-cluster`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon Route 53 Recovery Cluster

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetRoutingControlState	Grants permission to get a routing control state	Read	routingcontrol*		
ListRoutingControls	Grants permission to list routing controls	Read			
UpdateRoutingControlState	Grants permission to update a routing control state	Write	routingcontrol*		
				route53-recovery-cluster:AllowSafetyRulesOverrides	
UpdateRoutingControlStates	Grants permission to update a batch of routing control states	Write	routingcontrol*		
				route53-recovery-cluster:Al	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				lowSafetyRulesOverrides	

Resource types defined by Amazon Route 53 Recovery Cluster

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
routingcontrol	`arn:${Partition}:route53-recovery-control::${Account}:controlpanel/${ControlPanelId}/routingcontrol/${RoutingControlId}`	

Condition keys for Amazon Route 53 Recovery Cluster

Amazon Route 53 Recovery Cluster defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
route53-recovery-cluster:AllowSafetyRulesOverrides	Override safety rules to allow routing control state updates	Bool

Actions, resources, and condition keys for Amazon Route 53 Recovery Controls

Amazon Route 53 Recovery Controls (service prefix: `route53-recovery-control-config`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Route 53 Recovery Controls

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCluster	Grants permission to create a cluster	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateControlPanel	Grants permission to create a control panel	Write	cluster*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateRoutingControl	Grants permission to create a routing control	Write	cluster*		
CreateSafetyRule	Grants permission to create a safety rule	Write	cluster*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteCluster	Grants permission to delete a cluster	Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteControlPanel	Grants permission to delete a control panel	Write	controlpanel*		
DeleteResourcePolicy [permission only]	Grants permission to delete the RAM access control policy for a cluster	Permissions management	cluster*		
DeleteRoutingControl	Grants permission to delete a routing control	Write	routingcontrol*		
DeleteSafetyRule	Grants permission to delete a safety rule	Write	safetyrule*		
DescribeCluster	Grants permission to describe a cluster	Read	cluster*		
DescribeControlPanel	Grants permission to describe a control panel	Read	controlpanel*		
DescribeRoutingControl	Grants permission to describe a routing control	Read	routingcontrol*		
DescribeSafetyRule	Grants permission to describe a safety rule	Read	safetyrule*		
GetResourcePolicy	Grants permission to get the resource policy of a cluster	Read	cluster*		
ListAssociatedRoute53HealthChecks	Grants permission to list associated Route 53 health checks	List	routingcontrol*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListClusters	Grants permission to list clusters	Read			
ListControlPanels	Grants permission to list control panels	Read			
ListRoutingControls	Grants permission to list routing controls	Read	controlpanel*		
ListSafetyRules	Grants permission to list safety rules	Read	controlpanel*		
ListTagsForResource	Grants permission to list tags for a resource	Read	cluster		
			controlpanel		
			safetyrule		
PutResourcePolicy [permission only]	Grants permission to define the RAM access control policy for a cluster	Permissions management	cluster*		
TagResource	Grants permission to tag a resource	Tagging	cluster		
			controlpanel		
			safetyrule		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove tags from a resource	Tagging	cluster		
			controlpanel		
			safetyrule		
				aws:TagKeys	
UpdateCluster	Grants permission to update a cluster	Write	cluster*		
UpdateControlPanel	Grants permission to update a cluster	Write	controlpanel*		
UpdateRoutingControl	Grants permission to update a routing control	Write	routingcontrol*		
UpdateSafetyRule	Grants permission to update a safety rule	Write	safetyrule*		

Resource types defined by Amazon Route 53 Recovery Controls

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
cluster	`arn:${Partition}:route53-recovery-control::${Account}:cluster/${ResourceId}`	aws:ResourceTag/${TagKey}
controlpanel	`arn:${Partition}:route53-recovery-control::${Account}:controlpanel/${ControlPanelId}`	aws:ResourceTag/${TagKey}
routingcontrol	`arn:${Partition}:route53-recovery-control::${Account}:controlpanel/${ControlPanelId}/routingcontrol/${RoutingControlId}`	
safetyrule	`arn:${Partition}:route53-recovery-control::${Account}:controlpanel/${ControlPanelId}/safetyrule/${SafetyRuleId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Route 53 Recovery Controls

Amazon Route 53 Recovery Controls defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag's key and value in a request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Route 53 Recovery Readiness

Amazon Route 53 Recovery Readiness (service prefix: `route53-recovery-readiness`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Resource types defined by Amazon Route 53 Recovery Readiness

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
readinesscheck	`arn:${Partition}:route53-recovery-readiness::${Account}:readiness-check/${ResourceId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
resourceset	arn:${Partition}:route53-recovery-readiness::${Account}:resource-set/${ResourceId}	aws:ResourceTag/${TagKey}
cell	arn:${Partition}:route53-recovery-readiness::${Account}:cell/${ResourceId}	aws:ResourceTag/${TagKey}
recoverygroup	arn:${Partition}:route53-recovery-readiness::${Account}:recovery-group/${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Route 53 Recovery Readiness

Amazon Route 53 Recovery Readiness defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Route 53 Resolver

Amazon Route 53 Resolver (service prefix: `route53resolver`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Route 53 Resolver

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateFirewallRuleGroup	Grants permission to associate an Amazon VPC with a specified firewall rule group	Write	firewall-rule-group-association*		ec2:DescribeVpcs
				aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
AssociateResolverEndpointIpAddress	Grants permission to associate a specified IP address with a Resolver endpoint. This is an IP address that DNS queries pass through on the way to your network (outbound) or your VPCs (inbound)	Write	resolver-endpoint*		ec2:CreateNetworkInterface ec2:DescribeNetworkInterfaces ec2:DescribeSubnets
AssociateResolverQueryLogConfig	Grants permission to associate an Amazon VPC with a specified query logging configuration	Write	resolver-query-log-config*		ec2:DescribeVpcs
AssociateResolverRule	Grants permission to associate a specified Resolver rule with a specified VPC	Write	resolver-rule*		ec2:DescribeVpcs
CreateFirewallDomainList	Grants permission to create a Firewall domain list	Write	firewall-domain-list*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateFirewallRule	Grants permission to create a Firewall rule within a Firewall rule group	Write	firewall-domain-list*		
			firewall-rule-group*		
CreateFirewallRuleGroup	Grants permission to create a Firewall rule group	Write	firewall-rule-group*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateOutpostResolver	Grants permission to create a Route 53 Resolver on Outposts	Write	outpost-resolver*		outposts:GetOutpost

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateResolverEndpoint	Grants permission to create a Resolver endpoint. There are two types of Resolver endpoints, inbound and outbound	Write	resolver-endpoint*		ec2:CreateNetworkInterface ec2:DescribeNetworkInterfaces ec2:DescribeSecurityGroups ec2:DescribeSubnets ec2:DescribeVpcs

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateResolverQueryLogConfig	Grants permission to create a Resolver query logging configuration, which defines where you want Resolver to save DNS query logs that originate in your VPCs	Write	resolver-query-log-config*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateResolverRule	Grants permission to define how to route queries originating from your VPC out of the VPC	Write	resolver-rule*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteFirewallDomainList	Grants permission to delete a Firewall domain list	Write	firewall-domain-list*		
DeleteFirewallRule	Grants permission to delete a Firewall rule within a Firewall rule group	Write	firewall-domain-list*		
			firewall-rule-group*		
DeleteFirewallRuleGroup	Grants permission to delete a Firewall rule group	Write	firewall-rule-group*		
DeleteOutpostResolver	Grants permission to delete a Route 53 Resolver on Outposts	Write	outpost-resolver*		
DeleteResolverEndpoint	Grants permission to delete a Resolver endpoint. The effect of deleting a Resolver endpoint depends on whether it's an inbound or an outbound endpoint	Write	resolver-endpoint*		ec2:DeleteNetworkInterface ec2:DescribeNetworkInterfaces
DeleteResolverQueryLogConfig	Grants permission to delete a Resolver query logging configuration	Write	resolver-query-log-config*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteResolverRule	Grants permission to delete a Resolver rule	Write	resolver-rule*		
DisassociateFirewallRuleGroup	Grants permission to remove the association between a specified Firewall rule group and a specified VPC	Write	firewall-rule-group-association*		
DisassociateResolverEndpointIpAddress	Grants permission to remove a specified IP address from a Resolver endpoint. This is an IP address that DNS queries pass through on the way to your network (outbound) or your VPCs (inbound)	Write	resolver-endpoint*		ec2:DeleteNetworkInterface ec2:DescribeNetworkInterfaces
DisassociateResolverQueryLogConfig	Grants permission to remove the association between a specified Resolver query logging configuration and a specified VPC	Write	resolver-query-log-config*		
DisassociateResolverRule	Grants permission to remove the association between a specified Resolver rule and a specified VPC	Write	resolver-rule*		
GetFirewallConfig	Grants permission to get information about a specified Firewall config	Read	firewall-config*		ec2:DescribeVpcs

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetFirewallDomainList	Grants permission to get information about a specified Firewall domain list	Read	firewall-domain-list*		
GetFirewallRuleGroup	Grants permission to get information about a specified Firewall rule group	Read	firewall-rule-group*		
GetFirewallRuleGroupAssociation	Grants permission to get information about an association between a specified Firewall rule group and a VPC	Read	firewall-rule-group-association*		
GetFirewallRuleGroupPolicy	Grants permission to get information about a specified Firewall rule group policy, which specifies the Firewall rule group operations and resources that you want to allow another AWS account to use	Read	firewall-rule-group*		
GetOutpostResolver	Grants permission to get information about a specified Route 53 Resolver on Outposts	Read	outpost-resolver*		
GetResolverConfig	Grants permission to get the Resolver Config status within the specified resource	Read	resolver-config*		ec2:DescribeVpcs

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetResolverDnssecConfig	Grants permission to get the DNSSEC validation support status for DNS queries within the specified resource	Read	resolver-dnssec-config*		
GetResolverEndpoint	Grants permission to get information about a specified Resolver endpoint, such as whether it's an inbound or an outbound endpoint, and the IP addresses in your VPC that DNS queries are forwarded to on the way into or out of your VPC	Read	resolver-endpoint*		
GetResolverQueryLogConfig	Grants permission to get information about a specified Resolver query logging configuration, such as the number of VPCs that the configuration is logging queries for and the location that logs are sent to	Read	resolver-query-log-config*		ec2:DescribeVpcs

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetResolverQueryLogConfigAssociation	Grants permission to get information about a specified association between a Resolver query logging configuration and an Amazon VPC. When you associate a VPC with a query logging configuration, Resolver logs DNS queries that originate in that VPC	Read			
GetResolverQueryLogConfigPolicy	Grants permission to get information about a specified Resolver query logging policy, which specifies the Resolver query logging operations and resources that you want to allow another AWS account to use	Read	resolver-query-log-config*		
GetResolverRule	Grants permission to get information about a specified Resolver rule, such as the domain name that the rule forwards DNS queries for and the IP address that queries are forwarded to	Read	autodefined-rule resolver-rule		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetResolverRuleAssociation	Grants permission to get information about an association between a specified Resolver rule and a VPC	Read	autodefined-rule		
			resolver-rule		
GetResolverRulePolicy	Grants permission to get information about a Resolver rule policy, which specifies the Resolver operations and resources that you want to allow another AWS account to use	Read	resolver-rule*		
ImportFirewallDomains	Grants permission to add, remove or replace Firewall domains in a Firewall domain list	Write	firewall-domain-list*		
ListFirewallConfigs	Grants permission to list all the Firewall config that current AWS account is able to check	List			ec2:DescribeVpcs
ListFirewallDomainLists	Grants permission to list all the Firewall domain list that current AWS account is able to use	List			
ListFirewallDomains	Grants permission to list all the Firewall domain under a specified Firewall domain list	List	firewall-domain-list*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListFirewallRuleGroupAssociations	Grants permission to list information about associations between Amazon VPCs and Firewall rule group	List			
ListFirewallRuleGroups	Grants permission to list all the Firewall rule group that current AWS account is able to use	List			
ListFirewallRules	Grants permission to list all the Firewall rule under a specified Firewall rule group	List	firewall-rule-group*		
ListOutpostResolvers	Grants permission to list all instances of Route 53 Resolver on Outposts that were created using the current AWS account	List			
ListResolverConfigs	Grants permission to list Resolver Config statuses	List	resolver-config*		ec2:DescribeVpcs
ListResolverDnssecConfigs	Grants permission to list the DNSSEC validation support status for DNS queries	List	resolver-dnssec-config*		
ListResolverEndpointIpAddresses	Grants permission to list the IP addresses that DNS queries pass through on the way to your network (outbound) or your VPCs (inbound) for a specified Resolver endpoint	List	resolver-endpoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListResolverEndpoints	Grants permission to list all the Resolver endpoints that were created using the current AWS account	List			
ListResolverQueryLogConfigAssociations	Grants permission to list information about associations between Amazon VPCs and query logging configurations	List			ec2:DescribeVpcs
ListResolverQueryLogConfigs	Grants permission to list information about the specified query logging configurations, which define where you want Resolver to save DNS query logs and specify the VPCs that you want to log queries for	List			ec2:DescribeVpcs
ListResolverRuleAssociations	Grants permission to list the associations that were created between Resolver rules and VPCs using the current AWS account	List			ec2:DescribeVpcs
ListResolverRules	Grants permission to list the Resolver rules that were created using the current AWS account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTagsForResource	Grants permission to list the tags that you associated with the specified resource	Read	firewall-domain-list		
			firewall-rule-group		
			firewall-rule-group-association		
			outpost-resolver		
			resolver-endpoint		
			resolver-query-log-config		
			resolver-rule		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutFirewallRuleGroupPolicy	Grants permission to specify an AWS account that you want to share a Firewall rule group with, the Firewall rule group that you want to share, and the operations that you want the account to be able to perform on the configuration	Permissions management	firewall-rule-group*		
PutResolverQueryLogConfigPolicy	Grants permission to specify an AWS account that you want to share a query logging configuration with, the query logging configuration that you want to share, and the operations that you want the account to be able to perform on the configuration	Permissions management	resolver-query-log-config*		
PutResolverRulePolicy	Grants permission to specify an AWS account that you want to share rules with, the Resolver rules that you want to share, and the operations that you want the account to be able to perform on those rules	Permissions management	resolver-rule*		
TagResource	Grants permission to add one or more tags to a specified resource	Tagging	firewall-config		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			firewall-domain-list		
			firewall-rule-group		
			firewall-rule-group-association		
			outpost-resolver		
			resolver-dnssec-config		
			resolver-endpoint		
			resolver-query-log-config		
			resolver-rule		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove one or more tags from a specified resource	Tagging	firewall-config		
			firewall-domain-list		
			firewall-rule-group		
			firewall-rule-group-association		
			outpost-resolver		
			resolver-dnssec-config		
			resolver-endpoint

			resolver-query-log-config		
			resolver-rule		
				aws:TagKeys	
UpdateFirewallConfig	Grants permission to update selected settings for an Firewall config	Write	firewall-config*		ec2:DescribeVpcs
UpdateFirewallDomains	Grants permission to add, remove or replace Firewall domains in a Firewall domain list	Write	firewall-domain-list*		
UpdateFirewallRule	Grants permission to update selected settings for an Firewall rule in a Firewall rule group	Write	firewall-domain-list*		
			firewall-rule-group*		
UpdateFirewallRuleGroupAssociation	Grants permission to update selected settings for an Firewall rule group association	Write	firewall-rule-group-association*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateOutpostResolver	Grants permission to update seletected settings for a specified Route 53 Resolver on Outposts	Write	outpost-resolver*		
UpdateResolverConfig	Grants permission to update the Resolver Config status within the specified resource	Write	resolver-config*		ec2:DescribeVpcs
UpdateResolverDnssecConfig	Grants permission to update the DNSSEC validation support status for DNS queries within the specified resource	Write	resolver-dnssec-config*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateResolverEndpoint	Grants permission to update selected settings for an inbound or an outbound Resolver endpoint	Write	resolver-endpoint*		ec2:AssignIpv6Addresses ec2:DescribeNetworkInterfaces ec2:DescribeSubnets ec2:ModifyNetworkInterfaceAttribute ec2:UnassignIpv6Addresses
UpdateResolverRule	Grants permission to update settings for a specified Resolver rule	Write	resolver-rule*		

Resource types defined by Amazon Route 53 Resolver

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
resolver-dnssec-config	arn:${Partition}:route53resolver:${Region}:${Account}:resolver-dnssec-config/${ResourceId}	aws:ResourceTag/${TagKey}
resolver-query-log-config	arn:${Partition}:route53resolver:${Region}:${Account}:resolver-query-log-config/${ResourceId}	aws:ResourceTag/${TagKey}
resolver-rule	arn:${Partition}:route53resolver:${Region}:${Account}:resolver-rule/${ResourceId}	aws:ResourceTag/${TagKey}
autodefined-rule	arn:${Partition}:route53resolver:${Region}:${Account}:autodefined-rule/${ResourceId}	aws:ResourceTag/${TagKey}
resolver-endpoint	arn:${Partition}:route53resolver:${Region}:${Account}:resolver-endpoint/${ResourceId}	aws:ResourceTag/${TagKey}
firewall-rule-group	arn:${Partition}:route53resolver:${Region}:${Account}:firewall-rule-group/${ResourceId}	aws:ResourceTag/${TagKey}
firewall-rule-group-association	arn:${Partition}:route53resolver:${Region}:${Account}:firewall-rule-group-association/${ResourceId}	aws:ResourceTag/${TagKey}
firewall-domain-list	arn:${Partition}:route53resolver:${Region}:${Account}:firewall-domain-list/${ResourceId}	aws:ResourceTag/${TagKey}
firewall-config	arn:${Partition}:route53resolver:${Region}:${Account}:firewall-config/${ResourceId}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
resolver-config	arn:${Partition}:route53resolver:${Region}:${Account}:resolver-config/${ResourceId}	
outpost-resolver	arn:${Partition}:route53resolver:${Region}:${Account}:outpost-resolver/${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Route 53 Resolver

Amazon Route 53 Resolver defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the presence of tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS Route53 Global Resolver

AWS Route53 Global Resolver (service prefix: route53globalresolver) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS Route53 Global Resolver

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AllowVendedLogDeliveryForResource [permission only]	Grants permission to deliver logs for a global resolver	Permissions management	global-resolver*	aws:ResourceTag/${TagKey}	
AssociateHostedZone	Grants permission to associate a resource to a hosted zone	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchCreateFirewallRule	Grants permission to create multiple firewall rules	Write			
BatchDeleteFirewallRule	Grants permission to delete multiple firewall rules	Write			
BatchUpdateFirewallRule	Grants permission to update multiple firewall rules	Write			
CreateAccessSource	Grants permission to create an access source	Write	dns-view*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateAccessToken	Grants permission to create an access token	Write	access-token*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateDNSView	Grants permission to create a dns view	Write	dns-view*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateFirewallDomainList	Grants permission to create a firewall domain list	Write	firewall-domain-list*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateFirewallRule	Grants permission to create a firewall rule	Write	dns-view*		
			firewall-domain-list		
CreateGlobalResolver	Grants permission to create a global resolver	Write	global-resolver*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAccessSource	Grants permission to delete an access source	Write	access-source*		
DeleteAccessToken	Grants permission to delete an access token	Write	access-token*		
DeleteDNSView	Grants permission to delete a dns view	Write	dns-view*		
DeleteFirewallDomainList	Grants permission to delete a firewall domain list	Write	firewall-domain-list*		
DeleteFirewallRule	Grants permission to delete a firewall rule	Write			
DeleteGlobalResolver	Grants permission to delete a global resolver	Write	global-resolver*		
DisableDNSView	Grants permission to disable a dns view	Write	dns-view*		
DisassociateHostedZone	Grants permission to disassociate a hosted zone from a resource	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableDNSView	Grants permission to enable a dns view	Write	dns-view*		
GetAccessSource	Grants permission to get an access source	Read	access-source*		
GetAccessToken	Grants permission to get an access token	Read	access-token*		
GetDNSView	Grants permission to get a dns view	Read	dns-view*		
GetFirewallDomainList	Grants permission to get a firewall domain list	Read	firewall-domain-list*		
GetFirewallRule	Grants permission to get a firewall rule	Read			
GetGlobalResolver	Grants permission to get a global resolver	Read	global-resolver*		
GetHostedZoneAssociation	Grants permission to get a hosted zone association	Read			
GetManagedFirewallDomainList	Grants permission to get a managed firewall domain list	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ImportFirewallDomains	Grants permission to import firewall domains from an S3 bucket	Write	firewall-domain-list*		s3:GetObject s3:ListBucket
ListAccessSources	Grants permission to list access sources	List			
ListAccessTokens	Grants permission to list access tokens	List			
ListDNSViews	Grants permission to list dns views	List			
ListFirewallDomainLists	Grants permission to list firewall domain lists	List			
ListFirewallDomains	Grants permission to list firewall domains	Read	firewall-domain-list*		
ListFirewallRules	Grants permission to list firewall rules	List	dns-view*		
ListGlobalResolvers	Grants permission to list global resolvers	List			
ListHostedZoneAssociations	Grants permission to list hosted zone associations	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListManagedFirewallDomainLists	Grants permission to list managed firewall domain lists	List			
ListTagsForResource	Grants permission to list tags for a resource	Write	access-source		
			access-token		
			dns-view		
			firewall-domain-list		
			global-resolver		
TagResource	Grants permission to tag a resource	Tagging	access-source		
			access-token		
			dns-view		
			firewall-domain-list		
			global-resolver		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag a resource	Tagging	access-source		
			access-token		
			dns-view		
			firewall-domain-list		
			global-resolver		
				aws:TagKeys	
UpdateAccessSource	Grants permission to update an access source	Write	access-source*		
UpdateAccessToken	Grants permission to update an access token	Write	access-token*		
UpdateDNSView	Grants permission to update a dns view	Write	dns-view*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateFirewallDomains	Grants permission to update firewall domains	Write	firewall-domain-list*		
UpdateFirewallRule	Grants permission to update an firewall rule	Write			
UpdateGlobalResolver	Grants permission to update a global resolver	Write	global-resolver*		
UpdateHostedZoneAssociation	Grants permission to update a hosted zone association	Write			

Resource types defined by AWS Route53 Global Resolver

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
access-source	`arn:${Partition}:route53globalresolver::${Account}:access-source/${Id}`	aws:ResourceTag/${TagKey}
access-token	`arn:${Partition}:route53globalresolver::${Account}:access-token/${Id}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
dns-view	arn:${Partition}:route53globalresolver::${Account}:dns-view/${Id}	aws:ResourceTag/${TagKey}
firewall-domain-list	arn:${Partition}:route53globalresolver::${Account}:firewall-domain-list/${Id}	aws:ResourceTag/${TagKey}
global-resolver	arn:${Partition}:route53globalresolver::${Account}:global-resolver/${Id}	aws:ResourceTag/${TagKey}

Condition keys for AWS Route53 Global Resolver

AWS Route53 Global Resolver defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString

Actions, resources, and condition keys for AWS RTB Fabric

AWS RTB Fabric (service prefix: `rtbfabric`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS RTB Fabric

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptLink	Grants permission to accept a link invitation from another Gateway	Write	Link*		
CreateInboundExternalLink	Grants permission to create an inbound external link for a responder gateway	Write	ResponderGateway*		
				aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
CreateLink	Grants permission to create a new link between RTB applications	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateOutboundExternalLink	Grants permission to create an outbound external link for a requester gateway to connect to external public responder endpoints	Write	RequesterGateway*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateRequesterGateway	Grants permission to create a requester gateway	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateResponderGateway	Grants permission to create a responder gateway	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteInboundExternalLink	Grants permission to delete an inbound external link	Write	InboundExternalLink*		
			ResponderGateway*		
DeleteLink	Grants permission to delete a link between RTB applications	Write	Link*		
DeleteOutboundExternalLink	Grants permission to delete an outbound external link	Write	OutboundExternalLink*		
			RequesterGateway*		
DeleteRequesterGateway	Grants permission to delete a requester gateway	Write	RequesterGateway*		
DeleteResponderGateway	Grants permission to delete a responder gateway	Write	ResponderGateway*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetInboundExternalLink	Grants permission to retrieve information about an inbound external link	Read	InboundExternalLink*		
			ResponderGateway*		
GetLink	Grants permission to retrieve information about a link between RTB applications	Read	Link*		
GetOutboundExternalLink	Grants permission to retrieve information about an outbound external link	Read	OutboundExternalLink*		
			RequesterGateway*		
GetRequesterGateway	Grants permission to retrieve information about a requester gateway	Read	RequesterGateway*		
GetResponderGateway	Grants permission to retrieve information about a responder gateway	Read	ResponderGateway*		
ListLinks	Grants permission to list links associated with an RTB application	List			
ListRequesterGateways	Grants permission to list requester gateways with optional filtering and pagination	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListResponderGateways	Grants permission to list responder gateways with optional filtering and pagination	List			
ListTagsForResource	Grants permission to list tags for a resource	Read	InboundExternalLink		
			Link		
			OutboundExternalLink		
			RequesterGateway		
			ResponderGateway		
RejectLink	Grants permission to reject a link request between RTB applications	Write	Link*		
TagResource	Grants permission to assign one or more tags (key-value pairs) to the specified resource	Tagging	InboundExternalLink		
			Link		
			OutboundExternalLink		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			Requester Gateway		
			Responder Gateway		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove a tag or tags from a resource	Tagging	InboundExternalLink		
			Link		
			OutboundExternalLink		
			Requester Gateway		
			Responder Gateway		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateLink	Grants permission to update configuration settings for an existing link	Write	Link*		
UpdateLinkModuleFlow	Grants permission to update a link module flow	Write	Link*		
UpdateRequesterGateway	Grants permission to update a requester gateway	Write	RequesterGateway*		
UpdateResponderGateway	Grants permission to update a responder gateway	Write	ResponderGateway*		

Resource types defined by AWS RTB Fabric

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
InboundExternalLink	`arn:${Partition}:rtbfabric:${Region}:${Account}:gateway/${GatewayId}/link/${LinkId}`	aws:ResourceTag/${TagKey} rtbfabric:InboundExternalLinkLinkId

Resource types	ARN	Condition keys
		rtbfabric:RespondergatewayGatewayId
Link	arn:${Partition}:rtbfabric:${Region}:${Account}:gateway/${GatewayId}/link/${LinkId}	aws:ResourceTag/${TagKey} rtbfabric:LinkLinkId rtbfabric:RequestergatewayGatewayId rtbfabric:RespondergatewayGatewayId
OutboundExternalLink	arn:${Partition}:rtbfabric:${Region}:${Account}:gateway/${GatewayId}/link/${LinkId}	aws:ResourceTag/${TagKey} rtbfabric:OutboundExternalLinkLinkId rtbfabric:RequestergatewayGatewayId
RequesterGateway	arn:${Partition}:rtbfabric:${Region}:${Account}:gateway/${GatewayId}	aws:ResourceTag/${TagKey} rtbfabric:RequestergatewayGatewayId
ResponderGateway	arn:${Partition}:rtbfabric:${Region}:${Account}:gateway/${GatewayId}	aws:ResourceTag/${TagKey} rtbfabric:RespondergatewayGatewayId

Condition keys for AWS RTB Fabric

AWS RTB Fabric defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString
rtbfabric:InboundExternalLinkGatewayId	Filters access by gateway identifier supporting rtb-gw-* formats	String
rtbfabric:InboundExternalLinkLinkId	Filters access by InboundExternalLink resource linkId identifier	String
rtbfabric:LinkLinkId	Filters access by Link resource linkId identifier	String
rtbfabric:OutboundExternalLinkLinkId	Filters access by OutboundExternalLink resource linkId identifier	String

Condition keys	Description	Type
rtbfabric:RequesterGatewayGatewayId	Filters access by gateway identifier supporting rtb-gw-* formats	String
rtbfabric:ResponderGatewayGatewayId	Filters access by gateway identifier supporting rtb-gw-* formats	String

Actions, resources, and condition keys for Amazon S3

Amazon S3 (service prefix: s3) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Actions defined by Amazon S3

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AbortMultipartUpload	Grants permission to abort a multipart upload	Write	accesspointobject		
			object		
				s3:AccessGrantsInstanceArn s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
AssociateAccessGrantsIdentityCenter	Grants permission to associate Access Grants identity center	Permissions management	accessgrantsinstance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey}	
BypassGovernanceRetention	Grants permission to allow circumvention of governance-mode object retention settings	Permissions management	accesspointobject object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:RequestObjectTag/<key> s3:RequestObjectTagKeys s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-acl s3:x-amz-content-sha256 s3:x-amz-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				copy-source s3:x-amz-grant-full-control s3:x-amz-grant-read s3:x-amz-grant-read-acp s3:x-amz-grant-write s3:x-amz-grant-write-acp s3:x-amz-metadata-directive	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:x-amz-server-side-encryption s3:x-amz-server-side-encryption-aws-kms-key-id s3:x-amz-server-side-encryption-customer-algorithm s3:x-amz-storage-class s3:x-amz-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				website-redirect-location	
CreateAccessGrant	Grants permission to create Access Grant	Permissions management	accessgrantslocation*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantScope s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
CreateAccessGrantsInstance	Grants permission to Create Access Grants Instance	Permissions management	accessgrantsinstance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAccessGrantsLocation	Grants permission to create Access Grants location	Permissions management	accessgrantsinstance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantsLocationScope s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey} aws:RequestTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} aws:TagKeys	
CreateAccessPoint	Grants permission to create a new access point	Write	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointAccount s3:DataAccessPointArn s3:AccessPointNetworkOrigin s3:authType s3:locationconstraint s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-acl	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:x-amz-content-sha256 s3:AccessPointTag/${TagKey} aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
CreateAccessPointForObjectLambda	Grants permission to create an object lambda enabled accesspoint	Write	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointAccount s3:DataAccessPointArn s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateBucket	Grants permission to create a new bucket	Write	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:locationconstraint s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-acl s3:x-amz-content-sha256 s3:x-amz-grant-full-control	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:x-amz-grant-read s3:x-amz-grant-read-acp s3:x-amz-grant-write s3:x-amz-grant-write-acp s3:x-amz-bucket-namespace s3:x-amz-object-ownership aws:RequestTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateBucketMetadataTableConfiguration	Grants permission to create a new S3 Metadata configuration for a specified general purpose bucket	Write	bucket*		kms:DescribeKey s3tables:CreateNamespace s3tables:CreateTable s3tables:CreateTableBucket s3tables:GetTable s3tables:PutTableBucketPolicy s3tables:PutTableEncryption s3tables:PutTablePolicy

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateJob	Grants permission to create a new Amazon S3 Batch Operations job	Write		s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 s3:RequestJobPriority s3:RequestJobOperation aws:TagKeys aws:RequestTag/	iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey}	
CreateMultiRegionAccessPoint	Grants permission to create a new Multi-Region Access Point	Write	multiregionaccesspoint*		
				s3:DataAccessPointAccount s3:DataAccessPointArn s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureversion s3:signatureAge s3:TlsVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateStorageLensGroup	Grants permission to create an Amazon S3 Storage Lens group	Write		s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAccessGrant	Grants permission to delete Access Grant	Permissions management	accessgrant*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantScope s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey}	
DeleteAccessGrantsInstance	Grants permission to Delete Access Grants Instance	Permissions management	accessgrantsinstance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey}	
DeleteAccessGrantsInstanceResourcePolicy	Grants permission to read Access grants instance resource policy	Permissions management	accessgrantsinstance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey}	
DeleteAccessGrantsLocation	Grants permission to delete Access Grants location	Permissions management	accessgrantslocation*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantsLocationScope s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey}	
DeleteAccessPoint	Grants permission to delete the access point named in the URI	Write	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointArn s3:DataAccessPointAccount s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessPointTag/${TagKey} aws:ResourceTag/${TagKey}	
DeleteAccessPointForObjectLambda	Grants permission to delete the object lambda enabled access point named in the URI	Write	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointArn s3:DataAccessPointAccount s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAccessPointPolicy	Grants permission to delete the policy on a specified access point	Permissions management	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointArn s3:DataAccessPointAccount s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessPointTag/${TagKey} aws:ResourceTag/${TagKey}	
DeleteAccessPointPolicyForObjectLambda	Grants permission to delete the policy on a specified object lambda enabled access point	Permissions management	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointArn s3:DataAccessPointAccount s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteBucket	Grants permission to delete the bucket named in the URI	Write	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteBucketMetadataTableConfiguration	Grants permission to delete the S3 Metadata configuration for a specified general purpose bucket	Write	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteBucketPolicy	Grants permission to delete the policy on a specified bucket	Permissions management	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
DeleteBucketWebsite	Grants permission to remove the website configuration for a bucket	Write	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
DeleteJobTagging	Grants permission to remove tags from an existing Amazon S3 Batch Operations job	Tagging	job*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 s3:ExistingJobPriority s3:ExistingJobOperation	
DeleteMultiRegionAccessPoint	Grants permission to delete the Multi-Region Access Point named in the URI	Write	multiregionaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointAccount s3:DataAccessPointArn s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureversion s3:signatureAge s3:TlsVersion	
DeleteObject	Grants permission to remove the null version of an object and insert a delete marker, which becomes the current version of the object	Write	accesspointobject		
			object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantsInstanceArn s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 s3:if-match	
DeleteObjectTagging	Grants permission to use the tagging subresource to remove the entire tag set from the specified object	Tagging	accesspointobject object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:ExistingObjectTag/<key> s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
DeleteObjectVersion	Grants permission to remove a specific version of an object	Write	accesspointobject		
			object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantsInstanceArn s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:versionid s3:x-amz-content-sha256	
DeleteObjectVersionTagging	Grants permission to remove the entire tag set for a specific version of the object	Tagging	accesspointobject		
			object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:ExistingObjectTag/<key> s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:versionid s3:x-amz-content-sha256	
DeleteStorageLensConfiguration	Grants permission to delete an existing Amazon S3 Storage Lens configuration	Write	storagelensconfiguration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
DeleteStorageLensConfigurationTagging	Grants permission to remove tags from an existing Amazon S3 Storage Lens configuration	Tagging	storagelensconfiguration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
DeleteStorageLensGroup	Grants permission to delete an existing S3 Storage Lens group	Write	storagelensgroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeJob	Grants permission to retrieve the configuration parameters and status for a batch operations job	Read	job*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
DescribeMultiRegionAccessPointOperation	Grants permission to retrieve the configurations for a Multi-Region Access Point	Read	multiregionaccesspointrequestarn*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureversion s3:signatureAge s3:TlsVersion	
DissociateAccessGrantsIdentityCenter	Grants permission to disassociate Access Grants identity center	Permissions management	accessgrantsinstance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAccelerateConfiguration	Grants permission to uses the accelerate subresource to return the Transfer Acceleration state of a bucket, which is either Enabled or Suspended	Read	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetAccessGrant	Grants permission to read Access Grant	Read	accessgrant*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantScope s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey}	
GetAccessGrantsInstance	Grants permission to Read Access Grants Instance	Read	accessgrantsinstance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey}	
GetAccessGrantsInstanceForPrefix	Grants permission to Read Access Grants Instance by prefix	Read	accessgrantsinstance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey}	
GetAccessGrantsInstanceResourcePolicy	Grants permission to read Access grants instance resource policy	Read	accessgrantsinstance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey}	
GetAccessGrantsLocation	Grants permission to read Access Grants location	Read	accessgrantslocation*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantsLocationScope s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAccessPoint	Grants permission to return configuration information about the specified access point	Read		s3:DataAccessPointAccount s3:DataAccessPointArn s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessPointTag/${TagKey} aws:ResourceTag/${TagKey}	
GetAccessPointConfigurationForObjectLambda	Grants permission to retrieve the configuration of the object lambda enabled access point	Read	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointArn s3:DataAccessPointAccount s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAccessPointForObjectLambda	Grants permission to create an object lambda enabled accesspoint	Read	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointAccount s3:DataAccessPointArn s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAccessPointPolicy	Grants permission to return the access point policy associated with the specified access point	Read	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointAccount s3:DataAccessPointArn s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessPointTag/${TagKey} aws:ResourceTag/${TagKey}	
GetAccessPointPolicyForObjectLambda	Grants permission to return the access point policy associated with the specified object lambda enabled access point	Read	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointAccount s3:DataAccessPointArn s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAccessPointPolicyStatus	Grants permission to return the policy status for a specific access point policy	Read	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointAccount s3:DataAccessPointArn s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessPointTag/${TagKey} aws:ResourceTag/${TagKey}	
GetAccessPointPolicyStatusForObjectLambda	Grants permission to return the policy status for a specific object lambda access point policy	Read	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointAccount s3:DataAccessPointArn s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAccountPublicAccessBlock	Grants permission to retrieve the PublicAccessBlock configuration for an AWS account	Read		s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAnalyticsConfiguration	Grants permission to get an analytics configuration from an Amazon S3 bucket, identified by the analytics configuration ID	Read	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetBucketAbac	Grants permission to retrieve ABAC configuration for a general purpose bucket	Read	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetBucketAcl	Grants permission to use the acl subresource to return the access control list (ACL) of an Amazon S3 bucket	Read	accesspoint		
			bucket		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetBucketCORS	Grants permission to return the CORS configuration information set for an Amazon S3 bucket	Read	accesspoint bucket		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetBucketLocation	Grants permission to return the Region that an Amazon S3 bucket resides in	Read	accesspoint		
			bucket		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetBucketLogging	Grants permission to return the logging status of an Amazon S3 bucket and the permissions users have to view or modify that status	Read	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetBucketMetadataTableConfiguration	Grants permission to return the S3 Metadata configuration for a specified general purpose bucket	Read	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetBucketNotification	Grants permission to get the notification configuration of an Amazon S3 bucket	Read	accesspoint		
			bucket		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetBucketObjectLockConfiguration	Grants permission to get the Object Lock configuration of an Amazon S3 bucket	Read	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:signatureversion	
GetBucketOwnershipControls	Grants permission to retrieve ownership controls on a bucket	Read	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetBucketPolicy	Grants permission to return the policy of the specified bucket	Read	accesspoint		
			bucket		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetBucketPolicyStatus	Grants permission to retrieve the policy status for a specific Amazon S3 bucket, which indicates whether the bucket is public	Read	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetBucketPublicAccessBlock	Grants permission to retrieve the PublicAccessBlock configuration for an Amazon S3 bucket	Read	bucket*	s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetBucketRequestPayment	Grants permission to return the request payment configuration for an Amazon S3 bucket	Read	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetBucketTagging	Grants permission to return the tag set associated with an Amazon S3 bucket	Read	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetBucketVersioning	Grants permission to return the versioning state of an Amazon S3 bucket	Read	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetBucketWebsite	Grants permission to return the website configuration for an Amazon S3 bucket	Read	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetDataAccess	Grants permission to get Access	Read	accessgrantsinstance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetEncryptionConfiguration	Grants permission to return the default encryption configuration an Amazon S3 bucket	Read	bucket*	s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetIntelligentTieringConfiguration	Grants permission to get an or list all Amazon S3 Intelligent Tiering configuration in a S3 Bucket	Read	bucket*	s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetInventoryConfiguration	Grants permission to return an inventory configuration from an Amazon S3 bucket, identified by the inventory configuration ID	Read	bucket*	s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetJobTagging	Grants permission to return the tag set of an existing Amazon S3 Batch Operations job	Read	job*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetLifecycleConfiguration	Grants permission to return the lifecycle configuration information set on an Amazon S3 bucket	Read	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetMetricsConfiguration	Grants permission to get a metrics configuration from an Amazon S3 bucket	Read	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetMultiRegionAccessPoint	Grants permission to return configuration information about the specified Multi-Region Access Point	Read	multiregionaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointAccount s3:DataAccessPointArn s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureversion s3:signatureAge s3:TlsVersion	
GetMultiRegionAccessPointPolicy	Grants permission to return the access point policy associated with the specified Multi-Region Access Point	Read	multiregionaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointAccount s3:DataAccessPointArn s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureversion s3:signatureAge s3:TlsVersion	
GetMultiRegionAccessPointPolicyStatus	Grants permission to return the policy status for a specific Multi-Region Access Point policy	Read	multiregionaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointAccount s3:DataAccessPointArn s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureversion s3:signatureAge s3:TlsVersion	
GetMultiRegionAccessPointRoutes	Grants permission to return the route configuration for a Multi-Region Access Point	Read	multiregionaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointAccount s3:DataAccessPointArn s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureversion s3:signatureAge s3:TlsVersion	
GetObject	Grants permission to retrieve objects from Amazon S3	Read	accesspointobject		
			object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantsInstanceArn s3:ExistingObjectTag/<key> s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetObjectAcl	Grants permission to return the access control list (ACL) of an object	Read	accesspointobject		
			object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantsInstanceArn s3:ExistingObjectTag/<key> s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetObjectAttributes	Grants permission to retrieve attributes related to a specific object	Read	accesspointobject		
			object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:ExistingObjectTag/<key> s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetObjectLegalHold	Grants permission to get an object's current Legal Hold status	Read	accesspointobject		
			object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetObjectRetention	Grants permission to retrieve the retention settings for an object	Read	accesspointobject object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetObjectTagging	Grants permission to return the tag set of an object	Read	accesspointobject		
			object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:ExistingObjectTag/<key> s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetObjectTorrent	Grants permission to return torrent files from an Amazon S3 bucket	Read	object*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetObjectVersion	Grants permission to retrieve a specific version of an object	Read	accesspointobject		
			object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantsInstanceArn s3:ExistingObjectTag/<key> s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:versionid s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetObjectVersionAcl	Grants permission to return the access control list (ACL) of a specific object version	Read	accesspointobject		
			object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantsInstanceArn s3:ExistingObjectTag/<key> s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:versionid s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetObjectVersionAttributes	Grants permission to retrieve attributes related to a specific version of an object	Read	accesspointobject		
			object		
				s3:ExistingObjectTag/<key> s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:versionid s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetObjectVersionForReplication	Grants permission to replicate both unencrypted objects and objects encrypted with SSE-S3 or SSE-KMS	Read	object*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetObjectVersionTagging	Grants permission to return the tag set for a specific version of the object	Read	accesspointobject		
			object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:ExistingObjectTag/<key> s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:versionid s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetObjectVersionTorrent	Grants permission to get Torrent files about a different version using the versionId subresource	Read	object*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:versionid s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetReplicationConfiguration	Grants permission to get the replication configuration information set on an Amazon S3 bucket	Read	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetStorageLensConfiguration	Grants permission to get an Amazon S3 Storage Lens configuration	Read	storagelensconfiguration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetStorageLensConfigurationTagging	Grants permission to get the tag set of an existing Amazon S3 Storage Lens configuration	Read	storagelensconfiguration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetStorageLensDashboard	Grants permission to get an Amazon S3 Storage Lens dashboard	Read	storagelensconfiguration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
GetStorageLensGroup	Grants permission to get an Amazon S3 Storage Lens group	Read	storagelensgroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
InitiateReplication [permission only]	Grants permission to initiate the replication process by setting replication status of an object to pending	Write	object*		
				s3:ResourceAccount	
ListAccessGrants	Grants permission to list Access Grant	List	accessgrantsinstance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAccessGrantsInstances	Grants permission to List Access Grants Instances	List		s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
ListAccessGrantsLocations	Grants permission to list Access Grants locations	List	accessgrantsinstance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAccessPoints	Grants permission to list access points	List		s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAccessPointsForObjectLambda	Grants permission to list object lambda enabled accesspoints	List		s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAllMyBuckets	Grants permission to list all buckets owned by the authenticated sender of the request	List		s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
ListBucket	Grants permission to list some or all of the objects in an Amazon S3 bucket (up to 1000)	List	accesspoint bucket		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantsInstanceArn s3:authType s3:delimiter s3:max-keys s3:prefix s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
	Grants permission to list in-progress multipart uploads	List	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListBucketMultipartUploads					

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantsInstanceArn s3:DataAccessPointAccount s3:DataAccessPointArn s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				content-sha256 s3:AccessPointTag/${TagKey} aws:ResourceTag/${TagKey}	
ListBucketVersions	Grants permission to list metadata about all the versions of objects in an Amazon S3 bucket	List	accesspoint		
			bucket		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantsInstanceArn s3:authType s3:delimiter s3:max-keys s3:prefix s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListCallerAccessGrants	Grants permission to list caller's Access Grant	List	accessgrantsinstance*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListJobs	Grants permission to list current jobs and jobs that have ended recently	List		s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListMultiRegionAccessPoints	Grants permission to list Multi-Region Access Points	List		s3:authType s3:ResourceAccount s3:signatureversion s3:signatureAge s3:TlsVersion	
ListMultipartUploadParts	Grants permission to list the parts that have been uploaded for a specific multipart upload	List	accesspointobject object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantsInstanceArn s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListStorageLensConfigurations	Grants permission to list Amazon S3 Storage Lens configurations	List		s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListStorageLensGroups	Grants permission to list S3 Storage Lens groups	List		s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
ListTagsForResource	Grants permission to list the tags attached to the specified resource	List	accessgrant		
			accessgrantsinstance		
			accessgrantslocation		
			accesspoint		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			bucket		
			storagelensgroup		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ObjectOwnerOverrideToBucketOwner	Grants permission to change replica ownership	Permissions management	object*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
PauseReplication [permission only]	Grants permission to pause S3 Replication from target source buckets to destination buckets	Write	bucket*		s3:GetReplicationConfiguration s3:PutReplicationConfiguration

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:destinationRegion s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutAccelerateConfiguration	Grants permission to use the accelerate subresource to set the Transfer Acceleration state of an existing S3 bucket	Write	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
PutAccessGrantsInstanceResourcePolicy	Grants permission to put Access grants instance resource policy	Permissions management	accessgrantsinstance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey}	
PutAccessPointConfigurationForObjectLambda	Grants permission to set the configuration of the object lambda enabled access point	Write	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointArn s3:DataAccessPointAccount s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutAccessPointPolicy	Grants permission to associate an access policy with a specified access point	Permissions management	accesspoint*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
PutAccessPointPolicyForObjectLambda	Grants permission to associate an access policy with a specified object lambda enabled access point	Permissions management	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointAccount s3:DataAccessPointArn s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutAccessPointPublicAccessBlock	Grants permission to associate public access block configurations with a specified access point, while creating a access point	Permissions management			
PutAccountPublicAccessBlock	Grants permission to create or modify the PublicAccessBlock configuration for an AWS account	Permissions management		s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutAnalyticsConfiguration	Grants permission to set an analytics configuration for the bucket, specified by the analytics configuration ID	Write	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
PutBucketAbac	Grants permission to set ABAC configuration for a general purpose bucket	Write	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutBucketAcl	Grants permission to set the permissions on an existing bucket using access control lists (ACLs)	Permissions management	bucket*	s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-acl s3:x-amz-content-sha256 s3:x-amz-grant-full-control s3:x-amz-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				grant-read s3:x-amz-grant-read-acp s3:x-amz-grant-write s3:x-amz-grant-write-acp	
PutBucketCORS	Grants permission to set the CORS configuration for an Amazon S3 bucket	Write	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
PutBucketLogging	Grants permission to set the logging parameters for an Amazon S3 bucket	Write	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutBucketNotification	Grants permission to receive notifications when certain events happen in an Amazon S3 bucket	Write	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutBucketObjectLockConfiguration	Grants permission to put Object Lock configuration on a specific bucket	Write	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:TlsVersion s3:signatureversion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutBucketOwnershipControls	Grants permission to add, replace or delete ownership controls on a bucket	Permissions management	bucket*	s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutBucketPolicy	Grants permission to add or replace a bucket policy on a bucket	Permissions management	bucket*	s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutBucketPublicAccessBlock	Grants permission to create or modify the PublicAccessBlock configuration for a specific Amazon S3 bucket	Permissions management	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
PutBucketRequestPayment	Grants permission to set the request payment configuration of a bucket	Write	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
PutBucketTagging	Grants permission to add a set of tags to an existing Amazon S3 bucket	Tagging	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
PutBucketVersioning	Grants permission to set the versioning state of an existing Amazon S3 bucket	Write	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutBucketWebsite	Grants permission to set the configuration of the website that is specified in the website subresource	Write	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
PutEncryptionConfiguration	Grants permission to set the encryption configuration for an Amazon S3 bucket	Write	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutIntelligentTieringConfiguration	Grants permission to create new or update or delete an existing Amazon S3 Intelligent Tiering configuration	Write	bucket*	s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutInventoryConfiguration	Grants permission to add an inventory configuration to the bucket, identified by the inventory ID	Write	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 s3:InventoryAccessibleOptionalFields	
PutJobTagging	Grants permission to replace tags on an existing Amazon S3 Batch Operations job	Tagging	job*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 s3:ExistingJobPriority s3:ExistingJobOperation aws:TagKeys aws:RequestTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey}	
PutLifecycleConfiguration	Grants permission to create a new lifecycle configuration for the bucket or replace an existing lifecycle configuration	Write	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutMetricsConfiguration	Grants permission to set or update a metrics configuration for the CloudWatch request metrics from an Amazon S3 bucket	Write	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
PutMultiRegionAccessPointPolicy	Grants permission to associate an access policy with a specified Multi-Region Access Point	Permissions management	multiregionaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointAccount s3:DataAccessPointArn s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureversion s3:signatureAge s3:TlsVersion	
PutObject	Grants permission to add an object to a bucket	Write	accesspointobject		
			object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantsInstanceArn s3:RequestObjectTag/<key> s3:RequestObjectTagKeys s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-acl s3:x-amz-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				content-sha256 s3:x-amz-copy-source s3:x-amz-grant-full-control s3:x-amz-grant-read s3:x-amz-grant-read-acp s3:x-amz-grant-write s3:x-amz-grant-write-acp	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:x-amz-metadata-directive s3:x-amz-server-side-encryption s3:x-amz-server-side-encryption-aws-kms-key-id s3:x-amz-server-side-encryption-customer-algorithm s3:x-amz-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				storage-class s3:x-amz-website-redirect-location s3:object-lock-mode s3:object-lock-retain-until-date s3:object-lock-remaining-retention-days s3:object-lock-legal-hold s3:if-match s3:if-none-match	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:ObjectCreationOperation	
PutObjectAcl	Grants permission to set the access control list (ACL) permissions for new or existing objects in an S3 bucket	Permissions management	accesspointobject object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantsInstanceArn s3:ExistingObjectTag/<key> s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-acl s3:x-amz-content-sha256 s3:x-amz-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				grant-full-control s3:x-amz-grant-read s3:x-amz-grant-read-acp s3:x-amz-grant-write s3:x-amz-grant-write-acp s3:x-amz-storage-class	
PutObjectLegalHold	Grants permission to apply a Legal Hold configuration to the specified object	Write	accesspointobject		
			object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 s3:object-lock-legal-hold	
PutObjectRetention	Grants permission to place an Object Retention configuration on an object	Write	accesspointobject		
			object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 s3:object-lock-mode s3:object-lock-retain-until-date s3:object-lock-remaining-re	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				tention-days	
PutObjectTagging	Grants permission to set the supplied tag-set to an object that already exists in a bucket	Tagging	accesspointobject		
			object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:ExistingObjectTag/<key> s3:RequestObjectTag/<key> s3:RequestObjectTagKeys s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutObjectVersionAcl	Grants permission to use the acl subresource to set the access control list (ACL) permissions for an object that already exists in a bucket	Permissions management	accesspointobject object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantsInstanceArn s3:ExistingObjectTag/<key> s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:versionid s3:x-amz-acl s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:x-amz-grant-full-control s3:x-amz-grant-read s3:x-amz-grant-read-acp s3:x-amz-grant-write s3:x-amz-grant-write-acp s3:x-amz-storage-class	
PutObjectVersionTagging	Grants permission to set the supplied tag-set for a specific version of an object	Tagging	accesspointobject object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:ExistingObjectTag/<key> s3:RequestObjectTag/<key> s3:RequestObjectTagKeys s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:versionid s3:x-amz-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				content-sha256	
PutReplicationConfiguration	Grants permission to create a new replication configuration or replace an existing one	Write	bucket*		iam:PassRole
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 s3:isReplicationPauseRequest	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutStorageLensConfiguration	Grants permission to create or update an Amazon S3 Storage Lens configuration	Write		s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:TagKeys aws:RequestTag/${TagKey}	
PutStorageLensConfigurationTagging	Grants permission to put or replace tags on an existing Amazon S3 Storage Lens configuration	Tagging	storagelensconfiguration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:TagKeys aws:RequestTag/${TagKey}	
Replicate Delete	Grants permission to replicate delete markers to the destination bucket	Write	object*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
Replicate Object	Grants permission to replicate objects and object tags to the destination bucket	Write	object*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 s3:x-amz-server-side-encryption s3:x-amz-server-side-encryption-aws-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				kms-key-id s3:x-amz-server-side-encryption-customer-algorithm	
Replicate Tags	Grants permission to replicate object tags to the destination bucket	Tagging	object*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
RestoreObject	Grants permission to restore an archived copy of an object back into Amazon S3	Write	accesspointobject		
			object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
SubmitMultiRegionAccessPointRoutes	Grants permission to submit a route configuration update for a Multi-Region Access Point	Write	multiregionaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:DataAccessPointAccount s3:DataAccessPointArn s3:AccessPointNetworkOrigin s3:authType s3:ResourceAccount s3:signatureversion s3:signatureAge s3:TlsVersion	
TagResource	Grants permission to add tags to the specified resource	Tagging	accessgrant		
			accessgrantsinstance		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			accessgrantslocation		
			accesspoint		
			bucket		
			storagelensgroup		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove tags from the specified resource	Tagging	accessgrant		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			accessgrantsinstance		
			accessgrantslocation		
			accesspoint		
			bucket		
			storagelensgroup		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:TagKeys	
UpdateAccessGrantsLocation	Grants permission to update Access Grants location	Permissions management	accessgrantslocation*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:AccessGrantsLocationScope s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateBucketMetadataInventoryTableConfiguration	Grants permission to update the inventory table configuration on an existing S3 Metadata configuration for a specified general purpose bucket	Write	bucket*		kms:DescribeKey s3tables:CreateNamespace s3tables:CreateTable s3tables:CreateTableBucket s3tables:GetTable s3tables:PutTableEncryption s3tables:PutTablePolicy

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateBucketMetadataJournalTableConfiguration	Grants permission to update the journal table configuration on an existing S3 Metadata configuration for a specified general purpose bucket	Write	bucket*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	
UpdateJobPriority	Grants permission to update the priority of an existing job	Write	job*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 s3:RequestJobPriority s3:ExistingJobPriority s3:ExistingJobOperation	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateJobStatus	Grants permission to update the status for the specified job	Write	job*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 s3:ExistingJobPriority s3:ExistingJobOperation s3:JobSuspendedCause	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateObjectEncryption	Grants permission to update the server-side encryption type of an existing object in a general purpose bucket	Write	accesspointobject		
			object		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256 s3:x-amz-server-side-encryption s3:x-amz-server-side-encryption-aws-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				kms-key-id	
UpdateStorageLensGroup	Grants permission to update an existing S3 Storage Lens group	Write	storagelensgroup*		
				s3:authType s3:ResourceAccount s3:signatureAge s3:signatureversion s3:TlsVersion s3:x-amz-content-sha256	

Resource types defined by Amazon S3

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
accesspoint	arn:${Partition}:s3:${Region}:${Account}:accesspoint/${AccessPointName}	aws:ResourceTag/${TagKey} s3:AccessPointNetworkOrigin s3:AccessPointTag/${TagKey} s3:DataAccessPointAccount s3:DataAccessPointArn
accesspointobject	arn:${Partition}:s3:${Region}:${Account}:accesspoint/${AccessPointName}/object/${ObjectName}	aws:ResourceTag/${TagKey} s3:AccessPointNetworkOrigin s3:AccessPointTag/${TagKey} s3:BucketTag/${TagKey} s3:DataAccessPointAccount s3:DataAccessPointArn
bucket	arn:${Partition}:s3:::${BucketName}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
		s3:BucketTag/${TagKey}
object	arn:${Partition}:s3:::${BucketName}/${ObjectName}	aws:ResourceTag/${TagKey} s3:BucketTag/${TagKey}
job	arn:${Partition}:s3:${Region}:${Account}:job/${JobId}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys
storagelensconfiguration	arn:${Partition}:s3:${Region}:${Account}:storage-lens/${ConfigId}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys
storagelensgroup	arn:${Partition}:s3:${Region}:${Account}:storage-lens-group/${Name}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys
objectlambdaaccesspoint	arn:${Partition}:s3-object-lambda:${Region}:${Account}:accesspoint/${AccessPointName}	

Resource types	ARN	Condition keys
multiregionaccesspoint	arn:${Partition}:s3::${Account}:accesspoint/${AccessPointAlias}	
multiregionaccesspointrequestarn	arn:${Partition}:s3:us-west-2:${Account}:async-request/mrap/${Operation}/${Token}	
accessgrantsinstance	arn:${Partition}:s3:${Region}:${Account}:access-grants/default	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys
accessgrantslocation	arn:${Partition}:s3:${Region}:${Account}:access-grants/default/location/${Token}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys
accessgrant	arn:${Partition}:s3:${Region}:${Account}:access-grants/default/grant/${Token}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys

Condition keys for Amazon S3

Amazon S3 defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
s3:AccessGrantScope	Filters access by the grant scope of access grants grant	String
s3:AccessGrantsInstanceArn	Filters access by access grants instance ARN	ARN
s3:AccessGrantsLocationScope	Filters access by the location scope of access grants location	String
s3:AccessPointNetworkOrigin	Filters access by the network origin (Internet or VPC)	String
s3:AccessPointTag/${TagKey}	Filters access by existing access point tag key and value	String

Condition keys	Description	Type
s3:BucketTag/${TagKey}	Filters access by the tags associated with the bucket	String
s3:DataAccessPointAccount	Filters access by the AWS Account ID that owns the access point	String
s3:DataAccessPointArn	Filters access by an access point Amazon Resource Name (ARN)	ARN
s3:ExistingJobOperation	Filters access by operation to updating the job priority	String
s3:ExistingJobPriority	Filters access by priority range to cancelling existing jobs	Numeric
s3:ExistingObjectTag/<key>	Filters access by existing object tag key and value	String
s3:InventoryAccessibleOptionalFields	Filters access by restricting which optional metadata fields a user can add when configuring S3 Inventory reports	ArrayOfString
s3:JobSuspendedCause	Filters access by a specific job suspended cause (for example, AWAITING_CONFIRMATION) to cancelling suspended jobs	String
s3:ObjectCreationOperation	Filters access by whether or not the operation creates an object	Bool
s3:RequestJobOperation	Filters access by operation to creating jobs	String

Condition keys	Description	Type
s3:RequestJobPriority	Filters access by priority range to creating new jobs	Numeric
s3:RequestObjectTag/<key>	Filters access by the tag keys and values to be added to objects	String
s3:RequestObjectTagKeys	Filters access by the tag keys to be added to objects	ArrayOfString
s3:ResourceAccount	Filters access by the resource owner AWS account ID	String
s3:TlsVersion	Filters access by the TLS version used by the client	Numeric
s3:authType	Filters access by authentication method	String
s3:delimiter	Filters access by delimiter parameter	String
s3:destinationRegion	Filters access by a specific replication destination region for targeted buckets of the AWS FIS action aws:s3:bucket-pause-replication	String
s3:if-match	Filters access by the request's 'If-Match' conditional header	String
s3:if-none-match	Filters access by the request's 'If-None-Match' conditional header	String
s3:isReplicationPauseRequest	Filters access by request made via AWS FIS action aws:s3:bucket-pause-replication	Bool
s3:locationconstraint	Filters access by a specific Region	String
s3:max-keys	Filters access by maximum number of keys returned in a ListBucket request	Numeric

Condition keys	Description	Type
s3:object-lock-legal-hold	Filters access by object legal hold status	String
s3:object-lock-mode	Filters access by object retention mode (COMPLIANCE or GOVERNANCE)	String
s3:object-lock-remaining-retention-days	Filters access by remaining object retention days	Numeric
s3:object-lock-retain-until-date	Filters access by object retain-until date	Date
s3:prefix	Filters access by key name prefix	String
s3:signatureAge	Filters access by the age in milliseconds of the request signature	Numeric
s3:signatureversion	Filters access by the version of AWS Signature used on the request	String
s3:versionid	Filters access by a specific object version	String
s3:x-amz-acl	Filters access by canned ACL in the request's x-amz-acl header	String
s3:x-amz-bucket-namespace	Filters access by general purpose bucket namespace type	String
s3:x-amz-content-sha256	Filters access by unsigned content in your bucket	String
s3:x-amz-copy-source	Filters access by copy source bucket, prefix, or object in the copy object requests	String
s3:x-amz-grant-full-control	Filters access by x-amz-grant-full-control (full control) header	String

Condition keys	Description	Type
s3:x-amz-grant-read	Filters access by x-amz-grant-read (read access) header	String
s3:x-amz-grant-read-acp	Filters access by the x-amz-grant-read-acp (read permissions for the ACL) header	String
s3:x-amz-grant-write	Filters access by the x-amz-grant-write (write access) header	String
s3:x-amz-grant-write-acp	Filters access by the x-amz-grant-write-acp (write permissions for the ACL) header	String
s3:x-amz-metadata-directive	Filters access by object metadata behavior (COPY or REPLACE) when objects are copied	String
s3:x-amz-object-ownership	Filters access by Object Ownership	String
s3:x-amz-server-side-encryption	Filters access by server-side encryption	String
s3:x-amz-server-side-encryption-aws-kms-key-id	Filters access by AWS KMS customer managed CMK for server-side encryption	ARN
s3:x-amz-server-side-encryption-customer-algorithm	Filters access by customer specified algorithm for server-side encryption	String
s3:x-amz-storage-class	Filters access by storage class	String

Condition keys	Description	Type
s3:x-amz-website-redirect-location	Filters access by a specific website redirect location for buckets that are configured as static websites	String

Actions, resources, and condition keys for Amazon S3 Express

Amazon S3 Express (service prefix: `s3express`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon S3 Express

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAccessPoint	Grants permission to create a new access point	Write	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3express:DataAccessPointAccount s3express:DataAccessPointArn s3express:AccessPointNetworkOrigin s3express:authType s3express:LocationName s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3express:x-amz-content-sha256 aws:RequestTag/${TagKey} aws:TagKeys	
CreateBucket	Grants permission to create a new bucket	Write	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3express:authType s3express:LocationName s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-content-sha256 aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSession	Grants permission to Create Session token which is used for object APIs such as PutObject, GetObject, etc	Write	bucket*		
			accesspoint	s3express:Permissions	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3express:authType s3express:ResourceAccount s3express:SessionMode s3express:signatureAge s3express:signatureversion s3express:TlsVersion s3express:x-amz-content-sha256 s3express:x-amz-server-side-encryption	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3express:x-amz-server-side-encryption-aws-kms-key-id s3express:AllAccessRestrictedToLocalZoneGroup s3express:Permissions	
DeleteAccessPoint	Grants permission to delete the access point named in the URI	Write	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3express:DataAccessPointAccount s3express:DataAccessPointArn s3express:AccessPointNetworkOrigin s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				content-sha256	
DeleteAccessPointPolicy	Grants permission to delete the policy on a specified access point	Permissions management	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3express:DataAccessPointAccount s3express:DataAccessPointArn s3express:AccessPointNetworkOrigin s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				content-sha256	
DeleteAccessPointScope	Grants permission to delete the scope configuration on a specified access point	Permissions management	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3express:DataAccessPointAccount s3express:DataAccessPointArn s3express:AccessPointNetworkOrigin s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				content-sha256	
DeleteBucket	Grants permission to delete the bucket named in the URI	Write	bucket*		
				s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteBucketPolicy	Grants permission to delete the policy on a specified bucket	Permissions management	bucket*		
				s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-content-sha256	
GetAccessPoint	Grants permission to return configuration information about the specified access point	Read	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3express:DataAccessPointAccount s3express:DataAccessPointArn s3express:AccessPointNetworkOrigin s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				content-sha256	
GetAccessPointPolicy	Grants permission to return the access point policy associated with the specified access point	Read	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3express:DataAccessPointAccount s3express:DataAccessPointArn s3express:AccessPointNetworkOrigin s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				content-sha256	
GetAccessPointScope	Grants permission to return the scope configuration associated with the specified access point	Read	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3express:DataAccessPointAccount s3express:DataAccessPointArn s3express:AccessPointNetworkOrigin s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				content-sha256	
GetBucketPolicy	Grants permission to return the policy of the specified bucket	Read	bucket*		
				s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetEncryptionConfiguration	Grants permission to return the default encryption configuration for a directory bucket	Read	bucket*		
				s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetLifecycleConfiguration	Grants permission to return the lifecycle configuration information set on a directory bucket	Read	bucket*	s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAccessPointsForDirectoryBuckets	Grants permission to list access points	List		s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAllMyDirectoryBuckets	Grants permission to list all directory buckets owned by the authenticated sender of the request	List		s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-content-sha256	
ListTagsForResource	Grants permission to lists all of the tags for a specified resource	List	accesspoint bucket		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-content-sha256	
PutAccessPointPolicy	Grants permission to associate an access policy with a specified access point	Permissions management	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3express:DataAccessPointAccount s3express:DataAccessPointArn s3express:AccessPointNetworkOrigin s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				content-sha256	
PutAccessPointScope	Grants permission to associate an access point with a specified access point scope configuration	Permissions management	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3express:DataAccessPointAccount s3express:DataAccessPointArn s3express:AccessPointNetworkOrigin s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				content-sha256	
PutBucketPolicy	Grants permission to add or replace a bucket policy on a bucket	Permissions management	bucket*		
				s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-content-sha256	
PutEncryptionConfiguration	Grants permission to set the encryption configuration for a directory bucket	Write	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutLifecycleConfiguration	Grants permission to create a new lifecycle configuration for the directory bucket or replace an existing lifecycle configuration	Write	bucket*		
				s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-content-sha256	
TagResource	Grants permission to create a new user-defined tag or update an existing tag	Tagging	accesspoint		
			bucket		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-content-sha256 aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove the specified user-defined tags from an S3 resource	Tagging	accesspoint		
			bucket		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3express:authType s3express:ResourceAccount s3express:signatureversion s3express:TlsVersion s3express:x-amz-content-sha256 aws:TagKeys	

