			vpn-gateway	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys ec2:ResourceTag/${TagKey}	
				aws:TagKeys ec2:Region	
DeleteTrafficMirrorFilter	Grants permission to delete a traffic mirror filter	Write	traffic-mirror-filter*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
DeleteTrafficMirrorFilterRule	Grants permission to delete a traffic mirror filter rule	Write	traffic-mirror-filter*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			traffic-mirror-filter-rule*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteTrafficMirrorSession	Grants permission to delete a traffic mirror session	Write	traffic-mirror-session*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteTrafficMirrorTarget	Grants permission to delete a traffic mirror target	Write	traffic-mirror-target*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteTransitGateway	Grants permission to delete a transit gateway	Write	transit-gateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayId	
				ec2:Region	
DeleteTransitGatewayConnect	Grants permission to delete a transit gateway connect attachment	Write	transit-gateway-attachment*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
DeleteTransitGatewayConnectPeer	Grants permission to delete a transit gateway connect peer	Write	transit-gateway-connect-peer*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayConnectPeerId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteTransitGatewayMeteringPolicy	Grants permission to delete a transit gateway metering policy	Write	transit-gateway-metering-policy*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayMeteringPolicyId	
				ec2:Region	
DeleteTransitGatewayMeteringPolicyEntry	Grants permission to delete an entry from a transit gateway metering policy	Write	transit-gateway-metering-policy*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayMeteringPolicyId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
DeleteTransitGatewayMulticastDomain	Grants permission to delete a transit gateway multicast domain	Write	transit-gateway-multicast-domain*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayMulticastDomainId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteTransitGatewayPeeringAttachment	Grants permission to delete a peering attachment from a transit gateway	Write	transit-gateway-attachment*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
				ec2:Region	
DeleteTransitGatewayPolicyTable	Grants permission to delete a transit gateway policy table	Write	transit-gateway-policy-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayPolicyTableId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
DeleteTransitGatewayPrefixListReference	Grants permission to delete a transit gateway prefix list reference	Write	prefix-list*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			transit-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayRouteTableId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteTransitGatewayRoute	Grants permission to delete a route from a transit gateway route table	Write	transit-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayRouteTableId	
				ec2:Region	
DeleteTransitGatewayRouteTable	Grants permission to delete a transit gateway route table	Write	transit-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayRouteTableId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
DeleteTransitGatewayRouteTableAnnouncement	Grants permission to delete a transit gateway route table announcement	Write	transit-gateway-route-table-announcement*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayRouteTableAnnouncementId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteTransitGatewayVpcAttachment	Grants permission to delete a VPC attachment from a transit gateway	Write	transit-gateway-attachment*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
				ec2:Region	
DeleteVerifiedAccessEndpoint	Grants permission to delete a Verified Access endpoint	Write	verified-access-endpoint*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteVerifiedAccessGroup	Grants permission to delete a Verified Access group	Write	verified-access-group*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteVerifiedAccessInstance	Grants permission to delete a Verified Access instance	Write	verified-access-instance*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteVerifiedAccessTrustProvider	Grants permission to delete a verified trust provider	Write	verified-access-trust-provider*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteVolume	Grants permission to delete an EBS volume	Write	volume*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:Encrypted ec2:ManagedResourceOperator ec2:ParentSnapshot ec2:ParentVolume ec2:ResourceTag/${TagKey} ec2:VolumeID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:VolumeInitializationRate ec2:VolumeIops ec2:VolumeSize ec2:VolumeThroughput ec2:VolumeType	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteVpc	Grants permission to delete a VPC	Write	vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	