Resource types defined by Amazon S3 Express

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
bucket	arn:${Partition}:s3express:${Region}:${Account}:bucket/${BucketName}	aws:ResourceTag/${TagKey} s3express:BucketTag/${TagKey}
accesspoint	arn:${Partition}:s3express:${Region}:${Account}:accesspoint/${AccessPointName}	aws:ResourceTag/${TagKey} s3express:AccessPointTag/${TagKey}

Condition keys for Amazon S3 Express

Amazon S3 Express defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Condition keys	Description	Type
s3express:AccessPointNetworkOrigin	Filters access by the network origin (Internet or VPC)	String
s3express:AccessPointTag/${TagKey}	Filters access by tag key-value pairs attached to the access point	String
s3express:AllAccessRestrictedToLocalZoneGroup	Filters access by AWS Local Zone network border group(s) provided in this condition key	String
s3express:BucketTag/${TagKey}	Filters access by tag key-value pairs attached to the bucket	String
s3express:DataAccessPointAccount	Filters access by the AWS Account ID that owns the access point	String
s3express:DataAccessPointArn	Filters access by an access point Amazon Resource Name (ARN)	ARN
s3express:LocationName	Filters access by a specific Availability Zone or Local Zone ID	String
s3express:Permissions	Filters access by the permission requested by Access Point Scope configuration, such as GetObject, PutObject	ArrayOfString
s3express:ResourceAccount	Filters access by the resource owner AWS account ID	String

Condition keys	Description	Type
s3express:SessionMode	Filters access by the permission requested by CreateSession API, such as ReadOnly and ReadWrite	String
s3express:TlsVersion	Filters access by the TLS version used by the client	Numeric
s3express:authType	Filters access by authentication method	String
s3express:signatureAge	Filters access by the age in milliseconds of the request signature	Numeric
s3express:signaturversion	Filters access by the AWS Signature Version used on the request	String
s3express:x-amz-content-sha256	Filters access by unsigned content in your bucket	String
s3express:x-amz-server-side-encryption	Filters access by server-side encryption	String
s3express:x-amz-server-side-encryption-aws-kms-key-id	Filters access by AWS KMS customer managed key for server-side encryption	ARN

Actions, resources, and condition keys for Amazon S3 Glacier

Amazon S3 Glacier (service prefix: `glacier`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon S3 Glacier

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AbortMultipartUpload	Grants permission to abort a multipart upload identified by the upload ID	Write	vault*		
AbortVaultLock	Grants permission to abort the vault locking process if the vault lock is not in the Locked state	Permissions management	vault*		
AddTagsToVault	Grants permission to add the specified tags to a vault	Tagging	vault*		
CompleteMultipartUpload	Grants permission to complete a multipart upload process	Write	vault*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CompleteVaultLock	Grants permission to complete the vault locking process	Permissions management	vault*		
CreateVault	Grants permission to create a new vault with the specified name	Write	vault*		
DeleteArchive	Grants permission to delete an archive from a vault	Write	vault*		
				glacier:ArchiveAgeInDays	
DeleteVault	Grants permission to delete a vault	Write	vault*		
DeleteVaultAccessPolicy	Grants permission to delete the access policy associated with the specified vault	Permissions management	vault*		
DeleteVaultNotifications	Grants permission to delete the notification configuration set for a vault	Write	vault*		
DescribeJob	Grants permission to get information about a job previously initiated	Read	vault*		
DescribeVault	Grants permission to get information about a vault	Read	vault*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDataRetrievalPolicy	Grants permission to get the data retrieval policy	Read			
GetJobOutput	Grants permission to download the output of the job specified	Read	vault*		
GetVaultAccessPolicy	Grants permission to retrieve the access-policy subresource set on the vault	Read	vault*		
GetVaultLock	Grants permission to retrieve attributes from the lock-policy subresource set on the specified vault	Read	vault*		
GetVaultNotifications	Grants permission to retrieve the notification-configuration subresource set on the vault	Read	vault*		
InitiateJob	Grants permission to initiate a job of the specified type	Write	vault*		
				glacier:ArchiveAgeInDays	
InitiateMultipartUpload	Grants permission to initiate a multipart upload	Write	vault*		
InitiateVaultLock	Grants permission to initiate the vault locking process	Permissions management	vault*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListJobs	Grants permission to list jobs for a vault that are in-progress and jobs that have recently finished	List	vault*		
ListMultipartUploads	Grants permission to list in-progress multipart uploads for the specified vault	List	vault*		
ListParts	Grants permission to list the parts of an archive that have been uploaded in a specific multipart upload	List	vault*		
ListProvisionedCapacity	Grants permission to list the provisioned capacity for the specified AWS account	List			
ListTagsForVault	Grants permission to list all the tags attached to a vault	List	vault*		
ListVaults	Grants permission to list all vaults	List			
PurchaseProvisionedCapacity	Grants permission to purchases a provisioned capacity unit for an AWS account	Write			
RemoveTagsFromVault	Grants permission to remove one or more tags from the set of tags attached to a vault	Tagging	vault*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SetDataRetrievalPolicy	Grants permission to set and then enacts a data retrieval policy in the region specified in the PUT request	Permissions management			
SetVaultAccessPolicy	Grants permission to configure an access policy for a vault; will overwrite an existing policy	Permissions management	vault*		
SetVaultNotifications	Grants permission to configure vault notifications	Write	vault*		
UploadArchive	Grants permission to upload an archive to a vault	Write	vault*		
UploadMultipartPart	Grants permission to upload a part of an archive	Write	vault*		

Resource types defined by Amazon S3 Glacier

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
vault	`arn:${Partition}:glacier:${Region}:${Account}:vaults/${VaultName}`	

Condition keys for Amazon S3 Glacier

Amazon S3 Glacier defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
glacier:ArchiveAgeInDays	Filters access by how long an archive has been stored in the vault, in days	String
glacier:ResourceTag/	Filters access by a customer-defined tag	String

Actions, resources, and condition keys for Amazon S3 Object Lambda

Amazon S3 Object Lambda (service prefix: `s3-object-lambda`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon S3 Object Lambda

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AbortMultipartUpload	Grants permission to abort a multipart upload	Write	objectlambdaaccesspoint*		
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	
DeleteObject	Grants permission to remove the null version of an object and insert a delete marker, which becomes the current version of the object	Write	objectlambdaaccesspoint*		
				s3-object-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	
DeleteObjectTagging	Grants permission to use the tagging subresource to remove the entire tag set from the specified object	Tagging	objectlambdaaccesspoint*		
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteObjectVersion	Grants permission to remove a specific version of an object	Write	objectlambdaaccesspoint*		
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion s3-object-lambda:versionid	
DeleteObjectVersionTagging	Grants permission to remove the entire tag set for a specific version of the object	Tagging	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion s3-object-lambda:versionid	
GetObject	Grants permission to retrieve objects from Amazon S3	Read	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	
GetObjectAcl	Grants permission to return the access control list (ACL) of an object	Read	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	
GetObjectLegalHold	Grants permission to get an object's current Legal Hold status	Read	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	
GetObjectRetention	Grants permission to retrieve the retention settings for an object	Read	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	
GetObjectTagging	Grants permission to return the tag set of an object	Read	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	
GetObjectVersion	Grants permission to retrieve a specific version of an object	Read	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion s3-object-lambda:versionid	
GetObjectVersionAcl	Grants permission to return the access control list (ACL) of a specific object version	Read	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion s3-object-lambda:versionid	
GetObjectVersionTagging	Grants permission to return the tag set for a specific version of the object	Read	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion s3-object-lambda:versionid	
ListBucket	Grants permission to list some or all of the objects in an Amazon S3 bucket (up to 1000)	List	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	
ListBucketMultipartUploads	Grants permission to list in-progress multipart uploads	List	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	
ListBucketVersions	Grants permission to list metadata about all the versions of objects in an Amazon S3 bucket	List	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	
ListMultipartUploadParts	Grants permission to list the parts that have been uploaded for a specific multipart upload	List	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	
PutObject	Grants permission to add an object to a bucket	Write	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	
PutObjectAcl	Grants permission to set the access control list (ACL) permissions for new or existing objects in an S3 bucket	Permissions management	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	
PutObjectLegalHold	Grants permission to apply a Legal Hold configuration to the specified object	Write	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	
PutObjectRetention	Grants permission to place an Object Retention configuration on an object	Write	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	
PutObjectTagging	Grants permission to set the supplied tag-set to an object that already exists in a bucket	Tagging	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	
PutObjectVersionAcl	Grants permission to use the acl subresource to set the access control list (ACL) permissions for an object that already exists in a bucket	Permissions management	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion s3-object-lambda:versionid	
PutObjectVersionTagging	Grants permission to set the supplied tag-set for a specific version of an object	Tagging	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion s3-object-lambda:versionid	
RestoreObject	Grants permission to restore an archived copy of an object back into Amazon S3	Write	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	
WriteGetObjectResponse	Grants permission to provide data for GetObject requests send to S3 Object Lambda	Write	objectlambdaaccesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-object-lambda:authType s3-object-lambda:signatureAge s3-object-lambda:TlsVersion	

Resource types defined by Amazon S3 Object Lambda

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
objectlambdaaccesspoint	`arn:${Partition}:s3-object-lambda:${Region}:${Account}:accesspoint/${AccessPointName}`	

Condition keys for Amazon S3 Object Lambda

Amazon S3 Object Lambda defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
s3-object-lambda:TlsVersion	Filters access by the TLS version used by the client	Numeric
s3-object-lambda:authType	Filters access by authentication method	String
s3-object-lambda:signatureAge	Filters access by the age in milliseconds of the request signature	Numeric
s3-object-lambda:versionid	Filters access by a specific object version	String

Actions, resources, and condition keys for Amazon S3 on Outposts

Amazon S3 on Outposts (service prefix: `s3-outposts`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.

Topics

Actions defined by Amazon S3 on Outposts

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AbortMultipartUpload	Grants permission to abort a multipart upload	Write	object*		
				s3-outposts:DataAccessPointArn s3-outposts:DataAccessPointAccount s3-outposts:AccessPointNetworkOrigin s3-outpos	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
CreateAccessPoint	Grants permission to create a new access point	Write	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:DataAccessPointAccount s3-outposts:DataAccessPointArn s3-outposts:AccessPointNetworkOrigin s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:x-amz-content-sha256	
CreateBucket	Grants permission to create a new bucket	Write	bucket*		
				s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
CreateEndpoint	Grants permission to create a new endpoint	Write	endpoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAccessPoint	Grants permission to delete the access point named in the URI	Write	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:DataAccessPointArn s3-outposts:DataAccessPointAccount s3-outposts:AccessPointNetworkOrigin s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:x-amz-content-sha256	
DeleteAccessPointPolicy	Grants permission to delete the policy on a specified access point	Permissions management	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:DataAccessPointArn s3-outposts:DataAccessPointAccount s3-outposts:AccessPointNetworkOrigin s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:x-amz-content-sha256	
DeleteBucket	Grants permission to delete the bucket named in the URI	Write	bucket*		
				s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteBucketPolicy	Grants permission to delete the policy on a specified bucket	Permissions management	bucket*		
				s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
DeleteEndpoint	Grants permission to delete the endpoint named in the URI	Write	endpoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteObject	Grants permission to remove the null version of an object and insert a delete marker, which becomes the current version of the object	Write	object*		
				s3-outposts:DataAccessPointAccount s3-outposts:DataAccessPointArn s3-outposts:AccessPointNetworkOrigin s3-outposts:authType s3-outposts:signatureAge s3-outposts:signat

				s3-outposts:signatureversion s3-outposts:versionid s3-outposts:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAccessPoint	Grants permission to return configuration information about the specified access point	Read		s3-outposts:DataAccessPointAccount s3-outposts:DataAccessPointArn s3-outposts:AccessPointNetworkOrigin s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:x-amz-content-sha256	
GetAccessPointPolicy	Grants permission to returns the access point policy associated with the specified access point	Read	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:DataAccessPointAccount s3-outposts:DataAccessPointArn s3-outposts:AccessPointNetworkOrigin s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:x-amz-content-sha256	
GetBucket	Grants permission to return the bucket configuration associated with an Amazon S3 bucket	Read	bucket*		
				s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
GetBucketPolicy	Grants permission to return the policy of the specified bucket	Read	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
GetBucketTagging	Grants permission to return the tag set associated with an Amazon S3 bucket	Read	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
GetBucketVersioning	Grants permission to return the versioning state of an Amazon S3 bucket	Read	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetLifecycleConfiguration	Grants permission to return the lifecycle configuration information set on an Amazon S3 bucket	Read	bucket*		
				s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
GetObject	Grants permission to retrieve objects from Amazon S3	Read	object*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:DataAccessPointAccount s3-outposts:DataAccessPointArn s3-outposts:AccessPointNetworkOrigin s3-outposts:ExistingObjectTag/<key> s3-outposts:authType s3-outposts:signatureAge	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
GetObjectTagging	Grants permission to return the tag set of an object	Read	object*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:DataAccessPointAccount s3-outposts:DataAccessPointArn s3-outposts:AccessPointNetworkOrigin s3-outposts:ExistingObjectTag/<key> s3-outposts:authType s3-outposts:signatureAge	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
GetObjectVersion	Grants permission to retrieve a specific version of an object	Read	object*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:DataAccessPointAccount s3-outposts:DataAccessPointArn s3-outposts:AccessPointNetworkOrigin s3-outposts:ExistingObjectTag/<key> s3-outposts:authType s3-outposts:signatureAge	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:signatureversion s3-outposts:versionid s3-outposts:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetObjectVersionForReplication	Grants permission to replicate both unencrypted objects and objects encrypted with SSE-KMS	Read	object*		
				s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
GetObjectVersionTagging	Grants permission to return the tag set for a specific version of the object	Read	object*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:DataAccessPointAccount s3-outposts:DataAccessPointArn s3-outposts:AccessPointNetworkOrigin s3-outposts:ExistingObjectTag/<key> s3-outposts:authType s3-outposts:signatureAge	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:signatureversion s3-outposts:versionid s3-outposts:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetReplicationConfiguration	Grants permission to get the replication configuration information set on an Amazon S3 bucket	Read	bucket*	s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAccessPoints	Grants permission to list access points	List		s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
ListBucket	Grants permission to list some or all of the objects in an Amazon S3 bucket (up to 1000)	List	accesspoint* bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:DataAccessPointAccount s3-outposts:DataAccessPointArn s3-outposts:AccessPointNetworkOrigin s3-outposts:authType s3-outposts:delimiter s3-outposts:max-keys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:prefix s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
ListBucketMultipartUploads	Grants permission to list in-progress multipart uploads	List	accesspoint* bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:DataAccessPointAccount s3-outposts:DataAccessPointArn s3-outposts:AccessPointNetworkOrigin s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListBucketVersions	Grants permission to list metadata about all the versions of objects in an Amazon S3 bucket	List	bucket*	s3-outposts:DataAccessPointAccount s3-outposts:DataAccessPointArn s3-outposts:AccessPointNetworkOrigin s3-outposts:authType s3-outposts:delimiter s3-outpos	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ts:max-keys s3-outposts:prefix s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
ListEndpoints	Grants permission to list endpoints	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListMultipartUploadParts	Grants permission to list the parts that have been uploaded for a specific multipart upload	List	object*	s3-outposts:DataAccessPointAccount s3-outposts:DataAccessPointArn s3-outposts:AccessPointNetworkOrigin s3-outposts:authType s3-outposts:signatureAge s3-outposts:signat	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ureversion s3-outposts:x-amz-content-sha256	
ListOutpostsWithS3	Grants permission to list outposts with S3 capacity	List			
ListRegionalBuckets	Grants permission to list all buckets owned by the authenticated sender of the request	List		s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListSharedEndpoints	Grants permission to list shared endpoints	List			
PutAccessPointPolicy	Grants permission to associate an access policy with a specified access point	Permissions management	accesspoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:DataAccessPointAccount s3-outposts:DataAccessPointArn s3-outposts:AccessPointNetworkOrigin s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:x-amz-content-sha256	
PutBucketPolicy	Grants permission to add or replace a bucket policy on a bucket	Permissions management	bucket*		
				s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
PutBucketTagging	Grants permission to add a set of tags to an existing Amazon S3 bucket	Tagging	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
PutBucketVersioning	Grants permission to set the versioning state of an existing Amazon S3 bucket	Write	bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutLifecycleConfiguration	Grants permission to create a new lifecycle configuration for the bucket or replace an existing lifecycle configuration	Write	bucket*		
				s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
PutObject	Grants permission to add an object to a bucket	Write	object*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:DataAccessPointAccount s3-outposts:DataAccessPointArn s3-outposts:AccessPointNetworkOrigin s3-outposts:RequestObjectTag/<key> s3-outposts:RequestObjectTagKeys s3-outpos	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-acl s3-outposts:x-amz-content-sha256 s3-outposts:x-amz-copy-source s3-outposts:x-amz-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				metadata-directive s3-outposts:x-amz-server-side-encryption s3-outposts:x-amz-storage-class	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutObjectAcl	Grants permission to set the access control list (ACL) permissions for an object that already exists in a bucket	Permissions management	object*	s3-outposts:DataAccessPointAccount s3-outposts:DataAccessPointArn s3-outposts:AccessPointNetworkOrigin s3-outposts:ExistingObjectTag/<key> s3-outposts:authType s3-outpos	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-acl s3-outposts:x-amz-content-sha256 s3-outposts:x-amz-storage-class	
PutObjectTagging	Grants permission to set the supplied tag-set to an object that already exists in a bucket	Tagging	object*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:DataAccessPointAccount s3-outposts:DataAccessPointArn s3-outposts:AccessPointNetworkOrigin s3-outposts:ExistingObjectTag/<key> s3-outposts:RequestObjectTag/<key> s3-outposts:Reques	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				tObjectTagKeys s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
PutObjectVersionTagging	Grants permission to set the supplied tag-set for a specific version of an object	Tagging	object*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:DataAccessPointAccount s3-outposts:DataAccessPointArn s3-outposts:AccessPointNetworkOrigin s3-outposts:ExistingObjectTag/<key> s3-outposts:RequestObjectTag/<key> s3-outposts:Reques	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				tObjectTagKeys s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:versionid s3-outposts:x-amz-content-sha256	
PutReplicationConfiguration	Grants permission to create a new replication configuration or replace an existing one	Write	bucket*		iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
Replicate Delete	Grants permission to replicate delete markers to the destination bucket	Write	object*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	
Replicate Object	Grants permission to replicate objects and object tags to the destination bucket	Write	object*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256 s3-outposts:x-amz-server-side-encryption	
Replicate Tags	Grants permission to replicate object tags to the destination bucket	Tagging	object*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3-outposts:authType s3-outposts:signatureAge s3-outposts:signatureversion s3-outposts:x-amz-content-sha256	

Resource types defined by Amazon S3 on Outposts

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
accesspoint	arn:${Partition}:s3-outposts:${Region}:${Account}:outpost/${OutpostId}/accesspoint/${AccessPointName}	
bucket	arn:${Partition}:s3-outposts:${Region}:${Account}:outpost/${OutpostId}/bucket/${BucketName}	
endpoint	arn:${Partition}:s3-outposts:${Region}:${Account}:outpost/${OutpostId}/endpoint/${EndpointId}	
object	arn:${Partition}:s3-outposts:${Region}:${Account}:outpost/${OutpostId}/bucket/${BucketName}/object/${ObjectName}	

Condition keys for Amazon S3 on Outposts

Amazon S3 on Outposts defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
s3-outposts:AccessPointNetworkOrigin	Filters access by the network origin (Internet or VPC)	String

Condition keys	Description	Type
s3-outposts:DataAccessPointAccount	Filters access by the AWS Account ID that owns the access point	String
s3-outposts:DataAccessPointArn	Filters access by an access point Amazon Resource Name (ARN)	ARN
s3-outposts:ExistingObjectTag/<key>	Filters access by requiring that an existing object tag has a specific tag key and value	String
s3-outposts:RequestObjectTag/<key>	Filters access by restricting the tag keys and values allowed on objects	String
s3-outposts:RequestObjectTagKeys	Filters access by restricting the tag keys allowed on objects	String
s3-outposts:authType	Filters access by restricting incoming requests to a specific authentication method	String
s3-outposts:delimiter	Filters access by requiring the delimiter parameter	String
s3-outposts:max-keys	Filters access by limiting the maximum number of keys returned in a ListBucket request	Numeric
s3-outposts:prefix	Filters access by key name prefix	String

Condition keys	Description	Type
s3-outposts:signatureAge	Filters access by identifying the length of time, in milliseconds, that a signature is valid in an authenticated request	Numeric
s3-outposts:signatureversion	Filters access by identifying the version of AWS Signature that is supported for authenticated requests	String
s3-outposts:versionid	Filters access by a specific object version	String
s3-outposts:x-amz-acl	Filters access by requiring the x-amz-acl header with a specific canned ACL in a request	String
s3-outposts:x-amz-content-sha256	Filters access by disallowing unsigned content in your bucket	String
s3-outposts:x-amz-copy-source	Filters access by restricting the copy source to a specific bucket, prefix, or object	String
s3-outposts:x-amz-metadata-directive	Filters access by enabling enforcement of object metadata behavior (COPY or REPLACE) when objects are copied	String
s3-outposts:x-amz-server-side-encryption	Filters access by requiring server-side encryption	String
s3-outposts:x-amz-storage-class	Filters access by storage class	String

Actions, resources, and condition keys for Amazon S3 Tables

Amazon S3 Tables (service prefix: `s3tables`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon S3 Tables

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateNamespace	Grants permission to create a namespace	Write	TableBucket*		
CreateTable	Grants permission to create a table	Write	TableBucket*		
				s3tables:namespace	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3tables:SSEAlgorithm s3tables:KMSKeyArn s3tables:TableBucketTag/${TagKey} aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
CreateTableBucket	Grants permission to create a table bucket	Write	TableBucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3tables:SSEAlgorithm s3tables:KMSKeyArn s3tables:TableBucketTag/${TagKey} aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
DeleteNamespace	Grants permission to delete a namespace	Write	TableBucket*		
				s3tables:namespace	
DeleteTable	Grants permission to delete a table	Write	Table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3tables:namespace s3tables:tableName	
DeleteTableBucket	Grants permission to delete a table bucket	Write	TableBucket*		
DeleteTableBucketEncryption	Grants permission to delete encryption configuration on a table bucket	Write	TableBucket*		
DeleteTableBucketMetricsConfiguration	Grants permission to delete a metrics configuration on a table bucket	Write	TableBucket*		
DeleteTableBucketPolicy	Grants permission to delete a policy on a table bucket	Permissions management	TableBucket*		
DeleteTableBucketReplication	Grants permission to delete table bucket replication configuration on a bucket	Write	TableBucket*		
DeleteTablePolicy	Grants permission to delete a policy on a table	Permissions management	Table*		
				s3tables:namespace s3tables:tableName	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteTableReplication	Grants permission to delete table replication configuration on a table	Write	Table*		
				s3tables:namespace s3tables:tableName	
GetNamespace	Grants permission to get a namespace	Read	TableBucket*		
				s3tables:namespace	
GetTable	Grants permission to retrieve a table	Read	Table*		
				s3tables:namespace s3tables:tableName	
GetTableBucket	Grants permission to retrieve a table bucket	Read	TableBucket*		
GetTableBucketEncryption	Grants permission to retrieve encryption configuration on a table bucket	Read	TableBucket*		
GetTableBucketMaintenanceConfiguration	Grants permission to retrieve a maintenance configuration on a table bucket	Read	TableBucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTableBucketMetricsConfiguration	Grants permission to retrieve a metrics configuration on a bucket	Read	TableBucket*		
GetTableBucketPolicy	Grants permission to retrieve a policy on a table bucket	Read	TableBucket*		
GetTableBucketReplication	Grants permission to retrieve a table bucket replication configuration on a bucket	Read	TableBucket*		
GetTableBucketStorageClass	Grants permission to retrieve the storage class configuration for a table bucket	Read	TableBucket*		
GetTableData [permission only]	Grants permission to read metadata and data objects from a table storage endpoint using S3 APIs	Read	Table*		
				s3tables:namespace s3tables:tableName	
GetTableEncryption	Grants permission to retrieve encryption configuration on a table	Read	Table*		
				s3tables:namespace s3tables:tableName	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTableMaintenanceConfiguration	Grants permission to retrieve a maintenance configuration on a table	Read	Table*		
				s3tables:namespace	
				s3tables:tableName	
GetTableMaintenanceJobStatus	Grants permission to retrieve the status of maintenance jobs on a table	Read	Table*		
				s3tables:namespace	
				s3tables:tableName	
GetTableMetadataLocation	Grants permission to retrieve the metadata location of a table	Read	Table*		
				s3tables:namespace	
				s3tables:tableName	
GetTablePolicy	Grants permission to retrieve a policy on a table	Read	Table*		
				s3tables:namespace	
				s3tables:tableName	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTableRecordExpirationConfiguration	Grants permission to retrieve a table maintenance configuration on a system table	Read	Table*		
				s3tables:namespace	
				s3tables:tableName	
GetTableRecordExpirationJobStatus	Grants permission to retrieve the status of table record expiration jobs on a system table	Read	Table*		
				s3tables:namespace	
				s3tables:tableName	
GetTableReplication	Grants permission to retrieve a table replication configuration on a table	Read	Table*		
				s3tables:namespace	
				s3tables:tableName	
GetTableReplicationStatus	Grants permission to retrieve a table replication status on a table	Read	Table*		
				s3tables:namespace	
				s3tables:tableName	
GetTableStorageClass	Grants permission to retrieve the storage class configuration for a specific table	Read	Table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3tables:namespace s3tables:tableName	
ListNamespaces	Grants permission to list namespaces	List	TableBucket*		
ListTableBuckets	Grants permission to list table buckets	List			
ListTables	Grants permission to list tables	List	TableBucket*		
				s3tables:namespace	
ListTagsForResource	Grants permission to list the tags for an S3 Tables resource	List	Table		
			TableBucket		
				aws:ResourceTag/${TagKey} s3tables:TableBucketTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutTableBucketEncryption	Grants permission to put or overwrite encryption configuration on a table bucket	Write	TableBucket*		
				s3tables:KMSKeyArn s3tables:SSEAlgorithm	
PutTableBucketMaintenanceConfiguration	Grants permission to put a maintenance configuration on a table bucket	Write	TableBucket*		
PutTableBucketMetricsConfiguration	Grants permission to create or overwrite a metrics configuration on a table bucket	Write	TableBucket*		
PutTableBucketPolicy	Grants permission to create or overwrite a policy on a table bucket	Permissions management	TableBucket*		
PutTableBucketReplication	Grants permission to put table bucket replication configuration on a bucket	Write	TableBucket*		
PutTableBucketStorageClass	Grants permission to set or update the storage class configuration for a table bucket	Write	TableBucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				s3tables:StorageClass	
PutTableData [permission only]	Grants permission to write metadata and data objects to a table storage endpoint using S3 APIs	Write	Table*		
				s3tables:namespace s3tables:tableName	
PutTableEncryption [permission only]	Grants permission to put encryption configuration on a table	Write	Table*		
				s3tables:namespace s3tables:SSEAlgorithm s3tables:KMSKeyArn	
PutTableMaintenanceConfiguration	Grants permission to put a maintenance configuration on a table	Write	Table*		
				s3tables:namespace s3tables:tableName	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutTablePolicy	Grants permission to create or overwrite a policy on a table	Permissions management	Table*		
				s3tables:namespace s3tables:tableName	
PutTableRecordExpirationConfiguration	Grants permission to put a table record expiration configuration on a system table	Write	Table*		
				s3tables:namespace s3tables:tableName	
PutTableReplication	Grants permission to put table replication configuration on a table	Write	Table*		
				s3tables:namespace s3tables:tableName	
PutTableStorageClass	Grants permission to set or update the storage class configuration for a table	Write	Table*		
				s3tables:namespace s3tables:tableName s3tables:StorageClass	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RenameTable	Grants permission to rename a table or move a table across namespaces	Write	Table*		
				s3tables:namespace s3tables:tableName	
TagResource	Grants permission to tag a S3 Tables resource	Tagging	Table		
			TableBucket		
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} s3tables:TableBucketTag/${TagKey}	
UntagResource	Grants permission to untag a S3 Tables resource	Tagging	Table		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			TableBucket		
				aws:TagKeys aws:ResourceTag/${TagKey} s3tables:TableBucketTag/${TagKey}	
UpdateTableMetadataLocation	Grants permission to update the metadata location of a table	Write	Table*		
				s3tables:namespace s3tables:tableName	

Resource types defined by Amazon S3 Tables

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
TableBucket	arn:${Partition}:s3tables:${Region}:${Account}:bucket/${TableBucketName}	aws:ResourceTag/${TagKey} s3tables:TableBucketTag/${TagKey}
Table	arn:${Partition}:s3tables:${Region}:${Account}:bucket/${TableBucketName}/table/${TableID}	aws:ResourceTag/${TagKey} s3tables:TableBucketTag/${TagKey} s3tables:namespace s3tables:tableName

Condition keys for Amazon S3 Tables

Amazon S3 Tables defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String

Condition keys	Description	Type
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
s3tables:KMSKeyArn	Filters access by the AWS KMS key ARN for the key used to encrypt a table	ARN
s3tables:SSEAlgorithm	Filters access by the server-side encryption algorithm used to encrypt a table	String
s3tables:StorageClass	Filters access by the storage class that can be set on tables under a table bucket	String
s3tables:TableBucketTag/${TagKey}	Filters access by the tags associated with the table bucket	String
s3tables:namespace	Filters access by the namespaces created in the table bucket	String
s3tables:tableName	Filters access by the name of the tables in the table bucket	String

Actions, resources, and condition keys for Amazon S3 Vectors

Amazon S3 Vectors (service prefix: `s3vectors`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon S3 Vectors

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateIndex	Grants permission to create a new vector index within a specified vector bucket	Write	Index*		
				s3vectors:sseType s3vectors:kmsKeyArn aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey} s3vectors:VectorBu	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				cketTag/${TagKey}	
CreateVectorBucket	Grants permission to create a new vector bucket	Write	VectorBucket*		
				s3vectors:sseType s3vectors:kmsKeyArn aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteIndex	Grants permission to delete a specified vector index	Write	Index*		
				aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}	
DeleteVectorBucket	Grants permission to delete a specified vector bucket	Write	VectorBucket*		
				aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}	
DeleteVectorBucketPolicy	Grants permission to delete the IAM resource policy from a specified vector bucket	Permissions management	VectorBucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}	
DeleteVectors	Grants permission to delete a batch of vectors from a specified vector index	Write	Index*		
				aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}	
GetIndex	Grants permission to get the attributes of a specified vector index	Read	Index*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}	
GetVectorBucket	Grants permission to get the attributes of a specified vector bucket	Read	VectorBucket*		
				aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}	
GetVectorBucketPolicy	Grants permission to get the IAM resource policy for a specific vector bucket	Read	VectorBucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}	
GetVectors	Grants permission to get a batch of vectors by their vector keys	Read	Index*		
				aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}	
ListIndexes	Grants permission to get a paginated list of all indexes in a specified vector bucket	List	VectorBucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}	
ListTagsForResource	Grants permission to list tags for specified S3Vector resource	List	Index		
			VectorBucket		
				aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}	
ListVectorBuckets	Grants permission to get a paginated list of all vector buckets in the account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListVectors	Grants permission to get a paginated list of all vectors in a specified vector index	List	Index*		s3vectors:GetVectors
				aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}	
PutVectorBucketPolicy	Grants permission to add an IAM resource policy to a specified vector bucket	Permissions management	VectorBucket*		
				aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}	
PutVectors	Grants permission to add a batch of vectors to a specified vector index	Write	Index*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}	
QueryVectors	Grants permission to find approximate nearest neighbors within a specified search vector index for a given query vector	Read	Index*		s3vectors:GetVectors
				aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}	
TagResource	Grants permission to tag a S3Vector resource	Tagging	Index		
			VectorBucket		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}	
UntagResource	Grants permission to untag a S3Vector resource	Tagging	Index VectorBucket		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}	

Resource types defined by Amazon S3 Vectors

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Index	`arn:${Partition}:s3vectors:${Region}:${Account}:bucket/${BucketName}/index/${IndexName}`	aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}

Resource types	ARN	Condition keys
VectorBucket	arn:${Partition}:s3vectors:${Region}:${Account}:bucket/${BucketName}	aws:ResourceTag/${TagKey} s3vectors:VectorBucketTag/${TagKey}

Condition keys for Amazon S3 Vectors

Amazon S3 Vectors defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
s3vectors:VectorBucketTag/${TagKey}	Filters access by the tags associated with the vector bucket	String
s3vectors:kmsKeyArn	Filters access by the AWS KMS key ARN for the key used to encrypt a vector bucket	ARN

Condition keys	Description	Type
s3vectors:sseType	Filters access by server-side encryption type	String

Actions, resources, and condition keys for Amazon SageMaker

Amazon SageMaker (service prefix: `sagemaker`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon SageMaker

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which

the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddAssociation	Grants permission to associate a lineage entity (artifact, context, action,	Write	action*		
			artifact*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	experiment, experiment-trial-component) to each other		context*

				fficEncryption sagemaker:MaxRuntimeInSeconds sagemaker:NetworkIsolation sagemaker:OutputKmsKey sagemaker:VolumeKmsKey sagemaker:VpcSecurityGroupIds sagemaker:VpcSubnets	
CreateImage	Grants permission to create a SageMaker Image	Write	image*		iam:PassRole sagemaker:AddTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateImageVersion	Grants permission to create a SageMaker ImageVersion	Write	image*		
CreateInferenceComponent	Grants permission to create an inference component on an endpoint	Write	endpoint*		sagemaker:AddTags
			inference-component*		
				aws:RequestTag/${TagKey} aws:TagKeys sagemaker:ModelArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateInferenceExperiment	Grants permission to create an inference experiment	Write	inference-experiment*		iam:PassRole sagemaker:AddTags
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateInferenceRecommendationsJob	Grants permission to create an inference recommend ations job	Write	inference-recommendations-job*		iam:PassRole sagemaker:AddTags
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateLabelingJob	Grants permission to start a labeling job. A labeling job takes unlabeled data in and produces labeled data as output, which can be used for training SageMaker models	Write	labeling-job*		iam:PassRole sagemaker:AddTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				sagemaker:WorkteamArn sagemaker:WorkteamType sagemaker:VolumeKmsKey sagemaker:OutputKmsKey aws:RequestTag/${TagKey} aws:TagKeys	
CreateLineageGroupPolicy	Grants permission to create a lineage group policy	Write			
CreateMlflowApp	Grants permission to create an MLflow app	Write	mlflow-app*		iam:PassRole sagemaker:AddTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateMlflowTrackingServer	Grants permission to create an MLflow tracking server	Write	mlflow-tracking-server*	sagemaker:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	iam:PassRole sagemaker:AddTags
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateModel	Grants permission to create a model in Amazon SageMaker. In the request, you specify a name for the model and describe one or more containers	Write	model*		iam:PassRole sagemaker:AddTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys sagemaker:NetworkIsolation sagemaker:VpcSecurityGroupIds sagemaker:VpcSubnets sagemaker:DirectGatedModelAccess	
CreateModelBiasJobDefinition	Grants permission to create a model bias job definition	Write	model-bias-job-definition*		iam:PassRole sagemaker:AddTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys sagemaker:InstanceTypes sagemaker:InterContainerTrafficEncryption sagemaker:MaxRuntimeInSeconds sagemaker:NetworkIsolation sagemaker:OutputKmsKey sagemaker:VolumeKmsKey	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				sagemaker:VpcSecurityGroupIds sagemaker:VpcSubnets	
CreateModelCard	Grants permission to create a model card	Write	model-card*		sagemaker:AddTags
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateModelCardExportJob	Grants permission to create an export job for a model card	Write	model-card*		
CreateModelExplainabilityJobDefinition	Grants permission to create a model explainability job definition	Write	model-explainability-job-definition*		iam:PassRole sagemaker:AddTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys sagemaker:InstanceTypes sagemaker:InterContainerTrafficEncryption sagemaker:MaxRuntimeInSeconds sagemaker:NetworkIsolation sagemaker:OutputKmsKey sagemaker:VolumeKmsKey	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				sagemaker:VpcSecurityGroupIds sagemaker:VpcSubnets	
CreateModelPackage	Grants permission to create a ModelPackage	Write	model-package	sagemaker:CurrentModelLifeCycleStageStatus sagemaker:CurrentModelLifeCycleStage sagemaker:CurrentCustomerMetadataProperties/${MetadataKey}	sagemaker:AddTags
			model-package-group		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys sagemaker:ModelApprovalStatus sagemaker:CustomerMetadataProperties/${MetadataKey} sagemaker:ModelLifeCycle:Stage sagemaker:ModelLifeCycle:StageStatus	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateModelPackageGroup	Grants permission to create a ModelPackageGroup	Write	model-package-group*		sagemaker:AddTags
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateModelQualityJobDefinition	Grants permission to create a model quality job definition	Write	model-quality-job-definition*		iam:PassRole sagemaker:AddTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys sagemaker:InstanceTypes sagemaker:InterContainerTrafficEncryption sagemaker:MaxRuntimeInSeconds sagemaker:NetworkIsolation sagemaker:OutputKmsKey sagemaker:VolumeKmsKey	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				sagemaker:VpcSecurityGroupIds sagemaker:VpcSubnets	
CreateMonitoringSchedule	Grants permission to create a monitoring schedule	Write	monitoring-schedule*		iam:PassRole sagemaker:AddTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys sagemaker:InstanceTypes sagemaker:InterContainerTrafficEncryption sagemaker:MaxRuntimeInSeconds sagemaker:NetworkIsolation sagemaker:OutputKmsKey sagemaker:VolumeKmsKey	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				sagemaker:VpcSecurityGroupIds sagemaker:VpcSubnets	
CreateNotebookInstance	Grants permission to create an Amazon SageMaker notebook instance. A notebook instance is an Amazon EC2 instance running on a Jupyter Notebook	Write	notebook-instance*		iam:PassRole sagemaker:AddTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys sagemaker:AcceleratorTypes sagemaker:DirectInternetAccess sagemaker:InstanceTypes sagemaker:MinimumInstanceMetadataServiceVersion sagemaker:RootAccess	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				sagemaker:VolumeKmsKey sagemaker:VpcSecurityGroupIds sagemaker:VpcSubnets	
CreateNotebookInstanceLifecycleConfig	Grants permission to create a notebook instance lifecycle configuration that can be deployed using Amazon SageMaker	Write	notebook-instance-lifecycle-config*		sagemaker:AddTags
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateOptimizationJob	Grants permission to create an optimization job	Write	optimization-job*		iam:PassRole sagemaker:AddTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreatePartnerApp	Grants permission to create an Amazon SageMaker Partner AI App	Write	partner-app*		sagemaker:AddTags
				aws:RequestTag/${TagKey} aws:TagKeys	
CreatePartnerAppPresignedUrl	Grants permission to return a URL that you can use from your browser to connect to the Amazon SageMaker Partner AI App	Write	partner-app*		
CreatePipeline	Grants permission to create a pipeline	Write	pipeline*		iam:PassRole sagemaker:AddTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreatePresignedDomainUrl	Grants permission to return a URL that you can use from your browser to connect to the Domain as a specified UserProfile when AuthMode is 'IAM'	Write	user-profile*		
CreatePresignedMlflowAppUrl	Grants permission to return a URL that you can use from your browser to connect to the MLflow app	Write	mlflow-app*		
CreatePresignedMlflowTrackingServerUrl	Grants permission to return a URL that you can use from your browser to connect to the MLflow tracking server	Write	mlflow-tracking-server*	sagemaker:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreatePresignedNotebookInstanceUrl	Grants permission to create a URL that you can use from your browser to connect to the Notebook Instance	Write	notebook-instance*		
CreateProcessingJob	Grants permission to start a processing job. After processing completes, Amazon SageMaker saves the resulting artifacts and other optional output to an Amazon S3 location that you specify	Write	processing-job*		iam:PassRole sagemaker:AddTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys sagemaker:InstanceTypes sagemaker:MaxRuntimeInSeconds sagemaker:NetworkIsolation sagemaker:OutputKmsKey sagemaker:VolumeKmsKey sagemaker:VpcSecurityGroupIds	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				sagemaker:VpcSubnets sagemaker:InterContainerTrafficEncryption	
CreateProject	Grants permission to create a Project	Write	project*		sagemaker:AddTags
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateReservedCapacity [permission only]	Grants permission to create a reserved capacity	Write	reserved-capacity*		sagemaker:AddTags
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSharedModel [permission only]	Grants permission to create a shared model in a SageMaker Studio application	Write	shared-model*		
CreateSpace	Grants permission to create a Space for a SageMaker Domain	Write	space*		sagemaker:AddTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys sagemaker:InstanceTypes sagemaker:ImageArns sagemaker:ImageVersionArns sagemaker:OwnerUserProfileArn sagemaker:RemoteAccess sagemaker:SpaceSharingType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				sagemaker:StudioLifecycleConfigArns	
CreateStudioLifecycleConfig	Grants permission to create a Studio Lifecycle Configuration that can be deployed using Amazon SageMaker	Write	studio-lifecycle-config*		sagemaker:AddTags
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateTrainingJob	Grants permission to start a model training job. After training completes, Amazon SageMaker saves the resulting model artifacts and other optional output to an Amazon S3 location that you specify	Write	training-job*		iam:PassRole sagemaker:AddTags
			reserved-capacity		
			training-plan		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys sagemaker:FileSystemAccessMode sagemaker:FileSystemDirectoryPath sagemaker:FileSystemId sagemaker:FileSystemType sagemaker:InstanceTypes sagemaker:InterContainerTra	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				fficEncryption sagemaker:MaxRuntimeInSeconds sagemaker:NetworkIsolation sagemaker:OutputKmsKey sagemaker:VolumeKmsKey sagemaker:VpcSecurityGroupIds sagemaker:VpcSubnets sagemaker:KeepAlivePeriod	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				sagemaker:EnableRemoteDebu sagemaker:DirectGatedModelAccess	
CreateTrainingPlan	Grants permission to create a training plan that allocates resources for scheduling workloads within a specified time range	Write	training-plan*		sagemaker:AddTags sagemaker:CreateReservedCapacity
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTransformJob	Grants permission to start a transform job. After the results are obtained, Amazon SageMaker saves them to an Amazon S3 location that you specify	Write	transform-job*		sagemaker:AddTags
				aws:RequestTag/${TagKey} aws:TagKeys sagemaker:InstanceTypes sagemaker:ModelArn sagemaker:OutputKmsKey sagemaker:VolumeKmsKey	
CreateTrial	Grants permission to create a trial	Write	experiment*		sagemaker:AddTags
			experiment-trial*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateTrialComponent	Grants permission to create a trial component	Write	experiment-trial-component*		sagemaker:AddTags
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateUserProfile	Grants permission to create a UserProfile for a SageMaker Domain	Write	user-profile*		iam:PassRole sagemaker:AddTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys sagemaker:VpcSecurityGroupIds sagemaker:InstanceTypes sagemaker:DomainSharingOutputKmsKey sagemaker:ImageArns sagemaker:ImageVersionArns sagemaker:StudioLi	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				fecycleConfigArns	
CreateWorkforce	Grants permission to create a workforce	Write	workforce*		sagemaker:AddTags
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateWorkteam	Grants permission to create a workteam	Write	workteam*		sagemaker:AddTags
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAction	Grants permission to delete an action	Write	action*		
DeleteAlgorithm	Grants permission to delete an algorithm	Write	algorithm*		
DeleteApp	Grants permission to delete an App	Write	app*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				sagemaker:OwnerUserProfileArn sagemaker:SpaceSharingType	
DeleteAppImageConfig	Grants permission to delete an AppImageConfig	Write	app-image-config*		
DeleteArtifact	Grants permission to delete an artifact	Write	artifact*		
DeleteAssociation	Grants permission to delete the association from a lineage entity (artifact, context, action, experiment, experiment-trial-component) to another	Write	action*		
			artifact*		
			context*		
			experiment*		
			experiment-trial-component*		
DeleteCluster	Grants permission to delete a SageMaker HyperPod cluster	Write	cluster*		eks:DeleteAccessEntry

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteClusterSchedulerConfig	Grants permission to delete a cluster scheduler config	Write	cluster-scheduler-config*		
DeleteCodeRepository	Grants permission to delete a CodeRepository	Write	code-repository*		
DeleteCompilationJob	Grants permission to delete a compilation job	Write	compilation-job*		
DeleteComputeQuota	Grants permission to delete a compute quota	Write	compute-quota*		
DeleteContext	Grants permission to delete a context	Write	context*		
DeleteDataQualityJobDefinition	Grants permission to delete the data quality job definition created using the CreateDataQualityJobDefinition API	Write	data-quality-job-definition*		
DeleteDeviceFleet	Grants permission to delete a device fleet	Write	device-fleet*		
DeleteDomain	Grants permission to delete a Domain	Write	domain*		
DeleteEdgeDeploymentPlan	Grants permission to delete an edge deployment plan	Write	edge-deployment-plan*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteEdgeDeploymentStage	Grants permission to delete an edge deployment stage	Write	edge-deployment-plan*		
DeleteEndpoint	Grants permission to delete an endpoint. Amazon SageMaker frees up all the resources that were deployed when the endpoint was created	Write	endpoint*		
DeleteEndpointConfig	Grants permission to delete the endpoint configuration created using the CreateEndpointConfig API. The DeleteEndpointConfig API deletes only the specified configuration. It does not delete any endpoints created using the configuration	Write	endpoint-config*		
DeleteExperiment	Grants permission to delete an experiment	Write	experiment*		
DeleteFeatureGroup	Grants permission to delete a feature group	Write	feature-group*		
				aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteFlowDefinition	Grants permission to delete the specified flow definition	Write	flow-definition*		
DeleteHub	Grants permission to delete hubs	Write	hub*		
DeleteHubContent	Grants permission to delete hub content	Write	hub*		
			hub-content*		
DeleteHubContentReference	Grants permission to delete hub content reference	Write	hub*		
			hub-content*		
DeleteHumanLoop	Grants permission to delete a specified human loop	Write	human-loop*		
DeleteHumanTaskUi	Grants permission to delete the specified human task user interface (worker task template)	Write	human-task-ui*		
DeleteHyperParameterTuningJob	Grants permission to delete a hyper parameter tuning job	Write	hyper-parameter-tuning-job*		
DeleteImage	Grants permission to delete a SageMaker Image	Write	image*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteImageVersion	Grants permission to delete a SageMaker ImageVersion	Write	image-version*		
DeleteInferenceComponent	Grants permission to delete an inference component. Amazon SageMaker frees up the resources that were reserved when the inference component was created	Write	inference-component*		
DeleteInferenceExperiment	Grants permission to delete an inference experiment	Write	inference-experiment*		
DeleteLineageGroupPolicy	Grants permission to delete a lineage group policy	Write			
DeleteMlflowApp	Grants permission to delete an MLflow app	Write	mlflow-app*		
DeleteMlflowTrackingServer	Grants permission to delete an MLflow tracking server	Write	mlflow-tracking-server*	sagemaker:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteModel	Grants permission to delete a model created using the CreateModel API. The DeleteModel API deletes only the model entry in Amazon SageMaker that you created by calling the CreateModel API. It does not delete model artifacts, inference code, or the IAM role that you specified when creating the model	Write	model*		
DeleteModelBiasJobDefinition	Grants permission to delete the model bias job definition created using the CreateModelBiasJobDefinition API	Write	model-bias-job-definition*		
DeleteModelCard	Grants permission to delete a model card	Write	model-card*		
DeleteModelExplainabilityJobDefinition	Grants permission to delete the model explainability job definition created using the CreateModelExplainabilityJobDefinition API	Write	model-explainability-job-definition*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteModelPackage	Grants permission to delete a ModelPackage	Write	model-package*	sagemaker:CurrentModelLifeCycleStageStatus sagemaker:CurrentModelLifeCycleStage sagemaker:CurrentCustomerMetadataProperties/${MetadataKey}	
DeleteModelPackageGroup	Grants permission to delete a ModelPackageGroup	Write	model-package-group*		
DeleteModelPackageGroupPolicy	Grants permission to delete a ModelPackageGroup policy	Write	model-package-group*		
DeleteModelQualityJobDefinition	Grants permission to delete the model quality job definition created using the CreateModelQualityJobDefinition API	Write	model-quality-job-definition*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteMonitoringSchedule	Grants permission to delete a monitoring schedule	Write	monitoring-schedule*		
DeleteNotebookInstance	Grants permission to delete a Amazon SageMaker notebook instance. Before you can delete a notebook instance, you must call the StopNotebookInstance API	Write	notebook-instance*		
DeleteNotebookInstanceLifecycleConfig	Grants permission to delete a notebook instance lifecycle configuration	Write	notebook-instance-lifecycle-config*		
DeleteOptimizationJob	Grants permission to delete an optimization job	Write	optimization-job*		
DeletePartnerApp	Grants permission to delete an Amazon SageMaker Partner AI App	Write	partner-app*		
DeletePipeline	Grants permission to delete a pipeline	Write	pipeline*		
DeleteProject	Grants permission to delete a project	Write	project*		
DeleteRecord	Grants permission to delete a record from a feature group	Write	feature-group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteResourcePolicy [permission only]	Grants AWS Resource Access Manager permission to delete a resource policy on a SageMaker resource that supports cross-account sharing	Write			
DeleteSpace	Grants permission to delete a Space	Write	space*		
				sagemaker:OwnerUserProfileArn sagemaker:SpaceSharingType	
DeleteStudioLifecycleConfig	Grants permission to delete a Studio Lifecycle Configuration	Write	studio-lifecycle-config*		
DeleteTags	Grants permission to delete the specified set of tags from an Amazon SageMaker resource	Tagging	action		
			algorithm		
			app		
			app-image-config		
			artifact

DeleteUserProfile	Grants permission to delete a UserProfile	Write	user-profile*		
DeleteWorkforce	Grants permission to delete a workforce	Write	workforce*		
DeleteWorkteam	Grants permission to delete a workteam	Write	workteam*		
DeployHubModel	Grants permission to deploy a model in hub to an endpoint	Write	hub*		
			hub-content*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeregisterDevices	Grants permission to deregister a set of devices	Write	device*		
DescribeAction	Grants permission to get information about an action	Read	action*		
DescribeAlgorithm	Grants permission to describe an algorithm	Read	algorithm*		
DescribeApp	Grants permission to describe an App	Read	app*		
DescribeAppImageConfig	Grants permission to describe an AppImageConfig	Read	app-image-config*		
DescribeArtifact	Grants permission to get information about an artifact	Read	artifact*		
DescribeAutoMLJob	Grants permission to describe an AutoML job that was created via the CreateAutoMLJob API	Read	automl-job*		
DescribeAutoMLJobV2	Grants permission to describe an AutoML job that was created via the CreateAutoMLJobV2 API	Read	automl-job*		
DescribeCluster	Grants permission to return information about a SageMaker HyperPod cluster	Read	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeClusterEvent	Grants permission to return information about an Event within a SageMaker HyperPod cluster	Read	cluster*		
DescribeClusterInference [permission only]	Grants permission to get information about the inference operator for a SageMaker HyperPod cluster	Read	cluster*		
DescribeClusterNode	Grants permission to return information about a SageMaker HyperPod cluster node	Read	cluster*		
DescribeClusterSchedulerConfig	Grants permission to get information about a cluster scheduler config	Read	cluster-scheduler-config*		
DescribeCodeRepository	Grants permission to describe a CodeRepository	Read	code-repository*		
DescribeCompilationJob	Grants permission to return information about a compilation job	Read	compilation-job*		
DescribeComputeQuota	Grants permission to get information about a compute quota	Read	compute-quota*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeContext	Grants permission to get information about a context	Read	context*		
DescribeDataQualityJobDefinition	Grants permission to return information about a data quality job definition	Read	data-quality-job-definition*		
DescribeDevice	Grants permission to access information about a device	Read	device*		
DescribeDeviceFleet	Grants permission to access information about a device fleet	Read	device-fleet*		
DescribeDomain	Grants permission to describe a Domain	Read	domain*		
DescribeEdgeDeploymentPlan	Grants permission to access information about an edge deployment plan	Read	edge-deployment-plan*		
DescribeEdgePackagingJob	Grants permission to access information about an edge packaging job	Read	edge-packaging-job*		
DescribeEndpoint	Grants permission to return the description of an endpoint	Read	endpoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeEndpointConfig	Grants permission to return the description of an endpoint configuration, which was created using the CreateEndpointConfig API	Read	endpoint-config*		
DescribeExperiment	Grants permission to return information about an experiment	Read	experiment*		
DescribeFeatureGroup	Grants permission to return information about a feature group	Read	feature-group*		
DescribeFeatureMetadata	Grants permission to return information about a feature metadata	Read	feature-group*		
DescribeFlowDefinition	Grants permission to return information about the specified flow definition	Read	flow-definition*		
DescribeHub	Grants permission to describe hubs	Read	hub*		
DescribeHubContent	Grants permission to describe hub content	Read	hub*		
			hub-content*		
DescribeHumanLoop	Grants permission to return information about the specified human loop	Read	human-loop*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeHumanTaskUi	Grants permission to return detailed information about the specified human review workflow user interface	Read	human-task-ui*		
DescribeHyperParameterTuningJob	Grants permission to describe a hyper parameter tuning job that was created via the CreateHyperParameterTuningJob API	Read	hyper-parameter-tuning-job*		
DescribeImage	Grants permission to return information about a SageMaker Image	Read	image*		
DescribeImageVersion	Grants permission to return information about a SageMaker ImageVersion	Read	image-version*		
DescribeInferenceComponent	Grants permission to return the description of an inference component	Read	inference-component*		
DescribeInferenceExperiment	Grants permission to get information about an inference experiment	Read	inference-experiment*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeInferenceRecommendationsJob	Grants permission to get information about an inference recommendations job	Read	inference-recommendations-job*		
DescribeLabelingJob	Grants permission to return information about a labeling job	Read	labeling-job*		
DescribeLineageGroup	Grants permission to describe a lineage group	Read			
DescribeMlflowApp	Grants permission to get information about an MLflow app	Read	mlflow-app*		
DescribeMlflowTrackingServer	Grants permission to get information about an MLflow tracking server	Read	mlflow-tracking-server*	sagemaker:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
DescribeModel	Grants permission to describe a model that you created using the CreateModel API	Read	model*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeModelBiasJobDefinition	Grants permission to return information about a model bias job definition	Read	model-bias-job-definition*		
DescribeModelCard	Grants permission to get information about a model card	Read	model-card*		
DescribeModelCardExportJob	Grants permission to get information about a model card export job	Read	model-card-export-job*		
DescribeModelExplainabilityJobDefinition	Grants permission to return information about a model explainability job definition	Read	model-explainability-job-definition*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeModelPackage	Grants permission to describe a ModelPackage	Read	model-package*	sagemaker:CurrentModelLifeCycleStageStatus sagemaker:CurrentModelLifeCycleStage sagemaker:CurrentCustomerMetadataProperties/${MetadataKey}	
DescribeModelPackageGroup	Grants permission to describe a ModelPackageGroup	Read	model-package-group*		
DescribeModelQualityJobDefinition	Grants permission to return information about a model quality job definition	Read	model-quality-job-definition*		
DescribeMonitoringSchedule	Grants permission to return information about a monitoring schedule	Read	monitoring-schedule*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeNotebookInstance	Grants permission to return information about a notebook instance	Read	notebook-instance*		
DescribeNotebookInstanceLifecycleConfig	Grants permission to describe a notebook instance lifecycle configuration that was created via the CreateNotebookInstanceLifecycleConfig API	Read	notebook-instance-lifecycle-config*		
DescribeOptimizationJob	Grants permission to return information about an optimization job	Read	optimization-job*		
DescribePartnerApp	Grants permission to describe an Amazon SageMaker Partner AI App	Read	partner-app*		
DescribePipeline	Grants permission to get information about a pipeline	Read	pipeline*		
				sagemaker:PipelineVersionId	
DescribePipelineDefinitionForExecution	Grants permission to get the pipeline definition for a pipeline execution	Read	pipeline-execution*		
DescribePipelineExecution	Grants permission to get information about a pipeline execution	Read	pipeline-execution*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeProcessingJob	Grants permission to return information about a processing job	Read	processing-job*		
DescribeProject	Grants permission to describe a project	Read	project*		
DescribeReservedCapacity	Grants permission to return information about a specified Reserved Capacity	Read	reserved-capacity*		
DescribeSharedModel [permission only]	Grants permission to describe a shared model in a SageMaker Studio application	Read	shared-model*		
DescribeSpace	Grants permission to describe a Space	Read	space*		
DescribeStudioLifecycleConfig	Grants permission to describe a Studio Lifecycle Configuration	Read	studio-lifecycle-config*		
DescribeSubscribedWorkteam	Grants permission to return information about a subscribed workteam	Read	workteam*		
DescribeTrainingJob	Grants permission to return information about a training job	Read	training-job*		
DescribeTrainingPlan	Grants permission to return information about a specified training plan	Read	training-plan*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeTransformJob	Grants permission to return information about a transform job	Read	transform-job*		
DescribeTrial	Grants permission to return information about a trial	Read	experiment-trial*		
DescribeTrialComponent	Grants permission to return information about a trial component	Read	experiment-trial-component*		
DescribeUserProfile	Grants permission to describe a UserProfile	Read	user-profile*		
DescribeWorkforce	Grants permission to return information about a workforce	Read	workforce*		
DescribeWorkteam	Grants permission to return information about a workteam	Read	workteam*		
DetachClusterNodeVolume	Grants permission to detach an Amazon EBS volume from a SageMaker HyperPod cluster node	Write	cluster*		ec2:DescribeVolumes ec2:DetachVolume eks:DescribeCluster

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableSagemakerServicecatalogPortfolio	Grants permission to disable a SageMaker Service Catalog Portfolio	Write			
DisassociateTrialComponent	Grants permission to disassociate a trial component from a trial	Write	experiment-trial*		
			experiment-trial-component*		
			processing-job*		
EnableSagemakerServicecatalogPortfolio	Grants permission to enable a SageMaker Service Catalog Portfolio	Write			
GetDeployments	Grants permission to get deployment plan for device	Read	device*		
GetDeviceFleetReport	Grants permission to access a summary of the devices in a device fleet	Read	device-fleet*		
GetDeviceRegistration	Grants permission to get device registration. After you deploy a model onto edge devices this api is used to get current device registration	Read	device*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetLineageGroupPolicy	Grants permission to retreive a lineage group policy	Read			
GetModelPackageGroupPolicy	Grants permission to get a ModelPackageGroup policy	Read	model-package-group*		
GetRecord	Grants permission to get a record from a feature group	Read	feature-group*		
GetResourcePolicy [permission only]	Grants AWS Resource Access Manager permission to retrieve a resource policy on a SageMaker resource that supports cross-account sharing	Read			
GetSagemakerServicecatalogPortfolioStatus	Grants permission to get a SageMaker Service Catalog Portfolio	Read			
GetScalingConfigurationRecommendation	Grants permission to get a scaling policy configuration recommendation	Read	inference-recommendations-job*		
GetSearchSuggestions	Grants permission to get search suggestions when provided with a keyword	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ImportHubContent	Grants permission to import hub content	Write	hub*		sagemaker:AddTags
			hub-content*		
				aws:RequestTag/${TagKey} aws:TagKeys	
InvokeEndpoint	Grants permission to invoke an endpoint. After you deploy a model into production using Amazon SageMaker hosting services, your client applications use this API to get inferences from the model hosted at the specified endpoint	Read	endpoint*		
			inference-component		
				sagemaker:TargetModel	
InvokeEndpointAsync	Grants permission to get inferences from the hosted model at the specified endpoint in an asynchronous manner	Read	endpoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
InvokeEndpointWithResponseStream	Grants permission to get the inference response as a stream from the specified endpoint	Read	endpoint* inference-component		
ListActions	Grants permission to list actions	List			
ListAlgorithms	Grants permission to list Algorithms	List			
ListAliases	Grants permission to list Aliases that belong to a SageMaker Image or Sagemaker ImageVersion	List	image* image-version*		
ListAppImageConfigs	Grants permission to list the AppImageConfigs in your account	List			
ListApps	Grants permission to list the Apps in your account	List			
ListArtifacts	Grants permission to list artifacts	List			
ListAssociations	Grants permission to list associations	List			
ListAutoMLJobs	Grants permission to list AutoML jobs	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListCandidatesForAutoMLJob	Grants permission to lists candidates for an AutoML job	List			
ListClusterEvents	Grants permission to list events within a SageMaker HyperPod cluster	List	cluster*		
ListClusterNodes	Grants permission to list nodes within a SageMaker HyperPod cluster	List	cluster*		
ListClusterSchedulerConfigs	Grants permission to list cluster scheduler configs	List			
ListClusters	Grants permission to list SageMaker HyperPod clusters	List			
ListCodeRepositories	Grants permission to list code repositories	List			
ListCompilationJobs	Grants permission to list compilation jobs	List			
ListComputeQuotas	Grants permission to list compute quotas	List			
ListContexts	Grants permission to list contexts	List			
ListDataQualityJobDefinitions	Grants permission to list data quality job definitions	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDeviceFleets	Grants permission to list device fleets	List			
ListDevices	Grants permission to list devices	List			
ListDomains	Grants permission to list the Domains in your account	List			
ListEdgeDeploymentPlans	Grants permission to list edge deployment plans	List			
ListEdgePackagingJobs	Grants permission to list edge packaging jobs	List			
ListEndpointConfigs	Grants permission to list endpoint configurations	List			
ListEndpoints	Grants permission to list endpoints	List			
ListExperiments	Grants permission to list experiments	List			
ListFeatureGroups	Grants permission to list feature groups	List			
ListFlowDefinitions	Grants permission to return summary information about flow definitions, given the specified parameters	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListHubContentVersions	Grants permission to list all versions of hub content	List	hub*		
			hub-content*		
ListHubContents	Grants permission to list newest versions of hub content	List	hub*		
ListHubs	Grants permission to list hubs	List			
ListHumanLoops	Grants permission to return summary information about human loops, given the specified parameters	List			
ListHumanTaskUis	Grants permission to return summary information about human review workflow user interfaces, given the specified parameters	List			
ListHyperParameterTuningJobs	Grants permission to list hyper parameter tuning jobs	List			
ListImageVersions	Grants permission to list ImageVersions that belong to a SageMaker Image	List	image*		
ListImages	Grants permission to list SageMaker Images in your account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListInferenceComponents	Grants permission to list inference components	List			
ListInferenceExperiments	Grants permission to list inference experiments	List			
ListInferenceRecommendationsJobSteps	Grants permission to list inference recommendations job steps	List			
ListInferenceRecommendationsJobs	Grants permission to list inference recommendations jobs	List			
ListLabelingJobs	Grants permission to list labeling jobs	List			
ListLabelingJobsForWorkteam	Grants permission to list labeling jobs for workteam	List	workteam*		
ListLineageGroups	Grants permission to list lineage groups	List			
ListMlflowApps	Grants permission to list SageMaker MLflow Apps in your account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListMlflowTrackingServers	Grants permission to list MLflow tracking servers	List			
ListModelBiasJobDefinitions	Grants permission to list model bias job definitions	List			
ListModelCardExportJobs	Grants permission to list export jobs for a model card	List	model-card*		
ListModelCardVersions	Grants permission to list versions of a model card	List	model-card*		
ListModelCards	Grants permission to list model cards	List			
ListModelExplainabilityJobDefinitions	Grants permission to list model explainability job definitions	List			
ListModelMetadata	Grants permission to list model metadata for inference recommendations jobs	List			
ListModelPackageGroups	Grants permission to list ModelPackageGroups	List			
ListModelPackages	Grants permission to list ModelPackages	List	model-package		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListModelQualityJobDefinitions	Grants permission to list model quality job definitions	List			
ListModels	Grants permission to list the models created with the CreateModel API	List			
ListMonitoringAlertHistory	Grants permission to list the history of a monitoring alert	List			
ListMonitoringAlerts	Grants permission to list monitoring alerts	List			
ListMonitoringExecutions	Grants permission to list monitoring executions	List			
ListMonitoringSchedules	Grants permission to list monitoring schedules	List			
ListNotebookInstanceLifecycleConfigs	Grants permission to list the notebook instance lifecycle configurations that can be deployed using Amazon SageMaker	List			
ListNotebookInstances	Grants permission to list the Amazon SageMaker notebook instances in the requester's account in an AWS Region	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListOptimizationJobs	Grants permission to list optimization jobs	List			
ListPartnerApps	Grants permission to list the Amazon SageMaker Partner AI Apps in your account	List			
ListPipelineExecutionSteps	Grants permission to list steps for a pipeline execution	List	pipeline-execution*		
ListPipelineExecutions	Grants permission to list executions for a pipeline	List	pipeline*		
ListPipelineParametersForExecution	Grants permission to list parameters for a pipeline execution	List	pipeline-execution*		
ListPipelineVersions	Grants permission to list versions of a pipeline	List	pipeline*		
ListPipelines	Grants permission to list pipelines	List			
ListProcessingJobs	Grants permission to list processing jobs	List			
ListProjects	Grants permission to list Projects	List			
ListResourceCatalogs	Grants permission to list resource catalogs	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListSharedModelEvents [permission only]	Grants permission to list shared model events	List			
ListSharedModelVersions [permission only]	Grants permission to list shared model versions	List	shared-model*		
ListSharedModels [permission only]	Grants permission to list shared models	List			
ListSpaces	Grants permission to list the Spaces in your account	List			
ListStageDevices	Grants permission to list stage devices	List			
ListStudioLifecycleConfigs	Grants permission to list the Studio Lifecycle Configurations that can be deployed using Amazon SageMaker	List			
ListSubscribedWorkteams	Grants permission to list subscribed workteams	List			
ListTags	Grants permission to list the tag set associated with the specified resource	List	action		
			algorithm