DeleteVpcBlockPublicAccessExclusion	Grants permission to delete an exclusion list for blocked public access on a VPC	Write	vpc-block-public-access-exclusion*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteVpcEncryptionControl	Grants permission to delete a VPC Encryption Control	Write	vpc-encryption-control*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteVpcEndpointConnectionNotifications	Grants permission to delete one or more VPC endpoint connection notifications	Write	vpc-endpoint	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpc-endpoint-service	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:VpceMultiRegion ec2:VpceSupportedRegion	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteVpcEndpointServiceConfigurations	Grants permission to delete one or more VPC endpoint service configurations	Write	vpc-endpoint-service*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:VpceMultiRegion ec2:VpceSupportedRegion	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteVpcEndpoints	Grants permission to delete one or more VPC endpoints	Write	vpc-endpoint*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:VpceMultiRegion ec2:VpceServiceName ec2:VpceServiceRegion	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteVpcPeeringConnection	Grants permission to delete a VPC peering connection	Write	vpc-peering-connection*	aws:ResourceTag/${TagKey} ec2:AccepterVpc ec2:RequesterVpc ec2:ResourceTag/${TagKey} ec2:VpcPeeringConnectionID	
				ec2:Region	
DeleteVpnConcentrator	Grants permission to delete a VPN concentrator	Write	vpn-concentrator*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
DeleteVpnConnection	Grants permission to delete a VPN connection	Write	vpn-connection*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeleteVpnConnectionRoute	Grants permission to delete a static route for a VPN connection between a virtual private gateway and a customer gateway	Write	vpn-connection*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteVpnGateway	Grants permission to delete a virtual private gateway	Write	vpn-gateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeprovisionByoipCidr	Grants permission to release an IP address range that was provisioned through bring your own IP addresses (BYOIP), and to delete the corresponding address pool	Write		ec2:Region	
DeprovisionIpamByoasn	Grants permission to deprovision an Autonomous System Number (ASN) from an Amazon Web Services account	Write	ipam*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeprovisionIpamPoolCidr	Grants permission to deprovision a CIDR provisioned from an Amazon VPC IP Address Manager (IPAM) pool	Write	ipam-pool*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DeprovisionPublicIpv4PoolCidr	Grants permission to deprovision a CIDR from a public IPv4 pool	Write	ipv4pool-ec2*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeregisterImage	Grants permission to deregister an Amazon Machine Image (AMI)	Write	image*	aws:ResourceTag/${TagKey} ec2:ImageID ec2:ImageType ec2:Owner ec2:Public ec2:ResourceTag/${TagKey} ec2:RootDeviceType	
				ec2:Region	
DeregisterInstanceEventNotificationAttributes	Grants permission to remove tags from the set of tags to include in notifications about scheduled events for your instances	Write		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeregisterTransitGatewayMulticastGroupMembers	Grants permission to deregister one or more network interface members from a group IP address in a transit gateway multicast domain	Write	network-interface	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:ManagedResourceOperator ec2:NetworkInterfaceID ec2:ResourceTag/${TagKey} ec2:Subnet ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-multicast-domain	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayMulticastDomainId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeregisterTransitGatewayMulticastGroupSources	Grants permission to deregister one or more network interface sources from a group IP address in a transit gateway multicast domain	Write	network-interface	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:ManagedResourceOperator ec2:NetworkInterfaceID ec2:ResourceTag/${TagKey} ec2:Subnet ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-multicast-domain	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayMulticastDomainId	
				ec2:Region	
DescribeAccountAttributes	Grants permission to describe the attributes of the AWS account	List		ec2:Region	
DescribeAddressTransfers	Grants permission to describe an Elastic IP address transfer	List		ec2:Region	
DescribeAddresses	Grants permission to describe one or more Elastic IP addresses	List		ec2:Region	
DescribeAddressesAttribute	Grants permission to describe the attributes of the specified Elastic IP addresses	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeAggregateIdFormat	Grants permission to describe the longer ID format settings for all resource types	List		ec2:Region	
DescribeAvailabilityZones	Grants permission to describe one or more of the Availability Zones that are available to you	List		ec2:Region	
DescribeAwsNetworkPerformanceMetricSubscriptions	Grants permission to describe the current infrastructure performance metric subscriptions	List		ec2:Region	
DescribeBundleTasks	Grants permission to describe one or more bundling tasks	List		ec2:Region	
DescribeByoipCidrs	Grants permission to describe the IP address ranges that were provisioned through bring your own IP addresses (BYOIP)	List		ec2:Region	