ListTrainingJobsForHyperParameterTuningJob	Grants permission to list training jobs for a hyper parameter tuning job	List	hyper-parameter-tuning-job*		
ListTrainingPlans	Grants permission to list all the training plans that have been created in a specified account	List			
ListTransformJobs	Grants permission to list transform jobs	List			
ListTrialComponents	Grants permission to list trial components	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTrials	Grants permission to list trials	List			
ListUltraServersByReservedCapacity	Grants permission to list all UltraServers in a specified Reserved Capacity	List	reserved-capacity*		
ListUserProfiles	Grants permission to list the UserProfiles in your account	List			
ListWorkforces	Grants permission to list workforces	List			
ListWorkteams	Grants permission to list workteams	List			
PutLineageGroupPolicy	Grants permission to put a lineage group policy	Write			
PutModelPackageGroupPolicy	Grants permission to put a ModelPackageGroup policy	Write	model-package-group*		
PutRecord	Grants permission to put a record to a feature group	Write	feature-group*		
PutResourcePolicy [permission only]	Grants AWS Resource Access Manager permission to create a resource policy on a SageMaker resource that supports cross-account sharing	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
QueryLineage	Grants permission to explore the lineage graph	List			
RegisterDevices	Grants permission to register a set of devices	Write	device*		
				aws:RequestTag/${TagKey} aws:TagKeys	
RenderUiTemplate	Grants permission to render a UI template used for a human annotation task	Read			iam:PassRole
RetryPipelineExecution	Grants permission to retry a pipeline execution	Write	pipeline-execution*		
Search	Grants permission to search for SageMaker objects	Read		sagemaker:SearchVisibilityCondition/${FilterKey}	
SearchTrainingPlanOfferings	Grants permissions to search for the available training plan offerings that best match specified capacity requirements	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SendHeartbeat	Grants permission to publish heartbeat data from devices. After you deploy a model onto edge devices this api is used to report device status	Write	device*		
SendPipelineExecutionStepFailure	Grants permission to fail a pending callback step	Write	pipeline-execution*		
SendPipelineExecutionStepSuccess	Grants permission to succeed a pending callback step	Write	pipeline-execution*		
SendSharedModelEvent [permission only]	Grants permission to send a shared model event	Write	shared-model-event*		
StartEdgeDeploymentStage	Grants permission to start an edge deployment stage	Write	edge-deployment-plan*		
StartHumanLoop	Grants permission to start a human loop	Write	flow-definition*		
StartInferenceExperiment	Grants permission to start an inference experiment	Write	inference-experiment*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartMlflowTrackingServer	Grants permission to start an MLfLow tracking server	Write	mlflow-tracking-server*	sagemaker:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
StartMonitoringSchedule	Grants permission to start a monitoring schedule	Write	monitoring-schedule*		
StartNotebookInstance	Grants permission to start a notebook instance. This launches an EC2 instance with the latest version of the libraries and attaches your EBS volume	Write	notebook-instance*		
StartPipelineExecution	Grants permission to start a pipeline execution	Write	pipeline*		
				sagemaker:PipelineVersionId	
StartSession	Grants permission to start a remote session for a SageMaker space	Write	space*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StopAutoMLJob	Grants permission to stop a running AutoML job	Write	automl-job*		
StopCompilationJob	Grants permission to stop a compilation job	Write	compilation-job*		
StopEdgeDeploymentStage	Grants permission to stop an edge deployment stage	Write	edge-deployment-plan*		
StopEdgePackagingJob	Grants permission to stop an edge packaging job	Write	edge-packaging-job*		
StopHumanLoop	Grants permission to stop a specified human loop	Write	human-loop*		
StopHyperParameterTuningJob	Grants permission to stop a running hyper parameter tuning job create via the CreateHyperParameterTuningJob	Write	hyper-parameter-tuning-job*		
StopInferenceExperiment	Grants permission to stop an inference experiment	Write	inference-experiment*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StopInferenceRecommendationsJob	Grants permission to stop an inference recommendations job	Write	inference-recommendations-job*		
StopLabelingJob	Grants permission to stop a labeling job. Any labels already generated will be exported before stopping	Write	labeling-job*		
StopMlflowTrackingServer	Grants permission to stop an MLflow tracking server	Write	mlflow-tracking-server*	sagemaker:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
StopMonitoringSchedule	Grants permission to stop a monitoring schedule	Write	monitoring-schedule*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StopNotebookInstance	Grants permission to stop a notebook instance. This terminates the EC2 instance. Before terminating the instance, Amazon SageMaker disconnects the EBS volume from it. Amazon SageMaker preserves the EBS volume	Write	notebook-instance*		
StopOptimizationJob	Grants permission to stop an optimization job	Write	optimization-job*		
StopPipelineExecution	Grants permission to stop a pipeline execution	Write	pipeline-execution*		
StopProcessingJob	Grants permission to stop a processing job. To stop a job, Amazon SageMaker sends the algorithm the SIGTERM signal, which delays job termination for 120 seconds	Write	processing-job*		
StopTrainingJob	Grants permission to stop a training job. To stop a job, Amazon SageMaker sends the algorithm the SIGTERM signal, which delays job termination for 120 seconds	Write	training-job*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StopTransformJob	Grants permission to stop a transform job. When Amazon SageMaker receives a StopTransformJob request, the status of the job changes to Stopping. After Amazon SageMaker stops the job, the status is set to Stopped	Write	transform-job*		
TrainHubModel	Grants permission to train a model in hub	Write	hub*		
			hub-content*		
UpdateAction	Grants permission to update an action	Write	action*		
UpdateAppImageConfig	Grants permission to update an AppImageConfig	Write	app-image-config*		
UpdateArtifact	Grants permission to update an artifact	Write	artifact*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateCluster	Grants permission to update a SageMaker HyperPod cluster	Write	cluster*		ec2:DescribeImages ec2:DescribeSnapshots ec2:ModifyImageAttribute ec2:ModifySnapshotAttribute eks:AssociateAccessPolicy eks:CreateAccessEntry eks:DeleteAccessEntry eks:DescribeAccessEntry eks:DescribeCluster

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					iam:PassRole sagemaker:BatchAddClusterNodes sagemaker:BatchDeleteClusterNodes
			reserved-capacity		
			training-plan		
				sagemaker:InstanceTypes sagemaker:VpcSecurityGroupIds sagemaker:VpcSubnets	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateClusterInference [permission only]	Grants permission to update the inference operator for a SageMaker HyperPod cluster	Write	cluster*		eks:AssociateAccessPolicy eks:DescribeCluster eks:ListAssociatedAccessPolicies iam:PassRole sagemaker:DescribeCluster
UpdateClusterSchedulerConfig	Grants permission to update a cluster scheduler config	Write	cluster-scheduler-config*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateClusterSoftware	Grants permission to update platform software for a SageMaker HyperPod cluster	Write	cluster*		ec2:DescribeImages ec2:DescribeSnapshots ec2:ModifyImageAttribute ec2:ModifySnapshotAttribute eks:DescribeCluster
UpdateCodeRepository	Grants permission to update a CodeRepository	Write	code-repository*		
UpdateComputeQuota	Grants permission to update a compute quota	Write	compute-quota*		
UpdateContext	Grants permission to update a context	Write	context*		
UpdateDeviceFleet	Grants permission to update a device fleet	Write	device-fleet*		
UpdateDevices	Grants permission to update a set of devices	Write	device*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateDomain	Grants permission to update a Domain	Write	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				sagemaker:VpcSecurityGroupIds sagemaker:InstanceTypes sagemaker:DomainSharingOutputKmsKey sagemaker:ImageArns sagemaker:ImageVersionArns sagemaker:AppNetworkAccessType sagemaker:VpcSubnets sagemaker:StudioLi	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				fecycleConfigArns	
UpdateEndpoint	Grants permission to update an endpoint to use the endpoint configuration specified in the request	Write	endpoint*		
			endpoint-config*		
UpdateEndpointWeightsAndCapacities	Grants permission to update variant weight, capacity, or both of one or more variants associated with an endpoint	Write	endpoint*		
UpdateExperiment	Grants permission to update an experiment	Write	experiment*		
UpdateFeatureGroup	Grants permission to update a feature group	Write	feature-group*		
UpdateFeatureMetadata	Grants permission to update a feature metadata	Write	feature-group*		
UpdateHub	Grants permission to update hubs	Write	hub*		
UpdateHubContent	Grants permission to update hub content	Write	hub*		
			hub-content*		
UpdateHubContentReference	Grants permission to update hub content reference	Write	hub*		
			hub-content*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateImage	Grants permission to update the properties of a SageMaker Image	Write	image*		iam:PassRole
UpdateImageVersion	Grants permission to update the properties of a SageMaker ImageVersion	Write	image-version*		
UpdateInferenceComponent	Grants permission to update an inference component to use the specification and configurations specified in the request	Write	inference-component*		
UpdateInferenceComponentRuntimeConfig	Grants permission to update the runtime config of a given inference component	Write	inference-component*		
UpdateInferenceExperiment	Grants permission to update an inference experiment	Write	inference-experiment*		
UpdateMlflowApp	Grants permission to update an MLflow app	Write	mlflow-app*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateMlflowTrackingServer	Grants permission to update an MLflow tracking server	Write	mlflow-tracking-server*	sagemaker:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
UpdateModelCard	Grants permission to update a model card	Write	model-card*		
UpdateModelPackage	Grants permission to update a ModelPackage	Write	model-package*	sagemaker:CurrentModelLifeCycleStageStatus sagemaker:CurrentModelLifeCycleStage sagemaker:CurrentCustomerMetadataProperties/${MetadataKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				sagemaker:ModelApprovalStatus sagemaker:CustomerMetadataProperties/${MetadataKey} sagemaker:CustomerMetadataPropertiesToRemove sagemaker:ModelLifeCycle:Stage sagemaker:ModelLifeCycle:StageStatus	
UpdateMonitoringAlert	Grants permission to update a monitoring alert	Write	monitoring-schedule*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			monitoring-schedule-alert*		
UpdateMonitoringSchedule	Grants permission to update a monitoring schedule	Write	monitoring-schedule*		iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys sagemaker:InstanceTypes sagemaker:MaxRuntimeInSeconds sagemaker:NetworkIsolation sagemaker:OutputKmsKey sagemaker:VolumeKmsKey sagemaker:VpcSecurityGroupIds	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				sagemaker:VpcSubnets sagemaker:InterContainerTrafficEncryption	
UpdateNotebookInstance	Grants permission to update a notebook instance. Notebook instance updates include upgrading or downgrading the EC2 instance used for your notebook instance to accommodate changes in your workload requirements	Write	notebook-instance*	sagemaker:AcceleratorTypes sagemaker:InstanceTypes sagemaker:MinimumInstanceMetadataServiceVersion sagemaker:RootAccess	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateNotebookInstanceLifecycleConfig	Grants permission to updates a notebook instance lifecycle configuration created with the CreateNotebookInstanceLifecycleConfig API	Write	notebook-instance-lifecycle-config*		
UpdatePartnerApp	Grants permission to update an Amazon SageMaker Partner AI App	Write	partner-app*		
UpdatePipeline	Grants permission to update a pipeline	Write	pipeline*		iam:PassRole
UpdatePipelineExecution	Grants permission to update a pipeline execution	Write	pipeline-execution*		
UpdatePipelineVersion	Grants permission to update a pipeline version	Write	pipeline*		
				sagemaker:PipelineVersionId	
UpdateProject	Grants permission to update a Project	Write	project*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateSharedModel [permission only]	Grants permission to update a shared model	Write	shared-model*		
UpdateSpace	Grants permission to update a Space	Write	space*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				sagemaker:InstanceTypes sagemaker:ImageArns sagemaker:ImageVersionArns sagemaker:OwnerUserProfileArn sagemaker:RemoteAccess sagemaker:SpaceSharingType sagemaker:StudioLifecycleConfigArns	
UpdateTrainingJob	Grants permission to update a training job	Write	training-job*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				sagemaker:InstanceTypes sagemaker:KeepAlivePeriod sagemaker:EnableRemoteDebu	
UpdateTrial	Grants permission to update a trial	Write	experiment-trial*		
UpdateTrialComponent	Grants permission to update a trial component	Write	experiment-trial-component*		
UpdateUserProfile	Grants permission to update a UserProfile	Write	user-profile*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				sagemaker:InstanceTypes sagemaker:VpcSecurityGroupIds sagemaker:InstanceTypes sagemaker:DomainSharingOutputKmsKey sagemaker:ImageArns sagemaker:ImageVersionArns sagemaker:StudioLifecycleConfigArns	
UpdateWorkforce	Grants permission to update a workforce	Write	workforce*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateWorkteam	Grants permission to update a workteam	Write	workteam*		

Resource types defined by Amazon SageMaker

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
device	`arn:${Partition}:sagemaker:${Region}:${Account}:device-fleet/${DeviceFleetName}/device/${DeviceName}`	aws:ResourceTag/${TagKey} sagemaker:ResourceTag/${TagKey}
device-fleet	`arn:${Partition}:sagemaker:${Region}:${Account}:device-fleet/${DeviceFleetName}`	aws:ResourceTag/${TagKey} sagemaker:ResourceTag/${TagKey}
edge-packaging-job	`arn:${Partition}:sagemaker:${Region}:${Account}:edge-packaging-job/${EdgePackagingJobName}`	aws:ResourceTag/${TagKey} sagemaker:ResourceTag/${TagKey}

Condition keys for Amazon SageMaker

Amazon SageMaker defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a key that is present in the request the user makes to the SageMaker service	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair	String
aws:TagKeys	Filters access by the list of all the tag key names associated with the resource in the request	ArrayOfString
sagemaker:AcceleratorTypes	Filters access by the list of all accelerator types associated with the resource in the request	ArrayOfString
sagemaker:AppNetworkAccessType	Filters access by the app network access type associated with the resource in the request	String

Condition keys	Description	Type
sagemaker:CurrentCustomerMetadataProperties/${MetadataKey}	Filters access by a current metadata key and value pair associated with the model-package resource	String
sagemaker:CurrentModelLifeCycleStage	Filters access by the current value of the Stage field in the model life cycle object associated with the model-package resource	String
sagemaker:CurrentModelLifeCycleStageStatus	Filters access by the current value of the StageStatus field in the model life cycle object associated with the model-package resource	String
sagemaker:CustomerMetadataProperties/${MetadataKey}	Filters access by a metadata key and value pair	String
sagemaker:CustomerMetadataPropertiesToRemove	Filters access by the list of metadata properties associated with the model-package resource in the request	ArrayOfString
sagemaker:DirectGatedModelAccess	Used to deny direct access to SageMaker gated ModelReferences	String
sagemaker:DirectInternetAccess	Filters access by the direct internet access associated with the resource in the request	String

Condition keys	Description	Type
sagemaker:DomainId	You can use the domainId as a policy variable to filter requests from specific SageMaker Domains	String
sagemaker:DomainSharingOutputKmsKey	Filters access by the Domain sharing output KMS key associated with the resource in the request	ARN
sagemaker:EnableRemoteDebug	Filters access by the remote debug config in the request	Bool
sagemaker:FeatureGroupDisableGlueTableCreation	Filters access by the DisableGlueTableCreation flag associated with the feature group resource in the request	Bool
sagemaker:FeatureGroupEnableOnlineStore	Filters access by the EnableOnlineStore flag associated with feature group in the request	Bool
sagemaker:FeatureGroupOfflineStoreConfig	Filters access by the presence of an OfflineStoreConfig in the feature group resource in the request. This access filter only supports the null-conditional operator	Bool
sagemaker:FeatureGroupOfflineStoreKmsKey	Filters access by the offline store kms key associated with the feature group resource in the request	ARN

Condition keys	Description	Type
sagemaker:FeatureGroupOfflineStoreS3Uri	Filters access by the offline store s3 uri associated with the feature group resource in the request	String
sagemaker:FeatureGroupOnlineStoreKmsKey	Filters access by the online store kms key associated with the feature group resource in the request	ARN
sagemaker:FileSystemAccessMode	Filters access by a file system access mode associated with the resource in the request	String
sagemaker:FileSystemDirectoryPath	Filters access by a file system directory path associated with the resource in the request	String
sagemaker:FileSystemId	Filters access by a file system ID associated with the resource in the request	String
sagemaker:FileSystemType	Filters access by a file system type associated with the resource in the request	String
sagemaker:HomeEfsFileSystemKmsKey	Filters access by a key that is present in the request the user makes to the SageMaker service. This key is deprecated. It has been replaced by sagemaker:VolumeKmsKey	ARN
sagemaker:ImageArns	Filters access by the list of all image arns associated with the resource in the request	ArrayOfARN
sagemaker:ImageVersionArns	Filters access by the list of all image version arns associated with the resource in the request	ArrayOfARN

Condition keys	Description	Type
sagemaker:InstanceTypes	Filters access by the list of all instance types associated with the resource in the request	ArrayOfString
sagemaker:InterContainerTrafficEncryption	Filters access by the inter container traffic encryption associated with the resource in the request	Bool
sagemaker:KeepAlivePeriod	Filters access by the keep-alive period associated with the resource in the request	Numeric
sagemaker:MaxRuntimeInSeconds	Filters access by the max runtime in seconds associated with the resource in the request	Numeric
sagemaker:MinimumInstanceMetadataServiceVersion	Filters access by the minimum instance metadata service version used by the resource in the request	String
sagemaker:ModelApprovalStatus	Filters access by the model approval status with the model-package in the request	String
sagemaker:ModelArn	Filters access by the model arn associated with the resource in the request	ARN
sagemaker:ModelLifeCycle:Stage	Filters access by stage field in the model life cycle object associated with the model-package resource in the request	String
sagemaker:ModelLifeCycle:StageStatus	Filters access by stageStatus field in the model life cycle object associated with the model-package resource in the request	String

Condition keys	Description	Type
sagemaker:NetworkIsolation	Filters access by the network isolation associated with the resource in the request	Bool
sagemaker:OutputKmsKey	Filters access by the output kms key associated with the resource in the request	ARN
sagemaker:OwnerUserProfileArn	Filters access by the OwnerUserProfile arn associated with the space in the request	ARN
sagemaker:PipelineVersionId	Filters access to specific version IDs of a Sagemaker pipeline	String
sagemaker:RemoteAccess	Filters access by the remote access flag associated with the space in the request	String
sagemaker:ResourceTag/	Filters access by the preface string for a tag key and value pair attached to a resource	String
sagemaker:ResourceTag/${TagKey}	Filters access by a tag key and value pair	String
sagemaker:RootAccess	Filters access by the root access associated with the resource in the request	String
sagemaker:SearchVisibilityCondition/${FilterKey}	Limits the results of your search request to the resources that you can access. ${FilterKey} is a key that the VisibilityConditions configuration presents in the Search request	String

Condition keys	Description	Type
sagemaker:ServerlessMaxConcurrency	Filters access by limiting maximum concurrency used for Serverless inference in the request	Numeric
sagemaker:ServerlessMemorySize	Filters access by limiting memory size used for Serverless inference in the request	Numeric
sagemaker:SpaceSharingType	Filters access by the sharing type associated with the space in the request	String
sagemaker:StudioLifecycleConfigArns	Filters access by the list of lifecycle configuration ARNs associated with the resource in the request	ArrayOfARN
sagemaker:TaggingAction	Filters access by the API actions to which a user can apply tags. Uses the name of the API operation that creates a taggable resource to filter access	String
sagemaker:TargetModel	Filters access by the target model associated with the Multi-Model Endpoint in the request	String
sagemaker:UserProfileName	You can use the UserProfileName as a policy variable to filter requests from specific user profiles within a SageMaker Domain. This context key is not applicable to user profiles within shared spaces	String
sagemaker:VolumeKmsKey	Filters access by the volume kms key associated with the resource in the request	ARN
sagemaker:VpcSecurityGroupIds	Filters access by the list of all VPC security group ids associated with the resource in the request	ArrayOfString

Condition keys	Description	Type
sagemaker:VpcSubnets	Filters access by the list of all VPC subnets associated with the resource in the request	ArrayOfString
sagemaker:WorkteamArn	Filters access by the workteam arn associated to the request	ARN
sagemaker:WorkteamType	Filters access by the workteam type associated to the request. This can be public-crowd, private-crowd or vendor-crowd	String

Actions, resources, and condition keys for Amazon SageMaker data science assistant

Amazon SageMaker data science assistant (service prefix: `sagemaker-data-science-assistant`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Condition keys for Amazon SageMaker data science assistant

Actions defined by Amazon SageMaker data science assistant

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SendConversation [permission only]	Grants permission to start a conversation with SageMaker data science assistant	Write			

Resource types defined by Amazon SageMaker data science assistant

Amazon SageMaker data science assistant does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon SageMaker data science assistant, specify `"Resource": "*"` in your policy.

Condition keys for Amazon SageMaker data science assistant

SageMakerDataScienceAssistant has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon SageMaker geospatial capabilities

Amazon SageMaker geospatial capabilities (service prefix: `sagemaker-geospatial`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteEarthObservationJob	Grants permission to the DeleteEarthObservationJob operation which deletes an existing earth observation job	Write	EarthObservationJob*		
				aws:ResourceTag/${TagKey}	
DeleteVectorEnrichmentJob	Grants permission to the DeleteVectorEnrichmentJob operation which deletes an existing vector enrichment job	Write	VectorEnrichmentJob*		
				aws:ResourceTag/${TagKey}	
ExportEarthObservationJob	Grants permission to copy results of an earth observation job to an S3 location	Write	EarthObservationJob*		iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
ExportVectorEnrichmentJob	Grants permission to copy results of an VectorEnrichmentJob to an S3 location	Write	VectorEnrichmentJob*		iam:PassRole
				aws:ResourceTag/${TagKey}	
GetEarthObservationJob	Grants permission to return details about the earth observation job	Read	EarthObservationJob*		
				aws:ResourceTag/${TagKey}	
GetRasterDataCollection	Grants permission to return details about the raster data collection	Read	RasterDataCollection*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTile	Grants permission to get the tile of an earth observation job	Read	EarthObservationJob*		iam:PassRole
GetVectorEnrichmentJob	Grants permission to return details about the vector enrichment job	Read	VectorEnrichmentJob*		
				aws:ResourceTag/${TagKey}	
ListEarthObservationJobs	Grants permission to return an array of earth observation jobs associated with the current account	List			
ListRasterDataCollections	Grants permission to return an array of aster data collections associated with the given model name	List			
ListTagsForResource	Grants permission to lists tag for an SageMaker Geospatial resource	List	EarthObservationJob		
			RasterDataCollection		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			VectorEnrichmentJob		
				aws:ResourceTag/${TagKey}	
ListVectorEnrichmentJobs	Grants permission to return an array of vector enrichment jobs associated with the current account	List			
SearchRasterDataCollection	Grants permission to query raster data collections	Read			
StartEarthObservationJob	Grants permission to the StartEarthObservationJob operation which starts a new earth observation job to your account	Write	EarthObservationJob*		iam:PassRole sagemaker-geospatial:TagResource
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartVectorEnrichmentJob	Grants permission to the StartVectorEnrichmentJob operation which starts a new vector enrichment job to your account	Write	VectorEnrichmentJob*		iam:PassRole sagemaker-geospatial:TagResource
				aws:RequestTag/${TagKey} aws:TagKeys	
StopEarthObservationJob	Grants permission to the StopEarthObservationJob operation which stops an existing earth observation job	Write	EarthObservationJob*		
				aws:ResourceTag/${TagKey}	
StopVectorEnrichmentJob	Grants permission to the StopVectorEnrichmentJob operation which stops an existing vector enrichment job	Write	VectorEnrichmentJob*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to tag an SageMaker Geospatial resource	Tagging	EarthObservationJob		
			RasterDataCollection		
			VectorEnrichmentJob		
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
UntagResource	Grants permission to untag an SageMaker Geospatial resource	Tagging	EarthObservationJob		
			RasterDataCollection		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			VectorEnrichmentJob		
				aws:TagKeys	

Resource types defined by Amazon SageMaker geospatial capabilities

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
EarthObservationJob	`arn:${Partition}:sagemaker-geospatial:${Region}:${Account}:earth-observation-job/${JobID}`	aws:ResourceTag/${TagKey}
RasterDataCollection	`arn:${Partition}:sagemaker-geospatial:${Region}:${Account}:raster-data-collection/${CollectionID}`	aws:ResourceTag/${TagKey}
VectorEnrichmentJob	`arn:${Partition}:sagemaker-geospatial:${Region}:${Account}:vector-enrichment-job/${JobID}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon SageMaker geospatial capabilities

Amazon SageMaker geospatial capabilities defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon SageMaker Unified Studio MCP

Amazon SageMaker Unified Studio MCP (service prefix: `sagemaker-unified-studio-mcp`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AccessUI	Grants permission to access the MLflow UI	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateExperiment	Grants permission to create an MLflow experiment	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
CreateModelVersion	Grants permission to create a new model version	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
CreateRegisteredModel	Grants permission to create a registered model	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
CreateRun	Grants permission to create a new run within an experiment	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
DeleteExperiment	Grants permission to mark an MLflow experiment for deletion	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
DeleteLoggedModel	Grants permission to delete a logged model in MLflow	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteLoggedModelTag	Grants permission to delete a tag for a logged model in MLflow	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
DeleteModelVersion	Grants permission to delete a model version	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
DeleteModelVersionTag	Grants permission to delete a model version tag	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
DeleteRegisteredModel	Grants permission to delete a registered model	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
DeleteRegisteredModelAlias	Grants permission to delete a registered model alias	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
DeleteRegisteredModelTag	Grants permission to delete a registered model tag	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteRun	Grants permission to mark a run for deletion	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
DeleteTag	Grants permission to delete a tag on a run	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
DeleteTraceTag	Grants permission to delete a trace tag in MLflow	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
DeleteTraces	Grants permission to delete traces in MLflow	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
EndTrace	Grants permission to end a trace in MLflow	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
FinalizeLoggedModel	Grants permission to set status for a logged model in MLflow	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDownloadURIForModelVersionArtifacts	Grants permission to get a URI to download model artifacts for a specific model version	Read	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
GetExperiment	Grants permission to get metadata for an MLflow experiment	Read	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
GetExperimentByName	Grants permission to get metadata for an MLflow experiment by name	Read	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
GetLatestModelVersions	Grants permission to get the latest model versions	List	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
GetLoggedModel	Grants permission to get a logged model in MLflow	Read	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
GetMetricHistory	Grants permission to get a list of all values for the specified metric for a given run	Read	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetModelVersion	Grants permission to get a model version by model name and version	Read	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
GetModelVersionByAlias	Grants permission to get model version by alias in MLflow	Read	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
GetRegisteredModel	Grants permission to get a registered model	Read	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
GetRun	Grants permission to get metadata, metrics, parameters, and tags for a run	Read	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
GetTraceInfo	Grants permission to get information about a trace in MLflow	Read	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
ListArtifacts	Grants permission to list artifacts for a run	List	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListLoggedModelArtifacts	Grants permission to list artifacts for a logged model in MLflow	List	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
LogBatch	Grants permission to log a batch of metrics, parameters, and tags for a run	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
LogInputs	Grants permission to log inputs for a run	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
LogLoggedModelParams	Grants permission to log params for a logged model in MLflow	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
LogMetric	Grants permission to log a metric for a run	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
LogModel	Grants permission to log the model associated with a run	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
LogOutputs	Grants permission to log outputs, such as models, for a run in MLflow	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
LogParam	Grants permission to log a parameter tracked during a run	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
RenameRegisteredModel	Grants permission to rename a registered model	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
RestoreExperiment	Grants permission to restore an experiment marked for deletion	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
RestoreRun	Grants permission to restore a deleted run	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
SearchExperiments	Grants permission to search for MLflow experiments	Read	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SearchLoggedModels	Grants permission to search for logged models in MLflow	Read	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
SearchModelVersions	Grants permission to search for a model version	Read	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
SearchRegisteredModels	Grants permission to search for registered models in MLflow	Read	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
SearchRuns	Grants permission to search for runs that satisfy expressions	Read	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
SearchTraces	Grants permission to search for traces in MLflow	Read	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
SetExperimentTag	Grants permission to set a tag on an experiment	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SetLoggedModelTags	Grants permission to set tags for a logged model in MLflow	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
SetModelVersionTag	Grants permission to set a tag for the model version	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
SetRegisteredModelAlias	Grants permission to set a registered model alias	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
SetRegisteredModelTag	Grants permission to set a tag for a registered model	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
SetTag	Grants permission to set a tag on a run	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
SetTraceTag	Grants permission to set a trace tag in MLflow	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartTrace	Grants permission to start a trace in MLflow	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
TransitionModelVersionStage	Grants permission to transition a model version to a particular stage	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
UpdateExperiment	Grants permission to update the metadata for an MLflow experiment	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
UpdateModelVersion	Grants permission to update the model version	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
UpdateRegisteredModel	Grants permission to update a registered model	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	
UpdateRun	Grants permission to update run metadata	Write	mlflow-tracking-server*	aws:ResourceTag/${TagKey}	

Resource types defined by Amazon SageMaker with MLflow

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
mlflow-tracking-server	`arn:${Partition}:sagemaker:${Region}:${Account}:mlflow-tracking-server/${MlflowTrackingServerName}`	

Condition keys for Amazon SageMaker with MLflow

Amazon SageMaker with MLflow defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair	String

Actions, resources, and condition keys for AWS Savings Plans

AWS Savings Plans (service prefix: `savingsplans`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS Savings Plans

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSavingsPlan	Grants permission to create a savings plan	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteQueuedSavingsPlan	Grants permission to delete the queued savings plan associated with customers account	Write	savingsplan*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeSavingsPlanRates	Grants permission to describe the rates associated with customers savings plan	Read	savingsplan*		
				aws:ResourceTag/${TagKey}	
DescribeSavingsPlans	Grants permission to describe the savings plans associated with customers account	Read	savingsplan*		
				aws:ResourceTag/${TagKey}	
DescribeSavingsPlansOfferingRates	Grants permission to describe the rates assciated with savings plans offerings	Read			
DescribeSavingsPlansOfferings	Grants permission to describe the savings plans offerings that customer is eligible to purchase	Read			
ListTagsForResource	Grants permission to list tags for a savings plan	List	savingsplan*		
ReturnSavingsPlan	Grants permission to return a savings plan	Write	savingsplan*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
TagResource	Grants permission to tag a savings plan	Tagging	savingsplan*		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to untag a savings plan	Tagging	savingsplan*		
				aws:TagKeys	

Resource types defined by AWS Savings Plans

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
savingsplan	`arn:${Partition}:savingsplans::${Account}:savingsplan/${ResourceId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Savings Plans

AWS Savings Plans defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters access by tag-value associated with the resource	String
aws:TagKeys	Filters access by the presence of mandatory tags in the request	ArrayOfString

Actions, resources, and condition keys for AWS Secrets Manager

AWS Secrets Manager (service prefix: `secretsmanager`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Secrets Manager

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetSecretValue	Grants permission to retrieve and decrypt a list of secrets	List			
CancelRotateSecret	Grants permission to cancel an in-progress secret rotation	Write	Secret*	secretsmanager:SecretId secretsmanager:resource/AllowRotationLambdaArn secretsmanager:ResourceTag/tag-key	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} secretsmanager:SecretPrimaryRegion secretsmanager:resource/Type	
CreateSecret	Grants permission to create a secret that stores encrypted data that can be queried and rotated	Write	Secret*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				secretsmanager:Name secretsmanager:Description secretsmanager:KmsKeyArn secretsmanager:KmsKeyId aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys secretsmanager:ResourceTag/tag-key	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				secretsmanager:AddReplicaRegions secretsmanager:ForceOverwriteReplicaSecret secretsmanager:Type	
DeleteResourcePolicy	Grants permission to delete the resource policy attached to a secret	Permissions management	Secret*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				secretsmanager:SecretId secretsmanager:resource/AllowRotationLambdaArn secretsmanager:ResourceTag/tag-key aws:ResourceTag/${TagKey} secretsmanager:SecretPrimaryRegion secretsmanager:resource/Type	
DeleteSecret	Grants permission to delete a secret	Write	Secret*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				secretsmanager:SecretId secretsmanager:resource/AllowRotationLambdaArn secretsmanager:RecoveryWindowInDays secretsmanager:ForceDeleteWithoutRecovery secretsmanager:ResourceTag/tag-key aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				secretsmanager:SecretPrimaryRegion secretsmanager:resource/Type	
DescribeSecret	Grants permission to retrieve the metadata about a secret, but not the encrypted data	Read	Secret*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				secretsmanager:SecretId secretsmanager:resource/AllowRotationLambdaArn secretsmanager:ResourceTag/tag-key aws:ResourceTag/${TagKey} secretsmanager:SecretPrimaryRegion secretsmanager:resource/Type	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetRandomPassword	Grants permission to generate a random string for use in password creation	Read			
GetResourcePolicy	Grants permission to get the resource policy attached to a secret	Read	Secret*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				secretsmanager:SecretId secretsmanager:resource/AllowRotationLambdaArn secretsmanager:ResourceTag/tag-key aws:ResourceTag/${TagKey} secretsmanager:SecretPrimaryRegion secretsmanager:resource/Type	
GetSecretValue		Read	Secret*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	Grants permission to retrieve and decrypt the encrypted data				

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				secretsmanager:SecretId secretsmanager:VersionId secretsmanager:VersionStage secretsmanager:resource/AllowRotationLambdaArn secretsmanager:ResourceTag/tag-key aws:ResourceTag/${TagKey} secretsmanager:SecretPrimaryRegion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				secretsmanager:resource/Type	
ListSecretVersionIds	Grants permission to list the available versions of a secret	Read	Secret*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				secretsmanager:SecretId secretsmanager:resource/AllowRotationLambdaArn secretsmanager:ResourceTag/tag-key aws:ResourceTag/${TagKey} secretsmanager:SecretPrimaryRegion secretsmanager:resource/Type	
ListSecrets	Grants permission to list the available secrets	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutResourcePolicy	Grants permission to attach a resource policy to a secret	Permissions management	Secret*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				secretsmanager:SecretId secretsmanager:resource/AllowRotationLambdaArn secretsmanager:ResourceTag/tag-key aws:ResourceTag/${TagKey} secretsmanager:BlockPublicPolicy secretsmanager:SecretPrimaryRegion secretsmanager:res	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ource/ Type	
PutSecret Value	Grants permission to create a new version of the secret with new encrypted data	Write	Secret*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				secretsmanager:SecretId secretsmanager:resource/AllowRotationLambdaArn secretsmanager:ResourceTag/tag-key aws:ResourceTag/${TagKey} secretsmanager:SecretPrimaryRegion secretsmanager:resource/Type	
	Grants permission to remove regions from replication	Write	Secret*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RemoveRegionsFromReplication				secretsmanager:SecretId secretsmanager:resource/AllowRotationLambdaArn secretsmanager:ResourceTag/tag-key aws:ResourceTag/${TagKey} secretsmanager:SecretPrimaryRegion secretsmanager:resource/Type	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Replicate SecretToRegions	Grants permission to convert an existing secret to a multi-Region secret and begin replicating the secret to a list of new regions	Write	Secret*	secretsmanager:SecretId secretsmanager:resource/AllowRotationLambdaArn secretsmanager:ResourceTag/tag-key aws:ResourceTag/${TagKey} secretsmanager:SecretPrimaryRegion secretsmanager:AddReplicaRegions	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				secretsmanager:ForceOverwriteReplicaSecret secretsmanager:resource/Type

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				secretsmanager:SecretId secretsmanager:resource/AllowRotationLambdaArn secretsmanager:ResourceTag/tag-key aws:ResourceTag/${TagKey} secretsmanager:SecretPrimaryRegion secretsmanager:resource/Type	

Resource types defined by AWS Secrets Manager

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Secret	`arn:${Partition}:secretsmanager:${Region}:${Account}:secret:${SecretId}`	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys secretsmanager:ResourceTag/tag-key secretsmanager:resource/AllowRotationLambdaArn secretsmanager:resource/Type

Condition keys for AWS Secrets Manager

AWS Secrets Manager defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a key that is present in the request the user makes to the Secrets Manager service	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the list of all the tag key names present in the request the user makes to the Secrets Manager service	ArrayOfString
secretsmanager:AddReplicaRegions	Filters access by the list of Regions in which to replicate the secret	ArrayOfString
secretsmanager:BlockPublicPolicy	Filters access by whether the resource policy blocks broad AWS account access	Bool
secretsmanager:Description	Filters access by the description text in the request	String
secretsmanager:ExternalSecretRotationRoleArn	Filters access by the managed external secret rotation role ARN in the request	ARN
secretsmanager:ForceDeleteWithoutRecovery	Filters access by whether the secret is to be deleted immediately without any recovery window	Bool
secretsmanager:For	Filters access by whether to overwrite a secret with the same name in the destination Region	Bool

Condition keys	Description	Type
ceOverwriteReplicaSecret		
secretsmanager:KmsKeyArn	Filters access by the key ARN of the KMS key in the request	ARN
secretsmanager:KmsKeyId	Filters access by the key identifier of the KMS key in the request. Deprecated: Use secretsmanager:KmsKeyArn	String
secretsmanager:ModifyRotationRules	Filters access by whether the rotation rules of the secret are to be modified	Bool
secretsmanager:Name	Filters access by the friendly name of the secret in the request	String
secretsmanager:RecoveryWindowInDays	Filters access by the number of days that Secrets Manager waits before it can delete the secret	Numeric
secretsmanager:ResourceTag/tag-key	Filters access by a tag key and value pair	String
secretsmanager:RotateImmediately	Filters access by whether the secret is to be rotated immediately	Bool
secretsmanager:RotationLambdaARN	Filters access by the ARN of the rotation Lambda function in the request	ARN

Condition keys	Description	Type
secretsmanager:SecretId	Filters access by the SecretID value in the request	ARN
secretsmanager:SecretPrimaryRegion	Filters access by primary region in which the secret is created if the secret is a multi-Region secret	String
secretsmanager:Type	Filters access by the managed external secret type in the request	String
secretsmanager:VersionId	Filters access by the unique identifier of the version of the secret in the request	String
secretsmanager:VersionStage	Filters access by the list of version stages in the request	String
secretsmanager:resource/AllowRotationLambdaArn	Filters access by the ARN of the rotation Lambda function associated with the secret	ARN
secretsmanager:resource/Type	Filters access by the managed external secret type associated with the secret	String

Actions, resources, and condition keys for AWS Security Agent

AWS Security Agent (service prefix: `securityagent`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Topics

Actions defined by AWS Security Agent

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddArtifact	Grants permission to add an Artifact for the given Agent Space	Write	AgentSpace*		
BatchDeletePentests	Grants permission to delete multiple penetration tests in a single request	Write	AgentSpace*		kms:Decrypt
BatchGetAgentSpaces	Grants permission to retrieve multiple agent spaces in a single request	Read	AgentSpace*		kms:Decrypt
BatchGetArtifactMetadata	Grants permission to retrieve one or more Artifact Metadata records for the given Agent Space	Read	AgentSpace*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetFindings	Grants permission to retrieve multiple security testing findings in a single request	Read	AgentSpace*		kms:Decrypt
BatchGetPentestJobContentMetadata	Grants permission to retrieve multiple pentest job contents metadata in a single request	Read	AgentSpace*		kms:Decrypt
BatchGetPentestJobTasks	Grants permission to retrieve multiple pentest job tasks in a single request	Read	AgentSpace*		kms:Decrypt
BatchGetPentestJobs	Grants permission to retrieve multiple security testing jobs in a single request	Read	AgentSpace*		kms:Decrypt
BatchGetPentests	Grants permission to retrieve multiple penetration tests in a single request	Read	AgentSpace*		kms:Decrypt
BatchGetTargetDomains	Grants permission to retrieve multiple target domains in a single request	Read	TargetDomain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAgentSpace	Grants permission to create an agent space record	Write		aws:RequestTag/${TagKey} aws:TagKeys	kms:Decrypt kms:DescribeKey kms:GenerateDataKeyWithoutPlaintext
CreateApplication	Grants permission to create a new application	Write		aws:RequestTag/${TagKey} aws:TagKeys	iam:PassRole kms:DescribeKey sso:CreateApplication
CreateDesignReview	Grants permission to create a design review	Write	AgentSpace*		
CreateIntegration	Grants permission to create a security testing integration	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateMembership	Grants permission to add a single member to a agent space with specified role	Write	AgentSpace*		
CreateOneTimeLoginSession	Grants permission to create a one time login session	Write	AgentSpace*		
CreatePentest	Grants permission to create a new penetration test configuration	Write	AgentSpace*		kms:Decrypt
CreateSecurityRequirement	Grants permission to add a customer managed Security Requirement	Write	SecurityRequirementPack*		
CreateTargetDomain	Grants permission to create a target domain record	Write			
DeleteAgentSpace	Grants permission to delete an agent space record	Write	AgentSpace*		kms:Decrypt
DeleteApplication	Grants permission to delete application	Write	Application*		
DeleteArtifact	Grants permission to delete an Artifact	Write	AgentSpace*		
DeleteDesignReview	Grants permission to delete a design review	Write	AgentSpace*		
DeleteIntegration	Grants permission to delete the integration of an application	Write	Integration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteMembership	Grants permission to remove a single member associated to an agent space	Write	AgentSpace*		
DeleteSecurityRequirement	Grants permission to delete a customer managed Security Requirement	Write	SecurityRequirementPack*		
DeleteTargetDomain	Grants permission to delete a target domain record	Write	TargetDomain*		
GetApplication	Grants permission to get application details by application ID	Read	Application*		
GetArtifact	Grants permission to retrieve an Artifact for the given Agent Space	Read	AgentSpace*		
GetDesignReview	Grants permission to get the status of the associated agent space design review	Read	AgentSpace*		
GetDesignReviewArtifact	Grants permission to get design review artifact for a specific document	Read	AgentSpace*		
GetDesignReviewFeedback	Grants permission to get feedback for a design review comment	Read	AgentSpace*		
GetIntegration	Grants permission to get the integration metadata by ID	Read	Integration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSecurityRequirement	Grants permission to retrieve a Security Requirement	Read	SecurityRequirementPack*		
InitiateProviderRegistration	Grants permission to initiate the registration of Security Agent App for the given provider (eg: GitHub)	Write			
ListAgentSpaces	Grants permission to list agent spaces	List			
ListApplications	Grants permission to list all applications in the account	List			
ListArtifacts	Grants permission to list all artifacts for the given agent space	List	AgentSpace*		
ListDesignReviewComments	Grants permission to list design review comments	List	AgentSpace*		
ListDesignReviews	Grants permission to list all design reviews for the given agent space	List	AgentSpace*		
ListDiscoveredEndpoints	Grants permission to list discovered endpoints associated with a pentest job with optional URI prefix filtering	List	AgentSpace*		kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListFindings	Grants permission to list findings with filtering and pagination support	List	AgentSpace*		kms:Decrypt
ListIntegratedResources	Grants permission to list integrated resources for an agent space	List	AgentSpace*		
ListIntegrations	Grants permission to get the integrations owned by the caller's AWS account	List			
ListMemberships	Grants permission to list all members associated to an agent space with pagination support	List	AgentSpace*		
ListPentestJobTasks	Grants permission to list pentest job tasks associated with a pentest job	List	AgentSpace*		kms:Decrypt
ListPentestJobsForPentest	Grants permission to list penetration test jobs associated with a penetration test	List	AgentSpace*		kms:Decrypt
ListPentests	Grants permission to list penetration tests with optional filtering by status	List	AgentSpace*		kms:Decrypt
ListResourcesFromIntegration	Grants permission to list resources from Integration	List	Integration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListSecurityRequirements	Grants permission to list all Security Requirements	List	SecurityRequirementPack*		
ListTagsForResource	Grants permission to list the tags for a resource	Read	AgentSpace		
			Application		
			Integration		
			SecurityRequirementPack		
			TargetDomain		
ListTargetDomains	Grants permission to list target domains	List			
PutDesignReviewFeedback	Grants permission to submit feedback for a design review comment	Write	AgentSpace*		
StartCodeRemediation	Grants permission to start code remediation for the findings	Write	AgentSpace*		kms:Decrypt kms:GenerateDataKey

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartPentestJob	Grants permission to initiate the execution of a penetration test	Write	AgentSpace*		kms:Decrypt kms:GenerateDataKey
StopPentestJob	Grants permission to stop the execution of a running penetration test	Write	AgentSpace*		kms:Decrypt
TagResource	Grants permission to add tags to a resource	Tagging	AgentSpace		
			Application		
			Integration		
			SecurityRequirementPack		
			TargetDomain		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ToggleManagedSecurityRequirement	Grants permission to toggle the status of a managed Security Requirement	Write	SecurityRequirementPack*		
UntagResource	Grants permission to remove tags from a resource	Tagging	AgentSpace		
			Application		
			Integration		
			SecurityRequirementPack		
			TargetDomain		
				aws:TagKeys	
UpdateAgentSpace	Grants permission to update an agent space record	Write	AgentSpace*		kms:Decrypt
UpdateApplication	Grants permission to update application configuration	Write	Application*		iam:PassRole kms:DescribeKey

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateFinding	Grants permission to update an existing security finding with new details or status	Write	AgentSpace*		kms:Decrypt
UpdateIntegratedResources	Grants permission to update integrated resources for an agent space	Write	AgentSpace*		
UpdatePentest	Grants permission to update an existing penetration test with new configuration or settings	Write	AgentSpace*		kms:Decrypt
UpdateSecurityRequirement	Grants permission to update a customer managed Security Requirement	Write	SecurityRequirementPack*		
UpdateTargetDomain	Grants permission to update a target domain record	Write	TargetDomain*		
VerifyTargetDomain	Grants permission to verify ownership for a registered target domain	Write	TargetDomain*		

Resource types defined by AWS Security Agent

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Application	arn:${Partition}:securityagent:${Region}:${Account}:application/${ApplicationId}	aws:ResourceTag/${TagKey}
SecurityRequirementPack	arn:${Partition}:securityagent:${Region}:${Account}:security-requirement-pack/${SecurityRequirementPackId}	aws:ResourceTag/${TagKey}
Integration	arn:${Partition}:securityagent:${Region}:${Account}:integration/${IntegrationId}	aws:ResourceTag/${TagKey}
AgentSpace	arn:${Partition}:securityagent:${Region}:${Account}:agent-space/${AgentId}	aws:ResourceTag/${TagKey}
TargetDomain	arn:${Partition}:securityagent:${Region}:${Account}:target-domain/${TargetDomainId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Security Agent

AWS Security Agent defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Security Hub

AWS Security Hub (service prefix: `securityhub`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Condition keys for AWS Security Hub

Actions defined by AWS Security Hub

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of

access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptAdministratorInvitation	Grants permission to accept Security Hub invitations to become a member account	Write	hub		
AcceptInvitation	Grants permission to accept Security Hub invitations to become a member account	Write	hub		
AllowVendedLogDeliveryForResource [permission only]	Grants permission to log delivery for resources	Permissions management	hub hubv2		
BatchDeleteAutomationRules	Grants permission to delete one or more automation rules in Security Hub	Write	automation-rule*		
BatchDisableStandards	Grants permission to disable standards in Security Hub	Write	hub		
BatchEnableStandards	Grants permission to enable standards in Security Hub	Write	hub		
BatchGetAutomationRules	Grants permission to retrieve a list of details for automation rules from Security Hub based on rule Amazon Resource Names (ARNs)	Read	automation-rule*		
BatchGetConfigurat	Grants permission to retrieve information about configura	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ionPolicy Associations	tion policies associated with a specific list of member accounts and organizational units of the calling account's organization				
BatchGetControlEvaluations [permission only]	Grants permission to get the enablement and compliance status of controls, the findings count for controls, and the overall security score for controls on the Security Hub console	Read	hub		
BatchGetSecurityControls	Grants permission to get details about specific security controls identified by ID or ARN	Read			securityhub:DescribeStandardsControls
BatchGetStandardsControlAssociations	Grants permission to get the enablement status of a batch of security controls in standards	Read			securityhub:DescribeStandardsControls
BatchImportFindings	Grants permission to import findings into Security Hub from an integrated product	Write	product*		
				securityhub:TargetAccount	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchUpdateAutomationRules	Grants permission to update one or more automation rules from Security Hub based on rule Amazon Resource Names (ARNs) and input parameters	Write	automation-rule*		
BatchUpdateFindings	Grants permission to update customer-controlled fields for a selected set of Security Hub findings	Write	hub		
			hubv2		
				securityhub:ASFFSyntaxPath/${ASFFSyntaxPath} securityhub:OCSFSyntaxPath/${OCSFSyntaxPath}	
BatchUpdateStandardsControlAssociations	Grants permission to update the enablement status of a batch of security controls in standards	Write			securityhub:UpdateStandardsControl
ConnectorRegistrationsV2	Grants permission to complete the OAuth 2.0 authorization code flow based on input parameters	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateActionTarget	Grants permission to create custom actions in Security Hub	Write	hub		
CreateAggregatorV2	Grants permission to create an aggregatorV2, which configures data aggregation across Regions	Write			
CreateAutomationRule	Grants permission to create an automation rule based on input parameters	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateAutomationRuleV2	Grants permission to create an automation rule V2 based on input parameters	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateConfigurationPolicy	Grants permission to create a configuration policy to manage organization member settings in Security Hub	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateConnectorV2	Grants permission to create a connector V2 based on input parameters	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateFindingAggregator	Grants permission to create a finding aggregator, which contains the cross-Region finding aggregation configuration	Write			
CreateInsight	Grants permission to create insights in Security Hub. Insights are collections of related findings	Write	hub		
CreateMembers	Grants permission to create member accounts in Security Hub	Write	hub		
CreateTicketV2	Grants permission to create ticket for a selected OCSF finding	Write	connectorv2		
DeclineInvitations	Grants permission to decline Security Hub invitations to become a member account	Write	hub		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteActionTarget	Grants permission to delete custom actions in Security Hub	Write	hub		
DeleteAggregatorV2	Grants permission to delete an aggregatorV2, which configures data aggregation across Regions	Write	aggregatorv2*		
DeleteAutomationRuleV2	Grants permission to delete an automation rule V2 in Security Hub	Write	automation-rulev2*		
DeleteConfigurationPolicy	Grants permission to delete an existing configuration policy	Write	configuration-policy*		
DeleteConnectorV2	Grants permission to delete a connector V2 in Security Hub	Write	connectorv2*		
DeleteFindingAggregator	Grants permission to delete a finding aggregator, which disables finding aggregation across Regions	Write	finding-aggregator*		
DeleteInsight	Grants permission to delete insights from Security Hub	Write	hub		
DeleteInvitations	Grants permission to delete Security Hub invitations to become a member account	Write	hub		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteMembers	Grants permission to delete Security Hub member accounts	Write	hub		
DescribeActionTargets	Grants permission to retrieve a list of custom actions using the API	Read	hub		
DescribeHub	Grants permission to retrieve information about the hub resource in your account	Read	hub		
DescribeOrganizationConfiguration	Grants permission to describe the organization configuration for Security Hub	Read	hub		
DescribeProducts	Grants permission to retrieve information about the available Security Hub product integrations	Read	hub		
DescribeProductsV2	Grants permission to retrieve information about the available Security Hub V2 product integrations	Read	hubv2		
DescribeSecurityHubV2	Grants permission to retrieve information about the hub V2 resource in your account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeStandards	Grants permission to retrieve information about Security Hub standards	Read	hub		
DescribeStandardsControls	Grants permission to retrieve information about Security Hub standards controls	Read	hub		
DisableImportFindingsForProduct	Grants permission to disable the findings importing for a Security Hub integrated product	Write	hub		
DisableOrganizationAdminAccount	Grants permission to remove the Security Hub administrator account for your organization	Write	hub		organizations:DeregisterDelegatedAdministrator organizations:DescribeOrganization organizations:ListDelegatedAdministrators
DisableSecurityHub	Grants permission to disable Security Hub	Write	hub		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableSecurityHubV2	Grants permission to disable Security Hub V2	Write			
DisassociateFromAdministratorAccount	Grants permission to a Security Hub member account to disassociate from the associated administrator account	Write	hub		
DisassociateFromMasterAccount	Grants permission to a Security Hub member account to disassociate from the associated master account	Write	hub		
DisassociateMembers	Grants permission to disassociate Security Hub member accounts from the associated administrator account	Write	hub		
EnableImportFindingsForProduct	Grants permission to enable the findings importing for a Security Hub integrated product	Write	hub		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableOrganizationAdminAccount	Grants permission to designate a Security Hub administrator account for your organization	Write	hub		organizations:DescribeOrganization organizations:EnableAWSServiceAccess organizations:ListAWSServiceAccessForOrganization organizations:ListDelegatedAdministrators organizations:RegisterDelegatedAdministrator
EnableSecurityHub	Grants permission to enable Security Hub	Write	hub		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
EnableSecurityHubV2	Grants permission to enable Security Hub V2	Write		aws:RequestTag/${TagKey} aws:TagKeys	
GetAdhocInsightResults [permission only]	Grants permission to retrieve aggregated statistical data about the findings	Read	hub		
			hubv2		
GetAdministratorAccount	Grants permission to retrieve details about the Security Hub administrator account	Read	hub		
GetAggregatorV2	Grants permission to retrieve details for an aggregatorV2, which configures data aggregation across Regions	Read	aggregatorv2*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAutomationRuleV2	Grants permission to retrieve details for an automation rule V2 from Security Hub based on rule Amazon Resource Name (ARN)	Read	automation-rulev2*		
GetConfigurationPolicy	Grants permission to get a complete overview of one configuration policy created by the calling account	Read	configuration-policy*		
GetConfigurationPolicyAssociation	Grants permission to retrieve information about a configuration policy associated with a member account or organizational unit of the calling account's organization	Read			
GetConnectorV2	Grants permission to retrieve details for a connector V2 from Security Hub based on connector id	Read	connectorv2*		
GetControlFindingSummary [permission only]	Grants permission to retrieve a security score and counts of finding and control statuses for a security standard	Read	hub		
GetEnabledStandards	Grants permission to retrieve a list of the standards that are enabled in Security Hub	List	hub		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetFindingAggregator	Grants permission to retrieve details for a finding aggregator, which configures finding aggregation across Regions	Read	finding-aggregator*		
GetFindingHistory	Grants permission to retrieve a list of finding history from Security Hub	Read	hub		
GetFindings	Grants permission to retrieve a list of findings from Security Hub	Read	hub		
			hubv2		
GetFindingsTrendsV2	Grants permission to retrieve findings trends	Read	hubv2		
GetFreeTrialEndDate [permission only]	Grants permission to retrieve the end date for an account's free trial of Security Hub	Read	hub		
GetFreeTrialUsage [permission only]	Grants permission to retrieve information about Security Hub usage during the free trial period	Read	hub		
GetInsightFindingTrend [permission only]	Grants permission to retrieve an insight finding trend from Security Hub in order to generate a graph	Read	hub		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetInsightResults	Grants permission to retrieve insight results from Security Hub	Read	hub		
GetInsights	Grants permission to retrieve Security Hub insights	List	hub		
GetInvitationsCount	Grants permission to retrieve the count of Security Hub membership invitations sent to the account	Read	hub		
GetMasterAccount	Grants permission to retrieve details about the Security Hub master account	Read	hub		
GetMembers	Grants permission to retrieve the details of Security Hub member accounts	Read	hub		
GetResourcesStatisticsV2	Grants permission to retrieve aggregate statistics about resources	Read	hubv2		
GetResourcesTrendsV2	Grants permission to retrieve resources trends	Read	hubv2		
GetResourcesV2	Grants permission to retrieve a list of resources	Read	hubv2		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSecurityControlDefinition	Grants permission to get the definition details of a specific security control identified by ID	Read			securityhub:DescribeStandardsControls
GetUsage [permission only]	Grants permission to retrieve information about Security Hub usage by accounts	Read	hub		
InviteMembers	Grants permission to invite other AWS accounts to become Security Hub member accounts	Write	hub		
ListAggregatorsV2	Grants permission to retrieve a list of aggregatorsV2, which configures data aggregation across Regions	List			
ListAutomationRules	Grants permission to retrieve a list of automation rules and their metadata for the calling account from Security Hub	List			
ListAutomationRulesV2	Grants permission to retrieve a list of automation rules V2 and their metadata for the calling account from Security Hub	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListConfigurationPolicies	Grants permission to list the summaries of all configuration policies created by the calling account	List			
ListConfigurationPolicyAssociations	Grants permission to retrieve information about all configuration policies associationed with all member accounts and organizational units of the calling account's organization	List			
ListConnectorsV2	Grants permission to retrieve a list of connectors V2 and their metadata for the calling account from Security Hub	List			
ListControlEvaluationSummaries [permission only]	Grants permission to retrieve a list of controls for a standard, including the control IDs, statuses and finding counts	Read	hub		
ListEnabledProductsForImport	Grants permission to retrieve the Security Hub integrated products that are currently enabled	List	hub		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListFindingAggregators	Grants permission to retrieve a list of finding aggregators, which contain the cross-Region finding aggregation configuration	List			
ListInvitations	Grants permission to retrieve the Security Hub invitations sent to the account	List	hub		
ListMembers	Grants permission to retrieve details about Security Hub member accounts associated with the administrator account	List	hub		
ListOrganizationAdminAccounts	Grants permission to list the Security Hub administrator accounts for your organization	List	hub		organizations:DescribeOrganization organizations:ListDelegatedAdministrators
ListSecurityControlDefinitions	Grants permission to retrieve a list of security control definitions, which contain details for security controls in the current region	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListStandardsControlAssociations	Grants permission to list the enablement status of a security control in standards	List			securityhub:DescribeStandardsControls
ListTagsForResource	Grants permission to list of tags associated with a resource	Read	automation-rule		
			configuration-policy		
			hub		
SendFindingsEvents [permission only]	Grants permission to use a custom action to send Security Hub findings to Amazon EventBridge	Read	hub		
SendInsightEvents [permission only]	Grants permission to use a custom action to send Security Hub insights to Amazon EventBridge	Read	hub		
StartConfigurationPolicyAssociation	Grants permission to associate a configuration policy with a member account or organizational unit in the calling account's organization	Write	hub		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartConfiguration PolicyDisassociation	Grants permission to remove a configuration policy association from a member account or organizational unit in the calling account's organization	Write	hub		
TagResource	Grants permission to add tags to a Security Hub resource	Tagging	aggregatorv2		
			automation-rule		
			automation-rulev2		
			configuration-policy		
			connectorv2		
			hub		
			hubv2		
UntagResource	Grants permission to remove tags from a Security Hub resource	Tagging	aggregatorv2		
			automation-rule		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			automation-rulev2		
			configuration-policy		
			connectorv2

			hubv2		
UpdateActionTarget	Grants permission to update custom actions in Security Hub	Write	hub		
UpdateAggregatorV2	Grants permission to update an aggregatorV2, which configures data aggregation across Regions	Write	aggregatorv2*		
UpdateAutomationRuleV2	Grants permission to update an automation rule V2 in Security Hub based on rule Amazon Resource Name (ARN) and input parameters	Write	automation-rulev2*		
UpdateConfigurationPolicy	Grants permission to update an existing configuration policy	Write	configuration-policy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateConnectorV2	Grants permission to update a connector V2 in Security Hub based on connector id and input parameters	Write	connectorv2*		
UpdateFindingAggregator	Grants permission to update a finding aggregator, which contains the cross-Region finding aggregation configuration	Write	finding-aggregator*		
UpdateFindings	Grants permission to update Security Hub findings	Write	hub		
UpdateInsight	Grants permission to update insights in Security Hub	Write	hub		
UpdateOrganizationConfiguration	Grants permission to update the organization configuration for Security Hub	Write	hub		
UpdateSecurityControl	Grants permission to update properties of a specific security control identified by ID or ARN	Write			securityhub:UpdateStandardsControl
UpdateSecurityHubConfiguration	Grants permission to update Security Hub configuration	Write	hub		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateStandardsControl	Grants permission to update Security Hub standards controls	Write	hub		

Resource types defined by AWS Security Hub

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
hub	`arn:${Partition}:securityhub:${Region}:${Account}:hub/default`	aws:ResourceTag/${TagKey}
hubv2	`arn:${Partition}:securityhub:${Region}:${Account}:hubv2/${HubV2Id}`	aws:ResourceTag/${TagKey}
product	`arn:${Partition}:securityhub:${Region}:${Account}:product/${Company}/${ProductId}`	
finding-aggregator	`arn:${Partition}:securityhub:${Region}:${Account}:finding-aggregator/${FindingAggregatorId}`	
aggregatorv2	`arn:${Partition}:securityhub:${Region}:${Account}:aggregatorv2/${AggregatorV2Id}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
automation-rule	arn:${Partition}:securityhub:${Region}:${Account}:automation-rule/${AutomationRuleId}	aws:ResourceTag/${TagKey}
automation-rulev2	arn:${Partition}:securityhub:${Region}:${Account}:automation-rulev2/${AutomationRuleV2Id}	aws:ResourceTag/${TagKey}
configuration-policy	arn:${Partition}:securityhub:${Region}:${Account}:configuration-policy/${ConfigurationPolicyId}	aws:ResourceTag/${TagKey}
connectorv2	arn:${Partition}:securityhub:${Region}:${Account}:connectorv2/${ConnectorV2Id}	aws:ResourceTag/${TagKey}

Condition keys for AWS Security Hub

AWS Security Hub defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by actions based on the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by actions based on tag key-value pairs attached to the resource	String

Condition keys	Description	Type
aws:TagKeys	Filters access by actions based on the presence of tag keys in the request	ArrayOfString
securityhub:ASFFSyntaxPath/${ASFFSyntaxPath}	Filters access by the specified fields and values in the request	String
securityhub:OCSFSyntaxPath/${OCSFSyntaxPath}	Filters access by the specified fields and values in the request	String
securityhub:TargetAccount	Filters access by the AwsAccountId field that is specified in the request	String

Actions, resources, and condition keys for AWS Security Incident Response

AWS Security Incident Response (service prefix: `security-ir`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Condition keys for AWS Security Incident Response

Actions defined by AWS Security Incident Response

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetMemberAccountDetails	Grants permission to get member account details in batch	Read	membership*		
CancelMembership	Grants permission to cancel a membership	Write	membership*		
CloseCase	Grants permission to close a case	Write	case*		
CreateCase	Grants permission to create a case	Write	case*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateCaseComment	Grants permission to create a case comment	Write	case*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateMembership	Grants permission to create a membership	Write	membership*		iam:CreateServiceLinkedRole organizations:DescribeOrganization organizations:ListAWSServiceAccessForOrganization organizations:ListDelegatedAdministrators
				aws:RequestTag/${TagKey} aws:TagKeys

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCaseAttachmentDownloadUrl	Grants permission to get a case attachment download URL	Read	case*		
GetCaseAttachmentUploadUrl	Grants permission to get a case attachment upload URL	Write	case*		
GetMembership	Grants permission to get a membership	Read	membership*		
ListCaseEdits	Grants permission to list case edits	Read	case*		
ListCases	Grants permission to list cases	List			
ListComments	Grants permission to list case comments	Read	case*		
ListInvestigations	Grants permission to list investigations for a case	Read	case*		
ListMemberships	Grants permission to list memberships	List			
ListTagsForResource	Grants permission to list the tags attached to the specified resource	Read	case membership		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:TagKeys	
SendFeedback	Grants permission to send feedback for investigation results	Write	case*		
TagResource	Grants permission to add tags to the specified resource	Tagging	case		
			membership		
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from the specified resource	Tagging	case		
			membership		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:TagKeys	
UpdateCase	Grants permission to update a case	Write	case*		
UpdateCaseComment	Grants permission to update a case comment	Write	case*		
UpdateCaseStatus	Grants permission to update a case status	Write	case*		
UpdateMembership	Grants permission to update memberships	Write	membership*		iam:CreateServiceLinkedRole organizations:DescribeOrganizationalUnit
UpdateResolverType	Grants permission to update case resolver type	Write	case*		

Resource types defined by AWS Security Incident Response

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
case	`arn:${Partition}:security-ir:${Region}:${Account}:case/${CaseId}`	aws:ResourceTag/${TagKey}
membership	`arn:${Partition}:security-ir:${Region}:${Account}:membership/${MembershipId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Security Incident Response

AWS Security Incident Response defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String

Condition keys	Description	Type
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Security Lake

Amazon Security Lake (service prefix: `securitylake`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon Security Lake

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which

the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAwsLogSource	Grants permission to enable any source type in any region for accounts that are either	Write	data-lake*		glue:CreateDatabase

Resource types defined by Amazon Security Lake

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
data-lake	arn:${Partition}:securitylake:${Region}:${Account}:data-lake/default	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}
subscriber	arn:${Partition}:securitylake:${Region}:${Account}:subscriber/${SubscriberId}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}

Condition keys for Amazon Security Lake

Amazon Security Lake defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Security Token Service

AWS Security Token Service (service prefix: `sts`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS Security Token Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssumeRole	Grants permission to obtain a set of temporary security credentials that you can use to access AWS resources that you might not normally have access to	Write	role*		
				aws:TagKeys aws:RequestTag/${TagKey}

Resource types defined by AWS Security Token Service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
role	`arn:${Partition}:iam::${Account}:role/${RoleNameWithPath}`	aws:ResourceTag/${TagKey} iam:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
user	arn:${Partition}:iam::${Account}:user/${UserNameWithPath}	
root-user	arn:${Partition}:iam::${Account}:root	
self-session	arn:${Partition}:sts::${Account}:self	
context-provider	arn:${Partition}:iam::aws:contextProvider/${ContextProviderName}	
federated-user	arn:${Partition}:sts::${Account}:federated-user/${FederatedUserName}	

Condition keys for AWS Security Token Service

AWS Security Token Service defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
accounts.google.com:aud	Filters access by the Google application ID	String
accounts.google.com:oaud	Filters access by the Google audience	String
accounts.google.com:sub	Filters access by the subject of the claim (the Google user ID)	String

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
cognito-identity.amazonaws.com:amr	Filters access by the login information for Amazon Cognito	String
cognito-identity.amazonaws.com:aud	Filters access by the Amazon Cognito identity pool ID	String
cognito-identity.amazonaws.com:sub	Filters access by the subject of the claim (the Amazon Cognito user ID)	String
graph.facebook.com:app_id	Filters access by the Facebook application ID	String
graph.facebook.com:id	Filters access by the Facebook user ID	String
iam:ResourceTag/${TagKey}	Filters access by the tags that are attached to the role that is being assumed	String

Condition keys	Description	Type
saml:aud	Filters access by the endpoint URL to which SAML assertions are presented	String
saml:cn	Filters access by the eduOrg attribute	ArrayOfString
saml:commonName	Filters access by the commonName attribute	String
saml:doc	Filters access by on the principal that was used to assume the role	String
saml:eduorghomepageuri	Filters access by the eduOrg attribute	ArrayOfString
saml:eduorgidentityauthnpolicyuri	Filters access by the eduOrg attribute	ArrayOfString
saml:eduorglegalname	Filters access by the eduOrg attribute	ArrayOfString
saml:eduorgsuperioruri	Filters access by the eduOrg attribute	ArrayOfString
saml:eduorgwhitepagesuri	Filters access by the eduOrg attribute	ArrayOfString
saml:edupersonaffiliation	Filters access by the eduPerson attribute	ArrayOfString
saml:edupersonassurance	Filters access by the eduPerson attribute	ArrayOfString
saml:edupersonentitlement	Filters access by the eduPerson attribute	ArrayOfString

Condition keys	Description	Type
saml:edupersonnickname	Filters access by the eduPerson attribute	ArrayOfString
saml:edupersonorgdn	Filters access by the eduPerson attribute	String
saml:edupersonorgunitdn	Filters access by the eduPerson attribute	ArrayOfString
saml:edupersonprimaryaffiliation	Filters access by the eduPerson attribute	String
saml:edupersonprimaryorgunitdn	Filters access by the eduPerson attribute	String
saml:edupersonprincipalname	Filters access by the eduPerson attribute	String
saml:edupersonscopedaffiliation	Filters access by the eduPerson attribute	ArrayOfString
saml:edupersontargetedid	Filters access by the eduPerson attribute	ArrayOfString
saml:givenName	Filters access by the givenName attribute	String
saml:iss	Filters access by on the issuer, which is represented by a URN	String
saml:mail	Filters access by the mail attribute	String
saml:name	Filters access by the name attribute	String

Condition keys	Description	Type
saml:name qualifier	Filters access by the hash value of the issuer, account ID, and friendly name	String
saml:orga nizationStatus	Filters access by the organizationStatus attribute	String
saml:prim aryGroupSID	Filters access by the primaryGroupSID attribute	String
saml:sub	Filters access by the subject of the claim (the SAML user ID)	String
saml:sub_type	Filters access by the value persistent, transient, or the full Format URI	String
saml:surname	Filters access by the surname attribute	String
saml:uid	Filters access by the uid attribute	String
saml:x500 UniqueIdentifier	Filters access by the uid attribute	String
sts:AWSSe rviceName	Filters access by the service that is obtaining a bearer token	String
sts:Durat ionSeconds	Filters access by the duration in seconds when getting a bearer token or a JSON Web Token (JWT) from the GetWebIdentityToken API	Numeric
sts:ExternalId	Filters access by the unique identifier required when you assume a role in another account	String
sts:Ident ityTokenA udience	Filters access by the audience that is passed in the request	ArrayOfString

Condition keys	Description	Type
sts:RequestContext/${ContextKey}	Filters access by the session context key-value pairs embedded in the signed context assertion retrieved from a trusted context provider	String
sts:RequestContextProviders	Filters access by the context provider ARNs	ArrayOfARN
sts:RoleSessionName	Filters access by the role session name required when you assume a role	String
sts:SigningAlgorithm	Filters access by the signing algorithm that is passed in the request	String
sts:SourceIdentity	Filters access by the source identity that is passed in the request	String
sts:TaskPolicyArn	Filters access by TaskPolicyARN	String
sts:TransitiveTagKeys	Filters access by the transitive tag keys that are passed in the request	ArrayOfString
www.amazon.com:app_id	Filters access by the Login with Amazon application ID	String
www.amazon.com:user_id	Filters access by the Login with Amazon user ID	String

Actions, resources, and condition keys for AWS Server Migration Service

AWS Server Migration Service (service prefix: `sms`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Topics

Actions defined by AWS Server Migration Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateApp	Grants permission to create an application configuration to migrate on-premise application onto AWS	Write			
CreateReplicationJob	Grants permission to create a job to migrate on-premise server onto AWS	Write			
DeleteApp	Grants permission to delete an existing application configuration	Write			
DeleteAppLaunchConfiguration	Grants permission to delete launch configuration for an existing application	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAppReplicationConfiguration	Grants permission to delete replication configuration for an existing application	Write			
DeleteAppValidationConfiguration	Grants permission to delete validation configuration for an existing application	Write			
DeleteReplicationJob	Grants permission to delete an existing job to migrate on-premise server onto AWS	Write			
DeleteServerCatalog	Grants permission to delete the complete list of on-premise servers gathered into AWS	Write			
DisassociateConnector	Grants permission to disassociate a connector that has been associated	Write			
GenerateChangeSet	Grants permission to generate a changeSet for the CloudFormation stack of an application	Write			
GenerateTemplate	Grants permission to generate a CloudFormation template for an existing application	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetApp	Grants permission to get the configuration and statuses for an existing application	Read			
GetAppLaunchConfiguration	Grants permission to get launch configuration for an existing application	Read			
GetAppReplicationConfiguration	Grants permission to get replication configuration for an existing application	Read			
GetAppValidationConfiguration	Grants permission to get validation configuration for an existing application	Read			
GetAppValidationOutput	Grants permission to get notification sent from application validation script.	Read			
GetConnectors	Grants permission to get all connectors that have been associated	Read			
GetMessages [permission only]	Grants permission to gets messages from AWS Server Migration Service to Server Migration Connector	Read			
GetReplicationJobs	Grants permission to get all existing jobs to migrate on-premise servers onto AWS	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetReplicationRuns	Grants permission to get all runs for an existing job	Read			
GetServers	Grants permission to get all servers that have been imported	Read			
ImportAppCatalog	Grants permission to import application catalog from AWS Application Discovery Service	Write			
ImportServerCatalog	Grants permission to gather a complete list of on-premise servers	Write			
LaunchApp	Grants permission to create and launch a CloudFormation stack for an existing application	Write			
ListApps	Grants permission to get a list of summaries for existing applications	List			
NotifyAppValidationOutput	Grants permission to send notification for application validation script	Write			
PutAppLaunchConfiguration	Grants permission to create or update launch configuration for an existing application	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutAppReplicationConfiguration	Grants permission to create or update replication configuration for an existing application	Write			
PutAppValidationConfiguration	Grants permission to put validation configuration for an existing application	Write			
SendMessage [permission only]	Grants permission to send message from Server Migration Connector to AWS Server Migration Service	Write			
StartAppReplication	Grants permission to create and start replication jobs for an existing application	Write			
StartOnDemandAppReplication	Grants permission to start a replication run for an existing application	Write			
StartOnDemandReplicationRun	Grants permission to start a replication run for an existing replication job	Write			
StopAppReplication	Grants permission to stop and delete replication jobs for an existing application	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TerminateApp	Grants permission to terminate the CloudFormation stack for an existing application	Write			
UpdateApp	Grants permission to update an existing application configuration	Write			
UpdateReplicationJob	Grants permission to update an existing job to migrate on-premise server onto AWS	Write			

Resource types defined by AWS Server Migration Service

AWS Server Migration Service does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Server Migration Service, specify `"Resource": "*"` in your policy.

Condition keys for AWS Server Migration Service

ServerMigrationService has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Serverless Application Repository

AWS Serverless Application Repository (service prefix: `serverlessrepo`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS Serverless Application Repository

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateApplication	Grants permission to create an application, optionally including an AWS SAM file to create the first application version in the same call	Write			
CreateApplicationVersion	Grants permission to create an application version	Write	applications*		
CreateCloudFormationChangeSet	Grants permission to create an AWS CloudFormation ChangeSet for the given application	Write	applications*		
				serverlessrepo:applicationType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCloudFormationTemplate	Grants permission to create an AWS CloudFormation template	Write	applications*		
				serverlessrepo:applicationType	
DeleteApplication	Grants permission to delete the specified application	Write	applications*		
GetApplication	Grants permission to get the specified application	Read	applications*		
				serverlessrepo:applicationType	
GetApplicationPolicy	Grants permission to get the policy for the specified application	Read	applications*		
GetCloudFormationTemplate	Grants permission to get the specified AWS CloudFormation template	Read	applications*		
ListApplicationDependencies	Grants permission to retrieve the list of applications nested in the containing application	List	applications*		
				serverlessrepo:applicationType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListApplicationVersions	Grants permission to list versions for the specified application owned by the requester	List	applications*		
				serverlessrepo:applicationType	
ListApplications	Grants permission to list applications owned by the requester	List			
PutApplicationPolicy	Grants permission to put the policy for the specified application	Write	applications*		
SearchApplications	Grants permission to get all applications authorized for this user	Read		serverlessrepo:applicationType	
UnshareApplication	Grants permission to unshare the specified application	Write	applications*		
UpdateApplication	Grants permission to update meta-data of the application	Write	applications*		

Resource types defined by AWS Serverless Application Repository

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
applications	`arn:${Partition}:serverlessrepo:${Region}:${Account}:applications/${ResourceId}`	

Condition keys for AWS Serverless Application Repository

AWS Serverless Application Repository defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
serverlessrepo:applicationType	Filters access by application type	String

Actions, resources, and condition keys for AWS Service - Oracle Database@AWS

AWS Service - Oracle Database@AWS (service prefix: odb) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Service - Oracle Database@AWS

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptMarketplaceRegistration	Grants permission to register the Amazon Web Services Marketplace token for your Amazon Web Services account to activate your Oracle Database@Amazon Web Services subscription	Write			
CreateCloudAutonomousVmCluster	Grants permission to create a new Autonomous VM cluster in the specified Exadata infrastructure	Write	cloud-exadata-infrastructure*		
			odb-network*		
				aws:RequestTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} aws:TagKeys	
CreateCloudExadataInfrastructure	Grants permission to create an Exadata infrastructure	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateCloudVmCluster	Grants permission to create a VM cluster on the specified Exadata infrastructure	Write	cloud-exadata-infrastructure*		
			odb-network*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDbNode [permission only]	Grants permission to create a DB Node	Write	db-node*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateGrantShare [permission only]	Grants permission to create an ODB Grant Share	Write			
CreateOdbNetwork	Grants permission to create an ODB network	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateOdbPeeringConnection	Grants permission to create an ODB Peering Connection	Write	odb-network*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateOutboundIntegration [permission only]	Grants permission to create an Outbound Integration	Write	cloud-autonomous-vm-cluster*		
			cloud-vm-cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteCloudAutonomousVmCluster	Grants permission to Deletes an Autonomous VM cluster	Write	cloud-autonomous-vm-cluster*		
DeleteCloudExadataInfrastructure	Grants permission to delete a specified Exadata infrastructure. Before you use this operation, make sure to delete all of the VM clusters that are hosted on this Exadata infrastructure	Write	cloud-exadata-infrastructure*		
DeleteCloudVmCluster	Grants permission to delete a specified VM cluster	Write	cloud-vm-cluster*		
DeleteDbNode [permission only]	Grants permission to delete a DB Node	Write	db-node*		
DeleteGrantShare [permission only]	Grants permission to delete an ODB Grant Share	Write			
DeleteOdbNetwork	Grants permission to delete the specified ODB network	Write	odb-network*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteOdbPeeringConnection	Grants permission to delete the specified ODB Peering Connection. When you delete an ODB peering connection, the underlying VPC peering connection is also deleted	Write	odb-peering-connection*		
DeleteResourcePolicy [permission only]	Grants permission to delete a resource policy	Write	cloud-exadata-infrastructure*		
			odb-network*		
GetCloudAutonomousVmCluster	Grants permission to get information about a specific Autonomous VM cluster	Read	cloud-autonomous-vm-cluster*		
GetCloudExadataInfrastructure	Grants permission to get information about the specified Exadata infrastructure	Read	cloud-exadata-infrastructure*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCloudExadataInfrastructureUnallocatedResources	Grants permission to retrieve information about unallocated resources in a specified Cloud Exadata Infrastructure	Read	cloud-exadata-infrastructure*		
GetCloudVmCluster	Grants permission to get information about the specified VM cluster	Read	cloud-vm-cluster*		
GetDbNode	Grants permission to get information about the specified DB node	Read	cloud-vm-cluster*		
			db-node*		
GetDbServer	Grants permission to get information about the specified database server	Read	cloud-exadata-infrastructure*		
GetOciOnboardingStatus	Grants permission to get the tenancy activation link and onboarding status for your Amazon Web Services account	Read			
GetOdbNetwork	Grants permission to get information about the specified ODB network	Read	odb-network*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetOdbPeeringConnection	Grants permission to get information about the specified ODB Peering connection	Read	odb-peering-connection*		
GetResourcePolicy [permission only]	Grants permission to get a resource policy	Read	cloud-exadata-infrastructure*		
			odb-network*		
InitializeService	Grants permission to initialize the ODB service for the first time in an account	Write			
ListAutonomousVirtualMachines	Grants permission to list all Autonomous VMs in an Autonomous VM cluster	Read	cloud-autonomous-vm-cluster		
ListCloudAutonomousVmClusters	Grants permission to list all Autonomous VM clusters in a specified Cloud Exadata infrastructure	List	cloud-exadata-infrastructure		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListCloudExadataInfrastructures	Grants permission to list information about the Exadata infrastructures owned by your Amazon Web Services account	List			
ListCloudVmClusters	Grants permission to list information about the VM clusters owned by your Amazon Web Services account or only the ones on the specified Exadata infrastructure	List	cloud-exadata-infrastructure		
ListDbNodes	Grants permission to list information about the DB nodes for the specified VM cluster	List	cloud-vm-cluster*		
ListDbServers	Grants permission to list information about the database servers that belong to the specified Exadata infrastructure	Read	cloud-exadata-infrastructure*		
ListDbSystemShapes	Grants permission to list information about the shapes that are available for an Exadata infrastructure	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListGiVersions	Grants permission to list information about Oracle Grid Infrastructure (GI) software versions that are available for a VM cluster for the specified shape	Read			
ListOdbNetworks	Grants permission to list information about the ODB networks owned by your Amazon Web Services account	List			
ListOdbPeeringConnections	Grants permission to list all ODB peering connections or those associated with a specific ODB network	List	odb-network		
ListSystemVersions	Grants permission to list information about the system versions that are available for a VM cluster for the specified giVersion and shape	Read			
ListTagsForResource	Grants permission to list information about the tags applied to this resource	Read	cloud-autonomous-vm-cluster		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			cloud-exadata-infrastructure		
			cloud-vm-cluster		
			db-node		
			odb-network		
			odb-peering-connection		
				aws:ResourceTag/${TagKey}	
PutResourcePolicy [permission only]	Grants permission to update a resource policy	Write	cloud-exadata-infrastructure*		
			odb-network*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RebootDbNode	Grants permission to reboot the specified DB node in a VM cluster	Write	cloud-vm-cluster*		
			db-node*		
StartDbNode	Grants permission to start the specified DB node in a VM cluster	Write	cloud-vm-cluster*		
			db-node*		
StopDbNode	Grants permission to stop the specified DB node in a VM cluster	Write	cloud-vm-cluster*		
TagResource	Grants permission to apply tags to the specified resource	Tagging	cloud-autonomous-vm-cluster		
			cloud-exadata-infrastructure		
			cloud-vm-cluster		
			db-node		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			odb-network		
			odb-peering-connection		
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from the specified resource	Tagging	cloud-autonomous-vm-cluster		
			cloud-exadata-infrastructure		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			cloud-vm-cluster		
			db-node		
			odb-network		
			odb-peering-connection		
				aws:ResourceTag/${TagKey} aws:TagKeys	
UpdateCloudExadataInfrastructure	Grants permission to update the properties of an Exadata infrastructure resource	Write	cloud-exadata-infrastructure*		
UpdateGrantShare [permission only]	Grants permission to update an ODB Grant Share	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateOdbNetwork	Grants permission to update properties of a specified ODB network	Write	odb-network*		
UpdateOdbPeeringConnection	Grants permission to update properties of a specified ODB Peering Connection	Write	odb-peering-connection*		
UpdateOutboundIntegration [permission only]	Grants permission to update an Outbound Integration	Write	cloud-autonomous-vm-cluster*		
			cloud-vm-cluster*		

Resource types defined by AWS Service - Oracle Database@AWS

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
cloud-autonomous-vm-cluster	arn:${Partition}:odb:${Region}:${Account}:cloud-autonomous-vm-cluster/${CloudAutonomousVmClusterId}	aws:ResourceTag/${TagKey}
cloud-exadata-infrastructure	arn:${Partition}:odb:${Region}:${Account}:cloud-exadata-infrastructure/${CloudExadataInfrastructureId}	aws:ResourceTag/${TagKey}
cloud-vm-cluster	arn:${Partition}:odb:${Region}:${Account}:cloud-vm-cluster/${CloudVmClusterId}	aws:ResourceTag/${TagKey}
db-node	arn:${Partition}:odb:${Region}:${Account}:db-node/${DbNodeId}	aws:ResourceTag/${TagKey}
odb-network	arn:${Partition}:odb:${Region}:${Account}:odb-network/${OdbNetworkId}	aws:ResourceTag/${TagKey}
odb-peering-connection	arn:${Partition}:odb:${Region}:${Account}:odb-peering-connection/${OdbPeeringConnectionId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Service - Oracle Database@AWS

AWS Service - Oracle Database@AWS defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Service Catalog

AWS Service Catalog (service prefix: `servicecatalog`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Service Catalog

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptPortfolioShare	Grants permission to accept a portfolio that has been shared with you	Write	Portfolio*		
AssociateAttributeGroup	Grants permission to associate an attribute group with an application	Write	Application* AttributeGroup*		
AssociateBudgetWithResource	Grants permission to associate a budget with a resource	Write			
AssociatePrincipalWithPortfolio	Grants permission to associate an IAM principal with a portfolio, giving the specified principal access to any products associated with the specified portfolio	Write	Portfolio*		
AssociateProductWithPortfolio	Grants permission to associate a product with a portfolio	Write			
AssociateResource	Grants permission to associate a resource with an application	Write	Application*		cloudformation:DescribeStacks resource-groups:CreateGroup

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					resource-groups:GetGroup resource-groups:Tag
				servicecatalog:ResourceType servicecatalog:Resource	
AssociateServiceActionWithProvisioningArtifact	Grants permission to associate an action with a provisioning artifact	Write	Product*		
AssociateTagOptionWithResource	Grants permission to associate the specified TagOption with the specified portfolio or product	Write	Portfolio Product		
BatchAssociateServiceActionWithProvisioningArtifact	Grants permission to associate multiple self-service actions with provisioning artifacts	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchDisassociateServiceActionFromProvisioningArtifact	Grants permission to disassociate a batch of self-service actions from the specified provisioning artifact	Write			
CopyProduct	Grants permission to copy the specified source product to the specified target product or a new product	Write			
CreateApplication	Grants permission to create an application	Write	Application*		iam:CreateServiceLinkedRole
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateAttributeGroup	Grants permission to create an attribute group	Write	AttributeGroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateConstraint	Grants permission to create a constraint on an associated product and portfolio	Write	Product*		
CreatePortfolio	Grants permission to create a portfolio	Write	Portfolio*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreatePortfolioShare	Grants permission to share a portfolio you own with another AWS account	Permissions management	Portfolio*		
CreateProduct	Grants permission to create a product and that product's first provisioning artifact	Write	Product*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateProvisionedProductPlan	Grants permission to add a new provisioned product plan	Write		servicecatalog:accountLevel servicecatalog:roleLevel servicecatalog:userLevel	
CreateProvisioningArtifact	Grants permission to add a new provisioning artifact to an existing product	Write	Product*		
CreateServiceAction	Grants permission to create a self-service action	Write			
CreateTagOption	Grants permission to create a TagOption	Write			
DeleteApplication	Grants permission to delete an application if all associations have been removed from the application	Write	Application*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAttributeGroup	Grants permission to delete an attribute group if all associations have been removed from the attribute group	Write	AttributeGroup*		
DeleteConstraint	Grants permission to remove and delete an existing constraint from an associated product and portfolio	Write			
DeletePortfolio	Grants permission to delete a portfolio if all associations and shares have been removed from the portfolio	Write	Portfolio*		
DeletePortfolioShare	Grants permission to unshare a portfolio you own from an AWS account you previously shared the portfolio with	Permissions management	Portfolio*		
DeleteProduct	Grants permission to delete a product if all associations have been removed from the product	Write	Product*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteProvisionedProductPlan	Grants permission to delete a provisioned product plan	Write		servicecatalog:accountLevel servicecatalog:roleLevel servicecatalog:userLevel	
DeleteProvisioningArtifact	Grants permission to delete a provisioning artifact from a product	Write	Product*		
DeleteResourcePolicy [permission only]	Grants permission to delete a resource-based policy for the specified resource	Write	Application		
			AttributeGroup		
DeleteServiceAction	Grants permission to delete a self-service action	Write			
DeleteTagOption	Grants permission to delete the specified TagOption	Write			
DescribeConstraint	Grants permission to describe a constraint	Read			
DescribeCopyProductStatus	Grants permission to get the status of the specified copy product operation	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribePortfolio	Grants permission to describe a portfolio	Read	Portfolio*		
DescribePortfolioShareStatus	Grants permission to get the status of the specified portfolio share operation	Read			
DescribePortfolioShares	Grants permission to view a summary of each of the portfolio shares that were created for the specified portfolio	List	Portfolio*		
DescribeProduct	Grants permission to describe a product as an end-user	Read	Product*		
DescribeProductAsAdmin	Grants permission to describe a product as an admin	Read	Product*		
DescribeProductView	Grants permission to describe a product as an end-user	Read			
DescribeProvisionedProduct	Grants permission to describe a provisioned product	Read		servicecatalog:accountLevel servicecatalog:roleLevel servicecatalog:userLevel	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeProvisionedProductPlan	Grants permission to describe a provisioned product plan	Read		servicecatalog:accountLevel servicecatalog:roleLevel servicecatalog:userLevel	
DescribeProvisioningArtifact	Grants permission to describe a provisioning artifact	Read	Product*		
DescribeProvisioningParameters	Grants permission to describe the parameters that you need to specify to successfully provision a specified provisioning artifact	Read	Product*		
DescribeRecord	Grants permission to describe a record and lists any outputs	Read		servicecatalog:accountLevel servicecatalog:roleLevel servicecatalog:userLevel	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeServiceAction	Grants permission to describe a self-service action	Read			
DescribeServiceActionExecutionParameters	Grants permission to get the default parameters if you executed the specified Service Action on the specified Provisioned Product	Read		servicecatalog:accountLevel servicecatalog:roleLevel servicecatalog:userLevel	
DescribeTagOption	Grants permission to get information about the specified TagOption	Read			
DisableAWSOrganizationsAccess	Grants permission to disable portfolio sharing through AWS Organizations feature	Write			
DisassociateAttributeGroup	Grants permission to disassociate an attribute group from an application	Write	Application* AttributeGroup*		
DisassociateBudgetFromResource	Grants permission to disassociate a budget from a resource	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociatePrincipalFromPortfolio	Grants permission to disassociate an IAM principal from a portfolio	Write	Portfolio*		
DisassociateProductFromPortfolio	Grants permission to disassociate a product from a portfolio	Write			
DisassociateResource	Grants permission to disassociate a resource from an application	Write	Application*		resource-groups:DeleteGroup
				servicecatalog:ResourceType servicecatalog:Resource	
DisassociateServiceActionFromProvisioningArtifact	Grants permission to disassociate the specified self-service action association from the specified provisioning artifact	Write	Product*		
DisassociateTagOptionFromResource	Grants permission to disassociate the specified TagOption from the specified resource	Write	Portfolio		
			Product		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableAWSOrganizationsAccess	Grants permission to enable portfolio sharing feature through AWS Organizations	Write			
ExecuteProvisionedProductPlan	Grants permission to execute a provisioned product plan	Write		servicecatalog:accountLevel servicecatalog:roleLevel servicecatalog:userLevel	
ExecuteProvisionedProductServiceAction	Grants permission to executes a provisioned product plan	Write		servicecatalog:accountLevel servicecatalog:roleLevel servicecatalog:userLevel	
GetAWSOrganizationsAccessStatus	Grants permission to get the access status of AWS Organization portfolio share feature	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetApplication	Grants permission to get an application	Read	Application*		
GetAssociatedResource	Grants permission to get information about a resource associated to an application	Read	Application*		
				servicecatalog:ResourceType servicecatalog:Resource	
GetAttributeGroup	Grants permission to get an attribute group	Read	AttributeGroup*		
GetConfiguration	Grants permission to read AppRegistry configurations	Read			
GetProvisionedProductOutputs	Grants permission to get the provisioned product output with either provisioned product id or name	Read			
GetResourcePolicy [permission only]	Grants permission to get a resource-based policy for the specified resource	Read	Application		
			AttributeGroup		
ImportAsProvisionedProduct	Grants permission to import a resource into a provisioned product	Write	Product*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAcceptedPortfolioShares	Grants permission to list the portfolios that have been shared with you and you have accepted	List			
ListApplications	Grants permission to list your applications	List			
ListAssociatedAttributeGroups	Grants permission to list the attribute groups associated with an application	List	Application*		
ListAssociatedResources	Grants permission to list the resources associated with an application	List	Application*		
ListAttributeGroups	Grants permission to list your attribute groups	List			
ListAttributeGroupsForApplication	Grants permission to list the associated attribute groups for a given application	List	Application*		
ListBudgetsForResource	Grants permission to list all the budgets associated to a resource	List			
ListConstraintsForPortfolio	Grants permission to list constraints associated with a given portfolio	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListLaunchPaths	Grants permission to list the different ways to launch a given product as an end-user	List	Product*		
ListOrganizationPortfolioAccess	Grants permission to list the organization nodes that have access to the specified portfolio	List			
ListPortfolioAccess	Grants permission to list the AWS accounts you have shared a given portfolio with	List	Portfolio*		
ListPortfolios	Grants permission to list the portfolios in your account	List			
ListPortfoliosForProduct	Grants permission to list the portfolios associated with a given product	List	Product*		
ListPrincipalsForPortfolio	Grants permission to list the IAM principals associated with a given portfolio	List	Portfolio*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListProvisionedProductPlans	Grants permission to list the provisioned product plans	List		servicecatalog:accountLevel servicecatalog:roleLevel servicecatalog:userLevel	
ListProvisioningArtifacts	Grants permission to list the provisioning artifacts associated with a given product	List	Product*		
ListProvisioningArtifactsForServiceAction	Grants permission to list all provisioning artifacts for the specified self-service action	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListRecordHistory	Grants permission to list all the records in your account or all the records related to a given provisioned product	List		servicecatalog:accountLevel servicecatalog:roleLevel servicecatalog:userLevel	
ListResourcesForTagOption	Grants permission to list the resources associated with the specified TagOption	List			
ListServiceActions	Grants permission to list all self-service actions	List			
ListServiceActionsForProvisioningArtifact	Grants permission to list all the service actions associated with the specified provisioning artifact in your account	List	Product*		
				servicecatalog:accountLevel servicecatalog:roleLevel servicecatalog:userLevel	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListStackInstancesForProvisionedProduct	Grants permission to list account, region and status of each stack instances that are associated with a CFN_STACKSET type provisioned product	List		servicecatalog:accountLevel servicecatalog:roleLevel servicecatalog:userLevel	
ListTagOptions	Grants permission to list the specified TagOptions or all TagOptions	List			
ListTagsForResource	Grants permission to list the tags for a service catalog appregistry resource	Read	Application		
			AttributeGroup		
NotifyProvisionProductEngineWorkflowResult	Grants permission to notify the result of the provisioning engine execution	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
NotifyTerminateProvisionedProductEngineWorkflowResult	Grants permission to notify the result of the terminate engine execution	Write			
NotifyUpdateProvisionedProductEngineWorkflowResult	Grants permission to notify the result of the update engine execution	Write			
ProvisionProduct	Grants permission to provision a product with a specified provisioning artifact and launch parameters	Write	Product*		
PutConfiguration	Grants permission to assign AppRegistry configurations	Write			
PutResourcePolicy [permission only]	Grants permission to add a resource-based policy for the specified resource	Write	Application		
			AttributeGroup		
RejectPortfolioShare	Grants permission to reject a portfolio that has been shared with you that you previously accepted	Write	Portfolio*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ScanProvisionedProducts	Grants permission to list all the provisioned products in your account	List		servicecatalog:accountLevel servicecatalog:roleLevel servicecatalog:userLevel	
SearchProducts	Grants permission to list the products available to you as an end-user	List			
SearchProductsAsAdmin	Grants permission to list all the products in your account or all the products associated with a given portfolio	List			
SearchProvisionedProducts	Grants permission to list all the provisioned products in your account	List		servicecatalog:accountLevel servicecatalog:roleLevel servicecatalog:userLevel	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SyncResource	Grants permission to sync a resource with its current state in AppRegistry	Write			cloudformation:UpdateStack
TagResource	Grants permission to tag a service catalog appregistry resource	Tagging	Application		
			AttributeGroup		
				aws:TagKeys aws:RequestTag/${TagKey}	
TerminateProvisionedProduct	Grants permission to terminate an existing provisioned product	Write		servicecatalog:accountLevel servicecatalog:roleLevel servicecatalog:userLevel	
UntagResource	Grants permission to remove a tag from a service catalog appregistry resource	Tagging	Application		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			Attribute Group		
				aws:TagKeys	
UpdateApplication	Grants permission to update the attributes of an existing application	Write	Application*		iam:CreateServiceLinkedRole
UpdateAttributeGroup	Grants permission to update the attributes of an existing attribute group	Write	AttributeGroup*		
UpdateConstraint	Grants permission to update the metadata fields of an existing constraint	Write			
UpdatePortfolio	Grants permission to update the metadata fields and/or tags of an existing portfolio	Write	Portfolio*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdatePortfolioShare	Grants permission to enable or disable resource sharing for an existing portfolio share	Permissions management	Portfolio*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateProduct	Grants permission to update the metadata fields and/or tags of an existing product	Write	Product*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateProvisionedProduct	Grants permission to update an existing provisioned product	Write		servicecatalog:accountLevel servicecatalog:roleLevel servicecatalog:userLevel	
UpdateProvisionedProductProperties	Grants permission to update the properties of an existing provisioned product	Write			
UpdateProvisioningArtifact	Grants permission to update the metadata fields of an existing provisioning artifact	Write	Product*		
UpdateServiceAction	Grants permission to update a self-service action	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateTagOption	Grants permission to update the specified TagOption	Write			

Resource types defined by AWS Service Catalog

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Application	`arn:${Partition}:servicecatalog:${Region}:${Account}:/applications/${ApplicationId}`	aws:ResourceTag/${TagKey}
AttributeGroup	`arn:${Partition}:servicecatalog:${Region}:${Account}:/attribute-groups/${AttributeGroupId}`	aws:ResourceTag/${TagKey}
Portfolio	`arn:${Partition}:catalog:${Region}:${Account}:portfolio/${PortfolioId}`	aws:ResourceTag/${TagKey}
Product	`arn:${Partition}:catalog:${Region}:${Account}:product/${ProductId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Service Catalog

AWS Service Catalog defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the

policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

> **Note**
>
> For example policies that show how these condition keys can be used in an IAM policy, see Example Access Policies for Provisioned Product Management in the *Service Catalog Administrator Guide*.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
servicecatalog:Resource	Filters access by controlling what value can be specified as the Resource parameter in an AppRegistry associate resource API	String
servicecatalog:ResourceType	Filters access by controlling what value can be specified as the ResourceType parameter in an AppRegistry associate resource API	String
servicecatalog:accountLevel	Filters access by user to see and perform actions on resources created by anyone in the account	String
servicecatalog:roleLevel	Filters access by user to see and perform actions on resources created either by them or by anyone federating into the same role as them	String

Condition keys	Description	Type
servicecatalog:userLevel	Filters access by user to see and perform actions on only resources that they created	String

Actions, resources, and condition keys for AWS service providing managed private networks

AWS service providing managed private networks (service prefix: `private-networks`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS service providing managed private networks

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcknowledgeOrderReceipt	Grants permission to acknowledge that an order has been received	Write	order*		
ActivateDeviceIdentifier	Grants permission to activate a device identifier	Write	device-identifier*		
				aws:ResourceTag/${TagKey}	
ActivateNetworkSite	Grants permission to activate a network site	Write	network-site*		
			order*		
				aws:RequestTag/${TagKey} aws:TagKeys	
ConfigureAccessPoint	Grants permission to configure an access point	Write	network-resource*		
CreateNetwork	Grants permission to create a network	Write	network*		
				aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
CreateNetworkSite	Grants permission to create a network site	Write	network*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeactivateDeviceIdentifier	Grants permission to deactivate a device identifier	Write	device-identifier*		
DeleteNetwork	Grants permission to delete a network	Write	network*		
DeleteNetworkSite	Grants permission to delete a network site	Write	network-site*		
GetDeviceIdentifier	Grants permission to get a device identifier	Read	device-identifier*		
				aws:ResourceTag/${TagKey}	
GetNetwork	Grants permission to get a network	Read	network*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
GetNetworkResource	Grants permission to get a network resource	Read	network-resource*

GetNetworkSite	Grants permission to get a network site	Read	network-site*		
				aws:ResourceTag/${TagKey}	
GetOrder	Grants permission to get a network order	Read	order*		
				aws:ResourceTag/${TagKey}	
ListDeviceIdentifiers	Grants permission to list device identifiers	List	network*		
ListNetworkResources	Grants permission to list network resources	List	network*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListNetworkSites	Grants permission to list network sites	List	network*		
ListNetworks	Grants permission to list networks	List			
ListOrders	Grants permission to list network orders	List	network*		
ListTagsForResource	Grants permission to return a list of tags for a resource	List			
Ping	Grants permission to check the health of the service	Read			
StartNetworkResourceUpdate	Grants permission to start an update on the specified network resource	Write	network-resource*		
				aws:RequestTag/${TagKey} aws:TagKeys	
TagResource	Grants permission to adds tags to the specified resource	Tagging	device-identifier		
			network		
			network-resource		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			network-site		
			order		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to removes tags from the specified resource	Tagging	device-identifier		
			network		
			network-resource		
			network-site		
			order		
				aws:TagKeys	
UpdateNetworkSite	Grants permission to update a network site	Write	network-site*		
UpdateNetworkSitePlan	Grants permission to update a plan at a network site	Write	network-site*		

Resource types defined by AWS service providing managed private networks

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
network	`arn:${Partition}:private-networks:${Region}:${Account}:network/${NetworkName}`	aws:ResourceTag/${TagKey}
network-site	`arn:${Partition}:private-networks:${Region}:${Account}:network-site/${NetworkName}/${NetworkSiteName}`	aws:ResourceTag/${TagKey}
network-resource	`arn:${Partition}:private-networks:${Region}:${Account}:network-resource/${NetworkName}/${ResourceId}`	aws:ResourceTag/${TagKey}
order	`arn:${Partition}:private-networks:${Region}:${Account}:order/${NetworkName}/${OrderId}`	aws:ResourceTag/${TagKey}
device-identifier	`arn:${Partition}:private-networks:${Region}:${Account}:device-identifier/${NetworkName}/${DeviceId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS service providing managed private networks

AWS service providing managed private networks defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by checking the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by checking tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Service Quotas

Service Quotas (service prefix: `servicequotas`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Service Quotas

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateServiceQuotaTemplate	Grants permission to associate the Service Quotas template with your organization	Write			organizations:DescribeOrganization organizations:EnableAWSServiceAccess
CreateSupportCase	Grants permission to submit a request to create a support case for an existing quota increase request	Write			
DeleteServiceQuotaIncreaseRequestFromTemplate	Grants permission to remove the specified service quota from the service quota template	Write			organizations:DescribeOrganization
DisassociateServiceQuotaTemplate	Grants permission to disassociate the Service Quotas template from your organization	Write			organizations:DescribeOrganization
GetAWSDefaultServiceQuota	Grants permission to return the details for the specified service quota, including the AWS default value	Read			
GetAssociationForS	Grants permission to retrieve the ServiceQuotaTempla	Read			organizations:Desc

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
erviceQuotaTemplate	teAssociationStatus value, which tells you if the Service Quotas template is associated with an organization				ribeOrganization
GetAutoManagementConfiguration	Grants permission to retrieve the automatic management of Service Quotas configuration, including notification settings, opt-in type, and excluded quotas	Read			
GetQuotaUtilizationReport	Grants permission to view the generated report	Read			
GetRequestedServiceQuotaChange	Grants permission to retrieve the details for a particular service quota increase request	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetServiceQuota	Grants permission to return the details for the specified service quota, including the applied value	Read	quota		autoscaling:DescribeAccountLimits cloudformation:DescribeAccountLimits dynamodb:DescribeLimits elasticloadbalancing:DescribeAccountLimits iam:GetAccountSummary kinesis:DescribeLimits rds:DescribeAccountAttributes

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					route53:GetAccountLimit
ListServices	Grants permission to list the AWS services available in Service Quotas	Read			
ListTagsForResource	Grants permission to view the existing tags on a SQ resource	Read			
PutServiceQuotaIncreaseRequestIntoTemplate	Grants permission to define and add a quota to the service quota template	Write	quota		organizations:DescribeOrganization
				servicequotas:service	
RequestServiceQuotaIncrease	Grants permission to submit the request for a service quota increase	Write	quota		
				servicequotas:service	
StartAutoManagement	Grants permission to enable automatic management of Service Quotas for an AWS account, including notification preferences and excluded quotas configurations	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartQuotaUtilizationReport	Grants permission to query quota utilization and create a report for your account	Read			
StopAutoManagement	Grants permission to stop automatic management of Service Quotas for an AWS account and remove all associated configurations	Write			
TagResource	Grants permission to associate a set of tags with an existing SQ resource	Tagging		aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove a set of tags from a SQ resource, where tags to be removed match a set of customer-supplied tag keys	Tagging		aws:TagKeys	
UpdateAutoManagement	Grants permission to update the automatic management of Service Quotas configuration, including notification preferences and excluded quotas	Write			

Resource types defined by Service Quotas

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
quota	`arn:${Partition}:servicequotas:${Region}:${Account}:${ServiceCode}/${QuotaCode}`	

Condition keys for Service Quotas

Service Quotas defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
servicequotas:service	Filters access by the specified AWS service	String

Actions, resources, and condition keys for Amazon SES

Amazon SES (service prefix: `ses`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon SES

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CloneReceiptRuleSet	Grants permission to create a receipt rule set by cloning an existing one	Write		ses:ApiVersion	
CreateConfigurationSet	Grants permission to create a new configuration set	Write		ses:ApiVersion	
CreateConfiguratio	Grants permission to create a configuration set event destination	Write		ses:ApiVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
nSetEvent Destination					
CreateConfiguratio nSetTrack ingOptions	Grants permission to creates an association between a configuration set and a custom domain for open and click event tracking	Write		ses:ApiVersion	
CreateCus tomVerifi cationEma ilTemplate	Grants permission to create a new custom verification email template	Write		ses:ApiVersion	
CreateRec eiptFilter	Grants permission to create a new IP address filter	Write		ses:ApiVersion	
CreateRec eiptRule	Grants permission to create a receipt rule	Write		ses:ApiVersion	
CreateRec eiptRuleSet	Grants permission to create an empty receipt rule set	Write		ses:ApiVersion	
CreateTem plate	Grants permission to creates an email template	Write		ses:ApiVersion	
DeleteCon figurationSet	Grants permission to delete an existing configuration set	Write		ses:ApiVersion	
DeleteConfiguratio nSetEvent Destination	Grants permission to delete an event destination	Write		ses:ApiVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteConfigurationSetTrackingOptions	Grants permission to delete an association between a configuration set and a custom domain for open and click event tracking	Write		ses:ApiVersion	
DeleteCustomVerificationEmailTemplate	Grants permission to delete an existing custom verification email template	Write		ses:ApiVersion	
DeleteIdentity	Grants permission to delete the specified identity	Write		ses:ApiVersion	
DeleteIdentityPolicy	Grants permission to delete the specified sending authorization policy for the given identity (an email address or a domain)	Permissions management		ses:ApiVersion	
DeleteReceiptFilter	Grants permission to delete the specified IP address filter	Write		ses:ApiVersion	
DeleteReceiptRule	Grants permission to delete the specified receipt rule	Write		ses:ApiVersion	
DeleteReceiptRuleSet	Grants permission to delete the specified receipt rule set and all of the receipt rules it contains	Write		ses:ApiVersion	
DeleteTemplate	Grants permission to delete an email template	Write		ses:ApiVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteVerifiedEmailAddress	Grants permission to delete the specified email address from the list of verified addresses	Write		ses:ApiVersion	
DescribeActiveReceiptRuleSet	Grants permission to return the metadata and receipt rules for the receipt rule set that is currently active	Read		ses:ApiVersion	
DescribeConfigurationSet	Grants permission to return the details of the specified configuration set	Read		ses:ApiVersion	
DescribeReceiptRule	Grants permission to return the details of the specified receipt rule	Read		ses:ApiVersion	
DescribeReceiptRuleSet	Grants permission to return the details of the specified receipt rule set	Read		ses:ApiVersion	
GetAccountSendingEnabled	Grants permission to return the email sending status of your account	Read		ses:ApiVersion	
GetCustomVerificationEmailTemplate	Grants permission to return the custom email verification template for the template name you specify	Read		ses:ApiVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetIdentityDkimAttributes	Grants permission to return the current status of Easy DKIM signing for an entity	Read		ses:ApiVersion	
GetIdentityMailFromDomainAttributes	Grants permission to return the custom MAIL FROM attributes for a list of identities (email addresses and/or domains)	Read		ses:ApiVersion	
GetIdentityNotificationAttributes	Grants permission to return a structure describing identity notification attributes for a list of verified identities (email addresses and/or domains),	Read		ses:ApiVersion	
GetIdentityPolicies	Grants permission to return the requested sending authorization policies for the given identity (an email address or a domain)	Read		ses:ApiVersion	
GetIdentityVerificationAttributes	Grants permission to return the verification status and (for domain identities) the verification token for a list of identities	Read		ses:ApiVersion	
GetSendQuota	Grants permission to return the user's current sending limits	Read		ses:ApiVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSendStatistics	Grants permission to returns the user's sending statistics	Read		ses:ApiVersion	
GetTemplate	Grants permission to return the template object, which includes the subject line, HTML par, and text part for the template you specify	Read		ses:ApiVersion	
ListConfigurationSets	Grants permission to list all of the configuration sets for your account	List		ses:ApiVersion	
ListCustomVerificationEmailTemplates	Grants permission to list all of the existing custom verification email templates for your account	List		ses:ApiVersion	
ListIdentities	Grants permission to list the email identities for your account	List		ses:ApiVersion	
ListIdentityPolicies	Grants permission to list all of the email templates for your account	List		ses:ApiVersion	
ListReceiptFilters	Grants permission to list the IP address filters associated with your account	Read		ses:ApiVersion	
ListReceiptRuleSets	Grants permission to list the receipt rule sets that exist under your account	Read		ses:ApiVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTemplates	Grants permission to list the email templates present in your account	List		ses:ApiVersion	
ListVerifiedEmailAddresses	Grants permission to list all of the email addresses that have been verified in your account	Read		ses:ApiVersion	
PutConfigurationSetDeliveryOptions	Grants permission to add or update the delivery options for a configuration set	Write		ses:ApiVersion	
PutIdentityPolicy	Grants permission to add or update a sending authorization policy for the specified identity (an email address or a domain)	Permissions management		ses:ApiVersion	
ReorderReceiptRuleSet	Grants permission to reorder the receipt rules within a receipt rule set	Write		ses:ApiVersion	
SendBounce	Grants permission to generate and send a bounce message to the sender of an email you received through Amazon SES	Write	identity*		
				ses:ApiVersion ses:FromAddress	
SendBulkTemplatedEmail	Grants permission to compose an email message to multiple destinations	Write	identity*		
			template*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			configuration-set		
				ses:ApiVersion ses:FeedbackAddress ses:FromAddress ses:FromDisplayName ses:Recipients	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SendCustomVerificationEmail	Grants permission to add an email address to the list of identities and attempts to verify it for your account	Write	identity*		
				ses:ApiVersion ses:FeedbackAddress ses:FromAddress ses:FromDisplayName ses:Recipients	
SendEmail	Grants permission to send an email message	Write	identity*		
			configuration-set		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ses:ApiVersion ses:FeedbackAddress ses:FromAddress ses:FromDisplayName ses:Recipients	
SendRawEmail	Grants permission to send an email message, with header and content specified by the client	Write	identity* configuration-set		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ses:ApiVersion ses:FeedbackAddress ses:FromAddress ses:FromDisplayName ses:Recipients	
SendTemplatedEmail	Grants permission to compose an email message using an email template	Write	identity*		
			template*		
			configuration-set		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ses:ApiVersion ses:FeedbackAddress ses:FromAddress ses:FromDisplayName ses:Recipients	
SetActiveReceiptRuleSet	Grants permission to set the specified receipt rule set as the active receipt rule set	Write		ses:ApiVersion	
SetIdentityDkimEnabled	Grants permission to enable or disable Easy DKIM signing of email sent from an identity	Write		ses:ApiVersion	
SetIdentityFeedbackForwardingEnabled	Grants permission to enable or disable whether Amazon SES forwards bounce and complaint notifications for an identity (an email address or a domain)	Write		ses:ApiVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SetIdentityHeadersInNotificationsEnabled	Grants permission to set whether Amazon SES includes the original email headers in the Amazon Simple Notification Service (Amazon SNS) notifications of a specified type for a given identity (an email address or a domain)	Write		ses:ApiVersion	
SetIdentityMailFromDomain	Grants permission to enable or disable the custom MAIL FROM domain setup for a verified identity	Write		ses:ApiVersion	
SetIdentityNotificationTopic	Grants permission to set an Amazon Simple Notification Service (Amazon SNS) topic to use when delivering notifications for a verified identity	Write		ses:ApiVersion	
SetReceiptRulePosition	Grants permission to set the position of the specified receipt rule in the receipt rule set	Write		ses:ApiVersion	
TestRenderTemplate	Grants permission to create a preview of the MIME content of an email when provided with a template and a set of replacement data	Write		ses:ApiVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAccountSendingEnabled	Grants permission to enable or disable email sending for your account	Write		ses:ApiVersion	
UpdateConfigurationSetEventDestination	Grants permission to update the event destination of a configuration set	Write		ses:ApiVersion	
UpdateConfigurationSetReputationMetricsEnabled	Grants permission to enable or disable the publishing of reputation metrics for emails sent using a specific configuration set	Write		ses:ApiVersion	
UpdateConfigurationSetSendingEnabled	Grants permission to enable or disable email sending for messages sent using a specific configuration set	Write		ses:ApiVersion	
UpdateConfigurationSetTrackingOptions	Grants permission to modify an association between a configuration set and a custom domain for open and click event tracking	Write		ses:ApiVersion	
UpdateCustomVerificationEmailTemplate	Grants permission to update an existing custom verification email template	Write		ses:ApiVersion	
UpdateReceiptRule	Grants permission to update a receipt rule	Write		ses:ApiVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateTemplate	Grants permission to update an email template	Write		ses:ApiVersion	
VerifyDomainDkim	Grants permission to return a set of DKIM tokens for a domain	Write		ses:ApiVersion	
VerifyDomainIdentity	Grants permission to verify a domain	Write		ses:ApiVersion	
VerifyEmailAddress	Grants permission to verify an email address	Write		ses:ApiVersion	
VerifyEmailIdentity	Grants permission to verify an email identity	Write		ses:ApiVersion	

Resource types defined by Amazon SES

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
configuration-set	`arn:${Partition}:ses:${Region}:${Account}:configuration-set/${ConfigurationSetName}`	

Resource types	ARN	Condition keys
custom-verification-email-template	arn:${Partition}:ses:${Region}:${Account}:custom-verification-email-template/${TemplateName}	
identity	arn:${Partition}:ses:${Region}:${Account}:identity/${IdentityName}	
template	arn:${Partition}:ses:${Region}:${Account}:template/${TemplateName}	

Condition keys for Amazon SES

Amazon SES defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
ses:ApiVersion	Filters actions based on the SES API version	String
ses:FeedbackAddress	Filters actions based on the "Return-Path" address, which specifies where bounces and complaints are sent by email feedback forwarding	String
ses:FromAddress	Filters actions based on the "From" address of a message	String
ses:FromDisplayName	Filters actions based on the "From" address that is used as the display name of a message	String

Condition keys	Description	Type
ses:Recipients	Filters actions based on the recipient addresses of a message, which include the "To", "CC", and "BCC" addresses	ArrayOfString

Actions, resources, and condition keys for AWS Shield

AWS Shield (service prefix: `shield`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS Shield

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Associate DRTLogBucket	Grants permission to authorize the DDoS Response team to access the specified Amazon S3 bucket containing your flow logs	Write			s3:GetBucketPolicy s3:PutBucketPolicy
Associate DRTRole	Grants permission to authorize the DDoS Response team using the specified role, to access your AWS account to assist with DDoS attack mitigation during potential attacks	Write			iam:GetRole iam:ListAttachedRolePolicies iam:PassRole
Associate HealthCheck	Grants permission to add health-based detection to the Shield Advanced protection for a resource	Write	protection*		route53:GetHealthCheck
				aws:ResourceTag/${TagKey}	
Associate ProactiveEngagementDetails	Grants permission to initialize proactive engagement and set the list of contacts for the DDoS Response Team (DRT) to use	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateProtection	Grants permission to activate DDoS protection service for a given resource ARN	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateProtectionGroup	Grants permission to create a grouping of protected resources so they can be handled as a collective	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateSubscription	Grants permission to activate subscription	Write			
DeleteProtection	Grants permission to delete an existing protection	Write	protection*		
				aws:ResourceTag/${TagKey}	
DeleteProtectionGroup	Grants permission to remove the specified protection group	Write	protection-group*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteSubscription	Grants permission to deactivate subscription	Write			
DescribeAttack	Grants permission to get attack details	Read	attack*		
DescribeAttackContributors [permission only]	Grants permission to get detailed information about the contributors to a specific DDoS attack	Read	attack* protection-group		
DescribeAttackStatistics	Grants permission to describe information about the number and type of attacks AWS Shield has detected in the last year	Read			
DescribeDRTAccess	Grants permission to describe the current role and list of Amazon S3 log buckets used by the DDoS Response team to access your AWS account while assisting with attack mitigation	Read			
DescribeEmergencyContactSettings	Grants permission to list the email addresses that the DRT can use to contact you during a suspected attack	Read			
DescribeProtection	Grants permission to get protection details	Read	protection*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
DescribeProtectionGroup	Grants permission to describe the specification for the specified protection group	Read	protection-group*		
				aws:ResourceTag/${TagKey}	
DescribeSubscription	Grants permission to get subscription details, such as start time	Read			
DisableApplicationLayerAutomaticResponse	Grants permission to disable application layer automatic response for Shield Advanced protection for a resource	Write			
DisableProactiveEngagement	Grants permission to remove authorization from the DDoS Response Team (DRT) to notify contacts about escalations	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateDRTLogBucket	Grants permission to remove the DDoS Response team's access to the specified Amazon S3 bucket containing your flow logs	Write			s3:DeleteBucketPolicy s3:GetBucketPolicy s3:PutBucketPolicy
DisassociateDRTRole	Grants permission to remove the DDoS Response team's access to your AWS account	Write			
DisassociateHealthCheck	Grants permission to remove health-based detection from the Shield Advanced protection for a resource	Write	protection*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableApplicationLayerAutomaticResponse	Grants permission to enable application layer automatic response for Shield Advanced protection for a resource	Write			apprunner:DescribeWebAclForService cloudfront:GetDistribution cognito-idp:GetWebACLForResource ec2:GetVerifiedAccessInstanceWebAcl iam:CreateServiceLinkedRole iam:GetRole wafv2:GetWebACL wafv2:GetWebACLForResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableProactiveEngagement	Grants permission to authorize the DDoS Response Team (DRT) to use email and phone to notify contacts about escalations	Write			
GetGlobalThreatData [permission only]	Grants permission to retrieve global threat intelligence data and trends from AWS Shield's threat monitoring systems	Read			
GetSubscriptionState	Grants permission to get subscription state	Read			
ListAttacks	Grants permission to list all existing attacks	List			
ListMitigations [permission only]	Grants permission to retrieve a list of mitigation actions that have been applied during DDoS attacks	List	attack*		
ListProtectionGroups	Grants permission to retrieve the protection groups for the account	List			
ListProtections	Grants permission to list all existing protections	List			
ListResourcesInProtectionGroup	Grants permission to retrieve the resources that are included in the protection group	List	protection-group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTagsForResource	Grants permission to get information about AWS tags for a specified Amazon Resource Name (ARN) in AWS Shield	Read	protection		
			protection-group		
TagResource	Grants permission to add or updates tags for a resource in AWS Shield	Tagging	protection		
			protection-group		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from a resource in AWS Shield	Tagging	protection		
			protection-group		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateApplicationLayerAutomaticResponse	Grants permission to update application layer automatic response for Shield Advanced protection for a resource	Write			apprunner:DescribeWebAclForService cognito-idp:GetWebACLForResource ec2:GetVerifiedAccessInstanceWebAcl wafv2:GetWebACL wafv2:GetWebACLForResource
UpdateEmergencyContactSettings	Grants permission to update the details of the list of email addresses that the DRT can use to contact you during a suspected attack	Write			
UpdateProtectionGroup	Grants permission to update an existing protection group	Write	protection-group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
UpdateSubscription	Grants permission to update the details of an existing subscription	Write			

Resource types defined by AWS Shield

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
attack	`arn:${Partition}:shield::${Account}:attack/${Id}`	
protection	`arn:${Partition}:shield::${Account}:protection/${Id}`	aws:ResourceTag/${TagKey}
protection-group	`arn:${Partition}:shield::${Account}:protection-group/${Id}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Shield

AWS Shield defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters actions based on the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters actions based on tag key-value pairs attached to the resource	String
aws:TagKeys	Filters actions based on the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS Shield network security director

AWS Shield network security director (service prefix: `network-security-director`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Shield network security director

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetFinding	Grants permission to get a finding	Read			
GetResource	Grants permission to get a resource	Read			
ListAccountSummaries	Grants permission to list account summaries for an account	List			
ListFindings	Grants permission to list findings	List			
ListInsights	Grants permission to list insights about the latest network security scan	List			
ListRemediations	Grants permission to list remediations for a finding	List			
ListResources	Grants permission to list resources	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateFinding	Grants permission to update the status of a finding	Write			

Resource types defined by AWS Shield network security director

AWS Shield network security director does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Shield network security director, specify `"Resource": "*"` in your policy.

Condition keys for AWS Shield network security director

Network Security Director has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Signer

AWS Signer (service prefix: `signer`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Signin

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AuthorizeOAuth2Access	Grants permission to authenticate through a browser and obtain an OAuth 2.0 authorization code for credential exchange	Read	oauth2-public-client-localhost*		
			oauth2-public-client-remote*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateOAuth2Token	Grants permission to exchange an authorization code for OAuth 2.0 access token and refresh token that can be used to access AWS services from developer tools and applications	Read	oauth2-public-client-localhost*		
			oauth2-public-client-remote*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTrustedIdentityPropagationApplicationForConsole	Grants permission to create an Identity Center application that represents the AWS Management Console on an Identity Center organization instance	Write			sso:CreateApplication sso:GetSharedSsoConfiguration sso:ListApplications sso:PutApplicationAccessScope sso:PutApplicationAssignmentConfiguration sso:PutApplicationAuthenticationMethod sso:PutApplicationGrant

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTrustedIdentityPropagationApplicationsForConsole	Grants permission to list all Identity Center applications that represent the AWS Management Console	List			sso:GetSharedSsoConfiguration sso:ListApplications

Resource types defined by AWS Signin

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
oauth2-public-client-localhost	`arn:${Partition}:signin:${Region}:${Account}:oauth2/public-client/localhost`	
oauth2-public-client-remote	`arn:${Partition}:signin:${Region}:${Account}:oauth2/public-client/remote`	

Condition keys for AWS Signin

Signin has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Simple Email Service - Mail Manager

Amazon Simple Email Service - Mail Manager (service prefix: `ses`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Simple Email Service - Mail Manager

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AllowVendedLogDeliveryForResource [permission only]	Grants permission to configure vended log delivery for Mail Manager resources	Permissions management	mailmanager-ingress-point		
			mailmanager-rule-set		
CreateAddonInstance	Grants permission to create an addon instance	Write		aws:RequestTag/${TagKey} aws:TagKeys ses:AddonSubscriptionArn	
CreateAddonSubscription	Grants permission to create an addon subscription	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateAddressList	Grants permission to create an address list	Write		aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
CreateAddressListImportJob	Grants permission to create an import job on an address list	Write	mailmanager-address-list*	aws:ResourceTag/${TagKey}	
CreateArchive	Grants permission to create an archive	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateIngressPoint	Grants permission to create an ingress point	Write		aws:RequestTag/${TagKey} aws:TagKeys ses:MailManagerRuleSetArn ses:MailManagerTrafficPolicyArn	ec2:DescribeVpcEndpoints iam:CreateServiceLinkedRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateRelay	Grants permission to create a SMTP relay	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateRuleSet	Grants permission to create a rule set	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateTrafficPolicy	Grants permission to create a traffic policy	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAddonInstance	Grants permission to delete an addon instance	Write	addon-instance*		
				aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAddonSubscription	Grants permission to delete an addon subscription	Write	addon-subscription*		
				aws:RequestTag/${TagKey}	
DeleteAddressList	Grants permission to delete an address list	Write	mailmanager-address-list*	aws:ResourceTag/${TagKey}	
DeleteArchive	Grants permission to delete an archive	Write	mailmanager-archive*		
				aws:RequestTag/${TagKey}	
DeleteIngressPoint	Grants permission to delete an ingress point	Write	mailmanager-ingress-point*		
				aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteRelay	Grants permission to delete a SMTP relay	Write	mailmanager-smtp-relay*		
				aws:RequestTag/${TagKey}	
DeleteRuleSet	Grants permission to delete a rule set	Write	mailmanager-rule-set*		
				aws:RequestTag/${TagKey}	
DeleteTrafficPolicy	Grants permission to delete a traffic point	Write	mailmanager-traffic-policy*		
				aws:RequestTag/${TagKey}	
DeregisterMemberFromAddressList	Grants permission to remove a member from an address list	Write	mailmanager-address-list*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAddonInstance	Grants permission to get information about an addon instance	Read	addon-instance*		
				aws:RequestTag/${TagKey}	
GetAddonSubscription	Grants permission to get information about an addon subscription	Read	addon-subscription*		
				aws:RequestTag/${TagKey}	
GetAddressList	Grants permission to get information about an address list	Read	mailmanager-address-list*	aws:ResourceTag/${TagKey}	
GetAddressListImportJob	Grants permission to get information about an import job on an address list	Read	mailmanager-address-list*	aws:ResourceTag/${TagKey}	
GetArchive	Grants permission to get information about an archive	Read	mailmanager-archive*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey}	
GetArchiveExport	Grants permission to get information about an archive export	Read	mailmanager-archive*		
GetArchiveMessage	Grants permission to retrieve archived message	Read	mailmanager-archive*		
GetArchiveMessageContent	Grants permission to retrieve archived message content	Read	mailmanager-archive*		
GetArchiveSearch	Grants permission to get information about a search	Read	mailmanager-archive*		
GetArchiveSearchResults	Grants permission to get information about search results	Read	mailmanager-archive*		
GetIngressPoint	Grants permission to get information about an ingress point	Read	mailmanager-ingress-point*		
				aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetMemberOfAddressList	Grants permission to get information about a member in an address list	Read	mailmanager-address-list*	aws:ResourceTag/${TagKey}	
GetRelay	Grants permission to get information about a SMTP relay	Read	mailmanager-smtp-relay*		
				aws:RequestTag/${TagKey}	
GetRuleSet	Grants permission to get information about a rule set	Read	mailmanager-rule-set*		
				aws:RequestTag/${TagKey}	
GetTrafficPolicy	Grants permission to get information about a traffic policy	Read	mailmanager-traffic-policy*		
				aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAddonInstances	Grants permission to list all of the addon instances associated with your account	List			
ListAddonSubscriptions	Grants permission to list all of the addon subscriptions associated with your account	List			
ListAddressListImportJobs	Grants permission to list all of the import jobs associated with an address list	List	mailmanager-address-list*	aws:ResourceTag/${TagKey}	
ListAddressLists	Grants permission to list all of the address lists associated with your account	List			
ListArchiveExports	Grants permission to list all of the archive exports associated with your account	List			
ListArchiveSearches	Grants permission to list all of the archive searches associated with your account	List			
ListArchives	Grants permission to list all of the archives associated with your account	List			
ListIngressPoints	Grants permission to list all of the ingress points associated with your account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListMembersOfAddressList	Grants permission to list all of the members associated with an address list	List	mailmanager-address-list*	aws:ResourceTag/${TagKey}	
ListRelays	Grants permission to list all of the SMTP relays associated with your account	List			
ListRuleSets	Grants permission to list all of the rule sets associated with your account	List			
ListTagsForResource	Grants permission to list all of the tags associated with the resource	Read	addon-instance		
			addon-subscription		
			mailmanager-archive		
			mailmanager-ingress-point		
			mailmanager-rule-set

UpdateArchive	Grants permission to update an archive	Write	mailmanager-archive*		
				aws:RequestTag/${TagKey}	
UpdateIngressPoint	Grants permission to update an ingress point	Write	mailmanager-ingress-point*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} ses:MailManagerTrafficPolicyArn ses:MailManagerRuleSetArn	
UpdateRelay	Grants permission to update a SMTP relay	Write	mailmanager-smtp-relay*		
				aws:RequestTag/${TagKey}	
UpdateRuleSet	Grants permission to update a rule set	Write	mailmanager-rule-set*		
				aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateTrafficPolicy	Grants permission to update a traffic policy	Write	mailmanager-traffic-policy*		
				aws:RequestTag/${TagKey}	

Resource types defined by Amazon Simple Email Service - Mail Manager

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
addon-instance	`arn:${Partition}:ses:${Region}:${Account}:addon-instance/${AddonInstanceId}`	aws:ResourceTag/${TagKey}
addon-subscription	`arn:${Partition}:ses:${Region}:${Account}:addon-subscription/${AddonSubscriptionId}`	aws:ResourceTag/${TagKey}
mailmanager-archive	`arn:${Partition}:ses:${Region}:${Account}:mailmanager-archive/${ArchiveId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
mailmanager-ingress-point	arn:${Partition}:ses:${Region}:${Account}:mailmanager-ingress-point/${IngressPointId}	aws:ResourceTag/${TagKey} ses:MailManagerIngressPointType
mailmanager-smtp-relay	arn:${Partition}:ses:${Region}:${Account}:mailmanager-smtp-relay/${RelayId}	aws:ResourceTag/${TagKey}
mailmanager-rule-set	arn:${Partition}:ses:${Region}:${Account}:mailmanager-rule-set/${RuleSetId}	aws:ResourceTag/${TagKey}
mailmanager-traffic-policy	arn:${Partition}:ses:${Region}:${Account}:mailmanager-traffic-policy/${TrafficPolicyId}	aws:ResourceTag/${TagKey}
mailmanager-address-list	arn:${Partition}:ses:${Region}:${Account}:mailmanager-address-list/${AddressListId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Simple Email Service - Mail Manager

Amazon Simple Email Service - Mail Manager defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
ses:AddonSubscriptionArn	Filters access by SES Addon Subscription ARN	ARN
ses:MailManagerIngressPointType	Filters access by SES Mail Manager ingress point type, for example OPEN or AUTH	String
ses:MailManagerRuleSetArn	Filters access by SES Mail Manager rule set ARN	ARN
ses:MailManagerTrafficPolicyArn	Filters access by SES Mail Manager traffic policy ARN	ARN

Actions, resources, and condition keys for Amazon Simple Email Service v2

Amazon Simple Email Service v2 (service prefix: `ses`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Simple Email Service v2