DescribeCapacityBlockExtensionHistory	Grants permission to describe Capacity Block extensions history	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeCapacityBlockExtensionOfferings	Grants permission to describe Capacity Block extensions offerings	List	capacity-reservation*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:CapacityReservationFleet ec2:CreateDate ec2:DestinationCapacityReservationId ec2:EbsOptimized ec2:EndDate ec2:EndDateType ec2:InstanceCount	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMatchCriteria ec2:InstancePlatform ec2:InstanceType ec2:OutpostArn ec2:PlacementGroup ec2:ResourceTag/${TagKey} ec2:SourceCapacityReservationId ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeCapacityBlockOfferings	Grants permission to describe Capacity Block offerings available for purchase	List		ec2:Region	
DescribeCapacityBlockStatus	Grants permission to describe the availability of capacity for the specified Capacity blocks, or all of your Capacity Blocks	List		ec2:Region	
DescribeCapacityBlocks	Grants permission to describe details about Capacity Blocks in the AWS Region that you're currently using	List		ec2:Region	
DescribeCapacityManagerDataExports	Grants permission to describe one or more Capacity Manager data export configurations	List		ec2:Region	
DescribeCapacityReservationBillingRequests	Grants permission to describe one or more requests to assign the billing of the unused capacity of a Capacity Reservation	List		ec2:Region	
DescribeCapacityReservationFleets	Grants permission to describe one or more Capacity Reservation Fleets	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeCapacityReservationTopology	Grants permission to describe the topology of one or more Capacity Reservations	List		ec2:Region	
DescribeCapacityReservations	Grants permission to describe one or more Capacity Reservations	List		ec2:Region	
DescribeCarrierGateways	Grants permission to describe one or more Carrier Gateways	List		ec2:Region	
DescribeClassicLinkInstances	Grants permission to describe one or more linked EC2-Classic instances	List		ec2:Region	
DescribeClientVpnAuthorizationRules	Grants permission to describe the authorization rules for a Client VPN endpoint	List	client-vpn-endpoint*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeClientVpnConnections	Grants permission to describe active client connections and connections that have been terminated within the last 60 minutes for a Client VPN endpoint	List	client-vpn-endpoint*	aws:ResourceTag/${TagKey} ec2:ClientRootCertificateChainArn ec2:CloudwatchLogGroupArn ec2:CloudwatchLogStreamArn ec2:DirectoryArn ec2:ResourceTag/${TagKey} ec2:SamlProviderArn ec2:ServerCertificateArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
DescribeClientVpnEndpoints	Grants permission to describe one or more Client VPN endpoints	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeClientVpnRoutes	Grants permission to describe the routes for a Client VPN endpoint	List	client-vpn-endpoint*	aws:ResourceTag/${TagKey} ec2:ClientRootCertificateChainArn ec2:CloudwatchLogGroupArn ec2:CloudwatchLogStreamArn ec2:DirectoryArn ec2:ResourceTag/${TagKey} ec2:SamlProviderArn ec2:ServerCertificateArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeClientVpnTargetNetworks	Grants permission to describe the target networks that are associated with a Client VPN endpoint	List	client-vpn-endpoint*	aws:ResourceTag/${TagKey} ec2:ClientRootCertificateChainArn ec2:CloudwatchLogGroupArn ec2:CloudwatchLogStreamArn ec2:DirectoryArn ec2:ResourceTag/${TagKey} ec2:SamlProviderArn ec2:ServerCertificateArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
DescribeCoipPools	Grants permission to describe the specified customer-owned address pools or all of your customer-owned address pools	List		ec2:Region	
DescribeConversionTasks	Grants permission to describe one or more conversion tasks	List		ec2:Region	
DescribeCustomerGateways	Grants permission to describe one or more customer gateways	List		ec2:Region	
DescribeDeclarativePoliciesReports	Grants permission to describe one or more declarative policies reports	List		ec2:Region	
DescribeDhcpOptions	Grants permission to describe one or more DHCP options sets	List		ec2:Region	
DescribeEgressOnlyInternetGateways	Grants permission to describe one or more egress-only internet gateways	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeElasticGpus	Grants permission to describe an Elastic Graphics accelerator that is associated with an instance	List		ec2:Region	
DescribeExportImageTasks	Grants permission to describe one or more export image tasks	List		ec2:Region	
DescribeExportTasks	Grants permission to describe one or more export instance tasks	List		ec2:Region	
DescribeFastLaunchImages	Grants permission to describe fast-launch enabled Windows AMIs	List		ec2:Region	
DescribeFastSnapshotRestores	Grants permission to describe the state of fast snapshot restores for snapshots	List		ec2:Region	
DescribeFleetHistory	Grants permission to describe the events for an EC2 Fleet during a specified time	List	fleet*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeFleetInstances	Grants permission to describe the running instances for an EC2 Fleet	List	fleet*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DescribeFleets	Grants permission to describe one or more EC2 Fleets	List		ec2:Region	