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetMetricData	Grants permission to get metric data on your activity	Read	configuration-set		
			identity		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
CancelExportJob	Grants permission to cancel an export job	Write	export-job*		
				ses:ApiVersion ses:ExportSourceType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateConfigurationSet	Grants permission to create a new configuration set	Write	configuration-set*		
			dedicated-ip-pool		
			mailmanager-archive		
				ses:ApiVersion aws:TagKeys aws:RequestTag/${TagKey}	
CreateConfigurationSetEventDestination	Grants permission to create a configuration set event destination	Write	configuration-set*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
CreateContact	Grants permission to create a contact	Write	contact-list*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ses:ApiVersion aws:ResourceTag/${TagKey}	
CreateContactList	Grants permission to create a contact list	Write	contact-list*		
				ses:ApiVersion aws:TagKeys aws:RequestTag/${TagKey}	
CreateCustomVerificationEmailTemplate	Grants permission to create a new custom verification email template	Write	custom-verification-email-template*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ses:ApiVersion aws:TagKeys aws:RequestTag/${TagKey}	
CreateDedicatedIpPool	Grants permission to create a new pool of dedicated IP addresses	Write	dedicated-ip-pool*		
				ses:ApiVersion aws:TagKeys aws:RequestTag/${TagKey}	
CreateDeliverabilityTestReport	Grants permission to create a new predictive inbox placement test	Write	identity*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ses:ApiVersion aws:TagKeys aws:RequestTag/${TagKey}	
CreateEmailIdentity	Grants permission to start the process of verifying an email identity	Write	identity*		
				ses:ApiVersion aws:TagKeys aws:RequestTag/${TagKey}	
CreateEmailIdentityPolicy	Grants permission to create the specified sending authorization policy for the given identity	Permissions management	identity*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateEmailTemplate	Grants permission to create an email template	Write	template*		
				ses:ApiVersion aws:TagKeys aws:RequestTag/${TagKey}	
CreateExportJob	Grants permission to create an export job	Write		ses:ApiVersion ses:ExportSourceType	
CreateImportJob	Grants permission to creates an import job for a data destination	Write		ses:ApiVersion	
CreateMultiRegionEndpoint	Grants permission to create a new multi-region endpoint	Write		ses:ApiVersion aws:TagKeys aws:RequestTag/${TagKey}	iam:CreateServiceLinkedRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTenant	Grants permission to create a new tenant	Write	tenant*		
				ses:ApiVersion aws:TagKeys aws:RequestTag/${TagKey}	
CreateTenantResourceAssociation	Grants permission to associate a SES resource to a tenant	Write	configuration-set*		
			identity*		
			template*		
			tenant*		
				ses:ApiVersion aws:TagKeys aws:RequestTag/${TagKey}	
DeleteConfigurationSet	Grants permission to delete an existing configuration set	Write	configuration-set*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ses:ApiVersion aws:ResourceTag/${TagKey}	
DeleteConfigurationSetEventDestination	Grants permission to delete an event destination	Write	configuration-set*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
DeleteContact	Grants permission to delete a contact from a contact list	Write	contact-list*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
DeleteContactList	Grants permission to delete a contact list with all of its contacts	Write	contact-list*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ses:ApiVersion aws:ResourceTag/${TagKey}	
DeleteCustomVerificationEmailTemplate	Grants permission to delete an existing custom verification email template	Write	custom-verification-email-template*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
DeleteDedicatedIpPool	Grants permission to delete a dedicated IP pool	Write	dedicated-ip-pool*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteEmailIdentity	Grants permission to delete an email identity	Write	identity*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
DeleteEmailIdentityPolicy	Grants permission to delete the specified sending authorization policy for the given identity (an email address or a domain)	Permissions management	identity*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
DeleteEmailTemplate	Grants permission to delete an email template	Write	template*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
DeleteMultiRegionEndpoint	Grants permission to delete a multi-region endpoint	Write	multi-region-endpoint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ses:ApiVersion aws:ResourceTag/${TagKey}	
DeleteSuppressedDestination	Grants permission to remove an email address from the suppression list for your account	Write		ses:ApiVersion	
DeleteTenant	Grants permission to delete a tenant	Write	tenant*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
DeleteTenantResourceAssociation	Grants permission to remove an associated SES resource from a tenant	Write	configuration-set*		
			identity*		
			template*		
			tenant*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ses:ApiVersion aws:ResourceTag/${TagKey}	
GetAccount	Grants permission to get information about the email-sending status and capabilities for your account	Read		ses:ApiVersion	
GetBlacklistReports	Grants permission to retrieve a list of the deny lists on which your dedicated IP addresses or tracked domains appear	Read		ses:ApiVersion	
GetConfigurationSet	Grants permission to get information about an existing configuration set	Read	configuration-set*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
GetConfigurationSetEventDestinations	Grants permission to retrieve a list of event destinations that are associated with a configuration set	Read	configuration-set*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ses:ApiVersion aws:ResourceTag/${TagKey}	
GetContact	Grants permission to return a contact from a contact list	Read	contact-list*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
GetContactList	Grants permission to return contact list metadata	Read	contact-list*		
				ses:ApiVersion	
GetCustomVerificationEmailTemplate	Grants permission to return the custom email verification template for the template name you specify	Read	custom-verification-email-template*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ses:ApiVersion aws:ResourceTag/${TagKey}	
GetDedicatedIp	Grants permission to get information about a dedicated IP address	Read		ses:ApiVersion	
GetDedicatedIpPool	Grants permission to get information about a dedicated IP pool	Read	dedicated-ip-pool*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
GetDedicatedIps	Grants permission to list the dedicated IP addresses a dedicated IP pool	Read	dedicated-ip-pool*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDeliverabilityDashboardOptions	Grants permission to get the status of the Deliverability dashboard	Read		ses:ApiVersion	
GetDeliverabilityTestReport	Grants permission to retrieve the results of a predictive inbox placement test	Read	deliverability-test-report*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
GetDomainDeliverabilityCampaign	Grants permission to retrieve all the deliverability data for a specific campaign	Read		ses:ApiVersion	
GetDomainStatisticsReport	Grants permission to retrieve inbox placement and engagement rates for the domains that you use to send email	Read	identity*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetEmailAddressInsights	Grants permission to get insights about email address	Read		ses:ApiVersion	iam:CreateServiceLinkedRole
GetEmailIdentity	Grants permission to get information about a specific identity	Read	identity*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
GetEmailIdentityPolicies	Grants permission to return the requested sending authorization policies for the given identity (an email address or a domain)	Read	identity*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
GetEmailTemplate	Grants permission to return the template object, which includes the subject line, HTML part, and text part for the template you specify	Read	template*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetExportJob	Grants permission to get information about an export job	Read	export-job*		
				ses:ApiVersion ses:ExportSourceType	
GetImportJob	Grants permission to provide information about an import job	Read	import-job*		
				ses:ApiVersion	
GetMessageInsights	Grants permission to provide insights about a message	Read		ses:ApiVersion	
GetMultiRegionEndpoint	Grants permission to get information about a multi-region endpoint	Read	multi-region-endpoint*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
GetReputationEntity		Read	tenant*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	Grants permission to retrieve information about a reputation entity's status			ses:ApiVersion aws:ResourceTag/${TagKey}	
GetSuppressedDestination	Grants permission to retrieve information about a specific email address that's on the suppression list for your account	Read		ses:ApiVersion	
GetTenant	Grants permission to get information about a tenant	Read	tenant*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
ListConfigurationSets	Grants permission to list all of the configuration sets for your account	List		ses:ApiVersion	
ListContactLists	Grants permission to list all of the contact lists available for your account	List		ses:ApiVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListContacts	Grants permission to list the contacts present in a specific contact list	List	contact-list*		
				ses:ApiVersion	
ListCustomVerificationEmailTemplates	Grants permission to list all of the existing custom verification email templates for your account	List		ses:ApiVersion	
ListDedicatedIpPools	Grants permission to list all of the dedicated IP pools for your account	List		ses:ApiVersion	
ListDeliverabilityTestReports	Grants permission to retrieve the list of the predictive inbox placement tests that you've performed, regardless of their statuses, for your account	List		ses:ApiVersion	
ListDomainDeliverabilityCampaigns	Grants permission to list deliverability data for campaigns that used a specific domain to send email during a specified time range	Read		ses:ApiVersion	
ListEmailIdentities	Grants permission to list the email identities for your account	List		ses:ApiVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListEmailTemplates	Grants permission to list all of the email templates for your account	List		ses:ApiVersion	
ListExportJobs	Grants permission to list all the exports jobs for your account	List		ses:ApiVersion ses:ExportSourceType	
ListImportJobs	Grants permission to list all of the import jobs for your account	List		ses:ApiVersion	
ListMultiRegionEndpoints	Grants permission to list all of the multi-region endpoints for your account	List		ses:ApiVersion	
ListRecommendations	Grants permission to list recommendations for your account	Read	identity		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
ListReputationEntities	Grants permission to retrieve a list of reputation entities	List	tenant*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ses:ApiVersion aws:ResourceTag/${TagKey}	
ListResourceTenants	Grants permission to list all the tenants associated to a SES resource	List	configuration-set*		
			identity*		
			template*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
ListSuppressedDestinations	Grants permission to list email addresses that are on the suppression list for your account	Read		ses:ApiVersion	
ListTagsForResource	Grants permission to retrieve a list of the tags (keys and values) that are associated with a specific resource for your account	Read	configuration-set		
			contact-list		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			custom-verification-email-template		
			dedicated-ip-pool		
			deliverability-test-report		
			identity		
			template		
			tenant		
				ses:ApiVersion	
ListTenantResources	Grants permission to list all the resources associated to a tenant	List	tenant*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
ListTenants	Grants permission to list all the tenants for your account	List		ses:ApiVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutAccountDedicatedIpWarmupAttributes	Grants permission to enable or disable the automatic warm-up feature for dedicated IP addresses	Write		ses:ApiVersion	
PutAccountDetails	Grants permission to update your account details	Write		ses:ApiVersion	
PutAccountSendingAttributes	Grants permission to enable or disable the ability to send email for your account	Write		ses:ApiVersion	
PutAccountSuppressionAttributes	Grants permission to change the settings for the account-level suppression list	Write		ses:ApiVersion	
PutAccountVdmAttributes	Grants permission to change the settings for VDM for your account	Write		ses:ApiVersion	
PutConfigurationSetArchivingOptions	Grants permission to associate a configuration set with a Mail Manager archive	Write	configuration-set*		
			mailmanager-archive		
				ses:ApiVersion aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutConfigurationSetDeliveryOptions	Grants permission to associate a configuration set with a dedicated IP pool	Write	configuration-set*		
			dedicated-ip-pool		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
PutConfigurationSetReputationOptions	Grants permission to enable or disable collection of reputation metrics for emails that you send using a particular configuration set	Write	configuration-set*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
PutConfigurationSetSendingOptions	Grants permission to enable or disable email sending for messages that use a particular configuration set	Write	configuration-set*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ses:ApiVersion aws:ResourceTag/${TagKey}	
PutConfigurationSetSuppressionOptions	Grants permission to specify the account suppression list preferences for a particular configuration set	Write	configuration-set*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
PutConfigurationSetTrackingOptions	Grants permission to specify a custom domain to use for open and click tracking elements in email that you send for a particular configuration set	Write	configuration-set*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
PutConfigurationSetVdmOptions	Grants permission to override account-level VDM settings for a particular configuration set	Write	configuration-set*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ses:ApiVersion aws:ResourceTag/${TagKey}	
PutDedicatedIpInPool	Grants permission to move a dedicated IP address to an existing dedicated IP pool	Write	dedicated-ip-pool*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
PutDedicatedIpPoolScalingAttributes	Grants permission to transition a dedicated IP pool from Standard to Managed	Write	dedicated-ip-pool*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
PutDedicatedIpWarmupAttributes	Grants permission to put Dedicated IP warm up attributes	Write		ses:ApiVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutDeliverabilityDashboardOption	Grants permission to enable or disable the Deliverability dashboard	Write		ses:ApiVersion	
PutEmailIdentityConfigurationSetAttributes	Grants permission to associate a configuration set with an email identity	Write	identity*		
			configuration-set		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
PutEmailIdentityDkimAttributes	Grants permission to enable or disable DKIM authentication for an email identity	Write	identity*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutEmailIdentityDkimSigningAttributes	Grants permission to configure or change the DKIM authentication settings for an email domain identity	Write	identity*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
PutEmailIdentityFeedbackAttributes	Grants permission to enable or disable feedback forwarding for an email identity	Write	identity*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
PutEmailIdentityMailFromAttributes	Grants permission to enable or disable the custom MAIL FROM domain configuration for an email identity	Write	identity*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
PutSuppressedDestination	Grants permission to add an email address to the suppression list	Write		ses:ApiVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ReplicateEmailIdentityDkimSigningKey [permission only]	Grants permission to replicate email identity DKIM signing key	Permissions management	identity*		
				ses:ReplicaRegion	
SendBulkEmail	Grants permission to compose an email message to multiple destinations	Write	identity*		
			template*		
			configuration-set		
				ses:ApiVersion ses:MultiRegionEndpointId ses:TenantName	
SendCustomVerificationEmail	Grants permission to add an email address to the list of identities and attempts to verify it	Write	custom-verification-email-template*		
				ses:ApiVersion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SendEmail	Grants permission to send an email message	Write	identity*		
			configuration-set		
			template

UpdateEmailIdentityPolicy	Grants permission to update the specified sending authorization policy for the given identity (an email address or a domain)	Permissions management	identity*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
UpdateEmailTemplate	Grants permission to update an email template	Write	template*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ses:ApiVersion aws:ResourceTag/${TagKey}	
UpdateReputationEntityCustomerManagedStatus	Grants permission to update the customer-managed sending status	Write	tenant*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	
UpdateReputationEntityPolicy	Grants permission to assign a reputation policy	Write	reputation-policy*		
			tenant*		
				ses:ApiVersion aws:ResourceTag/${TagKey}	

Resource types defined by Amazon Simple Email Service v2

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
reputation-policy	`arn:${Partition}:ses:${Region}:aws:reputation-policy/${ReputationPolicyName}`	
configuration-set	`arn:${Partition}:ses:${Region}:${Account}:configuration-set/${ConfigurationSetName}`	aws:ResourceTag/${TagKey}
contact-list	`arn:${Partition}:ses:${Region}:${Account}:contact-list/${ContactListName}`	aws:ResourceTag/${TagKey}
custom-verification-email-template	`arn:${Partition}:ses:${Region}:${Account}:custom-verification-email-template/${TemplateName}`	aws:ResourceTag/${TagKey}
dedicated-ip-pool	`arn:${Partition}:ses:${Region}:${Account}:dedicated-ip-pool/${DedicatedIPPool}`	aws:ResourceTag/${TagKey}
deliverability-test-report	`arn:${Partition}:ses:${Region}:${Account}:deliverability-test-report/${ReportId}`	aws:ResourceTag/${TagKey}
export-job	`arn:${Partition}:ses:${Region}:${Account}:export-job/${ExportJobId}`	

Resource types	ARN	Condition keys
identity	arn:${Partition}:ses:${Region}:${Account}:identity/${IdentityName}	aws:ResourceTag/${TagKey}
import-job	arn:${Partition}:ses:${Region}:${Account}:import-job/${ImportJobId}	
template	arn:${Partition}:ses:${Region}:${Account}:template/${TemplateName}	aws:ResourceTag/${TagKey}
multi-region-endpoint	arn:${Partition}:ses:${Region}:${Account}:multi-region-endpoint/${EndpointName}	
mailmanager-archive	arn:${Partition}:ses:${Region}:${Account}:mailmanager-archive/${ArchiveId}	aws:ResourceTag/${TagKey}
tenant	arn:${Partition}:ses:${Region}:${Account}:tenant/${TenantName}/${TenantId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Simple Email Service v2

Amazon Simple Email Service v2 defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
ses:ApiVersion	Filters access by the SES API version	String
ses:ExportSourceType	Filters access by the export source type	String
ses:FeedbackAddress	Filters access by the "Return-Path" address, which specifies where bounces and complaints are sent by email feedback forwarding	String
ses:FromAddress	Filters access by the "From" address of a message	String
ses:FromDisplayName	Filters access by the "From" address that is used as the display name of a message	String
ses:MultiRegionEndpointId	Filters access by the multi-region endpoint ID that is used to send email	String
ses:Recipients	Filters access by the recipient addresses of a message, which include the "To", "CC", and "BCC" addresses	ArrayOfString
ses:ReplicaRegion	Filters access by the replica regions for Replicating domain DKIM signing key	ArrayOfString
ses:TenantName	Filters access by the tenant name that is used to send email	String

Actions, resources, and condition keys for Amazon Simple Workflow Service

Amazon Simple Workflow Service (service prefix: `swf`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon Simple Workflow Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelTimer [permission only]	Grants permission to cancel a previously started timer and record a TimerCanceled event in the history	Write	domain*		
CancelWorkflowExecution	Grants permission to close the workflow execution and record a WorkflowExecutionCanceled event in the history	Write	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
[permission only]					
CompleteWorkflowExecution [permission only]	Grants permission to close the workflow execution and record a WorkflowExecutionCompleted event in the history	Write	domain*		
ContinueAsNewWorkflowExecution [permission only]	Grants permission to close the workflow execution and start a new workflow execution of the same type using the same workflow ID and a unique run Id	Write	domain*		
CountClosedWorkflowExecutions	Grants permission to return the number of closed workflow executions within the given domain that meet the specified filtering criteria	Read	domain*		
				swf:tagFilter.tag swf:typeFilter.name swf:typeFilter.version	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CountOpenWorkflowExecutions	Grants permission to return the number of open workflow executions within the given domain that meet the specified filtering criteria	Read	domain*		
				swf:tagFilter.tag swf:typeFilter.name swf:typeFilter.version	
CountPendingActivityTasks	Grants permission to return the estimated number of activity tasks in the specified task list	Read	domain*		
				swf:taskList.name	
CountPendingDecisionTasks	Grants permission to return the estimated number of decision tasks in the specified task list	Read	domain*		
				swf:taskList.name	
DeleteActivityType	Grants permission to delete the specified activity type	Write	domain*		
				swf:activityType.name swf:activityType.version	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteWorkflowType	Grants permission to delete the specified workflow type	Write	domain*		
				swf:workflowType.name swf:workflowType.version	
DeprecateActivityType	Grants permission to deprecate the specified activity type	Write	domain*		
				swf:activityType.name swf:activityType.version	
DeprecateDomain	Grants permission to deprecate the specified domain	Write	domain*		
DeprecateWorkflowType	Grants permission to deprecate the specified workflow type	Write	domain*		
				swf:workflowType.name swf:workflowType.version	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeActivityType	Grants permission to return information about the specified activity type	Read	domain*		
				swf:activityType.name swf:activityType.version	
DescribeDomain	Grants permission to return information about the specified domain, including its description and status	Read	domain*		
DescribeWorkflowExecution	Grants permission to return information about the specified workflow execution including its type and some statistics	Read	domain*		
DescribeWorkflowType	Grants permission to return information about the specified workflow type	Read	domain*		
				swf:workflowType.name swf:workflowType.version	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
FailWorkflowExecution [permission only]	Grants permission to close the workflow execution and record a WorkflowExecutionFailed event in the history	Write	domain*		
GetWorkflowExecutionHistory	Grants permission to return the history of the specified workflow execution	Read	domain*		
ListActivityTypes	Grants permission to return information about all activities registered in the specified domain that match the specified name and registration status	List	domain*		
ListClosedWorkflowExecutions	Grants permission to return a list of closed workflow executions in the specified domain that meet the filtering criteria	List	domain*		
				swf:tagFilter.tag swf:typeFilter.name swf:typeFilter.version	
ListDomains	Grants permission to return the list of domains registered in the account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListOpenWorkflowExecutions	Grants permission to return a list of open workflow executions in the specified domain that meet the filtering criteria	List	domain*		
				swf:tagFilter.tag swf:typeFilter.name swf:typeFilter.version	
ListTagsForResource	Grants permission to list tags for an AWS SWF resource	List	domain		
ListWorkflowTypes	Grants permission to return information about workflow types in the specified domain	List	domain*		
PollForActivityTask	Grants permission to workers to get an ActivityTask from the specified activity taskList	Write	domain*		
				swf:taskList.name	
PollForDecisionTask	Grants permission to deciders to get a DecisionTask from the specified decision taskList	Write	domain*		
				swf:taskList.name	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RecordActivityTaskHeartbeat	Grants permission to workers to report to the service that the ActivityTask represented by the specified taskToken is still making progress	Write	domain*		
RecordMarker [permission only]	Grants permission to record a MarkerRecorded event in the history	Write	domain*		
RegisterActivityType	Grants permission to register a new activity type along with its configuration settings in the specified domain	Write	domain*		
				swf:defaultTaskList.name swf:name swf:version	
RegisterDomain	Grants permission to register a new domain	Write		aws:TagKeys aws:RequestTag/${TagKey}	
RegisterWorkflowType	Grants permission to register a new workflow type and its configuration settings in the specified domain	Write	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				swf:defaultTaskList.name swf:name swf:version	
RequestCancelActivityTask [permission only]	Grants permission to attempt to cancel a previously scheduled activity task	Write	domain*		
RequestCancelExternalWorkflowExecution [permission only]	Grants permission to request that a request be made to cancel the specified external workflow execution	Write	domain*		
RequestCancelWorkflowExecution	Grants permission to record a WorkflowExecutionCancelRequested event in the currently running workflow execution identified by the given domain, workflowId, and runId	Write	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RespondActivityTaskCanceled	Grants permission to workers to tell the service that the ActivityTask identified by the taskToken was successfully canceled	Write	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RespondActivityTaskCompleted	Grants permission to workers to tell the service that the ActivityTask identified by the taskToken completed successfully with a result (if provided)	Write	domain*		
				swf:activityType.name swf:activityType.version swf:tagList.member.0 swf:tagList.member.1 swf:tagList.member.2 swf:tagList.member.3 swf:tagList.member.4 swf:taskList.name	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				swf:workflowType.name swf:workflowType.version	
RespondActivityTaskFailed	Grants permission to workers to tell the service that the ActivityTask identified by the taskToken has failed with reason (if specified)	Write	domain*		
RespondDecisionTaskCompleted	Grants permission to deciders to tell the service that the DecisionTask identified by the taskToken has successfully completed	Write	domain*		
ScheduleActivityTask [permission only]	Grants permission to schedule an activity task	Write	domain*		
SignalExternalWorkflowExecution [permission only]	Grants permission to request a signal to be delivered to the specified external workflow execution and records	Write	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SignalWorkflowExecution	Grants permission to record a WorkflowExecutionSignaled event in the workflow execution history and create a decision task for the workflow execution identified by the given domain, workflowId and runId	Write	domain*		
StartChildWorkflowExecution [permission only]	Grants permission to request that a child workflow execution be started	Write	domain*		
StartTimer [permission only]	Grants permission to start a timer for a workflow execution	Write	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartWorkflowExecution	Grants permission to start an execution of the workflow type in the specified domain using the provided workflowId and input data	Write	domain*	swf:tagList.member.0 swf:tagList.member.1 swf:tagList.member.2 swf:tagList.member.3 swf:tagList.member.4 swf:taskList.name swf:workflowType.name swf:workflowType.version	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to tag an AWS SWF resource	Tagging	domain		
				aws:TagKeys aws:RequestTag/${TagKey}	
TerminateWorkflowExecution	Grants permission to record a WorkflowExecutionTerminated event and force closure of the workflow execution identified by the given domain, runId, and workflowId	Write	domain*		
UndeprecateActivityType	Grants permission to undeprecate a previously deprecated activity type	Write	domain*		
				swf:activityType.name swf:activityType.version	
UndeprecateDomain	Grants permission to undeprecate a previously deprecated domain	Write	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UndeprecateWorkflowType	Grants permission to undeprecate a previously deprecated workflow type	Write	domain*		
				swf:workflowType.name swf:workflowType.version	
UntagResource	Grants permission to remove a tag from an AWS SWF resource	Tagging	domain		
				aws:TagKeys	

Resource types defined by Amazon Simple Workflow Service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
domain	`arn:${Partition}:swf::${Account}:/domain/${DomainName}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Simple Workflow Service

Amazon Simple Workflow Service defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tag of the request	String
aws:ResourceTag/${TagKey}	Filters access by tag of the resource	String
aws:TagKeys	Filters access by tag of the key	ArrayOfString
swf:activityType.name	Filters access by the name of the activity type	String
swf:activityType.version	Filters access by the version of the activity type	String
swf:defaultTaskList.name	Filters access by the name of the default task list	String
swf:name	Filters access by the name of activities or workflows	String
swf:tagFilter.tag	Filters access by the value of tagFilter.tag	String
swf:tagList.member.0	Filters access by the specified tag	String
swf:tagList.member.1	Filters access by the specified tag	String

Condition keys	Description	Type
swf:tagList.member.2	Filters access by the specified tag	String
swf:tagList.member.3	Filters access by the specified tag	String
swf:tagList.member.4	Filters access by the specified tag	String
swf:taskList.name	Filters access by the name of the tasklist	String
swf:typeFilter.name	Filters access by the name of the type filter	String
swf:typeFilter.version	Filters access by the version of the type filter	String
swf:version	Filters access by the version of activities or workflows	String
swf:workflowType.name	Filters access by the name of the workflow type	String
swf:workflowType.version	Filters access by the version of the workflow type	String

Actions, resources, and condition keys for Amazon SimpleDB

Amazon SimpleDB (service prefix: sdb) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon SimpleDB

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchDeleteAttributes	Grants permission to perform multiple DeleteAttributes operations in a single call, which reduces round trips and latencies	Write	domain*		
BatchPutAttributes	Grants permission to perform multiple PutAttribute operations in a single call, which reduces round trips and latencies	Write	domain*		
CreateDomain	Grants permission to create a new domain	Write	domain*		
DeleteAttributes	Grants permission to delete one or more attributes associated with the item	Write	domain*		
DeleteDomain	Grants permission to delete a domain	Write	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DomainMetadata	Grants permission to return information about the domain, including when the domain was created, the number of items and attributes, and the size of attribute names and values	Read	domain*		
GetAttributes	Grants permission to return all of the attributes associated with the item	Read	domain*		
GetExport	Grants permission to return information for an existing domain export arn	Read	export*		
ListDomains	Grants permission to list all domains	List			
ListExports	Grants permission to list all exports that were created. The results are paginated and can be filtered by domain name	List	domain		
PutAttributes	Grants permission to create or replace attributes in an item	Write	domain*		
Select	Grants permission to execute a query against the items in a domain	Read	domain*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartDomainExport	Grants permission to initiates the export of a SimpleDB domain to an S3 bucket	Write	domain*		

Resource types defined by Amazon SimpleDB

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
domain	`arn:${Partition}:sdb:${Region}:${Account}:domain/${DomainName}`	
export	`arn:${Partition}:sdb:${Region}:${Account}:domain/${DomainName}/export/${ExportUUID}`	

Condition keys for Amazon SimpleDB

SimpleDB has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS SimSpace Weaver

AWS SimSpace Weaver (service prefix: `simspaceweaver`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS SimSpace Weaver

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSnapshot	Grants permission to create a snapshot	Write	Simulation*		
DeleteApp	Grants permission to delete an app	Write	Simulation*		
DeleteSimulation	Grants permission to delete a simulation	Write	Simulation*		
DescribeApp	Grants permission to describe an app	Read	Simulation*		
DescribeSimulation	Grants permission to describe a simulation	Read	Simulation*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListApps	Grants permission to list apps	Read	Simulation*		
ListSimulations	Grants permission to list simulations	List			
ListTagsForResource	Grants permission to list the tags for a resource	Read			
StartApp	Grants permission to start an app	Write	Simulation*		
StartClock	Grants permission to start a simulation clock	Write	Simulation*		
StartSimulation	Grants permission to start a simulation	Write		aws:RequestTag/${TagKey} aws:TagKeys	
StopApp	Grants permission to stop an app	Write	Simulation*		
StopClock	Grants permission to stop a simulation clock	Write	Simulation*		
StopSimulation	Grants permission to stop a simulation	Write	Simulation*		
TagResource	Grants permission to tag a resource	Tagging	Simulation*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag a resource	Tagging	Simulation*		
				aws:TagKeys	

Resource types defined by AWS SimSpace Weaver

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Simulation	`arn:${Partition}:simspaceweaver:${Region}:${Account}:simulation/${SimulationName}`	aws:ResourceTag/${TagKey}

Condition keys for AWS SimSpace Weaver

AWS SimSpace Weaver defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by tags associated with the resource	String
aws:TagKeys	Filters access by tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Snow Device Management

AWS Snow Device Management (service prefix: `snow-device-management`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Resource types defined by AWS Snow Device Management
- Condition keys for AWS Snow Device Management

Actions defined by AWS Snow Device Management

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelTask	Grants permission to cancel tasks on remote devices	Write	task*		
CreateTask	Grants permission to create tasks on remote devices	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
DescribeDevice	Grants permission to describe a remotely-managed device	Read	managed-device*		
DescribeDeviceEc2Instances	Grants permission to describe a remotely-managed device's EC2 instances	Read	managed-device*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeExecution	Grants permission to describe task executions	Read			
DescribeTask	Grants permission to describe a task	Read	task*		
ListDeviceResources	Grants permission to list a remotely-managed device's resources	List	managed-device*		
ListDevices	Grants permission to list remotely-managed devices	List			
ListExecutions	Grants permission to list task executions	List			
ListTagsForResource	Grants permission to list the tags for a resource (device or task)	Read		aws:RequestTag/${TagKey} aws:TagKeys	
ListTasks	Grants permission to list tasks	List			
TagResource	Grants permission to tag a resource	Tagging	managed-device		
			task		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag a resource	Tagging	managed-device		
			task		
				aws:TagKeys	

Resource types defined by AWS Snow Device Management

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
managed-device	`arn:${Partition}:snow-device-management:${Region}:${Account}:managed-device/${ResourceId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
task	arn:${Partition}:snow-device-management:${Region}:${Account}:task/${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Snow Device Management

AWS Snow Device Management defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag's key and value in a request	String
aws:ResourceTag/${TagKey}	Filters access by the presence of tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS Snowball

AWS Snowball (service prefix: snowball) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Topics

Actions defined by AWS Snowball

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelCluster	Grants permission to cancel a cluster job	Write			
CancelJob	Grants permission to cancel the specified job	Write			
CreateAddress	Grants permission to create an address for a Snowball to be shipped to	Write			
CreateCluster	Grants permission to create an empty cluster	Write			
CreateJob	Grants permission to creates a job to import or export data between Amazon S3 and your on-premises data center	Write			
CreateLongTermPricing	Grants permission to creates a LongTermPricingListEntry for	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	allowing customers to add an upfront billing contract for a job				
CreateReturnShippingLabel	Grants permission to create a shipping label that will be used to return the Snow device to AWS	Write			
DescribeAddress	Grants permission to get specific details about that address in the form of an Address object	Read			
DescribeAddresses	Grants permission to describe a specified number of ADDRESS objects	List			
DescribeCluster	Grants permission to describe information about a specific cluster including shipping information, cluster status, and other important metadata	Read			
DescribeJob	Grants permission to describe information about a specific job including shipping information, job status, and other important metadata	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeReturnShippingLabel	Grants permission to describe information on the shipping label of a Snow device that is being returned to AWS	Read			
GetJobManifest	Grants permission to get a link to an Amazon S3 presigned URL for the manifest file associated with the specified JobId value	Read			
GetJobUnlockCode	Grants permission to get the UnlockCode code value for the specified job	Read			
GetSnowballUsage	Grants permission to get information about the Snowball service limit for your account, and also the number of Snowballs your account has in use	Read			
GetSoftwareUpdates	Grants permission to return an Amazon S3 presigned URL for an update file associated with a specified JobId	Read			
ListClusterJobs	Grants permission to list JobListEntry objects of the specified length	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListClusters	Grants permission to list ClusterListEntry objects of the specified length	List			
ListCompatibleImages	Grants permission to return a list of the different Amazon EC2 Amazon Machine Images (AMIs) that are owned by your AWS account that would be supported for use on a Snow device	List			
ListJobs	Grants permission to list JobListEntry objects of the specified length	List			
ListLongTermPricing	Grants permission to list LongTermPricingListEntry objects for the account making the request	Read			
ListPickupLocations	Grants permission to list Address objects where pickup is available, of the specified length	List			
ListServiceVersions	Grants permission to list all supported versions for Snow on-device services	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateCluster	Grants permission to update while a cluster's ClusterState value is in the AwaitingQuorum state, you can update some of the information associated with a cluster	Write			
UpdateJob	Grants permission to update while a job's JobState value is New, you can update some of the information associated with a job	Write			
UpdateJobShipmentState	Grants permission to update the state when a the shipment states changes to a different state	Write			
UpdateLongTermPricing	Grants permission to update a specific upfront billing contract for a job	Write			

Resource types defined by AWS Snowball

AWS Snowball does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Snowball, specify `"Resource": "*"` in your policy.

Condition keys for AWS Snowball

Snowball has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon SNS

Amazon SNS (service prefix: `sns`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon SNS

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddPermission	Grants permission to add a statement to a topic's access control policy, granting access for the specified AWS accounts to the specified actions	Permissions management	topic*		
CheckIfPhoneNumberIsOptedOut	Grants permission to accept a phone number and indicate whether the phone holder has	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	opted out of receiving SMS messages from your account				
ConfirmSubscription	Grants permission to verify an endpoint owner's intent to receive messages by validating the token sent to the endpoint by an earlier Subscribe action	Write	topic*		
CreatePlatformApplication	Grants permission to create a platform application object for one of the supported push notification services, such as APNS and GCM, to which devices and mobile apps may register	Write			iam:PassRole
CreatePlatformEndpoint	Grants permission to create an endpoint for a device and mobile app on one of the supported push notification services, such as GCM and APNS	Write			
CreateSMSSandboxPhoneNumber	Grants permission to add a destination phone number and send a one-time password (OTP) to that phone number for an AWS account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTopic	Grants permission to create a topic to which notifications can be published	Write	topic*		iam:PassRole
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteEndpoint	Grants permission to delete the endpoint for a device and mobile app from Amazon SNS	Write			
DeletePlatformApplication	Grants permission to delete a platform application object for one of the supported push notification services, such as APNS and GCM	Write			
DeleteSMSSandboxPhoneNumber	Grants permission to delete an AWS account's verified or pending phone number	Write			
DeleteTopic	Grants permission to delete a topic and all its subscriptions	Write	topic*		
GetDataProtectionPolicy	Grants permission to return the data protection policy of the topic	Read	topic*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetEndpointAttributes	Grants permission to retrieve the endpoint attributes for a device on one of the supported push notification services, such as GCM and APNS	Read			
GetPlatformApplicationAttributes	Grants permission to retrieve the attributes of the platform application object for the supported push notification services, such as APNS and GCM	Read			
GetSMSAttributes	Grants permission to return the settings for sending SMS messages from your account	Read			
GetSMSSandboxAccountStatus	Grants permission to retrieve the sandbox status for the calling account in the target region	Read			
GetSubscriptionAttributes	Grants permission to return all of the properties of a subscription	Read			
GetTopicAttributes	Grants permission to return all of the properties of a topic	Read	topic*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListEndpointsByPlatformApplication	Grants permission to list the endpoints and endpoint attributes for devices in a supported push notification service, such as GCM and APNS	List			
ListOriginationNumbers	Grants permission to list all origination numbers, and their metadata	List			
ListPhoneNumbersOptedOut	Grants permission to return a list of phone numbers that are opted out, meaning you cannot send SMS messages to them	Read			
ListPlatformApplications	Grants permission to list the platform application objects for the supported push notification services, such as APNS and GCM	List			
ListSMSSandboxPhoneNumbers	Grants permission to list the calling account's current pending and verified destination phone numbers	List			
ListSubscriptions	Grants permission to return a list of the requester's subscriptions	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListSubscriptionsByTopic	Grants permission to return a list of the subscriptions to a specific topic	List	topic*		
ListTagsForResource	Grants permission to list all tags added to the specified Amazon SNS topic	Read	topic		
ListTopics	Grants permission to return a list of the requester's topics	List			
OptInPhoneNumber	Grants permission to opt in a phone number that is currently opted out, which enables you to resume sending SMS messages to the number	Write			
Publish	Grants permission to send a message to all of a topic's subscribed endpoints	Write	topic*		
PutDataProtectionPolicy	Grants permission to allow a topic owner to set the data protection policy	Write	topic*		
RemovePermission	Grants permission to remove a statement from a topic's access control policy	Permissions management	topic*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SetEndpointAttributes	Grants permission to set the attributes for an endpoint for a device on one of the supported push notification services, such as GCM and APNS	Write			
SetPlatformApplicationAttributes	Grants permission to set the attributes of the platform application object for the supported push notification services, such as APNS and GCM	Write			iam:PassRole
SetSMSAttributes	Grants permission to set the default settings for sending SMS messages and receiving daily SMS usage reports	Write			
SetSubscriptionAttributes	Grants permission to allow a subscription owner to set an attribute of the topic to a new value	Write			
SetTopicAttributes	Grants permission to allow a topic owner to set an attribute of the topic to a new value	Permissions management	topic*		iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Subscribe	Grants permission to prepare to subscribe an endpoint by sending the endpoint a confirmation message	Write	topic*		
				sns:Endpoint sns:Protocol	
TagResource	Grants permission to add tags to the specified Amazon SNS topic	Tagging	topic		
				aws:RequestTag/${TagKey} aws:TagKeys	
Unsubscribe	Grants permission to delete a subscription	Write			
UntagResource	Grants permission to remove tags from the specified Amazon SNS topic	Tagging	topic		
				aws:TagKeys	
VerifySMSSandboxPhoneNumber	Grants permission to verify a destination phone number with a one-time password (OTP) for an AWS account	Write			

Resource types defined by Amazon SNS

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
topic	`arn:${Partition}:sns:${Region}:${Account}:${TopicName}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon SNS

Amazon SNS defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tags from request	String
aws:ResourceTag/${TagKey}	Filters access by tags associated with the resource	String
aws:TagKeys	Filters access by tag keys from request	ArrayOfString
sns:Endpoint	Filters access by the URL, email address, or ARN from a Subscribe request or a previously confirmed subscription	String

Condition keys	Description	Type
sns:Protocol	Filters access by the protocol value from a Subscribe request or a previously confirmed subscription	String

Actions, resources, and condition keys for AWS SQL Workbench

AWS SQL Workbench (service prefix: `sqlworkbench`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS SQL Workbench

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which

the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateConnectionWithChart	Grants permission to associate connection to a chart	Write	chart*		
			connection*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
[permission only]					
AssociateConnectionWithTab [permission only]	Grants permission to associate connection to a tab	Write	connection*		
AssociateNotebookWithTab [permission only]	Grants permission to associate notebook to a tab	Write	notebook*		
AssociateQueryWithTab [permission only]	Grants permission to associate query to a tab	Write	query*		
BatchDeleteFolder [permission only]	Grants permission to delete folders on your account	Write			
BatchGetNotebookCell [permission only]	Grants permission to get notebook cells content on your account	Read	notebook*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAccount [permission only]	Grants permission to create SQLWorkbench account	Write			
CreateChart [permission only]	Grants permission to create new saved chart on your account	Write	chart*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateConnection [permission only]	Grants permission to create a new connection on your account	Write	connection*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateFolder [permission only]	Grants permission to create folder on your account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateNotebook [permission only]	Grants permission to create a new notebook on your account	Write	notebook*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateNotebookCell [permission only]	Grants permission to create a notebook cell on your account	Write	notebook*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateNotebookFromVersion [permission only]	Grants permission to create a new notebook from a notebook version on your account	Write	notebook*		
				aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateNotebookVersion [permission only]	Grants permission to create a notebook version on your account	Write	notebook*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateSavedQuery [permission only]	Grants permission to create a new saved query on your account	Write	query*		
				aws:TagKeys aws:RequestTag/${TagKey}	
DeleteChart [permission only]	Grants permission to remove charts on your account	Write	chart*		
DeleteConnection [permission only]	Grants permission to remove connections on your account	Write	connection*		
DeleteNotebook [permission only]	Grants permission to remove notebooks on your account	Write	notebook*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteNotebookCell [permission only]	Grants permission to remove notebooks cells on your account	Write	notebook*		
DeleteNotebookVersion [permission only]	Grants permission to remove notebooks cells on your account	Write	notebook*		
DeleteQCustomContext [permission only]	Grants permission to delete account-wide custom context	Write			
DeleteSavedQuery [permission only]	Grants permission to remove saved queries on your account	Write	query*		
DeleteSqlGenerationContext [permission only]	Grants permission to delete sql generation context	Write			
DeleteTab [permission only]	Grants permission to remove a tab on your account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DriverExecute [permission only]	Grants permission to execute a query in your redshift cluster	Write	connection*		
DuplicateNotebook [permission only]	Grants permission to create a new notebook by duplicating an existing one on your account	Write	notebook*		
				aws:TagKeys aws:RequestTag/${TagKey}	
ExportNotebook [permission only]	Grants permission to export a notebook on your account	Read	notebook*		
GenerateSession [permission only]	Grants permission to generate a new session on your account	Write			
GetAccountInfo [permission only]	Grants permission to get account info	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAccountSettings [permission only]	Grants permission to get account settings	Read			
GetAutocompletionMetadata [permission only]	Grants permission to get database structure metadata for auto-completion	Read			
GetAutocompletionResource [permission only]	Grants permission to get database structure information for auto-completion	Read			
GetChart [permission only]	Grants permission to get charts on your account	Read	chart*		
GetConnection [permission only]	Grants permission to get connections on your account	Read	connection*		
GetNotebook [permission only]	Grants permission to get notebook metadata on your account	Read	notebook*		
GetNotebookVersion [permission only]	Grants permission to get the content of a notebook version on your account	Read	notebook*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetQCustomContext [permission only]	Grants permission to get account-wide custom context	Read			
GetQSqlPromptQuotas [permission only]	Grants permission to get Q generative SQL maximum prompt quotas	Read			
GetQSqlRecommendations [permission only]	Grants permission to get text to SQL recommendations	Read			
GetQueryExecutionHistory [permission only]	Grants permission to get the query execution history on your account	Read			
GetSavedQuery [permission only]	Grants permission to get saved query on your account	Read	query*		
GetSchemaInference [permission only]	Grants permission to get the columns and data types inferred from a file	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSqlGenerationContext [permission only]	Grants permission to get sql generation context	Read			
GetSqlRecommendations [permission only]	Grants permission to get text to SQL recommendations	Read			
GetUserInfo [permission only]	Grants permission to get user info	Read			
GetUserWorkspaceSettings [permission only]	Grants permission to get workspace settings on your account	Read			
ImportNotebook [permission only]	Grants permission to import a notebook on your account	Write	notebook*		
				aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListConnections [permission only]	Grants permission to list the connections on your account	List			
ListDatabases [permission only]	Grants permission to list databases of your redshift cluster	List			
ListFiles [permission only]	Grants permission to list files and folders	List			
ListNotebookVersions [permission only]	Grants permission to get notebook versions metadata on your account	List	notebook*		
ListNotebooks [permission only]	Grants permission to list the notebooks on your account	List			
ListQueryExecutionHistory [permission only]	Grants permission to list the query execution history on your account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListRedshiftClusters [permission only]	Grants permission to list redshift clusters on your account	List			
ListSampleDatabases [permission only]	Grants permission to list sample databases	Read			
ListSavedQueryVersions [permission only]	Grants permission to list versions of saved query on your account	List	query*		
ListTabs [permission only]	Grants permission to list tabs on your account	List			
ListTaggedResources [permission only]	Grants permission to list tagged resources	Read			
ListTagsForResource [permission only]	Grants permission to list the tags of an sqlworkbench resource	Read	chart		
			connection		
			notebook		
			query		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PassAccountSettings [permission only]	Grants permission to provide account settings with the request	Write			
PutQCustomContext [permission only]	Grants permission to update account-wide custom context	Write			
PutSqlGenerationContext [permission only]	Grants permission to update sql generation context	Write			
PutTab [permission only]	Grants permission to create or update a tab on your account	Write			
PutUserWorkspaceSettings [permission only]	Grants permission to update workspace settings on your account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RestoreNotebookVersion [permission only]	Grants permission to restore a notebook on your account to a version	Write	notebook*		
				aws:TagKeys aws:RequestTag/${TagKey}	
TagResource [permission only]	Grants permission to tag an sqlworkbench resource	Tagging	chart		
			connection		
			notebook		
			query		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource [permission only]	Grants permission to untag an sqlworkbench resource	Tagging	chart		
			connection		
			notebook		
			query		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
UpdateAccountConnectionSettings [permission only]	Grants permission to update account-wide connection settings	Write			
UpdateAccountExportSettings [permission only]	Grants permission to update account-wide export settings	Write			
UpdateAccountGeneralSettings [permission only]	Grants permission to update account-wide general settings	Write			
UpdateAccountQSqlSettings [permission only]	Grants permission to update account-wide text to SQL settings	Write			
UpdateChart [permission only]	Grants permission to update a chart on your account	Write	chart*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
UpdateConnection [permission only]	Grants permission to update a connection on your account	Write	connection*		
				aws:TagKeys aws:RequestTag/${TagKey}	
UpdateFileFolder [permission only]	Grants permission to move files on your account	Write	chart		
			query		
UpdateFolder [permission only]	Grants permission to update a folder's name and details on your account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateNotebook [permission only]	Grants permission to update a notebook metadata on your account	Write	notebook*		
				aws:TagKeys aws:RequestTag/${TagKey}	
UpdateNotebookCellContent [permission only]	Grants permission to update a notebook cell content on your account	Write	notebook*		
				aws:TagKeys aws:RequestTag/${TagKey}	
UpdateNotebookCellLayout [permission only]	Grants permission to update a notebook cell layout on your account	Write	notebook*		
				aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateSavedQuery [permission only]	Grants permission to update a saved query on your account	Write	query*		
				aws:TagKeys aws:RequestTag/${TagKey}	

Resource types defined by AWS SQL Workbench

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
connection	`arn:${Partition}:sqlworkbench:${Region}:${Account}:connection/${ResourceId}`	aws:ResourceTag/${TagKey}
query	`arn:${Partition}:sqlworkbench:${Region}:${Account}:query/${ResourceId}`	aws:ResourceTag/${TagKey}
chart	`arn:${Partition}:sqlworkbench:${Region}:${Account}:chart/${ResourceId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
notebook	arn:${Partition}:sqlworkbench:${Region}:${Account}:notebook/${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for AWS SQL Workbench

AWS SQL Workbench defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags that are associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon SQS

Amazon SQS (service prefix: sqs) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon SQS

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddPermission	Grants permission to a queue for a specific principal	Permissions management	queue*		
CancelMessageMoveTask	Grants permission to cancel an in progress message move task	Write	queue*		
ChangeMessageVisibility	Grants permission to change the visibility timeout of a specified message in a queue to a new value	Write	queue*		
CreateQueue	Grants permission to create a new queue, or returns the URL of an existing one	Write	queue*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteMessage	Grants permission to delete the specified message from the specified queue	Write	queue*		
DeleteQueue	Grants permission to delete the queue specified by the queue URL, regardless of whether the queue is empty	Write	queue*		
GetQueueAttributes	Grants permission to get attributes for the specified queue	Read	queue*		
GetQueueUrl	Grants permission to return the URL of an existing queue	Read	queue*		
ListDeadLetterSourceQueues	Grants permission to return a list of your queues that have the RedrivePolicy queue attribute configured with a dead letter queue	Read	queue*		
ListMessageMoveTasks	Grants permission to list message move tasks	Read	queue*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListQueueTags	Grants permission to list tags added to an SQS queue	Read	queue*		
ListQueues	Grants permission to return a list of your queues	Read			
PurgeQueue	Grants permission to delete the messages in a queue specified by the queue URL	Write	queue*		
ReceiveMessage	Grants permission to retrieve one or more messages, with a maximum limit of 10 messages, from the specified queue	Read	queue*		
RemovePermission	Grants permission to revoke any permissions in the queue policy that matches the specified Label parameter	Permissions management	queue*		
SendMessage	Grants permission to deliver a message to the specified queue	Write	queue*		
SetQueueAttributes	Grants permission to set the value of one or more queue attributes	Write	queue*		
StartMessageMoveTask	Grants permission to start a message move task	Write	queue*		
TagQueue	Grants permission to add tags to the specified SQS queue	Tagging	queue*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagQueue	Grants permission to remove tags from the specified SQS queue	Tagging	queue*		
				aws:TagKeys	

Resource types defined by Amazon SQS

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

> **Note**
>
> The ARN of the queue is used only in IAM permission policies. In API and CLI calls, you use the queue's URL instead.

Resource types	ARN	Condition keys
queue	`arn:${Partition}:sqs:${Region}:${Account}:${QueueName}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon SQS

Amazon SQS defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Step Functions

AWS Step Functions (service prefix: `states`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Step Functions

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateActivity	Grants permission to create an activity	Write	activity*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateStateMachine	Grants permission to create a state machine	Write	statemachine*		iam:PassRole states:PublishStateMachineVersion
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateStateMachineAlias	Grants permission to create a state machine alias	Write	statemachine*		
				states:StateMachineQualifier	
DeleteActivity	Grants permission to delete an activity	Write	activity*		
DeleteStateMachine	Grants permission to delete a state machine	Write	statemachine*		
DeleteStateMachineAlias	Grants permission to delete a state machine alias	Write	statemachine*		
				states:StateMachineQualifier	
DeleteStateMachineVersion	Grants permission to delete a state machine version	Write	statemachine*		
				states:StateMachineQualifier	
DescribeActivity	Grants permission to describe an activity	Read	activity*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeExecution	Grants permission to describe an execution	Read	execution*		
			express*		
DescribeMapRun	Grants permission to describe a map run	Read	maprun*		
DescribeStateMachine	Grants permission to describe a state machine	Read	statemachine*		
				states:StateMachineQualifier	
DescribeStateMachineAlias	Grants permission to describe a state machine alias	Read	statemachine*		
				states:StateMachineQualifier	
DescribeStateMachineForExecution	Grants permission to describe the state machine for an execution	Read	execution*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetActivityTask	Grants permission to be used by workers to retrieve a task (with the specified activity ARN) which has been scheduled for execution by a running state machine	Write	activity*		
GetExecutionHistory	Grants permission to return the history of the specified execution as a list of events	Read	execution*		
InvokeHTTPEndpoint [permission only]	Grants permission to invoke the HTTP Task state	Write			
ListActivities	Grants permission to list the existing activities	List			
ListExecutions	Grants permission to list the executions of a state machine	List	maprun*		
			statemachine*		
				states:StateMachineQualifier	
ListMapRuns	Grants permission to list the map runs of an execution	List	execution*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListStateMachineAliases	Grants permission to list the aliases of a state machine	List	statemachine*		
				states:StateMachineQualifier	
ListStateMachineVersions	Grants permission to list the versions of a state machine	List	statemachine*		
ListStateMachines	Grants permission to lists the existing state machines	List			
ListTagsForResource	Grants permission to list tags for an AWS Step Functions resource	List	activity		
			statemachine		
PublishStateMachineVersion	Grants permission to publish a state machine version	Write	statemachine*		
RedriveExecution	Grants permission to redrive an execution	Write	execution*		
RevealSecrets [permission only]	Grants permission to reveal sensitive data from an execution	Read			
SendTaskFailure	Grants permission to report that the task identified by the taskToken failed	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SendTaskHeartbeat	Grants permission to report to the service that the task represented by the specified taskToken is still making progress	Write			
SendTaskSuccess	Grants permission to report that the task identified by the taskToken completed successfully	Write			
StartExecution	Grants permission to start a state machine execution	Write	statemachine*		
				states:StateMachineQualifier	
StartSyncExecution	Grants permission to start a Synchronous Express state machine execution	Write	statemachine*		
				states:StateMachineQualifier	
StopExecution	Grants permission to stop an execution	Write	execution*		
TagResource	Grants permission to tag an AWS Step Functions resource	Tagging	activity		
			statemachine		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
TestState	Grants permission to test a state machine definition	Write			states:RevealSecrets
UntagResource	Grants permission to remove a tag from an AWS Step Functions resource	Tagging	activity		
			statemachine		
				aws:TagKeys	
UpdateMapRun	Grants permission to update a map run	Write	maprun*		
UpdateStateMachine	Grants permission to update a state machine	Write	statemachine*		iam:PassRole states:PublishStateMachineVersion

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateStateMachineAlias	Grants permission to update a state machine alias	Write	statemachine*		
				states:StateMachineQualifier	
ValidateStateMachineDefinition	Grants permission to validate a state machine definition	Read			

Resource types defined by AWS Step Functions

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
activity	arn:${Partition}:states:${Region}:${Account}:activity:${ActivityName}	aws:ResourceTag/${TagKey}
execution	arn:${Partition}:states:${Region}:${Account}:execution:${StateMachineName}:${ExecutionId}	aws:ResourceTag/${TagKey}
express	arn:${Partition}:states:${Region}:${Account}:express:${StateMachineName}:${ExecutionId}:${ExpressId}	
statemachine	arn:${Partition}:states:${Region}:${Account}:stateMachine:${StateMachineName}	aws:ResourceTag/${TagKey}
statemachineversion	arn:${Partition}:states:${Region}:${Account}:stateMachine:${StateMachineName}:${StateMachineVersionId}	aws:ResourceTag/${TagKey}
statemachinealias	arn:${Partition}:states:${Region}:${Account}:stateMachine:${StateMachineName}:${StateMachineAliasName}	aws:ResourceTag/${TagKey}
maprun	arn:${Partition}:states:${Region}:${Account}:mapRun:${StateMachineName}/${MapRunLabel}:${MapRunId}	
labelled execution	arn:${Partition}:states:${Region}:${Account}:execution:${StateMachineName}/${MapRunLabel}:${ExecutionId}	
labelled express	arn:${Partition}:states:${Region}:${Account}:express:${StateMachineName}/${MapRunLabel}:${ExecutionId}:${ExpressId}	

Condition keys for AWS Step Functions

AWS Step Functions defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString
states:HTTPEndpoint	Filters access by the endpoint that the HTTP Task state allows in the request	String
states:HTTPMethod	Filters access by the method that the HTTP Task state allows in the request	String
states:StateMachineQualifier	Filters access by the qualifier of a state machine ARN	ArrayOfString

Actions, resources, and condition keys for AWS Storage Gateway

AWS Storage Gateway (service prefix: `storagegateway`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Topics

Actions defined by AWS Storage Gateway

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ActivateGateway	Grants permission to activate the gateway you previously deployed on your host	Write		aws:RequestTag/${TagKey} aws:TagKeys	
AddCache	Grants permission to configure one or more gateway local disks as cache for a cached-volume gateway	Write	gateway*		
AddTagsToResource	Grants permission to add one or more tags to the specified resource	Tagging	cache-report		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			fs-association		
			gateway		
			share		
			tape		
			tapepool		
			volume		
				aws:RequestTag/${TagKey} aws:TagKeys	
AddUploadBuffer	Grants permission to configure one or more gateway local disks as upload buffer for a specified gateway	Write	gateway*		
AddWorkingStorage	Grants permission to configure one or more gateway local disks as working storage for a gateway	Write	gateway*		
AssignTapePool		Write	tape*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	Grants permission to move a tape to the target pool specified		tapepool*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Associate FileSystem	Grants permission to associate an Amazon FSx file system with the Amazon FSx file gateway	Write	gateway*		ds:DescribeDirectories ec2:DescribeNetworkInterfaces fsx:DescribeFileSystems iam:CreateServiceLinkedRole logs:CreateLogDelivery logs:GetLogDelivery logs:ListLogDeliveries logs:UpdateLogDelivery

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
AttachVolume	Grants permission to connect a volume to an iSCSI connection and then attaches the volume to the specified gateway	Write	gateway* volume*		
BypassGovernanceRetention	Grants permission to allow the governance retention lock on a pool to be bypassed	Write	tapepool*		
CancelArchival	Grants permission to cancel archiving of a virtual tape to the virtual tape shelf (VTS) after the archiving process is initiated	Write	gateway* tape*		
CancelCacheReport	Grants permission to cancel a cache report	Write	cache-report*		
CancelRetrieval	Grants permission to cancel retrieval of a virtual tape from the virtual tape shelf (VTS) to a gateway after the retrieval process is initiated	Write	gateway* tape*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCachediSCSIVolume	Grants permission to create a cached volume on a specified cached gateway. This operation is supported only for the gateway-cached volume architecture	Write	gateway*		
			volume*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateNFSFileShare	Grants permission to create a NFS file share on an existing file gateway	Write	gateway*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSMBFileShare	Grants permission to create a SMB file share on an existing file gateway	Write	gateway*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSnapshot	Grants permission to initiate a snapshot of a volume	Write	volume*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSnapshotFromVolumeRecoveryPoint	Grants permission to initiate a snapshot of a gateway from a volume recovery point	Write	volume*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateStorediSCSIVolume	Grants permission to create a volume on a specified gateway	Write	gateway*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTapePool	Grants permission to create a tape pool	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateTapeWithBarcode	Grants permission to create a virtual tape by using your own barcode	Write	gateway* tapepool*	 aws:RequestTag/${TagKey} aws:TagKeys	
CreateTapes	Grants permission to create one or more virtual tapes. You write data to the virtual tapes and then archive the tapes	Write	gateway* tapepool*	 aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAutomaticTapeCreationPolicy	Grants permission to delete the automatic tape creation policy configured on a gateway-VTL	Write	gateway*		
DeleteBandwidthRateLimit	Grants permission to delete the bandwidth rate limits of a gateway	Write	gateway*		
DeleteCacheReport	Grants permission to delete the metadata associated with a cache report	Write	cache-report*		
DeleteChapCredentials	Grants permission to delete Challenge-Handshake Authentication Protocol (CHAP) credentials for a specified iSCSI target and initiator pair	Write	target*		
DeleteFileShare	Grants permission to delete a file share from a file gateway	Write	share*		
DeleteGateway	Grants permission to delete a gateway	Write	gateway*		
DeleteSnapshotSchedule	Grants permission to delete a snapshot of a volume	Write	volume*		
DeleteTape	Grants permission to delete the specified virtual tape	Write	gateway* tape*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteTapeArchive	Grants permission to delete the specified virtual tape from the virtual tape shelf (VTS)	Write			
DeleteTapePool	Grants permission to delete the specified tape pool	Write	tapepool*		
DeleteVolume	Grants permission to delete the specified gateway volume that you previously created using the CreateCachediSCSIVolume or CreateStorediSCSIVolume API	Write	volume*		
DescribeAvailabilityMonitorTest	Grants permission to get the information about the most recent high availability monitoring test that was performed on the gateway	Read	gateway*		
DescribeBandwidthRateLimit	Grants permission to get the bandwidth rate limits of a gateway	Read	gateway*		
DescribeBandwidthRateLimitSchedule	Grants permission to get the bandwidth rate limit schedule of a gateway	Read	gateway*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeCache	Grants permission to get information about the cache of a gateway. This operation is supported only for the gateway-cached volume architecture	Read	gateway*		
DescribeCacheReport	Grants permission to get a description of a cache report	Read	cache-report*		
DescribeCachediSCSIVolumes	Grants permission to get a description of the gateway volumes specified in the request. This operation is supported only for the gateway-cached volume architecture	Read	volume*		
DescribeChapCredentials	Grants permission to get an array of Challenge-Handshake Authentication Protocol (CHAP) credentials information for a specified iSCSI target, one for each target-initiator pair	Read	target*		
DescribeFileSystemAssociations	Grants permission to get a description for one or more file system associations	Read	fs-association*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeGatewayInformation	Grants permission to get metadata about a gateway such as its name, network interfaces, configured time zone, and the state (whether the gateway is running or not)	Read	gateway*		
DescribeMaintenanceStartTime	Grants permission to get your gateway's weekly maintenance start time including the day and time of the week	Read	gateway*		
DescribeNFSFileShares	Grants permission to get a description for one or more file shares from a file gateway	Read	share*		
DescribeSMBFileShares	Grants permission to get a description for one or more file shares from a file gateway	Read	share*		
DescribeSMBSettings	Grants permission to get a description of a Server Message Block (SMB) file share settings from a file gateway	Read	gateway*		
DescribeSnapshotSchedule	Grants permission to describe the snapshot schedule for the specified gateway volume	Read	volume*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeStorediSCSIVolumes	Grants permission to get the description of the gateway volumes specified in the request	Read	volume*		
DescribeTapeArchives	Grants permission to get a description of specified virtual tapes in the virtual tape shelf (VTS)	Read			
DescribeTapeRecoveryPoints	Grants permission to get a list of virtual tape recovery points that are available for the specified gateway-VTL	Read	gateway*		
DescribeTapes	Grants permission to get a description of the specified Amazon Resource Name (ARN) of virtual tapes	Read	gateway*		
DescribeUploadBuffer	Grants permission to get information about the upload buffer of a gateway	Read	gateway*		
DescribeVTLDevices	Grants permission to get a description of virtual tape library (VTL) devices for the specified gateway	Read	gateway*		
DescribeWorkingStorage	Grants permission to get information about the working storage of a gateway	Read	gateway*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DetachVolume	Grants permission to disconnect a volume from an iSCSI connection and then detaches the volume from the specified gateway	Write	volume*		
DisableGateway	Grants permission to disable a gateway when the gateway is no longer functioning	Write	gateway*		
DisassociateFileSystem	Grants permission to disassociate an Amazon FSx file system from an Amazon FSx file gateway	Write	fs-association*		
EvictFilesFailingUpload	Grants permission to clean a share's cache of file entries that are failing upload to Amazon S3	Write	share*		
JoinDomain	Grants permission to enable you to join an Active Directory Domain	Write	gateway*		
ListAutomaticTapeCreationPolicies	Grants permission to list the automatic tape creation policies configured on the specified gateway-VTL or all gateway-VTLs owned by your AWS account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListCacheReports	Grants permission to get a list of the cache reports owned by your AWS account	List			
ListFileShares	Grants permission to get a list of the file shares for a specific file gateway, or the list of file shares owned by your AWS account	List			
ListFileSystemAssociations	Grants permission to get a list of the file system associations for the specified gateway	List			
ListGateways	Grants permission to list gateways owned by an AWS account in a region specified in the request. The returned list is ordered by gateway Amazon Resource Name (ARN)	List			
ListLocalDisks	Grants permission to get a list of the gateway's local disks	List	gateway*		
ListTagsForResource	Grants permission to get the tags that have been added to the specified resource	List	gateway		
			share		
			tape		
			volume		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTapePools	Grants permission to list tape pools owned by your AWS account	List			
ListTapes	Grants permission to list virtual tapes in your virtual tape library (VTL) and your virtual tape shelf (VTS)	List			
ListVolumeInitiators	Grants permission to list iSCSI initiators that are connected to a volume	List	volume*		
ListVolumeRecoveryPoints	Grants permission to list the recovery points for a specified gateway	List	gateway*		
ListVolumes	Grants permission to list the iSCSI stored volumes of a gateway	List			
NotifyWhenUploaded	Grants permission to send you a notification through CloudWatch Events when all files written to your NFS file share have been uploaded to Amazon S3	Write	share*		
RefreshCache	Grants permission to refresh the cache for the specified file share	Write	share*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RemoveTagsFromResource	Grants permission to remove one or more tags from the specified resource	Tagging	cache-report		
			fs-association		
			gateway		
			share		
			tape		
			tapepool		
			volume		
				aws:TagKeys	
ResetCache	Grants permission to reset all cache disks that have encountered a error and makes the disks available for reconfiguration as cache storage	Write	gateway*		
RetrieveTapeArchive	Grants permission to retrieve an archived virtual tape from the virtual tape shelf (VTS) to a gateway-VTL	Write	gateway*		
			tape*		
RetrieveTapeRecoveryPoint	Grants permission to retrieve the recovery point for the specified virtual tape	Write	gateway*		
			tape*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SetLocalConsolePassword	Grants permission to set the password for your VM local console	Write	gateway*		
SetSMBGuestPassword	Grants permission to set the password for SMB Guest user	Write	gateway*		
ShutdownGateway	Grants permission to shut down a gateway	Write	gateway*		
StartAvailabilityMonitorTest	Grants permission to start a test that verifies that the specified gateway is configured for High Availability monitoring in your host environment	Write	gateway*		
StartCacheReport	Grants permission to start a cache report for an existing file share	Write	share*		
				aws:RequestTag/${TagKey} aws:TagKeys	
StartGateway	Grants permission to start a gateway that you previously shut down	Write	gateway*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAutomaticTapeCreationPolicy	Grants permission to update the automatic tape creation policy configured on a gateway-VTL	Write	gateway* tapepool*		
UpdateBandwidthRateLimit	Grants permission to update the bandwidth rate limits of a gateway	Write	gateway*		
UpdateBandwidthRateLimitSchedule	Grants permission to update the bandwidth rate limit schedule of a gateway	Write	gateway*		
UpdateChapCredentials	Grants permission to update the Challenge-Handshake Authentication Protocol (CHAP) credentials for a specified iSCSI target	Write	target*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateFileSystemAssociation	Grants permission to update a file system association	Write	fs-association*		logs:CreateLogDelivery logs:DeleteLogDelivery logs:GetLogDelivery logs:ListLogDeliveries logs:UpdateLogDelivery
UpdateGatewayInformation	Grants permission to update a gateway's metadata, which includes the gateway's name and time zone	Write	gateway*		
UpdateGatewaySoftwareNow	Grants permission to update the gateway virtual machine (VM) software	Write	gateway*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateMaintenanceStartTime	Grants permission to update a gateway's weekly maintenance start time information, including day and time of the week. The maintenance time is the time in your gateway's time zone	Write	gateway*		
UpdateNFSFileShare	Grants permission to update a NFS file share	Write	share*		
UpdateSMBFileShare	Grants permission to update a SMB file share	Write	share*		
UpdateSMBFileShareVisibility	Grants permission to update whether the shares on a gateway are visible in a net view or browse list	Write	gateway*		
UpdateSMBLocalGroups	Grants permission to update the list of Active Directory users and groups that have special permissions for SMB file shares on the gateway	Write	gateway*		
UpdateSMBSecurityStrategy	Grants permission to update the SMB security strategy on a file gateway	Write	gateway*		
UpdateSnapshotSchedule	Grants permission to update a snapshot schedule configured for a gateway volume	Write	volume*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateVTLDeviceType	Grants permission to update the type of medium changer in a gateway-VTL	Write	device*		

Resource types defined by AWS Storage Gateway

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
cache-report	`arn:${Partition}:storagegateway:${Region}:${Account}:share/${ShareId}/cache-report/${CacheReportId}`	aws:ResourceTag/${TagKey}
device	`arn:${Partition}:storagegateway:${Region}:${Account}:gateway/${GatewayId}/device/${Vtldevice}`	

Resource types	ARN	Condition keys
fs-association	arn:${Partition}:storagegateway:${Region}:${Account}:fs-association/${FsaId}	aws:ResourceTag/${TagKey}
gateway	arn:${Partition}:storagegateway:${Region}:${Account}:gateway/${GatewayId}	aws:ResourceTag/${TagKey}
share	arn:${Partition}:storagegateway:${Region}:${Account}:share/${ShareId}	aws:ResourceTag/${TagKey}
tape	arn:${Partition}:storagegateway:${Region}:${Account}:tape/${TapeBarcode}	aws:ResourceTag/${TagKey}
tapepool	arn:${Partition}:storagegateway:${Region}:${Account}:tapepool/${PoolId}	aws:ResourceTag/${TagKey}
target	arn:${Partition}:storagegateway:${Region}:${Account}:gateway/${GatewayId}/target/${IscsiTarget}	
volume	arn:${Partition}:storagegateway:${Region}:${Account}:gateway/${GatewayId}/volume/${VolumeId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Storage Gateway

AWS Storage Gateway defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters access by tag-value associated with the resource	String
aws:TagKeys	Filters access by the presence of mandatory tags in the request	ArrayOfString

Actions, resources, and condition keys for AWS Supply Chain

AWS Supply Chain (service prefix: `scn`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- Condition keys for AWS Supply Chain

Actions defined by AWS Supply Chain

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssignAdminPermissionsToUser	Grants permission to add AWS Supply Chain administrator permission to federated user	Write	instance*		
CreateBillOfMaterialsImportJob	Grants permission to create a BillOfMaterialsImportJob which will import a CSV file of BillOfMaterials records	Write	instance*		
CreateDataIntegrationFlow	Grants permission to create DataIntegrationFlow that can transform from multiple sources to one target	Write	instance*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDataLakeDataset	Grants permission to create the data lake dataset	Write	instance*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDataLakeNamespace	Grants permission to create the data lake namespace	Write	instance*		
				aws:RequestTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} aws:TagKeys	
CreateInstance	Grants permission to create a new AWS Supply Chain instance	Write	instance*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSSOApplication	Grants permission to create IAM Identity Center application for a AWS Supply Chain instance	Write	instance*		
DeleteDataIntegrationFlow	Grants permission to delete the DataIntegrationFlow	Write	data-integration-flow*		
DeleteDataLakeDataset	Grants permission to delete the data lake dataset	Write	dataset*		
DeleteDataLakeNamespace	Grants permission to delete the data lake namespace	Write	namespace*		
DeleteInstance	Grants permission to delete an AWS Supply Chain instance	Write	instance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteSSOApplication	Grants permission to delete IAM Identity Center application of the AWS Supply Chain instance	Write	instance*		
DescribeInstance	Grants permission to view details of an AWS Supply Chain instance	Read	instance*		
GetBillOfMaterialsImportJob	Grants permission to view status and details of a BillOfMaterialsImportJob	Read	bill-of-materials-import-job*		
GetDataIntegrationEvent	Grants permission to get a DataIntegrationEvent	Read	instance*		
GetDataIntegrationFlow	Grants permission to get the DataIntegrationFlow details	Read	data-integration-flow*		
GetDataIntegrationFlowExecution	Grants permission to get a particular execution of one specified DataIntegrationFlow	Read	data-integration-flow*		
GetDataLakeDataset	Grants permission to get the dataset details	Read	dataset*		
GetDataLakeNamespace	Grants permission to get the namespace details	Read	namespace*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetInstance	Grants permission to view details of an AWS Supply Chain instance	Read	instance*		
ListAdminUsers	Grants permission to list AWS Supply Chain administrators of an instance	List	instance*		
ListDataIntegrationEvents	Grants permission to list all DataIntegrationEvents under an instance	List	instance*		
ListDataIntegrationFlowExecutions	Grants permission to list all executions of one specified DataIntegrationFlow	List	data-integration-flow*		
ListDataIntegrationFlows	Grants permission to list all the DataIntegrationFlows in a paginated way	List	instance*		
ListDataLakeDatasets	Grants permission to list the data lake datasets under specific instance or namespace	List	instance*		
ListDataLakeNamespaces	Grants permission to list the data lake namespaces under specific instance	List	instance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListInstances	Grants permission to view the AWS Supply Chain instances associated with an AWS account	List	instance*		
ListTagsForResource	Grants permission to list tags for an AWS Supply Chain resource	List	instance*		
RemoveAdminPermissionsForUser	Grants permission to remove AWS Supply Chain administrator permission from federated user	Write	instance*		
SendDataIntegrationEvent	Grants permission to create a DataIntegrationEvent which will ingest data in real-time	Write	instance*		
TagResource	Grants permission to tag an AWS Supply Chain resource	Tagging	instance*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tag from an AWS Supply Chain resource	Tagging	instance*		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateDataIntegrationFlow	Grants permission to update the DataIntegrationFlow	Write	data-integration-flow*		
UpdateDataLakeDataset	Grants permission to update the data lake dataset	Write	dataset*		
UpdateDataLakeNamespace	Grants permission to update the data lake namespace	Write	namespace*		
UpdateInstance	Grants permission to update an AWS Supply Chain instance	Write	instance*		

Resource types defined by AWS Supply Chain

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
instance	`arn:${Partition}:scn:${Region}:${Account}:instance/${InstanceId}`	aws:ResourceTag/${TagKey}
bill-of-materials-import-job	`arn:${Partition}:scn:${Region}:${Account}:instance/${InstanceId}/bill-of-materials-import-job/${JobId}`	

Resource types	ARN	Condition keys
data-integration-flow	arn:${Partition}:scn:${Region}:${Account}:instance/${InstanceId}/data-integration-flows/${FlowName}	aws:ResourceTag/${TagKey}
namespace	arn:${Partition}:scn:${Region}:${Account}:instance/${InstanceId}/namespaces/${Namespace}	aws:ResourceTag/${TagKey}
dataset	arn:${Partition}:scn:${Region}:${Account}:instance/${InstanceId}/namespaces/${Namespace}/datasets/${DatasetName}	aws:ResourceTag/${TagKey}

Condition keys for AWS Supply Chain

AWS Supply Chain defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by using tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by using tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by using tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS Support

AWS Support (service prefix: `support`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Support

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

> **Note**
>
> Support provides the ability to access, modify and resolve cases, as well as use Trusted Advisor actions. When you use the Support API to call Trusted Advisor-related actions, none of the "trustedadvisor:*" actions restrict your access. The "trustedadvisor:*" actions apply only to Trusted Advisor in the AWS Management Console.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddAttachmentsToSet	Grants permission to add one or more attachments to an AWS Support case	Write			
AddCommunicationToCase	Grants permission to add a customer communication to an AWS Support case	Write			
CreateCase	Grants permission to creates a new AWS Support case	Write			
DescribeAttachment	Grants permission to describe attachment detail	Read			
DescribeCaseAttributes	Grants permission to allow secondary services to read AWS Support case attributes.This is an internally managed function	Read			
DescribeCaseOptions	Grants permission to describe the available options for a single AWS Support case. This is an internally managed function	Read			
DescribeCases	Grants permission to list AWS Support cases that matches the given inputs	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeCommunication	Grants permission to get a single communication and attachments for a single AWS Support case	Read			
DescribeCommunications	Grants permission to list the communications and attachments for one or more AWS Support cases	Read			
DescribeCreateCaseOptions	Grants permission to describes the available options for creating a support case	Read			
DescribeIssueTypes	Grants permission to return issue types for AWS Support cases	Read			
DescribeServices	Grants permission to list AWS services and categories that applies to each service	Read			
DescribeSeverityLevels	Grants permission to list severity levels that can be assigned to an AWS Support case	Read			
DescribeSupportLevel	Grants permission to return the support level for an AWS Account identifier	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeSupportedLanguages	Grants permission to describes the available support languages for a given category code, service code and issue type	Read			
DescribeTrustedAdvisorCheckRefreshStatuses	Grants permission to get the status of a Trusted Advisor refresh check based on a list of check identifiers	Read			
DescribeTrustedAdvisorCheckResult	Grants permission to get the results of the Trusted Advisor check that has the specified check identifier	Read			
DescribeTrustedAdvisorCheckSummaries	Grants permission to get the summaries of the results of the Trusted Advisor checks that have the specified check identifiers	Read			
DescribeTrustedAdvisorChecks	Grants permission to get a list of all available Trusted Advisor checks, including name, identifier, category and description	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetInteraction	Grants permission to retrieve personalized troubleshooting assistance for account and technical issues for a specific interaction	Read			
InitiateCallForCase	Grants permission to initiate a call on AWS Support Center. This is an internally managed function	Write			
InitiateChatForCase	Grants permission to initiate a chat on AWS Support Center.This is an internally managed function	Write			
InitiateLiveContactForCase	Grants permission to initiate a live contact on AWS Support Center. This is an internally managed function	Write			
ListInteractionEntries	Grants permission to retrieve a list of entries within a specific interaction, including messages, status updates, or other relevant data points	Read			
ListInteractions	Grants permission to retrieve a list of interactions, potentially with filters or pagination	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutCaseAttributes	Grants permission to allow secondary services to attach attributes to AWS Support cases. This is an internally managed function	Write			
RateCaseCommunication	Grants permission to rate an AWS Support case communication	Write			
RefreshTrustedAdvisorCheck	Grants permission to requests a refresh of the Trusted Advisor check that has the specified check identifier	Write			
ResolveCase	Grants permission to resolve an AWS Support case	Write			
ResolveInteraction	Grants permission to mark a specific interaction as resolved by its unique identifier, indicating that the issue has been addressed and no further action is needed	Write			
SearchForCases	Grants permission to return a list of AWS Support cases that matches the given inputs	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartInteraction	Grants permission to start a specific interaction to receive personalized troubleshooting assistance for account and technical issues	Write			support:DescribeSupportLevel
UpdateCaseSeverity	Grants permission to update the severity for a single AWS Support case. This is an internally managed function	Write			
UpdateInteraction	Grants permission to update a specific interaction to receive personalized troubleshooting assistance for account and technical issues	Write			

Resource types defined by AWS Support

AWS Support does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Support, specify `"Resource": "*"` in your policy.

Condition keys for AWS Support

Support has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Support App in Slack

AWS Support App in Slack (service prefix: `supportapp`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Support Console

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CheckSubscription [permission only]	Grants permission to check whether the account has access to given product	Read			
CreateCaseDraft [permission only]	Grants permission to create or update case draft for the given case type	Write			
CreateContact [permission only]	Grants permission to create an authenticated contact for the given contact type	Write			
DeleteCaseDraft	Grants permission to delete a case draft for the given case type	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
[permission only]					
DescribeDynamicHelp [permission only]	Grants permission to get dynamic help resources for given service and category	Read			
GetAccountGovCloudEnabled [permission only]	Grants permission to determines whether the calling account is GovCloud enabled	Read			
GetAccountState [permission only]	Grants permission to get the state of the calling account	Read			
GetBanner [permission only]	Grants permission to get the support banner information	Read			
GetCaseDraft [permission only]	Grants permission to get a case draft for given case type	Read			
GetIssueClassificationPredictions [permission only]	Grants permission to get classification predictions of an issue	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetIssueTextSummary [permission only]	Grants permission to get a generated text summary of an issue	Read			
GetQuestionnaire [permission only]	Grants permission to get a feedback questionnaire	Read			
SaveFeedback [permission only]	Grants permission to save questionnaire feedback	Write			

Resource types defined by AWS Support Console

AWS Support Console does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Support Console, specify `"Resource": "*"` in your policy.

Condition keys for AWS Support Console

Support Console has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Support Plans

AWS Support Plans (service prefix: `supportplans`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS Support Plans

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSupportPlanSchedule [permission only]	Grants permission to create support plan schedules for this AWS account	Write			
GetSupportPlan [permission only]	Grants permission to view details about the current support plan for this AWS account	Read			
GetSupportPlanUpdateStatus [permission only]	Grants permission to view details about the status for a request to update a support plan	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListSupportPlanModifiers [permission only]	Grants permission to view a list of all support plan modifiers for this AWS account	List			
StartSupportPlanUpdate [permission only]	Grants permission to update the support plan for this AWS account	Write			

Resource types defined by AWS Support Plans

AWS Support Plans does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Support Plans, specify `"Resource": "*"` in your policy.

Condition keys for AWS Support Plans

Support Plans has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Sustainability

AWS Sustainability (service prefix: `sustainability`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS Sustainability

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCarbon Footprint Summary	Grants permission to view the carbon footprint tool	Read			

Resource types defined by AWS Sustainability

AWS Sustainability does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Sustainability, specify `"Resource": "*"` in your policy.

Condition keys for AWS Sustainability

Sustainability has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Systems Manager

AWS Systems Manager (service prefix: `ssm`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Systems Manager

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddTagsToResource	Grants permission to add or overwrite one or more tags for a specified AWS resource	Tagging	association		
			automation-execution		
			document		
			instance		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			maintenancewindow		
			managed-instance		
			opsitem		
			opsmetadata		
			parameter		
			patchbaseline		
			task		
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys	
AssociateOpsItemRelatedItem	Grants permission to associate RelatedItem to an OpsItem	Write	opsitem*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelCommand	Grants permission to cancel a specified Run Command command	Write			
CancelMaintenanceWindowExecution	Grants permission to cancel an in-progress maintenance window execution	Write	maintenancewindow*		
CreateActivation	Grants permission to create an activation that is used to register on-premises servers and virtual machines (VMs) with Systems Manager	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateAssociation	Grants permission to associate a specified Systems Manager document with specified instances or other targets	Write	association*		
			document*		
			instance		
			managed-instance		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys	
CreateAssociationBatch	Grants permission to combine entries for multiple CreateAssociation operations in a single command	Write	document*		
			instance		
			managed-instance		
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateDocument	Grants permission to create a Systems Manager SSM document	Write	document*		iam:PassRole
				aws:RequestTag/${TagKey} aws:TagKeys ssm:DocumentType	
CreateMaintenanceWindow	Grants permission to create a maintenance window	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateOpsItem	Grants permission to create an OpsItem in OpsCenter	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateOpsMetadata	Grants permission to create an OpsMetadata object for an AWS resource	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreatePatchBaseline	Grants permission to create a patch baseline	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateResourceDataSync	Grants permission to create a resource data sync configuration, which regularly collects inventory data from managed instances and updates the data in an Amazon S3 bucket	Write	resourcedatasync*		
				ssm:SyncType	
DeleteActivation	Grants permission to delete a specified activation for managed instances	Write			
DeleteAssociation	Grants permission to disassociate a specified SSM document from a specified instance	Write	association		
			document		
			instance		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			managed-instance		
				aws:ResourceTag/${TagKey}	
DeleteDocument	Grants permission to delete a specified SSM document and its instance associations	Write	document*		
				ssm:DocumentType	
DeleteInventory	Grants permission to delete a specified custom inventory type, or the data associated with a custom inventory type	Write			
DeleteMaintenanceWindow	Grants permission to delete a specified maintenance window	Write	maintenancewindow*		
DeleteOpsItem	Grants permission to delete an OpsItem	Write	opsitem*		
DeleteOpsMetadata	Grants permission to delete an OpsMetadata object	Write	opsmetadata*		
DeleteParameter	Grants permission to delete a specified SSM parameter	Write	parameter*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
DeleteParameters	Grants permission to delete multiple specified SSM parameters	Write	parameter*		
				aws:ResourceTag/${TagKey}	
DeletePatchBaseline	Grants permission to delete a specified patch baseline	Write	patchbaseline*		
DeleteResourceDataSync	Grants permission to delete a specified resource data sync	Write	resourcedatasync*		
				ssm:SyncType	
DeleteResourcePolicy	Grants permission to delete a Systems Manager resource policy	Permissions management	document		
			opsitemgroup		
			parameter		
DeregisterManagedInstance	Grants permission to deregister a specified on-premises server or virtual machine (VM) from Systems Manager	Write	managed-instance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ssm:resourceTag/tag-key	
DeregisterPatchBaselineForPatchGroup	Grants permission to deregister a specified patch baseline from being the default patch baseline for a specified patch group	Write	patchbaseline*		
DeregisterTargetFromMaintenanceWindow	Grants permission to deregister a specified target from a maintenance window	Write	maintenancewindow*		
			windowtarget*		
DeregisterTaskFromMaintenanceWindow	Grants permission to deregister a specified task from a maintenance window	Write	maintenancewindow*		
			windowtask*		
DescribeActivations	Grants permission to view details about a specified managed instance activation, such as when it was created and the number of instances registered using the activation	Read			
DescribeAssociation	Grants permission to view details about the specified association for a specified instance or target	Read	association		
			document		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			instance		
			managed-instance		
				aws:ResourceTag/${TagKey}	
DescribeAssociationExecutionTargets	Grants permission to view information about a specified association execution	Read	association*		
				aws:ResourceTag/${TagKey}	
DescribeAssociationExecutions	Grants permission to view all executions for a specified association	Read	association*		
				aws:ResourceTag/${TagKey}	
DescribeAutomationExecutions	Grants permission to view details about all active and terminated Automation executions	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeAutomationStepExecutions	Grants permission to view information about all active and terminated step executions in an Automation workflow	Read	automation-execution*		
DescribeAvailablePatches	Grants permission to view all patches eligible to include in a patch baseline	Read			
DescribeDocument	Grants permission to view details about a specified SSM document	Read	document*		
				ssm:DocumentType	
DescribeDocumentParameters	Grants permission to display information about SSM document parameters in the Systems Manager console (internal Systems Manager action)	Read	document*		
DescribeDocumentPermission	Grants permission to view the permissions for a specified SSM document	Read	document*		
				ssm:DocumentType	
DescribeEffectiveInstanceAssociations	Grants permission to view all current associations for a specified instance	Read	instance*		
			managed-instance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
DescribeEffectivePatchesForPatchBaseline	Grants permission to view details about the patches currently associated with the specified patch baseline (Windows only)	Read	patchbaseline*		
DescribeInstanceAssociationsStatus	Grants permission to view the status of the associations for a specified instance	Read	instance*		
			managed-instance*		
				aws:ResourceTag/${TagKey}	
DescribeInstanceInformation	Grants permission to view details about a specified instance	Read			
DescribeInstancePatchStates	Grants permission to view status details about patches on a specified instance	Read	instance*		
			managed-instance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} ssm:resourceTag/${TagKey}	
DescribeInstancePatchStatesForPatchGroup	Grants permission to describe the high-level patch state for the instances in the specified patch group	Read			
DescribeInstancePatches	Grants permission to view general details about the patches on a specified instance	Read	instance* managed-instance*		
				aws:ResourceTag/${TagKey} ssm:resourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeInstanceProperties	Grants permission to user's Amazon EC2 console to render managed instances' nodes	Read			
DescribeInventoryDeletions	Grants permission to view details about a specified inventory deletion	Read			
DescribeMaintenanceWindowExecutionTaskInvocations	Grants permission to view details of a specified task execution for a maintenance window	List			
DescribeMaintenanceWindowExecutionTasks	Grants permission to view details about the tasks that ran during a specified maintenance window execution	List			
DescribeMaintenanceWindowExecutions	Grants permission to view the executions of a specified maintenance window	List	maintenancewindow*		
DescribeMaintenanceWindowSchedule	Grants permission to view details about upcoming executions of a specified maintenance window	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeMaintenanceWindowTargets	Grants permission to view a list of the targets associated with a specified maintenance window	List	maintenancewindow*		
DescribeMaintenanceWindowTasks	Grants permission to view a list of the tasks associated with a specified maintenance window	List	maintenancewindow*		
DescribeMaintenanceWindows	Grants permission to view information about all or specified maintenance windows	List			
DescribeMaintenanceWindowsForTarget	Grants permission to view information about the maintenance window targets and tasks associated with a specified instance	List			
DescribeOpsItems	Grants permission to view details about specified OpsItems	Read			
DescribeParameters	Grants permission to view details about a specified SSM parameter	List			
DescribePatchBaselines	Grants permission to view information about patch baselines that meet the specified criteria	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribePatchGroupState	Grants permission to view aggregated status details for patches for a specified patch group	List			
DescribePatchGroups	Grants permission to view information about the patch baseline for a specified patch group	List			
DescribePatchProperties	Grants permission to view details of available patches for a specified operating system and patch property	List			
DescribeSessions	Grants permission to view a list of recent Session Manager sessions that meet the specified search criteria	List			
DisassociateOpsItemRelatedItem	Grants permission to disassociate RelatedItem from an OpsItem	Write	opsitem*		
ExecuteAPI	Grants permission to a Systems Manager delegated administrator to view related resource details about OpsItems across multiple AWS accounts in the AWS Management Console	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAccessToken	Grants permission to return a credentials set to be used with just-in-time node access	Read	opsitem*		
GetAutomationExecution	Grants permission to view details of a specified Automation execution	Read	automation-execution*		
				aws:ResourceTag/${TagKey}	
GetCalendar [permission only]	Grants permission to view details of a specific calendar	Read	document*		
GetCalendarState	Grants permission to view the calendar state for a change calendar or a list of change calendars	Read	document*		
GetCommandInvocation	Grants permission to view details about the command execution of a specified invocation or plugin	Read			
GetConnectionStatus	Grants permission to view the Session Manager connection status for a specified managed instance	Read	instance		
			managed-instance		
			task		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ssm:resourceTag/${TagKey} aws:ResourceTag/${TagKey}	
GetDefaultPatchBaseline	Grants permission to view the current default patch baseline for a specified operating system type	Read	patchbaseline*		
GetDeployablePatchSnapshotForInstance	Grants permission to retrieve the current patch baseline snapshot for a specified instance	Read			
GetDocument	Grants permission to view the contents of a specified SSM document	Read	document*		
				ssm:DocumentCategories ssm:DocumentType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetExecutionPreview	Grants permission to retrieve an existing preview that shows the effects that running a specified Automation runbook would have on the targeted resources	Read			
GetInventory	Grants permission to view instance inventory details per the specified criteria	Read			
GetInventorySchema	Grants permission to view a list of inventory types or attribute names for a specified inventory item type	Read			
GetMaintenanceWindow	Grants permission to view details about a specified maintenance window	Read	maintenancewindow*		
GetMaintenanceWindowExecution	Grants permission to view details about a specified maintenance window execution	Read			
GetMaintenanceWindowExecutionTask	Grants permission to view details about a specified maintenance window execution task	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetMaintenanceWindowExecutionTaskInvocation	Grants permission to view details about a specific maintenance window task running on a specific target	Read			
GetMaintenanceWindowTask	Grants permission to view details about tasks registered with a specified maintenance window	Read	maintenancewindow*		
GetManifest [permission only]	Grants permission to Systems Manager and SSM Agent to determine package installation requirements for an instance (internal Systems Manager call)	Read			
GetOpsItem	Grants permission to view information about a specified OpsItem	Read	opsitem*		
GetOpsMetadata	Grants permission to retrieve an OpsMetadata object	Read	opsmetadata*		
GetOpsSummary	Grants permission to view summary information about OpsItems based on specified filters and aggregators	Read	resourcedatasync*		
GetParameter	Grants permission to view information about a specified parameter	Read	parameter*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
GetParameterHistory	Grants permission to view details and changes for a specified parameter	Read	parameter*		
				aws:ResourceTag/${TagKey}	
GetParameters	Grants permission to view information about multiple specified parameters	Read	parameter*		
				aws:ResourceTag/${TagKey}	
GetParametersByPath	Grants permission to view information about parameters in a specified hierarchy	Read	parameter*		
				ssm:Recursive	
GetPatchBaseline	Grants permission to view information about a specified patch baseline	Read	patchbaseline*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetPatchBaselineForPatchGroup	Grants permission to view the ID of the current patch baseline for a specified patch group	Read			
GetResourcePolicies	Grants permission to retrieve lists of Systems Manager resource policies	List	document		
			opsitemgroup		
			parameter		
GetServiceSetting	Grants permission to view the account-level setting for an AWS service	Read	servicesetting*		
LabelParameterVersion	Grants permission to apply an identifying label to a specified version of a parameter	Write	parameter*		
				aws:ResourceTag/${TagKey}	
ListAssociationVersions	Grants permission to list versions of the specified association	List	association*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAssociations	Grants permission to list the associations for a specified SSM document or managed instance	List			
ListCommandInvocations	Grants permission to list information about command invocations sent to a specified instance	List			
ListCommands	Grants permission to list the commands sent to a specified instance	List			
ListComplianceItems	Grants permission to list compliance status for specified resource types on a specified resource	List			
ListComplianceSummaries	Grants permission to list a summary count of compliant and noncompliant resources for a specified compliance type	List			
ListDocumentMetadataHistory	Grants permission to view metadata history about a specified SSM document	List	document*		
				ssm:DocumentType	
ListDocumentVersions	Grants permission to list all versions of a specified document	List	document*		
				ssm:DocumentType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDocuments	Grants permission to view information about a specified SSM document	List			
ListInstanceAssociations	Grants permission to SSM Agent to check for new State Manager associations (internal Systems Manager call)	List	instance		
			managed-instance		
				aws:ResourceTag/${TagKey}	
ListInventoryEntries	Grants permission to view a list of specified inventory types for a specified instance	List			
ListNodes	Grants permission to view details about managed nodes based on specified filters	List	resourcedatasync*		
ListNodesSummary	Grants permission to view summary information about managed nodes based on specified filters and aggregators	List	resourcedatasync*		
ListOpsItemEvents	Grants permission to view details about OpsItemEvents	List			
ListOpsItemRelatedItems	Grants permission to view details about OpsItem RelatedItems	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListOpsMetadata	Grants permission to view a list of OpsMetadata objects	List			
ListResourceComplianceSummaries	Grants permission to list resource-level summary count	List			
ListResourceDataSync	Grants permission to list information about resource data sync configurations in an account	List		ssm:SyncType	
ListTagsForResource	Grants permission to view a list of resource tags for a specified resource	List	association		
			automation-execution		
			document		
			maintenancewindow		
			managed-instance		
			opsitem		
			opsmetadata		
			parameter		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			patchbaseline		
				aws:ResourceTag/${TagKey}	
ModifyDocumentPermission	Grants permission to share a custom SSM document publicly or privately with specified AWS accounts	Permissions management	document*		
				ssm:DocumentType	
PutCalendar [permission only]	Grants permission to create/edit a specific calendar	Write	document*		
PutComplianceItems	Grants permission to register a compliance type and other compliance details on a specified resource	Write	instance		
			managed-instance		
				ssm:SourceInstanceARN	
				ec2:SourceInstanceARN	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutConfigurePackageResult [permission only]	Grants permission to SSM Agent to generate a report of the results of specific agent requests (internal Systems Manager call)	Read			
PutInventory	Grants permission to add or update inventory items on multiple specified managed instances	Write		ssm:InventoryTypeName	
PutParameter	Grants permission to create an SSM parameter	Write	parameter*		
				aws:RequestTag/${TagKey} aws:TagKeys ssm:Overwrite ssm:Policies	
PutResourcePolicy	Grants permission to create or update a Systems Manager resource policy	Permissions management	document		
			opsitemgroup		
			parameter		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RegisterDefaultPatchBaseline	Grants permission to specify the default patch baseline for an operating system type	Write	patchbaseline*		
RegisterManagedInstance	Grants permission to register a Systems Manager Agent	Write		aws:RequestTag/${TagKey} aws:TagKeys	
RegisterPatchBaselineForPatchGroup	Grants permission to specify the default patch baseline for a specified patch group	Write	patchbaseline*		
RegisterTargetWithMaintenanceWindow	Grants permission to register a target with a specified maintenance window	Write	maintenancewindow*		
RegisterTaskWithMaintenanceWindow	Grants permission to register a task with a specified maintenance window	Write	maintenancewindow*		
RemoveTagsFromResource	Grants permission to remove a specified tag key from a specified resource	Tagging	association		
			automation-execution		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			document		
			instance		
			maintenancewindow		
			managed-instance		
			opsitem		
			opsmetadata		
			parameter		
			patchbaseline		
			task		
				aws:ResourceTag/${TagKey} aws:TagKeys	
ResetServiceSetting	Grants permission to reset the service setting for an AWS account to the default value	Write	servicesetting*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ResumeSession	Grants permission to reconnect a Session Manager session to a managed instance	Write	session*		
				ssm:resourceTag/aws:ssmmessages:session-id ssm:resourceTag/aws:ssmmessages:target-id	
SendAutomationSignal	Grants permission to send a signal to change the current behavior or status of a specified Automation execution	Write	automation-execution*		
				aws:ResourceTag/${TagKey}	
SendCommand	Grants permission to run commands on one or more specified managed instances	Write	document*		
			bucket		
			instance		
			managed-instance		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} ssm:resourceTag/${TagKey}	
StartAccessRequest	Grants permission to start the workflow for just-in-time node access sessions	Write	instance		
			managed-instance		
				aws:RequestTag/${TagKey} aws:TagKeys	
StartAssociationsOnce	Grants permission to run a specified association manually	Write	association*		
				aws:ResourceTag/${TagKey}	
StartAutomationExecution	Grants permission to initiate the execution of an Automation document	Write	automation-execution*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			document*		
			automation-definition		
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys ssm:DocumentVersion	
StartChangeRequestExecution	Grants permission to initiate the execution of an Automation Change Template document	Write	automation-execution*		
			document*		
			automation-definition		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys ssm:AutoApprove ssm:DocumentVersion	
StartExecutionPreview	Grants permission to create a preview showing the effects that running a specified Automation runbook would have on the targeted resources	Read			
StartSession	Grants permission to initiate a connection to a specified target for a Session Manager session	Write	document		
			instance		
			managed-instance		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			task		
				ssm:SessionDocumentAccessCheck ssm:resourceTag/${TagKey} aws:ResourceTag/${TagKey} ssm:AccessRequestId	
StopAutomationExecution	Grants permission to stop a specified Automation execution that is already in progress	Write	automation-execution*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Terminate Session	Grants permission to permanently end a Session Manager connection to an instance	Write	session*		
				ssm:resourceTag/aws:ssmmessages:session-id ssm:resourceTag/aws:ssmmessages:target-id	
UnlabelParameterVersion	Grants permission to remove an identifying label from a specified version of a parameter	Write	parameter*		
				aws:ResourceTag/${TagKey}	
UpdateAssociation	Grants permission to update an association and immediately run the association on the specified targets	Write	association*		
			document		
			instance		
			managed-instance		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
UpdateAssociationStatus	Grants permission to update the status of the SSM document associated with a specified instance	Write	document*		
			instance		
			managed-instance		
				ssm:SourceInstanceARN ec2:SourceInstanceARN aws:ResourceTag/${TagKey}	
UpdateDocument	Grants permission to update one or more values for an SSM document	Write	document*		
				ssm:DocumentType	
UpdateDocumentDefaultVersion	Grants permission to change the default version of an SSM document	Write	document*		
				ssm:DocumentType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateDocumentMetadata	Grants permission to update the metadata of an SSM document	Write	document*		
				ssm:DocumentType	
UpdateInstanceAssociationStatus [permission only]	Grants permission to SSM Agent to update the status of the association that it is currently running (internal Systems Manager call)	Write	association*		
			instance		
			managed-instance		
				ssm:SourceInstanceARN ec2:SourceInstanceARN aws:ResourceTag/${TagKey}	
UpdateInstanceInformation	Grants permission to SSM Agent to send a heartbeat signal to the Systems Manager service in the cloud	Write	instance		
			managed-instance		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ssm:SourceInstanceARN ec2:SourceInstanceARN	
UpdateMaintenanceWindow	Grants permission to update a specified maintenance window	Write	maintenancewindow*		
UpdateMaintenanceWindowTarget	Grants permission to update a specified maintenance window target	Write	maintenancewindow*		
			windowtarget*		
UpdateMaintenanceWindowTask	Grants permission to update a specified maintenance window task	Write	maintenancewindow*		
			windowtask*		
UpdateManagedInstanceRole	Grants permission to assign or change the IAM role assigned to a specified managed instance	Write	iam-role*		
			managed-instance*		
				ssm:resourceTag/tag-key	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateOpsItem	Grants permission to edit or change an OpsItem	Write	opsitem*		
UpdateOpsMetadata	Grants permission to update an OpsMetadata object	Write	opsmetadata*		
UpdatePatchBaseline	Grants permission to update a specified patch baseline	Write	patchbaseline*		
UpdateResourceDataSync	Grants permission to update a resource data sync	Write	resourcedatasync*		
				ssm:SyncType	
UpdateServiceSetting	Grants permission to update the service setting for an AWS account	Write	servicesetting*		

Resource types defined by AWS Systems Manager

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

> **Note**
>
> Some State Manager API parameters have been deprecated. This might lead to unexpected behavior. For more information, see Working with associations using IAM.

Resource types	ARN	Condition keys
association	arn:${Partition}:ssm:${Region}:${Account}:association/${AssociationId}	aws:ResourceTag/${TagKey}
automation-execution	arn:${Partition}:ssm:${Region}:${Account}:automation-execution/${AutomationExecutionId}	aws:ResourceTag/${TagKey} ssm:resourceTag/tag-key
automation-definition	arn:${Partition}:ssm:${Region}:${Account}:automation-definition/${AutomationDefinitionName}:${VersionId}	ssm:DocumentType
bucket	arn:${Partition}:s3:::${BucketName}	
document	arn:${Partition}:ssm:${Region}:${Account}:document/${DocumentName}	aws:ResourceTag/${TagKey} ssm:DocumentCategories ssm:DocumentType ssm:resourceTag/${TagKey}

servicesetting	arn:${Partition}:ssm:${Region}:${Account}:servicesetting/${ResourceId}	
windowtarget	arn:${Partition}:ssm:${Region}:${Account}:windowtarget/${WindowTargetId}	aws:ResourceTag/${TagKey} ssm:resourceTag/tag-key
windowtask	arn:${Partition}:ssm:${Region}:${Account}:windowtask/${WindowTaskId}	aws:ResourceTag/${TagKey} ssm:resourceTag/tag-key
task	arn:${Partition}:ecs:${Region}:${Account}:task/${TaskId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Systems Manager

AWS Systems Manager defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by 'Create' requests based on the allowed set of values for a specified tags	String
aws:ResourceTag/${TagKey}	Filters access by based on a tag key-value pair assigned to the AWS resource	String
aws:TagKeys	Filters access by 'Create' requests based on whether mandatory tags are included in the request	ArrayOfString
ec2:SourceInstanceARN	Filters access by the ARN of the instance from which the request originated	ARN
ssm:AccessRequestId	Filters access by verifying that a user has access to the access request ID specified in the request	String
ssm:AutoApprove	Filters access by verifying that a user has permission to start Change Manager workflows without a review step (with the exception of change freeze events)	Bool
ssm:DocumentCategories	Filters access by verifying that a user has permission to access a document belonging to a specific category enum	ArrayOfString
ssm:DocumentType	Filters access by verifying that a user has permission to access a document belonging to a specific document	String

Condition keys	Description	Type
	type. Only available in "aws", "aws-cn", and "aws-us-gov" partitions	
ssm:DocumentVersion	Filters access by verifying that a user has permission to access a specific version of a document	ArrayOfString
ssm:InventoryTypeName	Filters access by verifying that a user also has access to the InventoryType specified in the request	ArrayOfString
ssm:Overwrite	Filters access by controling whether Systems Manager parameters can be overwritten	String
ssm:Policies	Filters access by controlling whether an IAM Entity (user or role) can create or update a parameter that includes a parameter policy	String
ssm:Recursive	Filters access by Systems Manager parameters created in a hierarchical structure	String
ssm:SessionDocumentAccessCheck	Filters access by verifying that a user has permission to access either the default Session Manager configuration document or the custom configuration document specified in a request	Bool
ssm:SourceInstanceARN	Filters access by verifying the Amazon Resource Name (ARN) of the AWS Systems Manager's managed instance from which the request is made. This key is not present when the request comes from the managed instance authenticated with an IAM role associated with EC2 instance profile	ARN
ssm:SyncType	Filters access by verifying that a user also has access to the ResourceDataSync SyncType specified in the request	String
ssm:resourceTag/${TagKey}	Filters access by a tag key-value pair assigned to the Systems Manager resource	String

Condition keys	Description	Type
ssm:resourceTag/aws:ssmmessages:session-id	Filters access by based on a tag key-value pair assigned to the Systems Manager session resource	String
ssm:resourceTag/aws:ssmmessages:target-id	Filters access by based on a tag key-value pair assigned to the Systems Manager session resource	String
ssm:resourceTag/tag-key	Filters access by based on a tag key-value pair assigned to the Systems Manager resource	String

Actions, resources, and condition keys for AWS Systems Manager for SAP

AWS Systems Manager for SAP (service prefix: `ssm-sap`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Systems Manager for SAP

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy,

you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BackupDatabase	Grants permission to perform backup operation on a specified database	Write			
DeleteResourcePermission	Grants permission to delete the SSM for SAP level resource permissions associated with a SSM for SAP database resource	Permissions management			
DeregisterApplication	Grants permission to deregister an SAP application with SSM for SAP	Write	application		
GetApplication	Grants permission to access information about an application registered with SSM for SAP by providing the application ID or application ARN	Read			
GetComponent	Grants permission to access information about a component registered with SSM for SAP by providing the application ID and component ID	Read	component		
GetConfigurationCheckOperation	Grants permission to get the details of a configuration check operation by specifying the operation ID	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDatabase	Grants permission to access information about a database registered with SSM for SAP by providing the application ID, component ID, and database ID	Read			
GetOperation	Grants permission to access information about an operation by providing its operation ID	Read			
GetResourcePermission	Grants permission to get the SSM for SAP level resource permissions associated with a SSM for SAP database resource	Permissions management			
ListApplications	Grants permission to retrieve a list of all applications registered with SSM for SAP under the customer AWS account	List			
ListComponents	Grants permission to retrieve a list of all components in the account of customer, or a specific application	List	application		
ListConfigurationCheckDefinitions	Grants permission to list all configuration check types supported by AWS Systems Manager for SAP	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListConfigurationCheckOperations	Grants permission to list past configuration check operations	List			
ListDatabases	Grants permission to retrieve a list of all databases in the account of customer, or a specific application	List			
ListOperationEvents	Grants permission to retrieve a list of all operation events in a specified operation	List			
ListOperations	Grants permission to retrieve a list of all operations in the account of customer, additional filters can be applied	List			
ListSubCheckResults	Grants permission to list the sub-check results of a specified configuration check operation	List			
ListSubCheckRuleResults	Grants permission to list the rules of a specified sub-check belonging to a configuration check operation	List			
ListTagsForResource	Grants permission to list the tags on a specified resource ARN	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutResourcePermission	Grants permission to add the SSM for SAP level resource permissions associated with a SSM for SAP database resource	Permissions management			
RegisterApplication	Grants permission to registers an SAP application with SSM for SAP	Write		aws:RequestTag/${TagKey} aws:TagKeys	
RestoreDatabase	Grants permission to restore a database from another database	Write			
StartApplication	Grants permission to start a registered SSM for SAP application	Write	application		
StartApplicationRefresh	Grants permission to start an on-demand discovery of a registered SSM for SAP application	Write	application		
StartConfigurationChecks	Grants permission to iniitiate configuration check operations against a specified application	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StopApplication	Grants permission to stop a registered SSM for SAP application	Write	application		
TagResource	Grants permission to tag a specified resource ARN	Tagging	application		
			component		
			database		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove tags from a specified resource ARN	Tagging	application		
			component		
			database		
				aws:TagKeys	
UpdateApplicationSettings	Grants permission to update settings of a registered SSM for SAP application	Write	application		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateHANABackupSettings	Grants permission to update the HANA backup settings of a specified database	Write			

Resource types defined by AWS Systems Manager for SAP

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
application	`arn:${Partition}:ssm-sap:${Region}:${Account}:${ApplicationType}/${ApplicationId}`	aws:ResourceTag/${TagKey}
component	`arn:${Partition}:ssm-sap:${Region}:${Account}:${ApplicationType}/${ApplicationId}/COMPONENT/${ComponentId}`	aws:ResourceTag/${TagKey}
database	`arn:${Partition}:ssm-sap:${Region}:${Account}:${ApplicationType}/${ApplicationId}/DB/${DatabaseId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Systems Manager for SAP

AWS Systems Manager for SAP defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions

under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Systems Manager GUI Connect

AWS Systems Manager GUI Connect (service prefix: `ssm-guiconnect`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Systems Manager GUI Connect

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelConnection [permission only]	Grants permission to terminate a GUI Connect connection	Write			
DeleteConnectionRecordingPreferences	Grants permission to remove GUI Connect connection recording preferences	Write			
GetConnection [permission only]	Grants permission to get the metadata for a GUI Connect connection	Read			
GetConnectionRecordingPreferences	Grants permission to get GUI Connect connection recording preferences	Read			
ListConnections [permission only]	Grants permission to list the metadata for GUI Connect connections	List			
StartConnection	Grants permission to start a GUI Connect connection	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
[permission only]					
UpdateConnectionRecordingPreferences	Grants permission to update GUI Connect connection recording preferences	Write			

Resource types defined by AWS Systems Manager GUI Connect

AWS Systems Manager GUI Connect does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Systems Manager GUI Connect, specify `"Resource": "*"` in your policy.

Condition keys for AWS Systems Manager GUI Connect

GUI Connect has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Systems Manager Incident Manager

AWS Systems Manager Incident Manager (service prefix: `ssm-incidents`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Systems Manager Incident Manager

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetIncidentFindings	Grants permission to retrieve details about specified findings for an incident record	Read	incident-record*		
			response-plan*		
CreateReplicationSet	Grants permission to create a replication set	Write		aws:TagKeys aws:RequestTag/${TagKey}	iam:CreateServiceLinkedRole ssm-incidents:TagResource
CreateResponsePlan	Grants permission to create a response plan	Write		aws:TagKeys aws:RequestTag/${TagKey}	iam:PassRole ssm-incidents:TagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTimelineEvent	Grants permission to create a timeline event for an incident record	Write	incident-record*		
			response-plan*		
DeleteIncidentRecord	Grants permission to delete an incident record	Write	incident-record*		
DeleteReplicationSet	Grants permission to delete a replication set	Write	replication-set*		
DeleteResourcePolicy	Grants permission to delete resource policy from a response plan	Permissions management	response-plan*		
DeleteResponsePlan	Grants permission to delete a response plan	Write	response-plan*		
DeleteTimelineEvent	Grants permission to delete a timeline event	Write	incident-record*		
GetIncidentRecord	Grants permission to view the contents of an incident record	Read	incident-record*		
			response-plan*		
GetReplicationSet	Grants permission to view the replication set	Read	replication-set*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetResourcePolicies	Grants permission to view resource policies of a response plan	Read	response-plan*		
GetResponsePlan	Grants permission to view the contents of a specified response plan	Read	response-plan*		
GetTimelineEvent	Grants permission to view a timeline event	Read	incident-record*		
			response-plan*		
ListIncidentFindings	Grants permission to list findings for an incident record	List	incident-record*		
			response-plan*		
ListIncidentRecords	Grants permission to list the contents of all incident records	List			
ListRelatedItems	Grants permission to list related items of an incident record	List	incident-record*		
			response-plan*		
ListReplicationSets	Grants permission to list all replication sets	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListResponsePlans	Grants permission to list all response plans	List			
ListTagsForResource	Grants permission to view a list of resource tags for a specified resource	Read	incident-record		
			replication-set		
			response-plan		
ListTimelineEvents	Grants permission to list all timeline events for an incident record	List	incident-record*		
			response-plan*		
PutResourcePolicy	Grants permission to put resource policy on a response plan	Permissions management	response-plan*		
StartIncident	Grants permission to start a new incident using a response plan	Write	response-plan*		
TagResource	Grants permission to add tags to a response plan	Tagging	incident-record		
			replication-set		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			response-plan		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove tags from a response plan	Tagging	incident-record		
			replication-set		
			response-plan		
				aws:TagKeys	
UpdateDeletionProtection	Grants permission to update replication set deletion protection	Write	replication-set*		
UpdateIncidentRecord	Grants permission to update the contents of an incident record	Write	incident-record*		
			response-plan*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateRelatedItems	Grants permission to update related items of an incident record	Write	incident-record*		
			response-plan*		
UpdateReplicationSet	Grants permission to update a replication set	Write	replication-set*		
UpdateResponsePlan	Grants permission to update the contents of a response plan	Write	response-plan*		iam:PassRole ssm-incidents:TagResource
				aws:TagKeys aws:RequestTag/${TagKey}	
UpdateTimelineEvent	Grants permission to update a timeline event	Write	incident-record*		
			response-plan*		

Resource types defined by AWS Systems Manager Incident Manager

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types

that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
response-plan	arn:${Partition}:ssm-incidents::${Account}:response-plan/${ResponsePlan}	aws:ResourceTag/${TagKey}
incident-record	arn:${Partition}:ssm-incidents::${Account}:incident-record/${ResponsePlan}/${IncidentRecord}	aws:ResourceTag/${TagKey}
replication-set	arn:${Partition}:ssm-incidents::${Account}:replication-set/${ReplicationSet}	aws:ResourceTag/${TagKey}

Condition keys for AWS Systems Manager Incident Manager

AWS Systems Manager Incident Manager defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String

Condition keys	Description	Type
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Systems Manager Incident Manager Contacts

AWS Systems Manager Incident Manager Contacts (service prefix: `ssm-contacts`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS Systems Manager Incident Manager Contacts

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptPage	Grants permission to accept a page	Write	page*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ActivateContactChannel	Grants permission to activate a contact's contact channel	Write	contactchannel*		
AssociateContact [permission only]	Grants permission to use a contact in an escalation plan	Permissions management	contact*		
CreateContact	Grants permission to create a contact	Write	contact*		ssm-contacts:AssociateContact
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateContactChannel	Grants permission to create a contact channel for a contact	Write	contact*		
CreateRotation	Grants permission to create a rotation in an on-call schedule	Write	rotation*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateRotationOverride	Grants permission to create an override for a rotation in an on-call schedule	Write	rotation*		
DeactivateContactChannel	Grants permission to deactivate a contact's contact channel	Write	contactchannel*		
DeleteContact	Grants permission to delete a contact	Write	contact*		
DeleteContactChannel	Grants permission to delete a contact's contact channel	Write	contactchannel*		
DeleteRotation	Grants permission to delete a rotation	Write	rotation*		
DeleteRotationOverride	Grants permission to delete a rotation's rotation override	Write	rotation*		
DescribeEngagement	Grants permission to describe an engagement	Read	engagement*		
DescribePage	Grants permission to describe a page	Read	page*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetContact	Grants permission to get a contact	Read	contact*		
GetContactChannel	Grants permission to get a contact's contact channel	Read	contactchannel*		
GetContactPolicy	Grants permission to get a contact's resource policy	Read	contact*		
GetRotation	Grants permission to retrieve information about an on-call rotation	Read	rotation*		
GetRotationOverride	Grants permission to retrieve information about an override in an on-call rotation	Read	rotation*		
ListContactChannels	Grants permission to list all of a contact's contact channels	List	contact*		
ListContacts	Grants permission to list all contacts	List			
ListEngagements	Grants permission to list all engagements	List			
ListPageReceipts	Grants permission to list all receipts of a page	List	page*		
ListPageResolutions	Grants permission to list the resolution path of an engagement	List	page*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListPagesByContact	Grants permission to list all pages sent to a contact	List	contact*		
ListPagesByEngagement	Grants permission to list all pages created in an engagement	List	engagement*		
ListPreviewRotationShifts	Grants permission to retrieve a list of shifts based on rotation configuration parameters	List			
ListRotationOverrides	Grants permission to retrieve a list of overrides currently specified for an on-call rotation	List	rotation*		
ListRotationShifts	Grants permission to retrieve a list of rotation shifts in an on-call schedule	List	rotation*		
ListRotations	Grants permission to retrieve a list of on-call rotations	List			
ListTagsForResource	Grants permission to view a list of resource tags for a specified resource	Read	contact		
			rotation		
PutContactPolicy	Grants permission to add a resource policy to a contact	Write	contact*		
SendActivationCode	Grants permission to send the activation code of a contact's contact channel	Write	contactchannel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartEngagement	Grants permission to start an engagement	Write	contact*		
StopEngagement	Grants permission to stop an engagement	Write	engagement*		
TagResource	Grants permission to add tags to the specified resource	Tagging	contact		
			rotation		
				aws:TagKeys	
				aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove tags from the specified resource	Tagging	contact		
			rotation		
				aws:TagKeys	
UpdateContact	Grants permission to update a contact	Write	contact*		ssm-contacts:AssociateContact
UpdateContactChannel	Grants permission to update a contact's contact channel	Write	contactchannel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateRotation	Grants permission to update the information specified for an on-call rotation	Write	rotation*		

Resource types defined by AWS Systems Manager Incident Manager Contacts

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
contact	`arn:${Partition}:ssm-contacts:${Region}:${Account}:contact/${ContactAlias}`	aws:ResourceTag/${TagKey}
contactchannel	`arn:${Partition}:ssm-contacts:${Region}:${Account}:contactchannel/${ContactAlias}/${ContactChannelId}`	
engagement	`arn:${Partition}:ssm-contacts:${Region}:${Account}:engagement/${ContactAlias}/${EngagementId}`	
page	`arn:${Partition}:ssm-contacts:${Region}:${Account}:page/${ContactAlias}/${PageId}`	

Resource types	ARN	Condition keys
rotation	arn:${Partition}:ssm-contacts:${Region}:${Account}:rotation/${RotationId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Systems Manager Incident Manager Contacts

AWS Systems Manager Incident Manager Contacts defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Systems Manager Quick Setup

AWS Systems Manager Quick Setup (service prefix: ssm-quicksetup) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Systems Manager Quick Setup

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateConfigurationManager	Grants permission to create a Quick Setup configuration manager resource	Write	configuration-manager*	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
DeleteConfigurationManager	Grants permission to delete a configuration manager	Write	configuration-manager*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetConfiguration	Grants permission to get Quick Setup configuration	Read	configuration-manager		
GetConfigurationManager	Grants permission to get a configuration manager	Read	configuration-manager*		
GetServiceSettings	Grants permission to get settings configured for Quick Setup in the requesting AWS account and AWS Region	Read			
ListConfigurationManagers	Grants permission to list Quick Setup configuration managers	List			
ListConfigurations	Grants permission to list Quick Setup configurations	List	configuration-manager		
ListQuickSetupTypes	Grants permission to list the available Quick Setup types	Read			
ListTagsForResource	Grants permission to list tags assigned to the resource	Read	configuration-manager*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to Assign key-value pairs of metadata to AWS resources	Tagging	configuration-manager*		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove tags from the specified resource	Tagging	configuration-manager*		
				aws:TagKeys	
UpdateConfigurationDefinition	Grants permission to update a Quick Setup configuration definition	Write	configuration-manager*		
UpdateConfigurationManager	Grants permission to update a Quick Setup configuration manager	Write	configuration-manager*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateServiceSettings	Grants permission to update settings configured for Quick Setup	Write			

Resource types defined by AWS Systems Manager Quick Setup

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
configuration-manager	`arn:${Partition}:ssm-quicksetup:${Region}:${Account}:configuration-manager/${ConfigurationManagerId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Systems Manager Quick Setup

AWS Systems Manager Quick Setup defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Tag Editor

Tag Editor (service prefix: `resource-explorer`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Tag Editor

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListResourceTypes [permission only]	Grants permission to retrieve the resource types currently supported by Tag Editor	List			
ListResources [permission only]	Grants permission to retrieve the identifiers of the resources in the AWS account	List			
ListTags [permission only]	Grants permission to retrieve the tags attached to the specified resource identifiers	Read			tag:GetResources

Resource types defined by Tag Editor

Tag Editor does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Tag Editor, specify `"Resource": "*"` in your policy.

Condition keys for Tag Editor

Tag Editor has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Tax Settings

AWS Tax Settings (service prefix: `tax`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS Tax Settings

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchDeleteTaxRegistration	Grants permission to batch delete tax registration data	Write			
BatchPutTaxRegistration	Grants permission to batch update tax registrations	Write			
CancelDocument	Grants permission to cancel documents such as withholding slips	Write			
CreateDocument	Grants permission to upload new documents such as withholding slips	Write			
DeleteSupplemental	Grants permission to delete supplemental tax registration data	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TaxRegistration					
DeleteTaxRegistration	Grants permission to delete tax registration data	Write			
GetDocument	Grants permission to retrieve documents such as withholding slips	Read			
GetDocumentUploadUrl	Grants permission to retrieve a generated URL to upload documents	Read			
GetExemptions	Grants permission to view tax exemptions data	Read			
GetTaxInfoReportingDocument [permission only]	Grants permission to view/download tax documents/forms	Read			
GetTaxInheritance	Grants permission to view tax inheritance status	Read			
GetTaxInterview [permission only]	Grants permission to retrieve tax interview data	Read			
GetTaxRegistration	Grants permission to view tax registrations data	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTaxRegistrationDocument	Grants permission to download tax registration documents	Read			
ListDocuments	Grants permission to view documents such as withholding slips	Read			
ListSupplementalTaxRegistrations	Grants permission to view supplemental tax registrations	Read			
ListTaxRegistrations	Grants permission to view tax registrations	Read			
ListWithholdingEligibleInvoices	Grants permission to view eligible withholding invoices	Read			
PutSupplementalTaxRegistration	Grants permission to update supplemental tax registrations data	Write			
PutTaxInheritance	Grants permission to set tax inheritance	Write			
PutTaxInterview [permission only]	Grants permission to update tax interview data	Write			
PutTaxRegistration	Grants permission to update tax registrations data	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateExemptions	Grants permission to update tax exemptions data	Write			

Resource types defined by AWS Tax Settings

AWS Tax Settings does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Tax Settings, specify `"Resource": "*"` in your policy.

Condition keys for AWS Tax Settings

Tax Settings has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Telco Network Builder

AWS Telco Network Builder (service prefix: `tnb`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

ValidateSolNetworkPackageContent	Grants permission to validate network package content	Write	network-package*		

Resource types defined by AWS Telco Network Builder

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
function-package	`arn:${Partition}:tnb:${Region}:${Account}:function-package/${FunctionPackageId}`	aws:ResourceTag/${TagKey}
network-package	`arn:${Partition}:tnb:${Region}:${Account}:network-package/${NetworkPackageId}`	aws:ResourceTag/${TagKey}
network-instance	`arn:${Partition}:tnb:${Region}:${Account}:network-instance/${NetworkInstanceId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
function-instance	arn:${Partition}:tnb:${Region}:${Account}:function-instance/${FunctionInstanceId}	aws:ResourceTag/${TagKey}
network-operation	arn:${Partition}:tnb:${Region}:${Account}:network-operation/${NetworkOperationId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Telco Network Builder

AWS Telco Network Builder defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by checking the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by checking tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Textract

Amazon Textract (service prefix: textract) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon Textract

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AnalyzeDocument	Grants permission to detect instances of real-world document entities within an image provided as input	Read			s3:GetObject
AnalyzeExpense	Grants permission to detect instances of real-world document entities within an image provided as input	Read			s3:GetObject
AnalyzeID	Grants permission to detect relevant information from	Read			s3:GetObject

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	identity documents provided as input				
CreateAdapter	Grants permission to create an Amazon Textract adapter	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateAdapterVersion	Grants permission to create an Amazon Textract adapter version	Write	adapter*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAdapter	Grants permission to delete an Amazon Textract adapter	Write	adapter*		
DeleteAdapterVersion	Grants permission to delete an Amazon Textract adapter version	Write	adapterversion*		
DetectDocumentText	Grants permission to detect text in document images	Read			s3:GetObject
GetAdapter	Grants permission to get an Amazon Textract adapter	Read	adapter*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAdapterVersion	Grants permission to get an Amazon Textract adapter version	Read	adapterversion*		
GetDocumentAnalysis	Grants permission to return information about a document analysis job	Read			
GetDocumentTextDetection	Grants permission to return information about a document text detection job	Read			
GetExpenseAnalysis	Grants permission to return information about an expense analysis job	Read			
GetLendingAnalysis	Grants permission to retrieve page-level information regarding a lending analysis job	Read			
GetLendingAnalysisSummary	Grants permission to retrieve summarized information regarding a lending analysis job	Read			
ListAdapterVersions	Grants permission to list Amazon Textract adapter versions	Read			
ListAdapters	Grants permission to list Amazon Textract adapters	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTagsForResource	Grants permission to return a list of tags associated with a resource	Read	adapter		
			adapterversion		
StartDocumentAnalysis	Grants permission to start an asynchronous job to detect instances of real-world document entities within an image or pdf provided as input	Write			s3:GetObject
StartDocumentTextDetection	Grants permission to start an asynchronous job to detect text in document images or pdfs	Write			s3:GetObject
StartExpenseAnalysis	Grants permission to start an asynchronous job to detect instances of invoices or receipts within an image or pdf provided as input	Write			s3:GetObject
StartLendingAnalysis	Grants permission to start an asynchronous job for detection of entities in a lending document, takes a provided image or PDF as input	Write			s3:GetObject
TagResource	Grants permission to add one or more tags to a resource	Tagging	adapter		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			adapterversion		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove one or more tags from a resource	Tagging	adapter		
			adapterversion		
				aws:TagKeys	
UpdateAdapter	Grants permission to update Amazon Textract adapter	Write	adapter*		

Resource types defined by Amazon Textract

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
adapter	arn:${Partition}:textract:${Region}:${Account}:/adapters/${AdapterId}	aws:ResourceTag/${TagKey}
adapterversion	arn:${Partition}:textract:${Region}:${Account}:/adapters/${AdapterId}/versions/${AdapterVersion}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Textract

Amazon Textract defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by tags associated with the resource	String
aws:TagKeys	Filters access by tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Timestream

Amazon Timestream (service prefix: timestream) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Resource types defined by Amazon Timestream

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
database	arn:${Partition}:timestream:${Region}:${Account}:database/${DatabaseName}	aws:ResourceTag/${TagKey}
table	arn:${Partition}:timestream:${Region}:${Account}:database/${DatabaseName}/table/${TableName}	aws:ResourceTag/${TagKey}
scheduled-query	arn:${Partition}:timestream:${Region}:${Account}:scheduled-query/${ScheduledQueryName}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Timestream

Amazon Timestream defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Timestream InfluxDB

Amazon Timestream InfluxDB (service prefix: `timestream-influxdb`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

TagResource	Grants permission to tag a Timestream InfluxDB resource	Tagging	db-cluster		
			db-instance		
			db-parameter-group		
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag a Timestream InfluxDB resource	Tagging	db-cluster		
			db-instance		
			db-parameter-group		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:TagKeys	
UpdateDbCluster	Grants permission to update a Timestream InfluxDB Cluster	Write	db-cluster*		timestream-influxdb:UpdateDbInstance
			db-parameter-group		
UpdateDbInstance	Grants permission to update a Timestream InfluxDB instance	Write	db-instance*		
			db-parameter-group		

Resource types defined by Amazon Timestream InfluxDB

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
db-cluster	`arn:${Partition}:timestream-influxdb:${Region}:${Account}:db-cluster/${DbClusterId}`	aws:ResourceTag/${TagKey}
db-instance	`arn:${Partition}:timestream-influxdb:${Region}:${Account}:db-instance/${DbInstanceIdentifier}`	aws:ResourceTag/${TagKey}
db-parameter-group	`arn:${Partition}:timestream-influxdb:${Region}:${Account}:db-parameter-group/${DbParameterGroupIdentifier}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Timestream InfluxDB

Amazon Timestream InfluxDB defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String

Condition keys	Description	Type
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Tiros

AWS Tiros (service prefix: `tiros`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Tiros

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which

the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateQuery [permission only]	Grants permission to create a VPC reachability query	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ExtendQuery [permission only]	Grants permission to extend a VPC reachability query to include the calling principals account	Write			
GetQueryAnswer [permission only]	Grants permission to get VPC reachability query answers	Read			
GetQueryExplanation [permission only]	Grants permission to get VPC reachability query explanations	Read			
GetQueryExtensionAccounts [permission only]	Grants permission to list accounts that might be useful in a new query	Read			

Resource types defined by AWS Tiros

AWS Tiros does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Tiros, specify `"Resource": "*"` in your policy.