DescribeFlowLogs	Grants permission to describe one or more flow logs	List		ec2:Region	
DescribeFpgaImageAttribute	Grants permission to describe the attributes of an Amazon FPGA Image (AFI)	List	fpga-image*	aws:ResourceTag/${TagKey} ec2:Owner ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeFpgaImages	Grants permission to describe one or more Amazon FPGA Images (AFIs)	List		ec2:Region	
DescribeHostReservationOfferings	Grants permission to describe the Dedicated Host Reservations that are available to purchase	List		ec2:Region	
DescribeHostReservations	Grants permission to describe the Dedicated Host Reservations that are associated with Dedicated Hosts in the AWS account	List		ec2:Region	
DescribeHosts	Grants permission to describe one or more Dedicated Hosts	List		ec2:Region	
DescribeIamInstanceProfileAssociations	Grants permission to describe the IAM instance profile associations	List		ec2:Region	
DescribeIdFormat	Grants permission to describe the ID format settings for resources	List		ec2:Region	
DescribeIdentityIdFormat	Grants permission to describe the ID format settings for resources for an IAM user, IAM role, or root user	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeImageAttribute	Grants permission to describe an attribute of an Amazon Machine Image (AMI)	List	image*	aws:ResourceTag/${TagKey} ec2:ImageID ec2:ImageType ec2:Owner ec2:Public ec2:ResourceTag/${TagKey} ec2:RootDeviceType	
				ec2:Region	
DescribeImageReferences	Grants permission to describe your AWS resources that are referencing specified images	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeImageUsageReportEntries	Grants permission to describe the entries of an AMI usage report	List		ec2:Region	
DescribeImageUsageReports	Grants permission to describe the configuration and status of an AMI usage report	List		ec2:Region	
DescribeImages	Grants permission to describe one or more images (AMIs, AKIs, and ARIs)	List		ec2:Region	
DescribeImportImageTasks	Grants permission to describe import virtual machine or import snapshot tasks	List		ec2:Region	
DescribeImportSnapshotTasks	Grants permission to describe import snapshot tasks	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeInstanceAttribute	Grants permission to describe the attributes of an instance	List	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	
DescribeInstanceConnectEndpoints	Grants permission to describe EC2 Instance Connect Endpoints	List		ec2:Region	
DescribeInstanceCreditSpecifications	Grants permission to describe the credit option for CPU usage of one or more burstable performance instances	List		ec2:Region	
DescribeInstanceEventNotificationAttributes	Grants permission to describe the set of tags to include in notifications about scheduled events for your instances	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeInstanceEventWindows	Grants permission to describe the specified event windows or all event windows	List		ec2:Region	
DescribeInstanceImageMetadata	Grants permission to describe the AMI that was used to launch an instance	List		ec2:Region	
DescribeInstanceSqlHaHistoryStates	Grants permission to describe EC2 instance SQL HA history states	List		ec2:Region	
DescribeInstanceSqlHaStates	Grants permission to describe EC2 instance SQL HA states	List		ec2:Region	
DescribeInstanceStatus	Grants permission to describe the status of one or more instances	List		ec2:Region	
DescribeInstanceTopology	Grants permission to describe a tree-based hierarchy that represents the physical host placement of EC2 instances	List		ec2:Region	
DescribeInstanceTypeOfferings	Grants permission to describe the set of instance types that are offered in a location	List		ec2:Region	
DescribeInstanceTypes	Grants permission to describe the details of instance types that are offered in a location	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeInstances	Grants permission to describe one or more instances	List		ec2:Region	
DescribeInternetGateways	Grants permission to describe one or more internet gateways	List		ec2:Region	
DescribeIpamByoasn	Grants permission to describe a bring your own Autonomous System Number (BYOASN) that you've brought to IPAM	List		ec2:Region	
DescribeIpamExternalResourceVerificationTokens	Grants permission to describe verification tokens, which proves ownership of an external resource	List		ec2:Region	
DescribeIpamPolicies	Grants permission to describe Amazon VPC IP Address Manager (IPAM) policies	List		ec2:Region	
DescribeIpamPools	Grants permission to describe Amazon VPC IP Address Manager (IPAM) pools	List		ec2:Region	
DescribeIpamPrefixListResolverTargets	Grants permission to describe IPAM prefix list resolver targets	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeIpamPrefixListResolvers	Grants permission to describe IPAM prefix list resolvers	List		ec2:Region	
DescribeIpamResourceDiscoveries	Grants permission to describe IPAM resource discoveries	List		ec2:Region	
DescribeIpamResourceDiscoveryAssociations	Grants permission to describe resource discovery associations with an Amazon VPC IPAM	List		ec2:Region	
DescribeIpamScopes	Grants permission to describe Amazon VPC IP Address Manager (IPAM) scopes	List		ec2:Region	
DescribeIpams	Grants permission to describe an Amazon VPC IP Address