Condition keys for AWS Tiros

Tiros has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Transcribe

Amazon Transcribe (service prefix: `transcribe`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon Transcribe

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCallAnalyticsCategory	Grants permission to create an analytics category. Amazon Transcribe applies the conditions specified by your analytics categories to your call analytics jobs	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
CreateLanguageModel	Grants permission to create a new custom language model	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	s3:GetObject s3:ListBucket
CreateMedicalVocabulary	Grants permission to create a new custom vocabulary that you can use to change the way Amazon Transcribe Medical handles transcription of an audio file	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	s3:GetObject

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateVocabulary	Grants permission to create a new custom vocabulary that you can use to change the way Amazon Transcribe handles transcription of an audio file	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	s3:GetObject
CreateVocabularyFilter	Grants permission to create a new vocabulary filter that you can use to filter out words from the transcription of an audio file generated by Amazon Transcribe	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	s3:GetObject
DeleteCallAnalyticsCategory	Grants permission to delete a call analytics category using its name from Amazon Transcribe	Write	callanalyticscategory*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteCallAnalyticsJob	Grants permission to delete a previously submitted call analytics job along with any other generated results such as the transcription, models, and so on	Write	callanalyticsjob*		
DeleteLanguageModel	Grants permission to delete a previously created custom language model	Write	languagemodel*		
DeleteMedicalScribeJob	Grants permission to delete a previously submitted Medical Scribe job	Write	medicalscribejob*		
DeleteMedicalTranscriptionJob	Grants permission to delete a previously submitted medical transcription job	Write	medicaltranscriptionjob*		
DeleteMedicalVocabulary	Grants permission to delete a medical vocabulary from Amazon Transcribe	Write	medicalvocabulary*		
DeleteTranscriptionJob	Grants permission to delete a previously submitted transcription job along with any other generated results such as the transcription, models, and so on	Write	transcriptionjob*		
DeleteVocabulary	Grants permission to delete a vocabulary from Amazon Transcribe	Write	vocabulary*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteVocabularyFilter	Grants permission to delete a vocabulary filter from Amazon Transcribe	Write	vocabularyfilter*		
DescribeLanguageModel	Grants permission to return information about a custom language model	Read	languagemodel*		
GetCallAnalyticsCategory	Grants permission to retrieve information about a call analytics category	Read	callanalyticscategory*		
GetCallAnalyticsJob	Grants permission to return information about a call analytics job	Read	callanalyticsjob*		
GetMedicalScribeJob	Grants permission to return information about a Medical Scribe job	Read	medicalscribejob*		
GetMedicalScribeStream	Grants permission to get information about the specified AWS HealthScribe streaming session	Read			
GetMedicalTranscriptionJob	Grants permission to return information about a medical transcription job	Read	medicaltranscriptionjob*		
GetMedicalVocabulary	Grants permission to get information about a medical vocabulary	Read	medicalvocabulary*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTranscriptionJob	Grants permission to return information about a transcription job	Read	transcriptionjob*		
GetVocabulary	Grants permission to to get information about a vocabulary	Read	vocabulary*		
GetVocabularyFilter	Grants permission to get information about a vocabulary filter	Read	vocabularyfilter*		
ListCallAnalyticsCategories	Grants permission to list call analytics categories that has been created	List			
ListCallAnalyticsJobs	Grants permission to list call analytics jobs with the specified status	List			
ListLanguageModels	Grants permission to list custom language models	List			
ListMedicalScribeJobs	Grants permission to list Medical Scribe jobs with the specified status	List			
ListMedicalTranscriptionJobs	Grants permission to list medical transcription jobs with the specified status	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListMedicalVocabularies	Grants permission to return a list of medical vocabularies that match the specified criteria. If no criteria are specified, returns the entire list of vocabularies	List			
ListTagsForResource	Grants permission to list tags for a resource	Read			
ListTranscriptionJobs	Grants permission to list transcription jobs with the specified status	List			
ListVocabularies	Grants permission to return a list of vocabularies that match the specified criteria. If no criteria are specified, returns the entire list of vocabularies	List			
ListVocabularyFilters	Grants permission to return a list of vocabulary filters that match the specified criteria. If no criteria are specified, returns the at most 5 vocabulary filters	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartCallAnalyticsJob	Grants permission to start an asynchronous analytics job that not only transcribes the audio recording of a caller and agent, but also returns additional insights	Write		transcribe:OutputEncryptionKMSKeyId transcribe:OutputLocation aws:RequestTag/${TagKey} aws:TagKeys	s3:GetObject
StartCallAnalyticsStreamTranscription	Grants permission to start a protocol where audio is streamed to Transcribe Call Analytics and the transcription results are streamed to your application	Write			
StartCallAnalyticsStreamTranscriptionWebSocket	Grants permission to start a WebSocket where audio is streamed to Transcribe Call Analytics and the transcription results are streamed to your application	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartMedicalScribeJob	Grants permission to start an asynchronous job to transcribe patient-clinician conversations and generates clinical notes	Write		transcribe:OutputBucketName transcribe:OutputEncryptionKMSKeyId aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	s3:GetObject
StartMedicalScribeStream	Grants permission to start a bidirectional HTTP2 stream where audio is streamed to AWS HealthScribe and the transcription results are streamed to your application	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartMedicalStreamTranscription	Grants permission to start a protocol where audio is streamed to Transcribe Medical and the transcription results are streamed to your application	Write			
StartMedicalStreamTranscriptionWebSocket	Grants permission to start a WebSocket where audio is streamed to Transcribe Medical and the transcription results are streamed to your application	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartMedicalTranscriptionJob	Grants permission to start an asynchronous job to transcribe medical speech to text	Write		transcribe:OutputBucketName transcribe:OutputEncryptionKMSKeyId transcribe:OutputKey aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	s3:GetObject
StartStreamTranscription	Grants permission to start a bidirectional HTTP2 stream to transcribe speech to text in real time	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartStreamTranscriptionWebSocket	Grants permission to start a websocket stream to transcribe speech to text in real time	Write			
StartTranscriptionJob	Grants permission to start an asynchronous job to transcribe speech to text	Write		transcribe:OutputBucketName transcribe:OutputEncryptionKMSKeyId transcribe:OutputKey aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	s3:GetObject

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to tag a resource with given key value pairs	Tagging		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} transcribe:OutputBucketName transcribe:OutputEncryptionKMSKeyId transcribe:OutputKey aws:TagKeys	
UntagResource	Grants permission to untag a resource with given key	Tagging		aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateCallAnalyticsCategory	Grants permission to update the call analytics category with new values. The UpdateCallAnalyticsCategory operation overwrites all of the existing information with the values that you provide in the request	Write	callanalyticscategory*		
UpdateMedicalVocabulary	Grants permission to update an existing medical vocabulary with new values. The UpdateMedicalVocabulary operation overwrites all of the existing information with the values that you provide in the request	Write	medicalvocabulary*		s3:GetObject
UpdateVocabulary	Grants permission to update an existing vocabulary with new values. The UpdateVocabulary operation overwrites all of the existing information with the values that you provide in the request	Write	vocabulary*		s3:GetObject

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateVocabularyFilter	Grants permission to update an existing vocabulary filter with new values. The UpdateVocabularyFilter operation overwrites all of the existing information with the values that you provide in the request	Write	vocabularyfilter*		s3:GetObject

Resource types defined by Amazon Transcribe

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
transcriptionjob	`arn:${Partition}:transcribe:${Region}:${Account}:transcription-job/${JobName}`	aws:ResourceTag/${TagKey}
vocabulary	`arn:${Partition}:transcribe:${Region}:${Account}:vocabulary/${VocabularyName}`	aws:ResourceTag/${TagKey}
vocabularyfilter	`arn:${Partition}:transcribe:${Region}:${Account}:vocabulary-filter/${VocabularyFilterName}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
languagemodel	arn:${Partition}:transcribe:${Region}:${Account}:language-model/${ModelName}	aws:ResourceTag/${TagKey}
medicaltranscriptionjob	arn:${Partition}:transcribe:${Region}:${Account}:medical-transcription-job/${JobName}	aws:ResourceTag/${TagKey}
medicalvocabulary	arn:${Partition}:transcribe:${Region}:${Account}:medical-vocabulary/${VocabularyName}	aws:ResourceTag/${TagKey}
callanalyticsjob	arn:${Partition}:transcribe:${Region}:${Account}:analytics/${JobName}	aws:ResourceTag/${TagKey}
callanalyticscategory	arn:${Partition}:transcribe:${Region}:${Account}:analytics-category/${CategoryName}	aws:ResourceTag/${TagKey}
medicalscribejob	arn:${Partition}:transcribe:${Region}:${Account}:medical-scribe-job/${JobName}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Transcribe

Amazon Transcribe defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by requiring tag values present in a resource creation request	String
aws:ResourceTag/${TagKey}	Filters access by requiring tag value associated with the resource	String
aws:TagKeys	Filters access by requiring the presence of mandatory tags in the request	ArrayOfString
transcribe:OutputBucketName	Filters access based on the output bucket name included in the request	String
transcribe:OutputEncryptionKMSKeyId	Filters access based on the KMS key id included in the request, provided in the form of a KMS key ARN	String
transcribe:OutputKey	Filters access based on the output key included in the request	String
transcribe:OutputLocation	Filters access based on the output location included in the request	String

Actions, resources, and condition keys for AWS Transfer Family

AWS Transfer Family (service prefix: `transfer`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS Transfer Family

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAccess	Grants permission to add an access associated with a server	Write	server*		iam:PassRole
CreateAgreement	Grants permission to add an agreement associated with a server	Write	server*		iam:PassRole
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
CreateConnector	Grants permission to create a connector	Write	profile		iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} transfer:RequestConnectorProtocol	
CreateProfile	Grants permission to create a profile	Write		aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateServer	Grants permission to create a server	Write		aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} transfer:RequestServerEndpointType transfer:RequestServerDomain transfer:RequestServerProtocols	iam:PassRole
CreateUser	Grants permission to add a user associated with a server	Write	server*		iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
CreateWebApp	Grants permission to create a webapp	Write		aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateWorkflow	Grants permission to create a workflow	Write		aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
DeleteAccess	Grants permission to delete access	Write	server*		
DeleteAgreement	Grants permission to delete agreement	Write	agreement*		
DeleteCertificate	Grants permission to delete certificate	Write	certificate*		
DeleteConnector	Grants permission to delete connector	Write	connector*		
DeleteHostKey	Grants permission to delete a host key associated with a server	Write	host-key*		
DeleteProfile	Grants permission to delete profile	Write	profile*		
DeleteServer	Grants permission to delete a server	Write	server*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteSshPublicKey	Grants permission to delete an SSH public key from a user	Write	user*		
DeleteUser	Grants permission to delete a user associated with a server	Write	user*		
DeleteWebApp	Grants permission to delete webapp	Write	webapp*		
DeleteWebAppCustomization	Grants permission to delete webapp customization	Write	webapp*		
DeleteWorkflow	Grants permission to delete a workflow	Write	workflow*		
DescribeAccess	Grants permission to describe an access assigned to a server	Read	server*		
DescribeAgreement	Grants permission to describe an agreement assigned to a server	Read	agreement*		
DescribeCertificate	Grants permission to describe a certificate	Read	certificate*		
DescribeConnector	Grants permission to describe a connector	Read	connector*		
DescribeExecution	Grants permission to describe an execution associated with a workflow	Read	workflow*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeHostKey	Grants permission to describe a host key associated with a server	Read	host-key*		
DescribeProfile	Grants permission to describe a profile	Read	profile*		
DescribeSecurityPolicy	Grants permission to describe a security policy	Read			
DescribeServer	Grants permission to describe a server	Read	server*		
DescribeUser	Grants permission to describe a user associated with a server	Read	user*		
DescribeWebApp	Grants permission to describe a webapp	Read	webapp*		
DescribeWebAppCustomization	Grants permission to describe a webapp customization	Read	webapp*		
DescribeWorkflow	Grants permission to describe a workflow	Read	workflow*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ImportCertificate	Grants permission to add a certificate	Write		aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
ImportHostKey	Grants permission to add a host key to a server	Write	server*		
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
ImportSshPublicKey	Grants permission to add an SSH public key to a user	Write	user*		
ListAccesses	Grants permission to list accesses	Read	server*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAgreements	Grants permission to list agreements	Read	server*		
ListCertificates	Grants permission to list certificates	Read			
ListConnectors	Grants permission to list connectors	Read			
ListExecutions	Grants permission to list executions associated with a workflow	Read	workflow*		
ListFileTransferResults	Grants permission to list file transfer statuses for connectors	Read	connector*		
ListHostKeys	Grants permission to list host keys associated with a server	Read	server*		
ListProfiles	Grants permission to list profiles	Read			
ListSecurityPolicies	Grants permission to list security policies	List			
ListServers	Grants permission to list servers	List			
ListTagsForResource	Grants permission to list tags for an AWS Transfer Family resource	Read	agreement		
			certificate		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			connector		
			host-key		
			profile		
			server		
			user		
			workflow		
ListUsers	Grants permission to list users associated with a server	List	server*		
ListWebApps	Grants permission to list webapps	List			
ListWorkflows	Grants permission to list workflows	List			
SendWorkflowStepState	Grants permission to send a callback for asynchronous custom steps	Write	workflow*		
StartDirectoryListing	Grants permission to initiate a list operation on a remote server using a connector	Write	connector*		
StartFileTransfer	Grants permission to initiate a connector file transfer	Write	connector*		
StartRemoteDelete	Grants permission to initiate a connector delete operation on remote server	Write	connector*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartRemoteMove	Grants permission to initiate a connector move operation on remote server	Write	connector*		
StartServer	Grants permission to start a server	Write	server*

				transfer:RequestServerEndpointType transfer:RequestServerProtocols	
UpdateUser	Grants permission to update the configuration of a user	Write	user*		iam:PassRole
UpdateWebApp	Grants permission to update the configuration of a webapp	Write	webapp*		iam:PassRole
UpdateWebAppCustomization	Grants permission to update the configuration of a webapp cutomization	Write	webapp*		iam:PassRole

Resource types defined by AWS Transfer Family

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
user	arn:${Partition}:transfer:${Region}:${Account}:user/${ServerId}/${UserName}	aws:ResourceTag/${TagKey}
server	arn:${Partition}:transfer:${Region}:${Account}:server/${ServerId}	aws:ResourceTag/${TagKey}
workflow	arn:${Partition}:transfer:${Region}:${Account}:workflow/${WorkflowId}	aws:ResourceTag/${TagKey}
certificate	arn:${Partition}:transfer:${Region}:${Account}:certificate/${CertificateId}	aws:ResourceTag/${TagKey}
connector	arn:${Partition}:transfer:${Region}:${Account}:connector/${ConnectorId}	aws:ResourceTag/${TagKey}
profile	arn:${Partition}:transfer:${Region}:${Account}:profile/${ProfileId}	aws:ResourceTag/${TagKey}
agreement	arn:${Partition}:transfer:${Region}:${Account}:agreement/${ServerId}/${AgreementId}	aws:ResourceTag/${TagKey}
host-key	arn:${Partition}:transfer:${Region}:${Account}:host-key/${ServerId}/${HostKeyId}	aws:ResourceTag/${TagKey}
webapp	arn:${Partition}:transfer:${Region}:${Account}:webapp/${WebAppId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Transfer Family

AWS Transfer Family defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the

policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
transfer:RequestConnectorProtocol	Filters access by the connector protocol that is passed in the request	String
transfer:RequestServerDomain	Filters access by the storage domain that is passed in the request	String
transfer:RequestServerEndpointType	Filters access by the endpoint type that is passed in the request	String
transfer:RequestServerProtocols	Filters access by the server protocols that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Transform

AWS Transform (service prefix: `transform`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS Transform

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Associate Connector Resource [permission only]	Grants permission to invoke AssociateConnectorResource on AWS Transform	Write	connector*		
CreateProfile [permission only]	Grants permission to invoke CreateProfile on AWS Transform	Write	profile*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAgentRuntimeConfiguration [permission only]	Grants permission to invoke DeleteAgentRuntimeConfiguration on AWS Transform	Write			
DeleteConnector [permission only]	Grants permission to invoke DeleteConnector on AWS Transform	Write	connector*		
DeleteProfile [permission only]	Grants permission to invoke DeleteProfile on AWS Transform	Write	profile*		
GetAccountSettings [permission only]	Grants permission to invoke GetAccountSettings on AWS Transform	Read			
GetAgent [permission only]	Grants permission to invoke GetAgent on AWS Transform	Read			
GetAgentRuntimeConfiguration [permission only]	Grants permission to invoke GetAgentRuntimeConfiguration on AWS Transform	Read			
GetConnector [permission only]	Grants permission to invoke GetConnector on AWS Transform	Read	connector*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAgents [permission only]	Grants permission to invoke ListAgents on AWS Transform	Read			
ListConnectors [permission only]	Grants permission to invoke ListConnectors on AWS Transform	List			
ListProfiles [permission only]	Grants permission to invoke ListProfiles on AWS Transform	List			
ListTagsForResource [permission only]	Grants permission to invoke ListTagsForResource on AWS Transform	Read	connector*		
PutAgentRuntimeConfiguration [permission only]	Grants permission to invoke PutAgentRuntimeConfiguration on AWS Transform	Write			
RejectConnector [permission only]	Grants permission to invoke RejectConnector on AWS Transform	Write	connector*		
TagResource [permission only]	Grants permission to invoke TagResource on AWS Transform	Tagging	connector*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource [permission only]	Grants permission to invoke UntagResource on AWS Transform	Tagging	connector*		
				aws:TagKeys	
UpdateAccountSettings [permission only]	Grants permission to invoke UpdateAccountSettings on AWS Transform	Write			
UpdateAgentAccess [permission only]	Grants permission to invoke UpdateAgentAccess on AWS Transform	Write			
UpdateProfile [permission only]	Grants permission to invoke UpdateProfile on AWS Transform	Write	profile*		

Resource types defined by AWS Transform

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
profile	`arn:${Partition}:transform:${Region}:${Account}:profile/${Identifier}`	
connector	`arn:${Partition}:transform:${Region}:${Account}:connector/${WorkspaceId}/${ConnectorId}`	

Condition keys for AWS Transform

AWS Transform defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Transform custom

AWS Transform custom (service prefix: `transform-custom`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.

Topics

Actions defined by AWS Transform custom

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CompleteTransformationPackageUpload	Grants permission to invoke CompleteTransformationPackageUpload on AWS Transform custom	Write	package*		
				aws:ResourceTag/${TagKey}	
ConverseStream	Grants permission to invoke ConverseStream on AWS Transform custom	Write			
CreateCampaign	Grants permission to invoke CreateCampaign on AWS Transform custom	Write	campaign*		
				aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:TagKeys	
CreateTransformationPackageUrl	Grants permission to invoke CreateTransformationPackageUrl on AWS Transform custom	Write	package*		
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
DeleteCampaign	Grants permission to invoke DeleteCampaign on AWS Transform custom	Write	campaign*		
				aws:ResourceTag/${TagKey}	
DeleteKnowledgeItem	Grants permission to invoke DeleteKnowledgeItem on AWS Transform custom	Write	knowledge-item*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
DeleteTransformationPackage	Grants permission to invoke DeleteTransformationPackage on AWS Transform custom	Write	package*		
				aws:ResourceTag/${TagKey}	
ExecuteTransformation	Grants permission to invoke ExecuteTransformation on AWS Transform custom	Write	package*		
				aws:ResourceTag/${TagKey}	
GetCampaign	Grants permission to invoke GetCampaign on AWS Transform custom	Read	campaign*		
				aws:ResourceTag/${TagKey}	
GetKnowledgeItem	Grants permission to invoke GetKnowledgeItem on AWS Transform custom	Read	knowledge-item*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTransformationPackageUrl	Grants permission to invoke GetTransformationPackageUrl on AWS Transform custom	Read	package*		
				aws:ResourceTag/${TagKey}	
ListCampaignRepositories	Grants permission to invoke ListCampaignRepositories on AWS Transform custom	Read	campaign*		
				aws:ResourceTag/${TagKey}	
ListCampaigns	Grants permission to invoke ListCampaign on AWS Transform custom	List			
ListKnowledgeItems	Grants permission to invoke ListKnowledgeItems on AWS Transform custom	List			
ListTagsForResource	Grants permission to invoke ListTagsForResource on AWS Transform custom	Read			
ListTransformationPackageMetadata	Grants permission to invoke ListTransformationPackageMetadata on AWS Transform custom	List			
TagResource	Grants permission to invoke TagResource on AWS Transform custom	Tagging	campaign		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			knowledge-item		
			package		
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to invoke UntagResource on AWS Transform custom	Tagging	campaign		
			knowledge-item		
			package		
				aws:TagKeys	
UpdateCampaign	Grants permission to invoke UpdateCampaign on AWS Transform custom	Write	campaign*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateCampaignRepositoryStatus	Grants permission to invoke UpdateCampaignRepositories on AWS Transform custom	Write	campaign*		
				aws:ResourceTag/${TagKey}	
UpdateKnowledgeItemConfiguration	Grants permission to invoke UpdateKnowledgeItemConfiguration on AWS Transform custom	Write	package*		
				aws:ResourceTag/${TagKey}	
UpdateKnowledgeItemStatus	Grants permission to invoke UpdateKnowledgeItemStatus on AWS Transform custom	Write	knowledge-item*		
				aws:ResourceTag/${TagKey}	

Resource types defined by AWS Transform custom

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
campaign	arn:${Partition}:transform-custom:${Region}:${Account}:campaign/${Name}	aws:ResourceTag/${TagKey}
knowledge-item	arn:${Partition}:transform-custom:${Region}:${Account}:package/${TransformationPackageName}/knowledge-item/${Id}	aws:ResourceTag/${TagKey}
package	arn:${Partition}:transform-custom:${Region}:${Account}:package/${Name}	aws:ResourceTag/${TagKey}

Condition keys for AWS Transform custom

AWS Transform custom defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Translate

Amazon Translate (service prefix: `translate`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon Translate

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateParallelData	Grants permission to create a Parallel Data	Write	parallel-data		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteParallelData	Grants permission to delete a Parallel Data	Write	parallel-data		
DeleteTerminology	Grants permission to delete a terminology	Write	terminology		
DescribeTextTranslationJob	Grants permission to get the properties associated with an asynchronous batch translation job	Read			
GetParallelData	Grants permission to get a Parallel Data	Read	parallel-data		
GetTerminology	Grants permission to retrieve a terminology	Read	terminology		
ImportTerminology	Grants permission to create or update a terminology, depending on whether or not one already exists for the given terminology name	Write	terminology		
				aws:RequestTag/${TagKey} aws:TagKeys	
ListLanguages	Grants permission to list supported languages	List			
ListParallelData	Grants permission to list Parallel Data associated with your account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTagsForResource	Grants permission to list tags for a resource	Read	parallel-data		
			terminology		
ListTerminologies	Grants permission to list terminologies associated with your account	List			
ListTextTranslationJobs	Grants permission to list batch translation jobs that you have submitted	List			
StartTextTranslationJob	Grants permission to start an asynchronous batch translation job. Batch translation jobs can be used to translate large volumes of text across multiple documents at once	Write	parallel-data		
			terminology		
StopTextTranslationJob	Grants permission to stop an asynchronous batch translation job that is in progress	Write			
TagResource	Grants permission to tag a resource with given key value pairs	Tagging	parallel-data		
			terminology		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
TranslateDocument	Grants permission to translate a document from a source language to a target language	Read	terminology		
TranslateText	Grants permission to translate text from a source language to a target language	Read	parallel-data		
			terminology		
UntagResource	Grants permission to untag a resource with given key	Tagging	parallel-data		
			terminology		
				aws:TagKeys	
UpdateParallelData	Grants permission to update an existing Parallel Data	Write	parallel-data		

Resource types defined by Amazon Translate

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types

that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
terminology	`arn:${Partition}:translate:${Region}:${Account}:terminology/${ResourceName}`	aws:ResourceTag/${TagKey}
parallel-data	`arn:${Partition}:translate:${Region}:${Account}:parallel-data/${ResourceName}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Translate

Amazon Translate defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by requiring tag values present in a resource creation request	String
aws:ResourceTag/${TagKey}	Filters access by requiring tag value associated with the resource	String
aws:TagKeys	Filters access by requiring the presence of mandatory tags in the request	ArrayOfString

Actions, resources, and condition keys for AWS Trusted Advisor

AWS Trusted Advisor (service prefix: `trustedadvisor`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.

Topics

Actions defined by AWS Trusted Advisor

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Note

The IAM Trusted Advisor policy description details apply only to the Trusted Advisor console. If you want to manage programmatic access to Trusted Advisor, use the Trusted Advisor operations in the AWS Support API.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchUpdateRecommendationRe	Grants permission to update one or more exclusion status	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
sourceExclusion	for a list of recommendation resources				
CreateEngagement	Grants permission to create an engagement	Write			
CreateEngagementAttachment	Grants permission to create an engagement attachment	Write			
CreateEngagementCommunication	Grants permission to create an engagement communication	Write			
DeleteNotificationConfigurationForDelegatedAdmin	Grants permission to the organization management account to delete email notification preferences from a delegated administrator account for Trusted Advisor Priority	Write			
DescribeAccount [permission only]	Grants permission to view the AWS Support plan and various AWS Trusted Advisor preferences	Read			
DescribeAccountAccess [permission only]	Grants permission to view if the AWS account has enabled or disabled AWS Trusted Advisor	Read			
DescribeCheckItems	Grants permission to view details for the check items	Read	checks*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeCheckRefreshStatuses	Grants permission to view the refresh statuses for AWS Trusted Advisor checks	Read	checks*		
DescribeCheckStatusHistoryChanges [permission only]	Grants permission to view the results and changed statuses for checks in the last 30 days	Read	checks*		
DescribeCheckSummaries	Grants permission to view AWS Trusted Advisor check summaries	Read	checks*		
DescribeChecks	Grants permission to view details for AWS Trusted Advisor checks	Read			
DescribeNotificationConfigurations	Grants permission to get your email notification preferences for Trusted Advisor Priority	Read			
DescribeNotificationPreferences [permission only]	Grants permission to view the notification preferences for the AWS account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeOrganization [permission only]	Grants permission to view if the AWS account meets the requirements to enable the organizational view feature	Read			
DescribeOrganizationAccounts [permission only]	Grants permission to view the linked AWS accounts that are in the organization	Read			
DescribeReports [permission only]	Grants permission to view details for organizational view reports, such as the report name, runtime, date created, status, and format	Read			
DescribeRisk	Grants permission to view risk details in AWS Trusted Advisor Priority	Read			
DescribeRiskResources	Grants permission to view affected resources for a risk in AWS Trusted Advisor Priority	Read			
DescribeRisks	Grants permission to view risks in AWS Trusted Advisor Priority	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeServiceMetadata [permission only]	Grants permission to view information about organizational view reports, such as the AWS Regions, check categories, check names, and resource statuses	Read			
DownloadRisk	Grants permission to download a file that contains details about the risk in AWS Trusted Advisor Priority	Read			
ExcludeCheckItems [permission only]	Grants permission to exclude recommendations for AWS Trusted Advisor checks	Write	checks*		
GenerateReport [permission only]	Grants permission to create a report for AWS Trusted Advisor checks in your organization	Write			
GetEngagement	Grants permission to view an engagment	Read			
GetEngagementAttachment	Grants permission to view an engagment attachment	Read			
GetEngagementType	Grants permission to view a specific engagement type	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetOrganizationRecommendation	Grants permission to get a specific recommendation within an AWS Organization's organization. This API supports only prioritized recommendations	Read			
GetRecommendation	Grants permission to get a specific Recommendation	Read			
IncludeCheckItems [permission only]	Grants permission to include recommendations for AWS Trusted Advisor checks	Write	checks*		
ListAccountsForParent [permission only]	Grants permission to view, in the Trusted Advisor console, all of the accounts in an AWS organization that are contained by a root or organizational unit (OU)	Read			
ListChecks	Grants permission to list a filterable set of Checks	List			
ListEngagementCommunications	Grants permission to view all communications for an engagement	Read			
ListEngagementTypes	Grants permission to view all engagement types	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListEngagements	Grants permission to view all engagements	Read			
ListOrganizationRecommendationAccounts	Grants permission to list the accounts that own the resources for an AWS Organization aggregate recommendation. This API only supports prioritized recommendations	List			
ListOrganizationRecommendationResources	Grants permission to list Resources of a Recommendation within an AWS Organization. This API only supports prioritized recommendations	List			
ListOrganizationRecommendations	Grants permission to list a filterable set of Recommendations within an AWS Organization. This API only supports prioritized recommendations	List			
ListOrganizationalUnitsForParent [permission only]	Grants permission to view, in the Trusted Advisor console, all of the organizational units (OUs) in a parent organizational unit or root	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListRecommendationResources	Grants permission to list Resources of a Recommendation	List			
ListRecommendations	Grants permission to list a filterable set of Recommendations	List			
ListRoots [permission only]	Grants permission to view, in the Trusted Advisor console, all of the roots that are defined in an AWS organization	Read			
RefreshCheck	Grants permission to refresh an AWS Trusted Advisor check	Write	checks*		
SetAccountAccess [permission only]	Grants permission to enable or disable AWS Trusted Advisor for the account	Write			
SetOrganizationAccess [permission only]	Grants permission to enable the organizational view feature for AWS Trusted Advisor	Write			
UpdateEngagement	Grants permission to update the details of an engagement	Write			
UpdateEngagementStatus	Grants permission to update the status of an engagement	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateNotificationConfigurations	Grants permission to create or update your email notification preferences for Trusted Advisor Priority	Write			
UpdateNotificationPreferences [permission only]	Grants permission to update notification preferences for AWS Trusted Advisor	Write			
UpdateOrganizationRecommendationLifecycle	Grants permission to update the lifecyle of a Recommendation within an AWS Organization. This API only supports prioritized recommendations	Write			
UpdateRecommendationLifecycle	Grants permission to update the lifecyle of a Recommendation. This API only supports prioritized recommendations	Write			
UpdateRiskStatus	Grants permission to update the risk status in AWS Trusted Advisor Priority	Write			

Resource types defined by AWS Trusted Advisor

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

> **Note**
>
> The ARN for the checks resource type should not include a region. In the format instead of '${Region}' use a '*' or the policy will not work correctly.

Resource types	ARN	Condition keys
checks	`arn:${Partition}:trustedadvisor:${Region}:${Account}:checks/${CategoryCode}/${CheckId}`	

Condition keys for AWS Trusted Advisor

Trusted Advisor has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS User Experience Customization

AWS User Experience Customization (service prefix: `uxc`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS User Experience Customization

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAccountColor	Grants permission to delete account color setting	Write			
GetAccountColor	Grants permission to retrieve account color for given account	Read			
GetAccountCustomizations	Grants permission to retrieve account customizations	Read			
ListServices	Grants permission to list available services	Read			
PutAccountColor	Grants permission to set account color	Write			
UpdateAccountCustomizations	Grants permission to update account customizations	Write			

Resource types defined by AWS User Experience Customization

AWS User Experience Customization does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS User Experience Customization, specify `"Resource": "*"` in your policy.

Condition keys for AWS User Experience Customization

User Experience Customization (UXC) has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS User Notifications

AWS User Notifications (service prefix: `notifications`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS User Notifications

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of

access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateChannel	Grants permission to associate a new Channel with a particular NotificationConfiguration	Write	NotificationConfiguration*		
AssociateManagedNotificationAccountContact	Grants permission to associate an Account contact to a particular Managed Notification Configuration	Write	ManagedNotificationConfiguration*		
AssociateManagedNotificationAdditionalChannel	Grants permission to associate a Channel to a particular Managed Notification Configuration	Write	ManagedNotificationConfiguration*		
AssociateOrganizationalUnit	Grants permission to associate an Organizational Unit to a particular Notification Configuration	Write	NotificationConfiguration*		
CreateEventRule	Grants permission to create a new EventRule, associating it with a NotificationConfiguration	Write			
CreateNotificationConfiguration	Grants permission to create a NotificationConfiguration	Write		aws:TagKeys aws:RequestTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey}	
DeleteEventRule	Grants permission to delete an EventRule	Write	EventRule*		
DeleteNotificationConfiguration	Grants permission to delete a NotificationConfiguration	Write	NotificationConfiguration*		
DeregisterNotificationHub	Grants permission to deregister a NotificationHub	Write			
DisableNotificationsAccessForOrganization	Grants permission to disable Service Trust for AWS User Notifications	Permissions management			organizations:DisableAWSServiceAccess
DisassociateChannel	Grants permission to remove a Channel from a NotificationConfiguration	Write	NotificationConfiguration*		
DisassociateManagedNotificationAccountContact	Grants permission to remove an Account contact from a Managed Notification Configuration	Write	ManagedNotificationConfiguration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

Condition keys for AWS User Notifications

AWS User Notifications defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String

Condition keys	Description	Type
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS User Notifications Contacts

AWS User Notifications Contacts (service prefix: `notifications-contacts`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS User Notifications Contacts

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ActivateEmailContact	Grants permission to activate the email contact associated with the given ARN if the provided code is valid	Write	EmailContactResource*		
CreateEmailContact	Grants permission to create an email contact	Write		aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
DeleteEmailContact	Grants permission to delete an email contact associated with the given ARN	Write	EmailContactResource*		
GetEmailContact	Grants permission to get an email contact associated with the given ARN	Read	EmailContactResource*		
ListEmailContacts	Grants permission to list email contacts	List			
ListTagsForResource	Grants permission to get tags for a resource	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SendActivationCode	Grants permission to send an activation link to the email associated with the given ARN	Write	EmailContactResource*		
TagResource	Grants permission to tag a resource	Tagging	EmailContactResource*		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove tags from a resource	Tagging	EmailContactResource*		
				aws:TagKeys	

Resource types defined by AWS User Notifications Contacts

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
EmailContactResource	arn:${Partition}:notifications-contacts::${Account}:emailcontact/${EmailContactId}	aws:ResourceTag/${TagKey}

Condition keys for AWS User Notifications Contacts

AWS User Notifications Contacts defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS User Subscriptions

AWS User Subscriptions (service prefix: user-subscriptions) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS User Subscriptions

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateClaim	Grants permission to create a User subscription Claim	Write		user-subscriptions:CreateForSelf	
DeleteClaim	Grants permission to delete a User subscription Claim	Write			
ListApplicationClaims	Grants permission to list all User subscription Claims for Application	List			
ListClaims	Grants permission to list all User subscription Claims	List			
ListUserSubscriptions	Grants permission to list all User subscriptions	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SetOverageConfig	Grants permission to set a User subscription overage configuration	Write			
UpdateClaim	Grants permission to update a User subscription Claim	Write			

Resource types defined by AWS User Subscriptions

AWS User Subscriptions does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS User Subscriptions, specify `"Resource": "*"` in your policy.

Condition keys for AWS User Subscriptions

AWS User Subscriptions defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
user-subscriptions:CreateForSelf	Filters access by only allowing creation of User subscription Claims for the caller	Bool

Actions, resources, and condition keys for AWS Verified Access

AWS Verified Access (service prefix: `verified-access`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Verified Access

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AllowVerifiedAccess [permission only]	Grants permission to create Verified Access Instance	Write			

Resource types defined by AWS Verified Access

AWS Verified Access does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Verified Access, specify `"Resource": "*"` in your policy.

Condition keys for AWS Verified Access

Verified Access has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Verified Permissions

Amazon Verified Permissions (service prefix: `verifiedpermissions`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateIdentitySource	Grants permission to create a reference to an external identity provider (IdP) that is compatible with OpenID Connect (OIDC) authentic	Write	policy-store*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	ation protocol, such as Amazon Cognito				
CreatePolicy	Grants permission to create a Cedar policy and save it in the specified policy store	Write	policy-store*		
CreatePolicyStore	Grants permission to create a Cedar policy and save it in the specified policy store	Write		aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys	
CreatePolicyTemplate	Grants permission to create a policy template	Write	policy-store*		
DeleteIdentitySource	Grants permission to delete an identity source that references an identity provider (IdP) such as Amazon Cognito	Write	policy-store*		
DeletePolicy	Grants permission to delete the specified policy from the policy store	Write	policy-store*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeletePolicyStore	Grants permission to delete the specified policy store	Write	policy-store*		
DeletePolicyTemplate	Grants permission to delete the specified policy template from the policy store	Write	policy-store*		
GetIdentitySource	Grants permission to retrieve the details about the specified identity source	Read	policy-store*		
GetPolicy	Grants permission to retrieve information about the specified policy	Read	policy-store*		
GetPolicyStore	Grants permission to retrieve details about a policy store	Read	policy-store*		verifiedpermissions:ListTagsForResource
GetPolicyTemplate	Grants permission to retrieve the details for the specified policy template in the specified policy store	Read	policy-store*		
GetSchema	Grants permission to retrieve the details for the specified schema in the specified policy store	Read	policy-store*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
IsAuthorized	Grants permission to make an authorization decision about a service request described in the parameters	Read	policy-store*		
IsAuthorizedWithToken	Grants permission to make an authorization decision about a service request described in the parameters. The principal in this request comes from an external identity source	Read	policy-store*		
ListIdentitySources	Grants permission to return a paginated list of all of the identity sources defined in the specified policy store	List	policy-store*		
ListPolicies	Grants permission to return a paginated list of all policies stored in the specified policy store	List	policy-store*		
ListPolicyStores	Grants permission to return a paginated list of all policy stores in the calling Amazon Web Services account	List			
ListPolicyTemplates	Grants permission to return a paginated list of all policy templates in the specified policy store	List	policy-store*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTagsForResource	Grants permission to view a list of resource tags for the specified policy store	Read	policy-store*		
PutSchema	Grants permission to create or update the policy schema in the specified policy store	Write	policy-store*		
TagResource	Grants permission to add tags to the specified policy store	Tagging	policy-store*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from the specified policy store	Tagging	policy-store*		
				aws:TagKeys	
UpdateIdentitySource	Grants permission to update the specified identity source to use a new identity provider (IdP) source, or to change the mapping of identities from the IdP to a different principal entity type	Write	policy-store*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdatePolicy	Grants permission to modify the specified Cedar static policy in the specified policy store	Write	policy-store*		
UpdatePolicyStore	Grants permission to modify the validation setting for a policy store	Write	policy-store*		
UpdatePolicyTemplate	Grants permission to update the specified policy template	Write	policy-store*		

Resource types defined by Amazon Verified Permissions

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
policy-store	`arn:${Partition}:verifiedpermissions::${Account}:policy-store/${PolicyStoreId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Verified Permissions

Amazon Verified Permissions defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions

under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon VPC Lattice

Amazon VPC Lattice (service prefix: `vpc-lattice`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Resource types defined by Amazon VPC Lattice

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types

that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
AccessLog Subscription	arn:${Partition}:vpc-lattice:${Region}:${Account}:accesslogsubscription/${AccessLogSubscriptionId}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys vpc-lattice:CreateAction
DomainVerification	arn:${Partition}:vpc-lattice:${Region}:${Account}:domainverification/${DomainVerificationId}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys vpc-lattice:CreateAction vpc-lattice:DomainName
Listener	arn:${Partition}:vpc-lattice:${Region}:${Account}:service/${ServiceId}/listener/${ListenerId}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys

Resource types	ARN	Condition keys
TargetGroup	arn:${Partition}:vpc-lattice:${Region}:${Account}:targetgroup/${TargetGroupId}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys vpc-lattice:CreateAction vpc-lattice:VpcId

Condition keys for Amazon VPC Lattice

Amazon VPC Lattice defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
vpc-lattice:AuthType	Filters access by the auth type specified in the request	String

Condition keys	Description	Type
vpc-lattice:CreateAction	Filters access by the name of a resource-creating API action	String
vpc-lattice:DomainName	Filters access by the domain name	String
vpc-lattice:PrivateDnsPreference	Filters access by the private dns preference	String
vpc-lattice:PrivateDnsSpecifiedDomains	Filters access by the private dns domains	ArrayOfString
vpc-lattice:Protocol	Filters access by the protocol specified in the request	String
vpc-lattice:ResourceConfigurationArn	Filters access by the ARN of a resource configuration	ARN
vpc-lattice:SecurityGroupIds	Filters access by the IDs of security groups	ArrayOfString
vpc-lattice:ServiceArn	Filters access by the ARN of a service	ARN
vpc-lattice:ServiceNetworkArn	Filters access by the ARN of a service network	ARN
vpc-lattice:TargetGroupArns	Filters access by the ARNs of target groups	ArrayOfARN

Condition keys	Description	Type
vpc-lattice:VpcEndpointId	Filters access by the ID of a VPC endpoint	String
vpc-lattice:VpcId	Filters access by the ID of a virtual private cloud (VPC)	String

Actions, resources, and condition keys for Amazon VPC Lattice Services

Amazon VPC Lattice Services (service prefix: `vpc-lattice-svcs`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

- Actions defined by Amazon VPC Lattice Services
- Resource types defined by Amazon VPC Lattice Services
- Condition keys for Amazon VPC Lattice Services

Actions defined by Amazon VPC Lattice Services

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of

access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Connect	Grants permission to connect to a VPC Lattice service	Write	TCP Service*		
				vpc-lattice-svcs:Port vpc-lattice-svcs:ServiceNetworkArn vpc-lattice-svcs:ServiceArn vpc-lattice-svcs:SourceVpc vpc-lattice-svcs:SourceVpcOwnerAccount	
Invoke	Grants permission to invoke a VPC Lattice service	Write	Service*		
				vpc-lattice-svcs:Port vpc-lattice-svcs:S	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				erviceNetworkArn vpc-lattice-svcs:ServiceArn vpc-lattice-svcs:SourceVpc vpc-lattice-svcs:SourceVpcOwnerAccount vpc-lattice-svcs:RequestMethod vpc-lattice-svcs:RequestPath vpc-lattice-svcs:RequestHeader/${HeaderName}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				vpc-lattice-svcs:RequestQueryString/${QueryStringKey}	

Resource types defined by Amazon VPC Lattice Services

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Service	`arn:${Partition}:vpc-lattice:${Region}:${Account}:service/${ServiceId}/${RequestPath}`	
TCP Service	`arn:${Partition}:vpc-lattice:${Region}:${Account}:service/${ServiceId}`	

Condition keys for Amazon VPC Lattice Services

Amazon VPC Lattice Services defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
vpc-lattice-svcs:Port	Filters access by the destination port the request is made to	Numeric
vpc-lattice-svcs:RequestHeader/${HeaderName}	Filters access by a header name-value pair in the request headers	String
vpc-lattice-svcs:RequestMethod	Filters access by the method of the request	String
vpc-lattice-svcs:RequestPath	Filters access by the path portion of the request URL	String
vpc-lattice-svcs:RequestQueryString/${QueryStringKey}	Filters access by the query string key-value pairs in the request URL	ArrayOfString
vpc-lattice-svcs:ServiceArn	Filters access by the ARN of the service receiving the request	ARN
vpc-lattice-svcs:ServiceNetworkArn	Filters access by the ARN of the service network receiving the request	ARN
vpc-lattice-svcs:SourceVpc	Filters access by the VPC the request is made from	String

Condition keys	Description	Type
vpc-lattice-svcs:SourceVpcOwnerAccount	Filters access by the owning account of the VPC the request is made from	String

Actions, resources, and condition keys for AWS WAF

AWS WAF (service prefix: `waf`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

- Actions defined by AWS WAF
- Resource types defined by AWS WAF
- Condition keys for AWS WAF

Actions defined by AWS WAF

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateByteMatchSet	Grants permission to create a ByteMatchSet	Write	bytematchset*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateGeoMatchSet	Grants permission to create a GeoMatchSet	Write	geomatchset*		
CreateIPSet	Grants permission to create an IPSet	Write	ipset*		
CreateRateBasedRule	Grants permission to create a RateBasedRule for limiting the volume of requests from a single IP address	Write	ratebasedrule*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateRegexMatchSet	Grants permission to create a RegexMatchSet	Write	regexmatchset*		
CreateRegexPatternSet	Grants permission to create a RegexPatternSet	Write	regexpatternset*		
CreateRule	Grants permission to create a Rule for filtering web requests	Write	rule*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateRuleGroup	Grants permission to create a RuleGroup, which is a collection of predefined rules that you can use in a WebACL	Write	rulegroup*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSizeConstraintSet	Grants permission to create a SizeConstraintSet	Write	sizeconstraintset*		
CreateSqlInjectionMatchSet	Grants permission to create an SqlInjectionMatchSet	Write	sqlinjectionmatchset*		
CreateWebACL	Grants permission to create a WebACL, which contains rules for filtering web requests	Permissions management	webacl*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateWebACLMigrationStack	Grants permission to create a CloudFormation web ACL template in an S3 bucket for the purposes of migrating the web ACL from AWS WAF Classic to AWS WAF v2	Write	webacl*		s3:PutObject
CreateXssMatchSet	Grants permission to create an XssMatchSet, which you use to detect requests that contain cross-site scripting attacks	Write	xssmatchset*		
DeleteByteMatchSet	Grants permission to delete a ByteMatchSet	Write	bytematchset*		
DeleteGeoMatchSet	Grants permission to delete a GeoMatchSet	Write	geomatchset*		
DeleteIPSet	Grants permission to delete an IPSet	Write	ipset*		
DeleteLoggingConfiguration	Grants permission to delete the LoggingConfiguration from a web ACL	Write	webacl*		
DeletePermissionPolicy	Grants permission to delete an IAM policy from a rule group	Permissions management	rulegroup*		
DeleteRateBasedRule	Grants permission to delete a RateBasedRule	Write	ratebasedrule*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteRegexMatchSet	Grants permission to delete a RegexMatchSet	Write	regexmatchset*		
DeleteRegexPatternSet	Grants permission to delete a RegexPatternSet	Write	regexpatternset*		
DeleteRule	Grants permission to delete a Rule	Write	rule*		
DeleteRuleGroup	Grants permission to delete a RuleGroup	Write	rulegroup*		
DeleteSizeConstraintSet	Grants permission to delete a SizeConstraintSet	Write	sizeconstraintset*		
DeleteSqlInjectionMatchSet	Grants permission to delete an SqlInjectionMatchSet	Write	sqlinjectionmatchset*		
DeleteWebACL	Grants permission to delete a WebACL	Permissions management	webacl*		
DeleteXssMatchSet	Grants permission to delete an XssMatchSet	Write	xssmatchset*		
GetByteMatchSet	Grants permission to retrieve a ByteMatchSet	Read	bytematchset*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetChangeToken	Grants permission to retrieve a change token to use in create, update, and delete requests	Read			
GetChangeTokenStatus	Grants permission to retrieve the status of a change token	Read			
GetGeoMatchSet	Grants permission to retrieve a GeoMatchSet	Read	geomatchset*		
GetIPSet	Grants permission to retrieve an IPSet	Read	ipset*		
GetLoggingConfiguration	Grants permission to retrieve a LoggingConfiguration for a web ACL	Read	webacl*		
GetPermissionPolicy	Grants permission to retrieve an IAM policy for a rule group	Read	rulegroup*		
GetRateBasedRule	Grants permission to retrieve a RateBasedRule	Read	ratebasedrule*		
GetRateBasedRuleManagedKeys	Grants permission to retrieve the array of IP addresses that are currently being blocked by a RateBasedRule	Read	ratebasedrule*		
GetRegexMatchSet	Grants permission to retrieve a RegexMatchSet	Read	regexmatchset*		
GetRegexPatternSet	Grants permission to retrieve a RegexPatternSet	Read	regexpatternset*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetRule	Grants permission to retrieve a Rule	Read	rule*		
GetRuleGroup	Grants permission to retrieve a RuleGroup	Read	rulegroup*		
GetSampledRequests	Grants permission to retrieve detailed information about a sample set of web requests	Read	webacl		
GetSizeConstraintSet	Grants permission to retrieve a SizeConstraintSet	Read	sizeconstraintset*		
GetSqlInjectionMatchSet	Grants permission to retrieve an SqlInjectionMatchSet	Read	sqlinjectionmatchset*		
GetWebACL	Grants permission to retrieve a WebACL	Read	webacl*		
GetXssMatchSet	Grants permission to retrieve an XssMatchSet	Read	xssmatchset*		
ListActivatedRulesInRuleGroup	Grants permission to retrieve an array of ActivatedRule objects	List			
ListByteMatchSets	Grants permission to retrieve an array of ByteMatchSetSummary objects	List			
ListGeoMatchSets	Grants permission to retrieve an array of GeoMatchSetSummary objects	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListIPSets	Grants permission to retrieve an array of IPSetSummary objects	List			
ListLoggingConfigurations	Grants permission to retrieve an array of LoggingConfiguration objects	List			
ListRateBasedRules	Grants permission to retrieve an array of RuleSummary objects	List			
ListRegexMatchSets	Grants permission to retrieve an array of RegexMatchSetSummary objects	List			
ListRegexPatternSets	Grants permission to retrieve an array of RegexPatternSetSummary objects	List			
ListRuleGroups	Grants permission to retrieve an array of RuleGroup objects	List			
ListRules	Grants permission to retrieve an array of RuleSummary objects	List			
ListSizeConstraintSets	Grants permission to retrieve an array of SizeConstraintSetSummary objects	List			
ListSqlInjectionMatchSets	Grants permission to retrieve an array of SqlInjectionMatchSet objects	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListSubscribedRuleGroups	Grants permission to retrieve an array of RuleGroup objects that you are subscribed to	List			
ListTagsForResource	Grants permission to retrieve the tags for a resource	Read	ratebasedrule		
			rule		
			rulegroup		
			webacl		
ListWebACLs	Grants permission to retrieve an array of WebACLSummary objects	List			
ListXssMatchSets	Grants permission to retrieve an array of XssMatchSet objects	List			
PutLoggingConfiguration	Grants permission to associate a LoggingConfiguration with a specified web ACL	Write	webacl*		iam:CreateServiceLinkedRole
PutPermissionPolicy	Grants permission to attach an IAM policy to a rule group, to share the rule group between accounts	Permissions management	rulegroup*		
TagResource	Grants permission to add a Tag to a resource	Tagging	ratebasedrule		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			rule		
			rulegroup		
			webacl		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove a Tag from a resource	Tagging	ratebasedrule		
			rule		
			rulegroup		
			webacl		
				aws:TagKeys	
UpdateByteMatchSet	Grants permission to insert or delete ByteMatchTuple objects in a ByteMatchSet	Write	bytematchset*		
UpdateGeoMatchSet	Grants permission to insert or delete GeoMatchConstraint objects in a GeoMatchSet	Write	geomatchset*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateIPSet	Grants permission to insert or delete IPSetDescriptor objects in an IPSet	Write	ipset*		
UpdateRateBasedRule	Grants permission to modify a rate based rule	Write	ratebasedrule*		
UpdateRegexMatchSet	Grants permission to insert or delete RegexMatchTuple objects in a RegexMatchSet	Write	regexmatchset*		
UpdateRegexPatternSet	Grants permission to insert or delete RegexPatternStrings in a RegexPatternSet	Write	regexpatternset*		
UpdateRule	Grants permission to modify a Rule	Write	rule*		
UpdateRuleGroup	Grants permission to insert or delete ActivatedRule objects in a RuleGroup	Write	rulegroup*		
UpdateSizeConstraintSet	Grants permission to insert or delete SizeConstraint objects in a SizeConstraintSet	Write	sizeconstraintset*		
UpdateSqlInjectionMatchSet	Grants permission to insert or delete SqlInjectionMatchTuple objects in an SqlInjectionMatchSet	Write	sqlinjectionmatchset*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateWebACL	Grants permission to insert or delete ActivatedRule objects in a WebACL	Permissions management	webacl*		
UpdateXssMatchSet	Grants permission to insert or delete XssMatchTuple objects in an XssMatchSet	Write	xssmatchset*		

Resource types defined by AWS WAF

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
bytematchset	`arn:${Partition}:waf::${Account}:bytematchset/${Id}`	
ipset	`arn:${Partition}:waf::${Account}:ipset/${Id}`	
ratebasedrule	`arn:${Partition}:waf::${Account}:ratebasedrule/${Id}`	aws:ResourceTag/${TagKey}
rule	`arn:${Partition}:waf::${Account}:rule/${Id}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
sizeconstraintset	arn:${Partition}:waf::${Account}:sizeconstraintset/${Id}	
sqlinjectionmatchset	arn:${Partition}:waf::${Account}:sqlinjectionset/${Id}	
webacl	arn:${Partition}:waf::${Account}:webacl/${Id}	aws:ResourceTag/${TagKey}
xssmatchset	arn:${Partition}:waf::${Account}:xssmatchset/${Id}	
regexmatchset	arn:${Partition}:waf::${Account}:regexmatch/${Id}	
regexpatternset	arn:${Partition}:waf::${Account}:regexpatternset/${Id}	
geomatchset	arn:${Partition}:waf::${Account}:geomatchset/${Id}	
rulegroup	arn:${Partition}:waf::${Account}:rulegroup/${Id}	aws:ResourceTag/${TagKey}

Condition keys for AWS WAF

AWS WAF defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters actions based on the allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters actions based on tag-value associated with the resource	String
aws:TagKeys	Filters actions based on the presence of mandatory tags in the request	ArrayOfString

Actions, resources, and condition keys for AWS WAF Regional

AWS WAF Regional (service prefix: `waf-regional`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS WAF Regional

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateWebACL	Grants permission to associate a web ACL with a resource	Write	loadbalancer/app/* webacl*		
CreateByteMatchSet	Grants permission to create a ByteMatchSet	Write	bytematchset*		
CreateGeoMatchSet	Grants permission to create a GeoMatchSet	Write	geomatchset*		
CreateIPSet	Grants permission to create an IPSet	Write	ipset*		
CreateRateBasedRule	Grants permission to create a RateBasedRule	Write	ratebasedrule*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateRegexMatchSet	Grants permission to create a RegexMatchSet	Write	regexmatchset*		
CreateRegexPatternSet	Grants permission to create a RegexPatternSet	Write	regexpatternset*		
CreateRule	Grants permission to create a Rule	Write	rule*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateRuleGroup	Grants permission to create a RuleGroup	Write	rulegroup*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSizeConstraintSet	Grants permission to create a SizeConstraintSet	Write	sizeconstraintset*		
CreateSqlInjectionMatchSet	Grants permission to create an SqlInjectionMatchSet	Write	sqlinjectionmatchset*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateWebACL	Grants permission to create a WebACL	Permissions management	webacl*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateWebACLMigrationStack	Grants permission to create a CloudFormation web ACL template in an S3 bucket for the purposes of migrating the web ACL from AWS WAF Classic to AWS WAF v2	Write	webacl*		s3:PutObject
CreateXssMatchSet	Grants permission to create an XssMatchSet	Write	xssmatchset*		
DeleteByteMatchSet	Grants permission to delete a ByteMatchSet	Write	bytematchset*		
DeleteGeoMatchSet	Grants permission to delete a GeoMatchSet	Write	geomatchset*		
DeleteIPSet	Grants permission to delete an IPSet	Write	ipset*		
DeleteLoggingConfiguration	Grants permission to delete a LoggingConfiguration from a web ACL	Write	webacl*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeletePermissionPolicy	Grants permission to delete an IAM policy from a rule group	Permissions management	rulegroup*		
DeleteRateBasedRule	Grants permission to delete a RateBasedRule	Write	ratebasedrule*		
DeleteRegexMatchSet	Grants permission to delete a RegexMatchSet	Write	regexmatchset*		
DeleteRegexPatternSet	Grants permission to delete a RegexPatternSet	Write	regexpatternset*		
DeleteRule	Grants permission to delete a Rule	Write	rule*		
DeleteRuleGroup	Grants permission to delete a RuleGroup	Write	rulegroup*		
DeleteSizeConstraintSet	Grants permission to delete a SizeConstraintSet	Write	sizeconstraintset*		
DeleteSqlInjectionMatchSet	Grants permission to delete an SqlInjectionMatchSet	Write	sqlinjectionmatchset*		
DeleteWebACL	Grants permission to delete a WebACL	Permissions management	webacl*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteXssMatchSet	Grants permission to delete an XssMatchSet	Write	xssmatchset*		
DisassociateWebACL	Grants permission to delete an association between a web ACL and a resource	Write	loadbalancer/app/*		
GetByteMatchSet	Grants permission to retrieve a ByteMatchSet	Read	bytematchset*		
GetChangeToken	Grants permission to retrieve a change token to use in create, update, and delete requests	Read			
GetChangeTokenStatus	Grants permission to retrieve the status of a change token	Read			
GetGeoMatchSet	Grants permission to retrieve a GeoMatchSet	Read	geomatchset*		
GetIPSet	Grants permission to retrieve an IPSet	Read	ipset*		
GetLoggingConfiguration	Grants permission to retrieve a LoggingConfiguration	Read	webacl*		
GetPermissionPolicy	Grants permission to retrieve an IAM policy attached to a RuleGroup	Read	rulegroup*		
GetRateBasedRule	Grants permission to retrieve a RateBasedRule	Read	ratebasedrule*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetRateBasedRuleManagedKeys	Grants permission to retrieve the array of IP addresses that are currently being blocked by a RateBasedRule	Read	ratebasedrule*		
GetRegexMatchSet	Grants permission to retrieve a RegexMatchSet	Read	regexmatchset*		
GetRegexPatternSet	Grants permission to retrieve a RegexPatternSet	Read	regexpatternset*		
GetRule	Grants permission to retrieve a Rule	Read	rule*		
GetRuleGroup	Grants permission to retrieve a RuleGroup	Read	rulegroup*		
GetSampledRequests	Grants permission to retrieve detailed information for a sample set of web requests	Read	webacl		
GetSizeConstraintSet	Grants permission to retrieve a SizeConstraintSet	Read	sizeconstraintset*		
GetSqlInjectionMatchSet	Grants permission to retrieve an SqlInjectionMatchSet	Read	sqlinjectionmatchset*		
GetWebACL	Grants permission to retrieve a WebACL	Read	webacl*		
GetWebACLForResource	Grants permission to retrieve a WebACL that's associated with a specified resource	Read	loadbalancer/app/*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetXssMatchSet	Grants permission to retrieve an XssMatchSet	Read	xssmatchset*		
ListActivatedRulesInRuleGroup	Grants permission to retrieve an array of ActivatedRule objects	List			
ListByteMatchSets	Grants permission to retrieve an array of ByteMatch SetSummary objects	List			
ListGeoMatchSets	Grants permission to retrieve an array of GeoMatchS etSummary objects	List			
ListIPSets	Grants permission to retrieve an array of IPSetSummary objects	List			
ListLoggingConfigurations	Grants permission to retrieve an array of LoggingCo nfiguration objects	List			
ListRateBasedRules	Grants permission to retrieve an array of RuleSummary objects	List			
ListRegexMatchSets	Grants permission to retrieve an array of RegexMatc hSetSummary objects	List			
ListRegexPatternSets	Grants permission to retrieve an array of RegexPatt ernSetSummary objects	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListResourcesForWebACL	Grants permission to retrieve an array of resources associated with a specified WebACL	List	webacl*		
ListRuleGroups	Grants permission to retrieve an array of RuleGroup objects	List			
ListRules	Grants permission to retrieve an array of RuleSummary objects	List			
ListSizeConstraintSets	Grants permission to retrieve an array of SizeConstraintSetSummary objects	List			
ListSqlInjectionMatchSets	Grants permission to retrieve an array of SqlInjectionMatchSet objects	List			
ListSubscribedRuleGroups	Grants permission to retrieve an array of RuleGroup objects that you are subscribed to	List			
ListTagsForResource	Grants permission to lists the Tags for a resource	Read	ratebasedrule		
			rule		
			rulegroup		
			webacl		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListWebACLs	Grants permission to retrieve an array of WebACLSummary objects	List			
ListXssMatchSets	Grants permission to retrieve an array of XssMatchSet objects	List			
PutLoggingConfiguration	Grants permission to associates a LoggingConfiguration with a web ACL	Write	webacl*		iam:CreateServiceLinkedRole
PutPermissionPolicy	Grants permission to attach an IAM policy to a specified rule group, to support rule group sharing between accounts	Permissions management	rulegroup*		
TagResource	Grants permission to add a Tag to a resource	Tagging	ratebasedrule		
			rule		
			rulegroup		
			webacl		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UntagResource	Grants permission to remove a Tag from a resource	Tagging	ratebasedrule		
			rule		
			rulegroup		
			webacl		
				aws:TagKeys	
UpdateByteMatchSet	Grants permission to insert or delete ByteMatchTuple objects in a ByteMatchSet	Write	bytematchset*		
UpdateGeoMatchSet	Grants permission to insert or delete GeoMatchConstraint objects in a GeoMatchSet	Write	geomatchset*		
UpdateIPSet	Grants permission to insert or delete IPSetDescriptor objects in an IPSet	Write	ipset*		
UpdateRateBasedRule	Grants permission to insert or delete predicate objects in a rate based rule and update the RateLimit in the rule	Write	ratebasedrule*		
UpdateRegexMatchSet	Grants permission to insert or delete RegexMatchTuple objects in a RegexMatchSet	Write	regexmatchset*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateRegexPatternSet	Grants permission to insert or delete RegexPatternStrings in a RegexPatternSet	Write	regexpatternset*		
UpdateRule	Grants permission to insert or delete predicate objects in a Rule	Write	rule*		
UpdateRuleGroup	Grants permission to insert or delete ActivatedRule objects in a RuleGroup	Write	rulegroup*		
UpdateSizeConstraintSet	Grants permission to insert or delete SizeConstraint objects in a SizeConstraintSet	Write	sizeconstraintset*		
UpdateSqlInjectionMatchSet	Grants permission to insert or delete SqlInjectionMatchTuple objects in an SqlInjectionMatchSet	Write	sqlinjectionmatchset*		
UpdateWebACL	Grants permission to insert or delete ActivatedRule objects in a WebACL	Permissions management	webacl*		
UpdateXssMatchSet	Grants permission to insert or delete XssMatchTuple objects in an XssMatchSet	Write	xssmatchset*		

Resource types defined by AWS WAF Regional

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
bytematchset	`arn:${Partition}:waf-regional:${Region}:${Account}:bytematchset/${Id}`	
ipset	`arn:${Partition}:waf-regional:${Region}:${Account}:ipset/${Id}`	
loadbalancer/app/	`arn:${Partition}:elasticloadbalancing:${Region}:${Account}:loadbalancer/app/${LoadBalancerName}/${LoadBalancerId}`	
ratebasedrule	`arn:${Partition}:waf-regional:${Region}:${Account}:ratebasedrule/${Id}`	aws:ResourceTag/${TagKey}
rule	`arn:${Partition}:waf-regional:${Region}:${Account}:rule/${Id}`	aws:ResourceTag/${TagKey}
sizeconstraintset	`arn:${Partition}:waf-regional:${Region}:${Account}:sizeconstraintset/${Id}`	
sqlinjectionmatchset	`arn:${Partition}:waf-regional:${Region}:${Account}:sqlinjectionset/${Id}`	
webacl	`arn:${Partition}:waf-regional:${Region}:${Account}:webacl/${Id}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
xssmatchset	arn:${Partition}:waf-regional:${Region}:${Account}:xssmatchset/${Id}	
regexmatchset	arn:${Partition}:waf-regional:${Region}:${Account}:regexmatch/${Id}	
regexpatternset	arn:${Partition}:waf-regional:${Region}:${Account}:regexpatternset/${Id}	
geomatchset	arn:${Partition}:waf-regional:${Region}:${Account}:geomatchset/${Id}	
rulegroup	arn:${Partition}:waf-regional:${Region}:${Account}:rulegroup/${Id}	aws:ResourceTag/${TagKey}

Condition keys for AWS WAF Regional

AWS WAF Regional defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters actions based on the allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters actions based on tag-value assoicated with the resource	String

Condition keys	Description	Type
aws:TagKeys	Filters actions based on the presence of mandatory tags in the request	ArrayOfString

Actions, resources, and condition keys for AWS WAF V2

AWS WAF V2 (service prefix: `wafv2`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS WAF V2

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which

the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

Resource types defined by AWS WAF V2

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
webacl	`arn:${Partition}:wafv2:${Region}:${Account}:${Scope}/webacl/${Name}/${Id}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
ipset	arn:${Partition}:wafv2:${Region}:${Account}:${Scope}/ipset/${Name}/${Id}	aws:ResourceTag/${TagKey}
managedruleset	arn:${Partition}:wafv2:${Region}:${Account}:${Scope}/managedruleset/${Name}/${Id}	
rulegroup	arn:${Partition}:wafv2:${Region}:${Account}:${Scope}/rulegroup/${Name}/${Id}	aws:ResourceTag/${TagKey}
regexpatternset	arn:${Partition}:wafv2:${Region}:${Account}:${Scope}/regexpatternset/${Name}/${Id}	aws:ResourceTag/${TagKey}
loadbalancer/app/	arn:${Partition}:elasticloadbalancing:${Region}:${Account}:loadbalancer/app/${LoadBalancerName}/${LoadBalancerId}	
apigateway	arn:${Partition}:apigateway:${Region}::/restapis/${ApiId}/stages/${StageName}	
appsync	arn:${Partition}:appsync:${Region}:${Account}:apis/${GraphQLAPIId}	
userpool	arn:${Partition}:cognito-idp:${Region}:${Account}:userpool/${UserPoolId}	
apprunner	arn:${Partition}:apprunner:${Region}:${Account}:service/${ServiceName}/${ServiceId}	

Resource types	ARN	Condition keys
verified-access-instance	arn:${Partition}:ec2:${Region}:${Account}:verified-access-instance/${VerifiedAccessInstanceId}	
amplify-app	arn:${Partition}:amplify:${Region}:${Account}:apps/${AppId}	

Condition keys for AWS WAF V2

AWS WAF V2 defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters access by tag-value associated with the resource	String
aws:TagKeys	Filters access by the presence of mandatory tags in the request	ArrayOfString
wafv2:LogDestinationResource	Filters access by log destination ARN for PutLoggingConfiguration API	ARN
wafv2:LogScope	Filters access by log scope for Logging Configuration API	String

Actions, resources, and condition keys for AWS Well-Architected Tool

AWS Well-Architected Tool (service prefix: `wellarchitected`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS Well-Architected Tool

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Associate Lenses	Grants permission to associate a lens to the specified workload	Write	workload*		
				aws:ResourceTag/${TagKey}	
Associate Profiles	Grants permission to associate a profile to the specified workload	Write	workload*		
				aws:ResourceTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey}	
Configure Integration [permission only]	Grants permission to configure the integration	Write			
CreateLensShare	Grants permission to an owner of a lens to share with other AWS accounts and IAM users	Write	lens*		
				aws:ResourceTag/${TagKey}	
CreateLensVersion	Grants permission to create a new lens version	Write	lens*		
				aws:ResourceTag/${TagKey}	
CreateMilestone	Grants permission to create a new milestone for the specified workload	Write	workload*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateProfile	Grants permission to create a new profile	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateProfileShare	Grants permission to an owner of a profile to share with other AWS accounts and IAM users	Write	profile*		
				aws:ResourceTag/${TagKey}	
CreateReviewTemplate	Grants permission to create a new review template	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateTemplateShare	Grants permission to an owner of a review template to share with other AWS accounts and IAM users	Write	review-template*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateWorkload	Grants permission to create a new workload	Write		aws:RequestTag/${TagKey} aws:TagKeys wellarchitected:JiraProjectKey	
CreateWorkloadShare	Grants permission to share a workload with another account	Write	workload*		
				aws:ResourceTag/${TagKey}	
DeleteLens	Grants permission to delete a lens	Write	lens*		
				aws:ResourceTag/${TagKey}	
DeleteLensShare	Grants permission to delete an existing lens share	Write	lens*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteProfile	Grants permission to delete a profile	Write	profile*		
				aws:ResourceTag/${TagKey}	
DeleteProfileShare	Grants permission to delete an existing profile share	Write	profile*		
				aws:ResourceTag/${TagKey}	
DeleteReviewTemplate	Grants permission to delete an existing review template	Write	review-template*		
				aws:ResourceTag/${TagKey}	
DeleteTemplateShare	Grants permission to delete an existing review template share	Write	review-template*		
				aws:ResourceTag/${TagKey}	
DeleteWorkload	Grants permission to delete an existing workload	Write	workload*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
DeleteWorkloadShare	Grants permission to delete an existing workload share	Write	workload*		
				aws:ResourceTag/${TagKey}	
DisassociateLenses	Grants permission to disassociate a lens from the specified workload	Write	workload*		
				aws:ResourceTag/${TagKey}	
DisassociateProfiles	Grants permission to disassociate a profile from the specified workload	Write	workload*		
				aws:ResourceTag/${TagKey}	
ExportLens	Grants permission to export an existing lens	Read	lens*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAnswer	Grants permission to retrieve the specified answer from the specified lens review	Read	workload*		
				aws:ResourceTag/${TagKey}	
GetConsolidatedReport	Grants permission to get consolidated report metrics or to generate the consolidated report PDF in this account	Read			
GetGlobalSettings	Grants permission to get all settings for the account	Read			
GetLens	Grants permission to get an existing lens	Read	lens*		
				aws:ResourceTag/${TagKey}	
GetLensReview	Grants permission to retrieve the specified lens review of the specified workload	Read	workload*		
				aws:ResourceTag/${TagKey}	
GetLensReviewReport	Grants permission to retrieve the report for the specified lens review	Read	workload*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
GetLensVersionDifference	Grants permission to get the difference between the specified lens version and latest available lens version	Read	lens*		
				aws:ResourceTag/${TagKey}	
GetMilestone	Grants permission to retrieve the specified milestone of the specified workload	Read	workload*		
				aws:ResourceTag/${TagKey}	
GetProfile	Grants permission to retrieve the specified profile	Read	profile*		
				aws:ResourceTag/${TagKey}	
GetProfileTemplate	Grants permission to retrieve the specified profile template	Read			
GetReviewTemplate	Grants permission to retrieve the specified review template	Read	review-template*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
GetReviewTemplateAnswer	Grants permission to retrieve the specified answer from the specified review template lens review	Read	review-template*		
				aws:ResourceTag/${TagKey}	
GetReviewTemplateLensReview	Grants permission to retrieve the specified lens review of the specified review template	Read	review-template*		
				aws:ResourceTag/${TagKey}	
GetWorkload	Grants permission to retrieve the specified workload	Read	workload*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ImportLens	Grants permission to import a new lens	Write		aws:RequestTag/${TagKey} aws:TagKeys	
ListAnswers	Grants permission to list the answers from the specified lens review	List	workload*		
				aws:ResourceTag/${TagKey}	
ListCheckDetails	Grants permission to list the check-details for the workload	List	workload*		
				aws:ResourceTag/${TagKey}	
ListCheckSummaries	Grants permission to list the check-summaries for the workload	List	workload*		
				aws:ResourceTag/${TagKey}	
ListLensReviewImprovements	Grants permission to list the improvements of the specified lens review	List	workload*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
ListLensReviews	Grants permission to list the lens reviews of the specified workload	List	workload*		
				aws:ResourceTag/${TagKey}	
ListLensShares	Grants permission to list all shares created for a lens	List	lens*		
				aws:ResourceTag/${TagKey}	
ListLenses	Grants permission to list the lenses available to this account	List			
ListMilestones	Grants permission to list the milestones of the specified workload	List	workload*		
				aws:ResourceTag/${TagKey}	
ListNotifications	Grants permission to list notifications related to the account or specified resource	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListProfileNotifications	Grants permission to list profile notifications related to specified resource	List			
ListProfileShares	Grants permission to list all shares created for a profile	List	profile*		
				aws:ResourceTag/${TagKey}	
ListProfiles	Grants permission to list the profiles available to this account	List			
ListReviewTemplateAnswers	Grants permission to list the answers from the specified review template lens review	List	review-template*		
				aws:ResourceTag/${TagKey}	
ListReviewTemplates	Grants permission to list the review templates available to this account	List			
ListShareInvitations	Grants permission to list the workload share invitations of the specified account or user	List			
ListTagsForResource	Grants permission to list tags for a Well-Architected resource	Read	lens		
			profile		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			review-template		
			workload		
				aws:ResourceTag/${TagKey}	
ListTemplateShares	Grants permission to list all shares created for a review template	List	review-template*		
				aws:ResourceTag/${TagKey}	
ListWorkloadShares	Grants permission to list the workload shares of the specified workload	List	workload*		
				aws:ResourceTag/${TagKey}	
ListWorkloads	Grants permission to list the workloads in this account	List			
TagResource	Grants permission to tag a Well-Architected resource	Tagging	lens		
			profile		
			review-template		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			workload		
				aws:TagKeys	
				aws:RequestTag/${TagKey}	
UntagResource	Grants permission to untag a Well-Architected resource	Tagging	lens		
			profile		
			review-template		
			workload		
				aws:TagKeys	
UpdateAnswer	Grants permission to update properties of the specified answer	Write	workload*		
				aws:ResourceTag/${TagKey}	
UpdateGlobalSettings	Grants permission to manage all settings for the account	Write		wellarchitected:JiraProjectKey	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateIntegration	Grants permission to update properties of the integration	Write	workload*		
				aws:ResourceTag/${TagKey}	
UpdateLensReview	Grants permission to update properties of the specified lens review	Write	workload*		
				aws:ResourceTag/${TagKey}	
UpdateProfile	Grants permission to update properties of the specified profile	Write	profile*		
				aws:ResourceTag/${TagKey}	
UpdateReviewTemplate	Grants permission to update properties of the specified review template	Write	review-template*		
				aws:ResourceTag/${TagKey}	
UpdateReviewTemplateAnswer	Grants permission to update properties of the specified review template answer	Write	review-template*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
UpdateReviewTemplateLensReview	Grants permission to update properties of the specified review template lens review	Write	review-template*		
				aws:ResourceTag/${TagKey}	
UpdateShareInvitation	Grants permission to update status of the specified workload share invitation	Write			
UpdateWorkload	Grants permission to update properties of the specified workload	Write	workload*		
				aws:ResourceTag/${TagKey} wellarchitected:JiraProjectKey	
UpdateWorkloadShare	Grants permission to update properties of the specified workload share	Write	workload*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
UpgradeLensReview	Grants permission to upgrade the specified lens review to use the latest version of the associated lens	Write	workload*		
				aws:ResourceTag/${TagKey}	
UpgradeProfileVersion	Grants permission to upgrade the specified workload to use the latest version of the associated profile	Write	profile*		
			workload*		
				aws:ResourceTag/${TagKey}	
UpgradeReviewTemplateLensReview	Grants permission to upgrade the specified lens review of the specified review template	Write	review-template*		
				aws:ResourceTag/${TagKey}	

Resource types defined by AWS Well-Architected Tool

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types

that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
workload	`arn:${Partition}:wellarchitected:${Region}:${Account}:workload/${ResourceId}`	aws:ResourceTag/${TagKey}
lens	`arn:${Partition}:wellarchitected:${Region}:${Account}:lens/${ResourceId}`	aws:ResourceTag/${TagKey}
profile	`arn:${Partition}:wellarchitected:${Region}:${Account}:profile/${ResourceId}`	aws:ResourceTag/${TagKey}
review-template	`arn:${Partition}:wellarchitected:${Region}:${Account}:review-template/${ResourceId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Well-Architected Tool

AWS Well-Architected Tool defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tag key-value pairs in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by tag keys in the request	ArrayOfString
wellarchitected:JiraProjectKey	Filters access by project key	String

Actions, resources, and condition keys for AWS Wickr

AWS Wickr (service prefix: `wickr`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Wickr

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchCreateUser	Grants permission to batch create users in a Wickr network	Write	network*		
BatchDeleteUser	Grants permission to batch delete users from a Wickr network	Write	network*		
BatchLookupUserUname	Grants permission to batch lookup user unames in a Wickr network	Read	network*		
BatchReinviteUser	Grants permission to batch reinvite users in a Wickr network	Write	network*		
BatchResetDevicesForUser	Grants permission to batch reset devices for a user in a Wickr network	Write	network*		
BatchToggleUserSuspendStatus	Grants permission to batch toggle user suspend status in a Wickr network	Write	network*		
CreateAdminSession	Grants permission to create and manage Wickr networks	Write	network*		
CreateBot	Grants permission to create a bot in a Wickr network	Write	network*		
CreateDataRetentionBot	Grants permission to create a data retention bot in a Wickr network	Write	network*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateDataRetentionBotChallenge	Grants permission to create a data retention bot challenge in a Wickr network	Write	network*		
CreateNetwork	Grants permission to create a new Wickr network	Write	network*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSecurityGroup	Grants permission to create a security group in a Wickr network	Write	network*		
DeleteBot	Grants permission to delete a bot from a Wickr network	Write	network*		
DeleteDataRetentionBot	Grants permission to delete a data retention bot from a Wickr network	Write	network*		
DeleteNetwork	Grants permission to delete Wickr networks	Write	network*		
DeleteSecurityGroup	Grants permission to delete a security group from a Wickr network	Write	network*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetBot	Grants permission to get bot information in a Wickr network	Read	network*		
GetBotsCount	Grants permission to get bot count for a Wickr network	Read	network*		
GetDataRetentionBot	Grants permission to get data retention bot information in a Wickr network	Read	network*		
GetGuestUserHistoryCount	Grants permission to get guest user history count for a Wickr network	Read	network*		
GetNetwork	Grants permission to get details of a Wickr network	Read	network*		
GetNetworkSettings	Grants permission to get network settings for a Wickr network	Read	network*		
GetOidcInfo	Grants permission to get OIDC information for a Wickr network	Read	network*		
GetSecurityGroup	Grants permission to get security group information in a Wickr network	Read	network*		
GetUser	Grants permission to get information about a user in a Wickr network	Read	network*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetUsersCount	Grants permission to get user count for a Wickr network	Read	network*		
ListBlockedGuestUsers	Grants permission to list blocked guest users in a Wickr network	Read	network*		
ListBots	Grants permission to list bots in a Wickr network	Read	network*		
ListDevicesForUser	Grants permission to list devices for a user in a Wickr network	Read	network*		
ListGuestUsers	Grants permission to list guest users in a Wickr network	Read	network*		
ListNetworks	Grants permission to list Wickr networks	Read			
ListSecurityGroupUsers	Grants permission to list users in a security group in a Wickr network	Read	network*		
ListSecurityGroups	Grants permission to list security groups in a Wickr network	Read	network*		
ListTagsForResource	Grants permission to list the tags applied to a Wickr resource	Read	network*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListUsers	Grants permission to list users in a Wickr network	Read	network*		
RegisterOidcConfig	Grants permission to register OIDC configuration for a Wickr network	Write	network*		
RegisterOidcConfigTest	Grants permission to test OIDC configuration for a Wickr network	Write	network*		
TagResource	Grants permission to add tags to a specified Wickr resource	Tagging	network*		
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
UntagResource	Grants permission to untag the specified tags from the specified Wickr resource	Tagging	network*		
				aws:TagKeys	
UpdateBot	Grants permission to update a bot in a Wickr network	Write	network*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateDataRetention	Grants permission to update data retention settings in a Wickr network	Write	network*		
UpdateGuestUser	Grants permission to update guest user status in a Wickr network	Write	network*		
UpdateNetworkDetails	Grants permission to update Wickr network details	Write	network*		
UpdateNetworkSettings	Grants permission to update network settings for a Wickr network	Write	network*		
UpdateSecurityGroup	Grants permission to update a security group in a Wickr network	Write	network*		
UpdateUser	Grants permission to update user information in a Wickr network	Write	network*		

Resource types defined by AWS Wickr

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
network	`arn:${Partition}:wickr:${Region}:${Account}:network/${NetworkId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Wickr

AWS Wickr defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag's key and value in a request	String
aws:ResourceTag/${TagKey}	Filters access by the tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the tag keys in a request	ArrayOfString

Actions, resources, and condition keys for Amazon WorkDocs

Amazon WorkDocs (service prefix: `workdocs`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon WorkDocs

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AbortDocumentVersionUpload	Grants permission to abort the upload of the specified document version that was previously initiated by InitiateDocumentVersionUpload	Write			
ActivateUser	Grants permission to activate the specified user. Only active users can access Amazon WorkDocs	Write			
AddNotificationPermissions [permission only]	Grants permission to add principals that are allowed to call notification subscription APIs for a given WorkDocs site	Write			
AddResourcePermissions	Grants permission to create a set of permissions for the specified folder or document	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddUserToGroup [permission only]	Grants permission to add a user to a group	Write			
CheckAlias [permission only]	Grants permission to check an alias	Read			
CreateComment	Grants permission to add a new comment to the specified document version	Write			
CreateCustomMetadata	Grants permission to add one or more custom properties to the specified resource	Write			
CreateFolder	Grants permission to create a folder with the specified name and parent folder	Write			
CreateInstance [permission only]	Grants permission to create an instance	Write			
CreateLabels	Grants permission to add labels to the given resource	Write			
CreateNotificationSubscription	Grants permission to configure WorkDocs to use Amazon SNS notifications	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateUser	Grants permission to create a user in a Simple AD or Microsoft AD directory	Write			
DeactivateUser	Grants permission to deactivate the specified user, which revokes the user's access to Amazon WorkDocs	Write			
DeleteComment	Grants permission to delete the specified comment from the document version	Write			
DeleteCustomMetadata	Grants permission to delete custom metadata from the specified resource	Write			
DeleteDocument	Grants permission to permanently delete the specified document and its associated metadata	Write			
DeleteDocumentVersion	Grants permission to delete versions of a specified document	Write			
DeleteFolder	Grants permission to permanently delete the specified folder and its contents	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteFolderContents	Grants permission to delete the contents of the specified folder	Write			
DeleteInstance [permission only]	Grants permission to delete an instance	Write			
DeleteLabels	Grants permission to delete one or more labels from a resource	Write			
DeleteNotificationPermissions [permission only]	Grants permission to delete principals that are allowed to call notification subscription APIs for a given WorkDocs site	Write			
DeleteNotificationSubscription	Grants permission to delete the specified subscription from the specified organization	Write			
DeleteUser	Grants permission to delete the specified user from a Simple AD or Microsoft AD directory	Write			
DeregisterDirectory [permission only]	Grants permission to deregister a directory	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeActivities	Grants permission to fetch user activities in a specified time period	List			
DescribeAvailableDirectories [permission only]	Grants permission to describe available directories	List			
DescribeComments	Grants permission to list all the comments for the specified document version	List			
DescribeDocumentVersions	Grants permission to retrieve the document versions for the specified document	List			
DescribeFolderContents	Grants permission to describe the contents of the specified folder, including its documents and sub-folders	List			
DescribeGroups	Grants permission to describe the user groups	List			
DescribeInstanceExports [permission only]	Grants permission to describe the export history for an instance	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeInstances [permission only]	Grants permission to describe instances	List			
DescribeNotificationPermissions [permission only]	Grants permission to describe principals that are allowed to call notification subscription APIs for a given WorkDocs site	List			
DescribeNotificationSubscriptions	Grants permission to list the specified notification subscriptions	List			
DescribeResourcePermissions	Grants permission to view a description of a specified resource's permissions	List			
DescribeRootFolders	Grants permission to describe the root folders	List			
DescribeUsers	Grants permission to view a description of the specified users. You can describe all users or filter the results (for example, by status or organization)	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DownloadDocumentVersion [permission only]	Grants permission to download a specified document version	Read			
GetCurrentUser	Grants permission to retrieve the details of the current user	Read			
GetDocument	Grants permission to retrieve the specified document object	Read			
GetDocumentPath	Grants permission to retrieve the path information (the hierarchy from the root folder) for the requested document	Read			
GetDocumentVersion	Grants permission to retrieve version metadata for the specified document	Read			
GetFolder	Grants permission to retrieve the metadata of the specified folder	Read			
GetFolderPath	Grants permission to retrieve the path information (the hierarchy from the root folder) for the specified folder	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetGroup [permission only]	Grants permission to retrieve details for the specified group	Read			
GetResources	Grants permission to get a collection of resources	Read			
InitiateDocumentVersionUpload	Grants permission to create a new document object and version object	Write			
RegisterDirectory [permission only]	Grants permission to register a directory	Write			
RemoveAllResourcePermissions	Grants permission to remove all the permissions from the specified resource	Write			
RemoveResourcePermission	Grants permission to remove the permission for the specified principal from the specified resource	Write			
RestoreDocumentVersions	Grants permission to restore versions of a specified document	Write			
SearchResources	Grants permission to search metadata and the content of resources	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartInstanceExport [permission only]	Grants permission to start an export for an instance	Write	organization*		
UpdateDocument	Grants permission to update the specified attributes of the specified document	Write			
UpdateDocumentVersion	Grants permission to change the status of the document version to ACTIVE	Write			
UpdateFolder	Grants permission to update the specified attributes of the specified folder	Write			
UpdateInstanceAlias [permission only]	Grants permission to update an instance alias	Write			
UpdateUser	Grants permission to update the specified attributes of the specified user, and grants or revokes administrative privileges to the Amazon WorkDocs site	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateUserAdministrativeSettings [permission only]	Grants permission to update the administrative settings for a user	Write			

Resource types defined by Amazon WorkDocs

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
organization	`arn:${Partition}:workdocs:${Region}:${Account}:organization/${ResourceId}`	

Condition keys for Amazon WorkDocs

WorkDocs has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon WorkLink

Amazon WorkLink (service prefix: `worklink`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon WorkLink

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Associate Domain	Grants permission to associate a domain with an Amazon WorkLink fleet	Write	fleet*		
Associate WebsiteAuthorizationProvider	Grants permission to associate a website authorization provider with an Amazon WorkLink fleet	Write	fleet*		
Associate WebsiteCe	Grants permission to associate a website certifica	Write	fleet*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
rtificate Authority	te authority with an Amazon WorkLink fleet				
CreateFleet	Grants permission to create an Amazon WorkLink fleet	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteFleet	Grants permission to delete an Amazon WorkLink fleet	Write	fleet*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DescribeAuditStreamConfiguration	Grants permission to describe the audit stream configuration for an Amazon WorkLink fleet	Read	fleet*		
DescribeCompanyNetworkConfiguration	Grants permission to describe the company network configuration for an Amazon WorkLink fleet	Read	fleet*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeDevice	Grants permission to describe details of a device associated with an Amazon WorkLink fleet	Read	fleet*		
DescribeDevicePolicyConfiguration	Grants permission to describe the device policy configuration for an Amazon WorkLink fleet	Read	fleet*		
DescribeDomain	Grants permission to describe details about a domain associated with an Amazon WorkLink fleet	Read	fleet*		
DescribeFleetMetadata	Grants permission to describe metadata of an Amazon WorkLink fleet	Read	fleet*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DescribeIdentityProviderConfiguration	Grants permission to describe the identity provider configuration for an Amazon WorkLink fleet	Read	fleet*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeWebsiteCertificateAuthority	Grants permission to describe a website certificate authority associated with an Amazon WorkLink fleet	Read	fleet*		
DisassociateDomain	Grants permission to disassociate a domain from an Amazon WorkLink fleet	Write	fleet*		
DisassociateWebsiteAuthorizationProvider	Grants permission to disassociate a website authorization provider from an Amazon WorkLink fleet	Write	fleet*		
DisassociateWebsiteCertificateAuthority	Grants permission to disassociate a website certificate authority from an Amazon WorkLink fleet	Write	fleet*		
ListDevices	Grants permission to list the devices associated with an Amazon WorkLink fleet	List	fleet*		
ListDomains	Grants permission to list the associated domains for an Amazon WorkLink fleet	List	fleet*		
ListFleets	Grants permission to list the Amazon WorkLink fleets associated with the account	List			
ListTagsForResource	Grants permission to list tags for a resource	Read	fleet*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListWebsiteAuthorizationProviders	Grants permission to list the website authorization providers for an Amazon WorkLink fleet	List	fleet*		
ListWebsiteCertificateAuthorities	Grants permission to list the website certificate authorities associated with an Amazon WorkLink fleet	List	fleet*		
RestoreDomainAccess	Grants permission to restore access to a domain associated with an Amazon WorkLink fleet	Write	fleet*		
RevokeDomainAccess	Grants permission to revoke access to a domain associated with an Amazon WorkLink fleet	Write	fleet*		
SearchEntity [permission only]	Grants permission to list devices for an Amazon WorkLink fleet	List	fleet*		
SignOutUser	Grants permission to sign out a user from an Amazon WorkLink fleet	Write	fleet*		
TagResource	Grants permission to add one or more tags to a resource	Tagging	fleet*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove one or more tags from a resource	Tagging	fleet*		
				aws:TagKeys	
UpdateAuditStreamConfiguration	Grants permission to update the audit stream configuration for an Amazon WorkLink fleet	Write	fleet*		
UpdateCompanyNetworkConfiguration	Grants permission to update the company network configuration for an Amazon WorkLink fleet	Write	fleet*		
UpdateDevicePolicyConfiguration	Grants permission to update the device policy configuration for an Amazon WorkLink fleet	Write	fleet*		
UpdateDomainMetadata	Grants permission to update the metadata for a domain associated with an Amazon WorkLink fleet	Write	fleet*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateFleetMetadata	Grants permission to update the metadata of an Amazon WorkLink fleet	Write	fleet*		
UpdateIdentityProviderConfiguration	Grants permission to update the identity provider configuration for an Amazon WorkLink fleet	Write	fleet*		

Resource types defined by Amazon WorkLink

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
fleet	`arn:${Partition}:worklink::${Account}:fleet/${FleetName}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon WorkLink

Amazon WorkLink defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters actions based on the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters actions based on tag key-value pairs attached to the resource	String
aws:TagKeys	Filters actions based on the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon WorkMail

Amazon WorkMail (service prefix: `workmail`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon WorkMail

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AllowVendedLogDeliveryForResource [permission only]	Grants permission to configure vended log delivery for WorkMail audit logs	Write	organization*		
AssociateDelegateToResource	Grants permission to add a member (user or group) to the resource's set of delegates	Write	organization*		
AssociateMemberToGroup	Grants permission to add a member (user or group) to the group's set	Write	organization*		
AssumeImpersonationRole	Grants permission to assume an impersonation role for the given Amazon WorkMail organization	Write	organization*		
				workmail:ImpersonationRoleId	
CancelMailboxExportJob	Grants permission to cancel a currently running mailbox export job	Write	organization*		
CreateAlias	Grants permission to add an alias to the set of a given member (user or group) of WorkMail	Write	organization*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAvailabilityConfiguration	Grants permission to create an AvailabilityConfiguration for the given Amazon WorkMail organization and domain	Write	organization*		
CreateGroup	Grants permission to create a group that can be used in WorkMail by calling the RegisterToWorkMail operation	Write	organization*		
CreateIdentityCenterApplication	Grants permission to create an Identity Center application for WorkMail	Write			
CreateImpersonationRole	Grants permission to create an impersonation role for the given Amazon WorkMail organization	Write	organization*		
CreateInboundMailFlowRule [permission only]	Grants permission to create an inbound email flow rule which will apply to all email sent to an organization	Write	organization*		
CreateMailDomain [permission only]	Grants permission to create a mail domain	Write	organization*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateMobileDeviceAccessRule	Grants permission to create a new mobile device access rule	Write	organization*		
CreateOrganization	Grants permission to create a new Amazon WorkMail organization	Write			
CreateOutboundMailFlowRule [permission only]	Grants permission to create an outbound email flow rule which will apply to all email sent from an organization	Write	organization*		
CreateResource	Grants permission to create a new WorkMail resource	Write	organization*		
CreateSmtpGateway [permission only]	Grants permission to register an SMTP gateway to a WorkMail organization	Write	organization*		
CreateUser	Grants permission to create a user, which can be enabled afterwards by calling the RegisterToWorkMail operation	Write	organization*		
DeleteAccessControlRule	Grants permission to delete an access control rule	Write	organization*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAlias	Grants permission to remove one or more specified aliases from a set of aliases for a given user	Write	organization*		
DeleteAvailabilityConfiguration	Grants permission to delete the AvailabilityConfiguration for the given Amazon WorkMail organization and domain	Write	organization*		
DeleteEmailMonitoringConfiguration	Grants permission to delete the email monitoring configuration for an organization	Write	organization*		
DeleteGroup	Grants permission to delete a group from WorkMail	Write	organization*		
DeleteIdentityCenterApplication	Grants permission to delete an Identity Center application for WorkMail	Write			
DeleteIdentityProviderConfiguration	Grants permission to delete the identity provider configuration for the organization	Write	organization*		
DeleteImpersonationRole	Grants permission to delete an impersonation role for the given Amazon WorkMail organization	Write	organization*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteInboundMailFlowRule [permission only]	Grants permission to remove an inbound email flow rule to no longer apply to emails sent to an organization	Write	organization*		
DeleteMailDomain [permission only]	Grants permission to remove an unused mail domain from an organization	Write	organization*		
DeleteMailboxPermissions	Grants permission to delete permissions granted to a member (user or group)	Write	organization*		
DeleteMobileDevice [permission only]	Grants permission to remove a mobile device from a user	Write	organization*		
DeleteMobileDeviceAccessOverride	Grants permission to delete a mobile device access override	Write	organization*		
DeleteMobileDeviceAccessRule	Grants permission to delete a mobile device access rule	Write	organization*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteOrganization	Grants permission to delete an Amazon WorkMail organization and all underlying AWS resources managed by Amazon WorkMail as part of the organization	Write	organization*		
DeleteOutboundMailFlowRule [permission only]	Grants permission to remove an outbound email flow rule so that it no longer applies to emails sent from an organization	Write	organization*		
DeletePersonalAccessToken	Grants permission to delete a personal access token	Write	organization*		
DeleteResource	Grants permission to delete the specified resource	Write	organization*		
DeleteRetentionPolicy	Grants permission to delete the retention policy based on the supplied organization and policy identifiers	Write	organization*		
DeleteSmtpGateway [permission only]	Grants permission to remove an SMTP gateway from an organization	Write	organization*		
DeleteUser	Grants permission to delete a user from WorkMail and all subsequent systems	Write	organization*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeliverToMailbox [permission only]	Grants permission to deliver emails to a WorkMail organization via the SES MailManager DeliverToMailbox action	Write	organization*		
DeregisterFromWorkMail	Grants permission to mark a user, group, or resource as no longer used in WorkMail	Write	organization*		
DeregisterMailDomain	Grants permission to deregister a mail domain from an organization	Write	organization*		
DescribeEmailMonitoringConfiguration	Grants permission to retrieve the email monitoring configuration for an organization	Read	organization*		
DescribeEntity	Grants permission to read details of an entity	Read	organization*		
DescribeGroup	Grants permission to read the details for a group	List	organization*		
DescribeIdentityProviderConfiguration	Grants permission to read the identity provider configuration for the organization	Read	organization*		
DescribeInboundDmarcSettings	Grants permission to read the settings in a DMARC policy for a specified organization	Read	organization*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeInboundMailFlowRule [permission only]	Grants permission to read the details of an inbound mail flow rule configured for an organization	Read	organization*		
DescribeMailDomains [permission only]	Grants permission to show the details of all mail domains associated with the organization	List	organization*		
DescribeMailboxExportJob	Grants permission to retrieve details of a mailbox export job	Read	organization*		
DescribeOrganization	Grants permission to read details of an organization	List	organization*		
DescribeOutboundMailFlowRule [permission only]	Grants permission to read the details of an outbound mail flow rule configured for an organization	Read	organization*		
DescribeResource	Grants permission to read the details for a resource	List	organization*		
DescribeSmtpGateway [permission only]	Grants permission to read the details of an SMTP gateway registered to an organization	Read	organization*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeUser	Grants permission to read details for a user	List	organization*		
DisassociateDelegateFromResource	Grants permission to remove a member from the resource's set of delegates	Write	organization*		
DisassociateMemberFromGroup	Grants permission to remove a member from a group	Write	organization*		
EnableMailDomain [permission only]	Grants permission to enable a mail domain in the organization	Write	organization*		
GetAccessControlEffect	Grants permission to get the effects of access control rules as they apply to a specified IPv4 address, access protocol action, or user ID	Read	organization*		
GetDefaultRetentionPolicy	Grants permission to retrieve the retention policy associated at an organizational level	Read	organization*		
GetImpersonationRole	Grants permission to retrieve an impersonation role for the given Amazon WorkMail organization	Read	organization*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetImpersonationRoleEffect	Grants permission to get the effect of the rules associated to an impersonation role for a specific user	Read	organization*		
GetJournalingRules [permission only]	Grants permission to read the configured journaling and fallback email addresses for email journaling	Read	organization*		
GetMailDomain	Grants permission to retrieve details of a given mail domain in an organization	Read	organization*		
GetMailDomainDetails [permission only]	Grants permission to get the details of the mail domain	Read	organization*		
GetMailboxDetails	Grants permission to read the details of the user's mailbox	Read	organization*		
GetMobileDeviceAccessEffect	Grants permission to simulate the effect of the mobile device access rules for the given attributes of a sample access event	Read	organization*		
GetMobileDeviceAccessOverride	Grants permission to retrieve a mobile device access override	Read	organization*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetMobileDeviceDetails [permission only]	Grants permission to get the details of the mobile device	Read	organization*		
GetMobileDevicesForUser [permission only]	Grants permission to get a list of the mobile devices associated with the user	Read	organization*		
GetMobilePolicyDetails [permission only]	Grants permission to get the details of the mobile device policy associated with the organization	Read	organization*		
GetPersonalAccessTokenMetadata	Grants permission to read metadata for a personal access token	Read	organization*		
ListAccessControlRules	Grants permission to list the access control rules	Read	organization*		
ListAliases	Grants permission to list the aliases associated with a given entity	List	organization*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAvailabilityConfigurations	Grants permission to list all the AvailabilityConfiguration's for the given Amazon WorkMail organization	Read	organization*		
ListGroupMembers	Grants permission to read an overview of the members of a group. Users and groups can be members of a group	List	organization*		
ListGroups	Grants permission to list summaries of the organization's groups	List	organization*		
ListGroupsForEntity	Grants permission to list the groups to which an entity belongs	List	organization*		
ListImpersonationRoles	Grants permission to list the impersonation roles for the given Amazon WorkMail organization	List	organization*		
ListInboundMailFlowRules [permission only]	Grants permission to list inbound mail flow rules configured for an organization	List	organization*		
ListMailDomains	Grants permission to list the mail domains for a given organization	List	organization*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListMailboxExportJobs	Grants permission to list mailbox export jobs	List	organization*		
ListMailboxPermissions	Grants permission to list the mailbox permissions associated with a user, group, or resource mailbox	List	organization*		
ListMobileDeviceAccessOverrides	Grants permission to list the mobile device access overrides	Read	organization*		
ListMobileDeviceAccessRules	Grants permission to list the mobile device access rules	Read	organization*		
ListOrganizations	Grants permission to list the non-deleted organizations	List			
ListOutboundMailFlowRules [permission only]	Grants permission to list outbound mail flow rules configured for an organization	List	organization*		
ListPersonalAccessTokens	Grants permission to list metadata for personal access tokens	List	organization*		
ListResourceDelegates	Grants permission to list the delegates associated with a resource	List	organization*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListResources	Grants permission to list the organization's resources	List	organization*		
ListSmtpGateways [permission only]	Grants permission to list SMTP gateways registered to the organization	List	organization*		
ListTagsForResource	Grants permission to list the tags applied to an Amazon WorkMail organization resource	List	organization*		
				aws:TagKeys aws:RequestTag/${TagKey}	
ListUsers	Grants permission to list the organization's users	List	organization*		
PutAccessControlRule	Grants permission to add a new access control rule	Write	organization*		
PutEmailMonitoringConfiguration	Grants permission to add or update the email monitoring configuration for an organization	Write	organization*		
PutIdentityProviderConfiguration	Grants permission to add or update the identity provider configuration for the organization	Write	organization*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutInboundDmarcSettings	Grants permission to enable or disable a DMARC policy for a given organization	Write	organization*		
PutMailboxPermissions	Grants permission to set permissions for a user, group, or resource, replacing any existing permissions	Write	organization*		
PutMobileDeviceAccessOverride	Grants permission to add or update a mobile device access override	Write	organization*		
PutRetentionPolicy	Grants permission to add or update the retention policy	Write	organization*		
RegisterMailDomain	Grants permission to register a new mail domain in an organization	Write	organization*		
RegisterToWorkMail	Grants permission to register an existing and disabled user, group, or resource for use by associating a mailbox and calendaring capabilities	Write	organization*		
ResetPassword	Grants permission to allow the administrator to reset the password for a user	Write	organization*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SearchMembers [permission only]	Grants permission to perform a prefix search to find a specific user in a mail group	Read	organization*		
SetDefaultMailDomain [permission only]	Grants permission to set the default mail domain for the organization	Write	organization*		
SetJournalingRules [permission only]	Grants permission to set journaling and fallback email addresses for email journaling	Write	organization*		
SetMobilePolicyDetails [permission only]	Grants permission to set the details of a mobile policy associated with the organization	Write	organization*		
StartMailboxExportJob	Grants permission to start a new mailbox export job	Write	organization*		
TagResource	Grants permission to tag the specified Amazon WorkMail organization resource	Tagging	organization*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
TestAvailabilityConfiguration	Grants permission to performs a test on an availability provider to ensure that access is allowed	Read	organization*		
TestInboundMailFlowRules [permission only]	Grants permission to test what inbound rules will apply to an email with a given sender and recipient	Write	organization*		
TestOutboundMailFlowRules [permission only]	Grants permission to test what outbound rules will apply to an email with a given sender and recipient	Write	organization*		
UntagResource	Grants permission to untag the specified Amazon WorkMail organization resource	Tagging	organization*		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAvailabilityConfiguration	Grants permission to update an existing AvailabilityConfiguration for the given Amazon WorkMail organization and domain	Write	organization*		
UpdateDefaultMailDomain	Grants permission to update which domain is the default domain for an organization	Write	organization*		
UpdateGroup	Grants permission to update details of a group	Write	organization*		
UpdateImpersonationRole	Grants permission to update an existing impersonation role for the given Amazon WorkMail organization	Write	organization*		
UpdateInboundMailFlowRule [permission only]	Grants permission to update the details of an inbound email flow rule which will apply to all email sent to an organization	Write	organization*		
UpdateMailboxQuota	Grants permission to update the maximum size (in MB) of the user's mailbox	Write	organization*		
UpdateMobileDeviceAccessRule	Grants permission to update a mobile device access rule	Write	organization*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateOutboundMailFlowRule [permission only]	Grants permission to update the details of an outbound email flow rule which will apply to all email sent from an organization	Write	organization*		
UpdatePrimaryEmailAddress	Grants permission to update the primary email for a user, group, or resource	Write	organization*		
UpdateResource	Grants permission to update details for the resource	Write	organization*		
UpdateSmtpGateway [permission only]	Grants permission to update the details of an existing SMTP gateway registered to an organization	Write	organization*		
UpdateUser	Grants permission to update details of a user	Write	organization*		
WipeMobileDevice [permission only]	Grants permission to remotely wipe the mobile device associated with a user's account	Write	organization*		

Resource types defined by Amazon WorkMail

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
organization	`arn:${Partition}:workmail:${Region}:${Account}:organization/${ResourceId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon WorkMail

Amazon WorkMail defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tag key-value pairs that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
workmail:ImpersonationRoleId	Filters access by the ImpersonationRoleId that is passed in the request	String

Actions, resources, and condition keys for Amazon WorkMail Message Flow

Amazon WorkMail Message Flow (service prefix: `workmailmessageflow`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Topics

Actions defined by Amazon WorkMail Message Flow

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit

resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetRawMessageContent	Grants permission to read the content of email messages with the specified message ID	Read	RawMessage*		
PutRawMessageContent	Grants permission to update the content of email messages with the specified message ID	Write	RawMessage*		

Resource types defined by Amazon WorkMail Message Flow

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
RawMessage	`arn:${Partition}:workmailmessageflow:${Region}:${Account}:message/${OrganizationId}/${Context}/${MessageId}`	

Condition keys for Amazon WorkMail Message Flow

WorkMail Message Flow has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon WorkSpaces

Amazon WorkSpaces (service prefix: `workspaces`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon WorkSpaces

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptAccountLinkInvitation	Grants permission to accept invitations from other AWS accounts to share the same configuration for WorkSpaces BYOL	Write			
AssociateConnectionAlias	Grants permission to associate connection aliases with directories	Write	connectionalias*		
			directoryid*		
AssociateIpGroups	Grants permission to associate IP access control groups with directories	Write	directoryid*		
			workspaceipgroup*		
AssociateWorkspaceApplication	Grants permission to associate a workspace application with a WorkSpace	Write	workspaceapplication*		
			workspaceid*		
				aws:ResourceTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey}	
AuthorizeIpRules	Grants permission to add rules to IP access control groups	Write	workspaceipgroup*		workspaces:UpdateRulesOfIpGroup
CopyWorkspaceImage	Grants permission to copy a WorkSpace image	Write	workspaceimage*		workspaces:DescribeWorkspaceImages
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateAccountLinkInvitation	Grants permission to invite other AWS accounts to share the same configuration for WorkSpaces BYOL	Write			
CreateConnectClientAddIn	Grants permission to create an Amazon Connect client add-in within a directory	Write	directoryid*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateConnectionAlias	Grants permission to create connection aliases for use with cross-Region redirection	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateIpGroup	Grants permission to create IP access control groups	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateRootClientCertificate [permission only]	Grants permission to create a root client certificate	Write	certificateid*		
CreateStandbyWorkspaces	Grants permission to create one or more Standby WorkSpaces	Write	directoryid* workspaceid*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateTags	Grants permission to create tags for WorkSpaces resources	Tagging		aws:RequestTag/${TagKey} aws:TagKeys	
CreateUpdatedWorkspaceImage	Grants permission to create an updated WorkSpace image	Write	workspaceimage*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateWorkspaceBundle	Grants permission to create a WorkSpace bundle	Write	workspacebundle*		workspaces:CreateTags
			workspaceimage*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateWorkspaceImage	Grants permission to create a new WorkSpace image	Write	workspaceid*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateWorkspaces	Grants permission to create one or more WorkSpaces	Write	directoryid*	aws:ResourceTag/${TagKey}	
			workspacebundle*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			workspaceid*	aws:RequestTag/${TagKey} aws:TagKeys	
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateWorkspacesPool	Grants permission to create a WorkSpaces Pool	Write	directoryid*		
			workspacebundle*		
			workspacespoolid*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAccountLinkInvitation	Grants permission to delete invitations to other AWS accounts to share the same configuration for WorkSpaces BYOL	Write			
DeleteClientBranding	Grants permission to delete AWS WorkSpaces Client branding data within a directory	Write	directoryid*		
DeleteConnectClientAddIn	Grants permission to delete an Amazon Connect client add-in that is configured within a directory	Write	directoryid*		
DeleteConnectionAlias	Grants permission to delete connection aliases	Write	connectionalias*		
DeleteIpGroup	Grants permission to delete IP access control groups	Write	workspaceipgroup*		
DeleteRootClientCertificate [permission only]	Grants permission to delete root client certificate	Write	certificateid*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteTags	Grants permission to delete tags from WorkSpaces resources	Tagging		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteWorkspaceBundle	Grants permission to delete WorkSpace bundles	Write	workspacebundle*		
DeleteWorkspaceImage	Grants permission to delete WorkSpace images	Write	workspaceimage*		
DeployWorkspaceApplications	Grants permission to deploy all pending workspace applications on a WorkSpace	Write	workspaceid*		
				aws:ResourceTag/${TagKey}	
DeregisterWorkspaceDirectory	Grants permission to deregister directories from use with Amazon WorkSpaces	Write	directoryid*		
DescribeAccount	Grants permission to retrieve the configuration of Bring Your Own License (BYOL) for WorkSpaces accounts	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeAccountModifications	Grants permission to retrieve modifications to the configuration of Bring Your Own License (BYOL) for WorkSpaces accounts	Read			
DescribeApplicationAssociations	Grants permission to retrieve information about resources associated with a WorkSpace application	List	workspaceapplication*		
				aws:ResourceTag/${TagKey}	
DescribeApplications	Grants permission to obtain information about WorkSpace applications	List			
DescribeBundleAssociations	Grants permission to retrieve information about resources associated with a WorkSpace bundle	List	workspacebundle*		
				aws:ResourceTag/${TagKey}	
DescribeClientBranding	Grants permission to retrieve AWS WorkSpaces Client branding data within a directory	Read	directoryid*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeClientProperties	Grants permission to retrieve information about WorkSpaces clients	List	directoryid*		
DescribeConnectClientAddIns	Grants permission to retrieve a list of Amazon Connect client add-ins that have been created	List	directoryid*		
DescribeConnectionAliasPermissions	Grants permission to retrieve the permissions that the owners of connection aliases have granted to other AWS accounts for connection aliases	Read	connectionalias*		
DescribeConnectionAliases	Grants permission to retrieve a list that describes the connection aliases used for cross-Region redirection	Read			
DescribeConsent [permission only]	Grants permission to retrieve information about consent agreement to BYOL minimum requirements	Read			
DescribeCustomWorkspaceImageImport	Grants permission to retrieve information about WorkSpace BYOL image import task	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeImageAssociations	Grants permission to retrieve information about resources associated with a WorkSpace image	List	workspaceimage*		
				aws:ResourceTag/${TagKey}	
DescribeIpGroups	Grants permission to retrieve information about IP access control groups	Read	workspaceipgroup*		
DescribeTags	Grants permission to describe the tags for WorkSpaces resources	Read			
DescribeWorkspaceAssociations	Grants permission to retrieve information about resources associated with a WorkSpace	List	workspaceid*		
				aws:ResourceTag/${TagKey}	
DescribeWorkspaceBundles	Grants permission to obtain information about WorkSpace bundles	List			
DescribeWorkspaceDirectories	Grants permission to retrieve information about directories that are registered with WorkSpaces	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeWorkspaceImagePermissions	Grants permission to retrieve information about WorkSpace image permissions	Read	workspaceimage*		
DescribeWorkspaceImages	Grants permission to retrieve information about WorkSpace images	List			
DescribeWorkspaceSnapshots	Grants permission to retrieve information about WorkSpace snapshots	List	workspaceid*		
DescribeWorkspaces	Grants permission to obtain information about WorkSpaces	List			
DescribeWorkspacesConnectionStatus	Grants permission to obtain the connection status of WorkSpaces	Read			
DescribeWorkspacesPoolSessions	Grants permission to retrieve information about the sessions of a WorkSpaces Pool	List	workspacespoolid*		
DescribeWorkspacesPools	Grants permission to retrieve information about WorkSpaces Pools	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DirectoryAccessManagement [permission only]	Grants permission to directory management actions while managing and provisioning workspaces	List	directoryid*		
DisassociateConnectionAlias	Grants permission to disassociate connection aliases from directories	Write	connectionalias*		
DisassociateIpGroups	Grants permission to disassociate IP access control groups from directories	Write	directoryid*		
			workspaceipgroup*		
DisassociateWorkspaceApplication	Grants permission to disassociate a workspace application from a WorkSpace	Write	workspaceapplication*		
			workspaceid*		
				aws:ResourceTag/${TagKey}	
GetAccountLink	Grants permission to retrieve a link with another AWS Account for sharing configuration for WorkSpaces BYOL	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ImportClientBranding	Grants permission to import AWS WorkSpaces Client branding data within a directory	Write	directory id*		
ImportCustomWorkspaceImage	Grants permission to import Bring Your Own License (BYOL) images into Amazon WorkSpaces	Write			
ImportWorkspaceImage	Grants permission to import Bring Your Own License (BYOL) images into Amazon WorkSpaces	Write			ec2:DescribeImages ec2:ModifyImageAttribute
ListAccountLinks	Grants permission to retrieve links with the AWS Account(s) that share your configuration for WorkSpaces BYOL	List			
ListAvailableManagementCidrRanges	Grants permission to list the available CIDR ranges for enabling Bring Your Own License (BYOL) for WorkSpaces accounts	List			
MigrateWorkspace	Grants permission to migrate WorkSpaces	Write	workspacebundle* workspaceid*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyAccount	Grants permission to modify the configuration of Bring Your Own License (BYOL) for WorkSpaces accounts	Write			
ModifyCertificateBasedAuthProperties	Grants permission to modify the certificate-based authorization properties of a directory	Write	directory id*		
ModifyClientProperties	Grants permission to modify the properties of WorkSpaces clients	Write	directory id*		
ModifyEndpointEncryptionMode	Grants permission to configure the specified directory between Standard TLS and FIPS 140-2 validated mode	Write	directory id*		
ModifySamlProperties	Grants permission to modify the SAML properties of a directory	Write	directory id*		
ModifySelfservicePermissions	Grants permission to modify the self-service WorkSpace management capabilities for your users	Permissions management	directory id*		
ModifyStreamingProperties	Grants permission to modify the streaming properties	Write	directory id*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyWorkspaceAccessProperties	Grants permission to specify which devices and operating systems users can use to access their WorkSpaces	Write	directory id*		
ModifyWorkspaceCreationProperties	Grants permission to modify the default properties used to create WorkSpaces	Write	directory id*		
ModifyWorkspaceProperties	Grants permission to modify WorkSpace properties, including the running mode and the AutoStop period	Write	workspace id*		
ModifyWorkspaceState	Grants permission to modify the state of WorkSpaces	Write	workspace id*		
RebootWorkspaces	Grants permission to reboot WorkSpaces	Write	workspace id*		
RebuildWorkspaces	Grants permission to rebuild WorkSpaces	Write	workspace id*		
RegisterWorkspaceDirectory	Grants permission to register directories for use with Amazon WorkSpaces	Write	directory id*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RejectAccountLinkInvitation	Grants permission to reject invitations from other AWS accounts to share the same configuration for WorkSpaces BYOL	Write			
RestoreWorkspace	Grants permission to restore WorkSpaces	Write	workspaceid*		
RevokeIpRules	Grants permission to remove rules from IP access control groups	Write	workspaceipgroup*		workspaces:UpdateRulesOfIpGroup
StartWorkspaces	Grants permission to start AutoStop WorkSpaces	Write	workspaceid*		
StartWorkspacesPool	Grants permission to start a WorkSpaces Pool	Write	workspacespoolid*		
StopWorkspaces	Grants permission to stop AutoStop WorkSpaces	Write	workspaceid*		
StopWorkspacesPool	Grants permission to stop a WorkSpaces Pool	Write	workspacespoolid*		
Stream	Grants permission to federated users to sign in by using their existing credentials and stream their workspace	Write	directoryid*		
				workspaces:userId	
TerminateWorkspaces	Grants permission to terminate WorkSpaces	Write	workspaceid*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TerminateWorkspacesPool	Grants permission to terminate a WorkSpaces Pool	Write	workspacespoolid*		
TerminateWorkspacesPoolSession	Grants permission to terminate a WorkSpaces Pool session	Write			
UpdateConnectClientAddIn	Grants permission to update an Amazon Connect client add-in. Use this action to update the name and endpoint URL of an Amazon Connect client add-in	Write	directoryid*		
UpdateConnectionAliasPermission	Grants permission to share or unshare connection aliases with other accounts	Permissions management	connectionalias*		
UpdateConsent [permission only]	Grants permission to update the consent agreement to BYOL minimum requirements	Write			
UpdateRootClientCertificate [permission only]	Grants permission to update a root client certificate	Write	certificateid*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateRulesOfIpGroup	Grants permission to replace rules for IP access control groups	Write	workspaceipgroup*		workspaces:AuthorizeIpRules workspaces:RevokeIpRules
UpdateWorkspaceBundle	Grants permission to update the WorkSpace images used in WorkSpace bundles	Write	workspacebundle* workspaceimage*		
UpdateWorkspaceImagePermission	Grants permission to share or unshare WorkSpace images with other accounts by specifying whether other accounts have permission to copy the image	Permissions management	workspaceimage*		
UpdateWorkspacesPool	Grants permission to update the WorkSpaces pool	Write	workspacespoolid*		

Resource types defined by Amazon WorkSpaces

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
certificateid	arn:${Partition}:workspaces:${Region}:${Account}:workspacecertificate/${CertificateId}	
directoryid	arn:${Partition}:workspaces:${Region}:${Account}:directory/${DirectoryId}	aws:ResourceTag/${TagKey}
workspacebundle	arn:${Partition}:workspaces:${Region}:${Account}:workspacebundle/${BundleId}	aws:ResourceTag/${TagKey}
workspaceid	arn:${Partition}:workspaces:${Region}:${Account}:workspace/${WorkspaceId}	aws:ResourceTag/${TagKey}
workspaceimage	arn:${Partition}:workspaces:${Region}:${Account}:workspaceimage/${ImageId}	aws:ResourceTag/${TagKey}
workspaceipgroup	arn:${Partition}:workspaces:${Region}:${Account}:workspaceipgroup/${GroupId}	aws:ResourceTag/${TagKey}
workspacespoolid	arn:${Partition}:workspaces:${Region}:${Account}:workspacespool/${PoolId}	aws:ResourceTag/${TagKey}
connectionalias	arn:${Partition}:workspaces:${Region}:${Account}:connectionalias/${ConnectionAliasId}	aws:ResourceTag/${TagKey}
workspaceapplication	arn:${Partition}:workspaces:${Region}:${Account}:workspaceapplication/${WorkSpaceApplicationId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon WorkSpaces

Amazon WorkSpaces defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access based on the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access based on the tags associated with the resource	String
aws:TagKeys	Filters access based on the tag keys that are passed in the request	ArrayOfString
workspaces:userId	Filters access by the ID of the Workspaces user	String

Actions, resources, and condition keys for Amazon WorkSpaces Application Manager

Amazon WorkSpaces Application Manager (service prefix: `wam`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon WorkSpaces Application Manager

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AuthenticatePackager [permission only]	Allows the Amazon WAM packaging instance to access your application package catalog.	Write			

Resource types defined by Amazon WorkSpaces Application Manager

Amazon WorkSpaces Application Manager does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon WorkSpaces Application Manager, specify `"Resource": "*"` in your policy.

Condition keys for Amazon WorkSpaces Application Manager

WAM has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS WorkSpaces Managed Instances

AWS WorkSpaces Managed Instances (service prefix: `workspaces-instances`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.

Actions defined by AWS WorkSpaces Managed Instances

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action

with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Associate Volume	Grants permission to associate a workspace managed volume to a workspace managed instance in your account	Write	WorkspaceInstanceId*		ec2:AttachVolume ec2:DescribeVolumes

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateVolume	Grants permission to create a workspace managed volume in your account	Write			ec2:CreateVolume
CreateWorkspaceInstance	Grants permission to create a workspace managed instance in your account	Write		aws:RequestTag/${TagKey} aws:TagKeys	ec2:DescribeInstances ec2:RunInstances
DeleteVolume	Grants permission to delete a workspace managed volume in your account	Write	VolumeId*		ec2:DeleteVolume ec2:DescribeVolumes
DeleteWorkspaceInstance	Grants permission to delete a workspace managed instance in your account	Write	WorkspaceInstanceId*		ec2:TerminateInstances
DisassociateVolume	Grants permission to disassociate a workspace managed volume from a workspace managed instance in your account	Write	WorkspaceInstanceId*		ec2:DescribeVolumes ec2:DetachVolume
GetWorkspaceInstance	Grants permission to get details for a specific workspace managed instance in your account	Read	WorkspaceInstanceId*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListInstanceTypes	Grants permission to list all supported instance types	List			
ListRegions	Grants permission to list all supported AWS regions	List			
ListTagsForResource	Grants permission to list user tags for resources in your account	List	WorkspaceInstanceId*		
ListWorkspaceInstances	Grants permission to list workspace managed instances in your account	List			
TagResource	Grants permission to add user tags to resources in your account	Tagging	WorkspaceInstanceId*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove user tags from resources in your account	Tagging	WorkspaceInstanceId*		
				aws:TagKeys	

Resource types defined by AWS WorkSpaces Managed Instances

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
WorkspaceInstanceId	`arn:${Partition}:workspaces-instances:${Region}:${Account}:workspaceinstance/${WorkspaceInstanceId}`	aws:ResourceTag/${TagKey}
VolumeId	`arn:${Partition}:ec2:${Region}:${Account}:volume/${VolumeId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS WorkSpaces Managed Instances

AWS WorkSpaces Managed Instances defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access based on the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access based on the tags associated with the resource	String

Condition keys	Description	Type
aws:TagKeys	Filters access based on the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon WorkSpaces Secure Browser

Amazon WorkSpaces Secure Browser (service prefix: `workspaces-web`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon WorkSpaces Secure Browser

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Associate BrowserSettings	Grants permission to associate browser settings to web portals	Write	browserSettings*		
			portal*		
Associate DataProtectionSettings	Grants permission to associate data protection settings with web portals	Write	dataProtectionSettings*		
			portal*		
Associate IpAccessSettings	Grants permission to associate ip access settings with web portals	Write	ipAccessSettings*		
			portal*

UpdateUserSettings	Grants permission to update user settings	Write	userSettings*		

Resource types defined by Amazon WorkSpaces Secure Browser

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
browserSettings	`arn:${Partition}:workspaces-web:${Region}:${Account}:browserSettings/${BrowserSettingsId}`	aws:ResourceTag/${TagKey}
identityProvider	`arn:${Partition}:workspaces-web:${Region}:${Account}:identityProvider/${PortalId}/${IdentityProviderId}`	aws:ResourceTag/${TagKey}
networkSettings	`arn:${Partition}:workspaces-web:${Region}:${Account}:networkSettings/${NetworkSettingsId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
portal	arn:${Partition}:workspaces-web:${Region}:${Account}:portal/${PortalId}	aws:ResourceTag/${TagKey}
trustStore	arn:${Partition}:workspaces-web:${Region}:${Account}:trustStore/${TrustStoreId}	aws:ResourceTag/${TagKey}
userSettings	arn:${Partition}:workspaces-web:${Region}:${Account}:userSettings/${UserSettingsId}	aws:ResourceTag/${TagKey}
userAccessLoggingSettings	arn:${Partition}:workspaces-web:${Region}:${Account}:userAccessLoggingSettings/${UserAccessLoggingSettingsId}	aws:ResourceTag/${TagKey}
ipAccessSettings	arn:${Partition}:workspaces-web:${Region}:${Account}:ipAccessSettings/${IpAccessSettingsId}	aws:ResourceTag/${TagKey}
dataProtectionSettings	arn:${Partition}:workspaces-web:${Region}:${Account}:dataProtectionSettings/${DataProtectionSettingsId}	aws:ResourceTag/${TagKey}
sessionLogger	arn:${Partition}:workspaces-web:${Region}:${Account}:sessionLogger/${SessionLoggerId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon WorkSpaces Secure Browser

Amazon WorkSpaces Secure Browser defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon WorkSpaces Thin Client

Amazon WorkSpaces Thin Client (service prefix: `thinclient`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon WorkSpaces Thin Client

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy,

you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateEnvironment	Grants permission to create environments	Write		aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	appstream:DescribeStacks iam:CreateServiceLinkedRole workspaces-web:GetPortal workspaces-web:GetUserSettings workspaces:DescribeWorkspaceDirectories
DeleteDevice	Grants permission to delete devices	Write	device*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteEnvironment	Grants permission to delete environments	Write	environment*		
				aws:ResourceTag/${TagKey}	
DeregisterDevice	Grants permission to deregister devices	Write	device*		
				aws:ResourceTag/${TagKey}	
GetDevice	Grants permission to get devices	Read	device*		
				aws:ResourceTag/${TagKey}	
GetDeviceDetails [permission only]	Grants permission to get details of devices	Read	device*

Actions defined by AWS X-Ray

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of

access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetTraceSummaryById [permission only]	Grants permission to retrieve metadata for a list of traces specified by ID	Read			
BatchGetTraces	Grants permission to retrieve a list of traces specified by ID. Each trace is a collection of segment documents that originates from a single request. Use GetTraceSummaries to get a list of trace IDs	List			
CancelTraceRetrieval	Grants permission to cancel an ongoing trace retrieval job initiated by StartTraceRetrieval using the provided RetrievalToken. A successful cancellation will return an HTTP 200 response	Read			
CreateGroup	Grants permission to create a group resource with a name and a filter expression	Write	group*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSamplingRule	Grants permission to create a rule to control sampling behavior for instrumented applications	Write	sampling-rule*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteGroup	Grants permission to delete a group resource	Write	group*		
				aws:ResourceTag/${TagKey}	
DeleteResourcePolicy	Grants permission to delete resource policies	Write		xray:ResourcePolicyName	
DeleteSamplingRule	Grants permission to delete a sampling rule	Write	sampling-rule*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDistinctTraceGraphs [permission only]	Grants permission to retrieve distinct service graphs for one or more specific trace IDs	Read			
GetEncryptionConfig	Grants permission to retrieve the current encryption configuration for X-Ray data	Read			
GetGroup	Grants permission to retrieve group resource details	Read	group*		
				aws:ResourceTag/${TagKey}	
GetGroups	Grants permission to retrieve all active group details	Read			
GetIndexingRules	Grants permission to retrieve all indexing rules. Indexing rules are used to determine the server-side sampling rate for spans ingested through the CloudWatchLogs destination and indexed by X-Ray	Read			
GetInsight	Grants permission to retrieve the details of a specific insight	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetInsightEvents	Grants permission to retrieve the events of a specific insight	Read			
GetInsightImpactGraph	Grants permission to retrieve the part of the service graph which is impacted for a specific insight	Read			
GetInsightSummaries	Grants permission to retrieve the summary of all insights for a group and time range with optional filters	Read			
GetRetrievedTracesGraph	Grants permission to retrieve a service graph for traces based on the specified RetrievalToken from the Transaction Search CloudWatch log group	Read			
GetSamplingRules	Grants permission to retrieve all sampling rules	Read			
GetSamplingStatisticSummaries	Grants permission to retrieve information about recent sampling results for all sampling rules	Read			
GetSamplingTargets	Grants permission to request a sampling quota for rules that the service is using to sample requests	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetServiceGraph	Grants permission to retrieve a document that describes services that process incoming requests, and downstream services that they call as a result	Read			
GetTimeSeriesServiceStatistics	Grants permission to retrieve an aggregation of service statistics defined by a specific time range bucketed into time intervals	Read			
GetTraceGraph	Grants permission to retrieve a service graph for one or more specific trace IDs	Read			
GetTraceSegmentDestination	Grants permission to retrieve the current destination of data sent to PutTraceSegments and OpenTelemetry API	Read			
GetTraceSummaries	Grants permission to retrieve IDs and metadata for traces available for a specified time frame using an optional filter. To get the full traces, pass the trace IDs to BatchGetTraces	Read			
Link [permission only]	Grants permission to share X-Ray resources with a monitoring account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListResourcePolicies	Grants permission to list resource policies	List			
ListRetrievedTraces	Grants permission to retrieve a list of traces for a given RetrievalToken from the Transaction Search CloudWatch log group	List			
ListTagsForResource	Grants permission to list tags for an X-Ray resource	List	group		
			sampling-rule		
PutEncryptionConfig	Grants permission to update the encryption configuration for X-Ray data	Permissions management			
PutResourcePolicy	Grants permission to create or update resource policies	Write		xray:ResourcePolicyName	
PutSpans	Grants permission to upload OpenTelemetry spans to AWS X-Ray	Write		logs:LogGeneratingResourceArns	
PutSpansForIndexing [permission only]	Grants permission to upload spans to AWS X-Ray to be indexed	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutTelemetryRecords	Grants permission to send AWS X-Ray daemon telemetry to the service	Write			
PutTraceSegments	Grants permission to upload segment documents to AWS X-Ray. The X-Ray SDK generates segment documents and sends them to the X-Ray daemon, which uploads them in batches	Write		logs:LogGeneratingResourceArns	
StartTraceRetrieval	Grants permission to initiate a trace retrieval process using the specified time range and for the given trace IDs on the Transaction Search CloudWatch log group	Read			
TagResource	Grants permission to add tags to an X-Ray resource	Tagging	group		
			sampling-rule		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove tags from an X-Ray resource	Tagging	group		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			sampling-rule		
				aws:TagKeys	
UpdateGroup	Grants permission to update a group resource	Write	group*		
				aws:ResourceTag/${TagKey}	
UpdateIndexingRule	Grants permission to modify an indexing rule's configuration	Write			
UpdateSamplingRule	Grants permission to modify a sampling rule's configuration	Write	sampling-rule*		
				aws:ResourceTag/${TagKey}	
UpdateTraceSegmentDestination	Grants permission to modify the destination of data sent to PutTraceSegments and OpenTelemetry API	Write		xray:TraceSegmentDestination	

Resource types defined by AWS X-Ray

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
group	`arn:${Partition}:xray:${Region}:${Account}:group/${GroupName}/${Id}`	aws:ResourceTag/${TagKey}
sampling-rule	`arn:${Partition}:xray:${Region}:${Account}:sampling-rule/${SamplingRuleName}`	aws:ResourceTag/${TagKey}

Condition keys for AWS X-Ray

AWS X-Ray defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Condition keys	Description	Type
logs:LogGenerating ResourceArns	Filters access by LogGeneratingResourceArn in the request	ArrayOfARN
xray:ResourcePolicyName	Filters access by PolicyName in the request	String
xray:TraceSegmentDestination	Filters access by TraceSegmentDestination type in the request	String

- AWS services that work with IAM
- Policy evaluation logic

Simplified AWS service information for programmatic access

AWS provides service reference information in JSON format to streamline the automation of policy management workflows. With the service reference information, you can access available operations, actions, resources, and condition keys across AWS services from machine-readable files. Service reference information includes metadata beyond authorization details, including IAM action last accessed information and IAM Access Analyzer policy generation data.

Security administrators can establish guardrails and developers can ensure appropriate access to applications by identifying the available actions, resources, and condition keys for each AWS service. AWS provides service reference information for AWS services to allow you to incorporate the metadata into your policy management workflows.

- For an inventory of actions, resources, and condition keys for use in IAM policies, see the Service Authorization Reference page for the AWS service. Actions, resources, and condition keys for services that share a service prefix may be split across multiple pages in the Service Authorization Reference.
- For a list of AWS services and actions for which IAM action last accessed information is displayed, see IAM action last accessed information services and actions in the IAM User Guide.
- For a list of AWS services and actions for which IAM Access Analyzer generates policies with action-level information, see IAM Access Analyzer policy generation services in the IAM User Guide.

The content presented in the Service Authorization Reference may be presented differently or contain different metadata. For more information, see Additional field definitions.

The service reference information also offers metadata on operations, including information on authorized actions and the method names in SDKs.

Additional context of the value of condition keys may be available to assist in scoping permissions. For example, the value of `iam:PassedToService` may appear when the action `iam:PassRole` is authorized by an operation.

This operation to action mapping is not supported for all services. Services that don't yet support this mapping will omit the AuthorizedAction property. Additionally, authorized action information

for operations does not include permissions that might be required for operations called on your behalf with Forward Access Sessions.

> **Note**
>
> Changes to the service reference information may take up to 24 hours to be reflected in the list of metadata for the service.

Accessing AWS service reference information

1. Navigate to the service reference information to access the list of AWS services for which reference information is available.

   There are two main entry points:

   http://servicereference.us-east-1.amazonaws.com/ displays a list of AWS services for which reference information is available.

   The following example shows a partial list of services and URLs for their respective reference information:

   ```
   [
       {
           "service": "s3",
           "url": "https://servicereference.us-east-1.amazonaws.com/v1/s3/s3.json"
       },
       {
           "service": "dynamodb",
           "url": "https://servicereference.us-east-1.amazonaws.com/v1/dynamodb/
   dynamodb.json"
       },
       …
   ]
   ```

   https://servicereference.us-east-1.amazonaws.com/v1/mapping.json displays a mapping from SDK services to the location in the service reference that information can be found under.

   The following example shows a partial list of mappings:

   ```
   {
   ```

```
  "SDK" : {
    "Python" : {
      "Boto3" : {
        "accessanalyzer" : {
          "service" : "access-analyzer",
          "url" : "https://servicereference.us-east-1.amazonaws.com/v1/access-
analyzer/access-analyzer.json"
        },
        "account" : {
          "service" : "account",
          "url" : "https://servicereference.us-east-1.amazonaws.com/v1/account/
account.json"
        },
        "amp" : {
          "service" : "aps",
          "url" : "https://servicereference.us-east-1.amazonaws.com/v1/aps/
aps.json"
        },
        ...
      }
    }
  }
}
```

2. Choose a service and navigate to the service information page in the `url` field for the service to view a list of actions, resources, and condition keys for the service.

   The following example shows a partial list of service reference information for Amazon S3:

```
{
    "Name": "s3",
    "Actions": [
        {
            "Name": "GetObject",
            "ActionConditionKeys": [
                "s3:AccessGrantsInstanceArn",
                "s3:AccessPointNetworkOrigin",
                "s3:DataAccessPointAccount",
                "s3:DataAccessPointArn",
                "s3:ExistingObjectTag/key",
                "s3:ResourceAccount",
                "s3:TlsVersion",
                "s3:authType",
```

```
                "s3:if-match",
                "s3:if-none-match",
                "s3:signatureAge",
                "s3:signatureversion",
                "s3:x-amz-content-sha256"
            ],
            "Annotations" : {
            "Properties" : {
                    "IsList" : false,
                    "IsPermissionManagement" : false,
                    "IsTaggingOnly" : false,
                    "IsWrite" : false
                }
            },
            "Resources": [
                {
                    "Name": "object"
                }
            ],
            "SupportedBy" : {
                "IAM Access Analyzer Policy Generation" : false,
                "IAM Action Last Accessed" : false
            }
        },
        {
            "Name": "ListBucket",
            "ActionConditionKeys": [
                "s3:AccessGrantsInstanceArn",
                "s3:AccessPointNetworkOrigin",
                "s3:DataAccessPointAccount",
                "s3:DataAccessPointArn",
                "s3:ResourceAccount",
                "s3:TlsVersion",
                "s3:authType",
                "s3:delimiter",
                "s3:max-keys",
                "s3:prefix",
                "s3:signatureAge",
                "s3:signatureversion",
                "s3:x-amz-content-sha256"
            ],
            "Annotations" : {
                "Properties" : {
                    "IsList" : true,
```

```
                    "IsPermissionManagement" : false,
                    "IsTaggingOnly" : false,
                    "IsWrite" : false
                }
            },
            "Resources": [
                {
                    "Name": "bucket"
                }
            ],
            "SupportedBy" : {
                "IAM Access Analyzer Policy Generation" : false,
                "IAM Action Last Accessed" : false
            }
        },
        ...
    ],
    "ConditionKeys": [
        {
            "Name": "s3:TlsVersion",
            "Types": [
                "Numeric"
            ]
        },
        {
            "Name": "s3:authType",
            "Types": [
                "String"
            ]
        },
        ...
    ],
    "Operations": [
        {
            "Name" : "GetObject",
            "AuthorizedActions" : [
                {
                    "Name" : "GetObject",
                    "Service" : "s3"
                }, {
                    "Name" : "GetObject",
                    "Service" : "s3-object-lambda"
                }, {
                    "Name" : "GetObjectLegalHold",
```

```
                    "Service" : "s3"
                }, {
                    "Name" : "GetObjectRetention",
                    "Service" : "s3"
                }, {
                    "Name" : "GetObjectTagging",
                    "Service" : "s3"
                }, {
                    "Name" : "GetObjectVersion",
                    "Service" : "s3"
                }
            ],
            "SDK" : [
                {
                    "Name" : "s3",
                    "Method" : "get_object",
                    "Package" : "Boto3"
                }
            ]
        },
        ...
    ],
    "Resources": [
        {
            "Name": "accesspoint",
            "ARNFormats": [
                "arn:${Partition}:s3:${Region}:${Account}:accesspoint/
${AccessPointName}"
            ]
        },
        {
            "Name": "bucket",
            "ARNFormats": [
                "arn:${Partition}:s3:::${BucketName}"
            ]
        }
        ...
    ],
    "Version": "v1.4"
}
```

3. Download the JSON file from the service URL to use in your policy authoring workflows.

Glossary

- Operation - An API that can be called, usually through an SDK
- Action - Permission that is authorized when performing an operation

Additional field definitions

Action properties provide additional metadata about service actions to help categorize them based on their permission scope. These properties are found under the `Annotations` field for each action. The metadata consists of four boolean values:

- `IsList` – Provides permissions to discover and list resources, including basic metadata, without accessing resource contents.

  Example – This property is `true` for the Amazon S3 `ListBucket` action, allowing users to view bucket listings without accessing the objects themselves.
- `IsPermissionManagement` – Provides permissions to modify IAM permissions or access credentials.

  Example – This property is `true` for most IAM and AWS Organizations actions, as well as Amazon S3 actions like `PutBucketPolicy` and `DeleteBucketPolicy`.
- `IsTaggingOnly` – Provides permissions only for modifying tags.

  Example – This property is `true` for IAM actions `TagRole` and `UntagRole`, while this property is `false` for `CreateRole` since it provides broader permissions beyond tagging.
- `IsWrite` – Provides permissions to modify resources, which may include tag modifications.

  Example – This property is `true` for Amazon S3 actions `CreateBucket`, `DeleteBucket`, and `PutObject` since they allow resource modification.

> **Note**
>
> These properties are not mutually exclusive. An action may have multiple properties set to `true`.
> It's also possible for all properties to be `false`, as seen with Amazon S3's `GetObject` action. This indicates the action only grants read permissions on an object.

These properties can be used to generate insights for services. The following example shows which permissions with the s3 prefix allow mutating resources:

```
> curl https://servicereference.us-east-1.amazonaws.com/v1/s3/s3.json | \
    jq '.Actions[] | select(.Annotations.Properties.IsWrite == true) | .Name'

"AssociateAccessGrantsIdentityCenter"
"BypassGovernanceRetention"
"CreateAccessGrant"
"CreateAccessGrantsInstance"
"CreateAccessGrantsLocation"
...
```

The following example shows which action condition keys with the lambda prefix you can use to limit access to permission management actions:

```
> curl https://servicereference.us-east-1.amazonaws.com/v1/lambda/lambda.json | \
    jq '.Actions[] | select(.Annotations.Properties.IsPermissionManagement == true) |
 {Name: .Name, ActionConditionKeys: (.ActionConditionKeys // [])}'

{
   "Name": "AddLayerVersionPermission",
    "ActionConditionKeys": []
}
{
    "Name": "AddPermission",
    "ActionConditionKeys": [
        "lambda:FunctionUrlAuthType",
        "lambda:Principal"
    ]
}
{
    "Name": "DisableReplication",
    "ActionConditionKeys": []
}
{
    "Name": "EnableReplication",
    "ActionConditionKeys": []
}
{
    "Name": "RemoveLayerVersionPermission",
    "ActionConditionKeys": []
}
```

```
{
    "Name": "RemovePermission",
    "ActionConditionKeys": [
        "lambda:FunctionUrlAuthType",
        "lambda:Principal"
    ]
}
```
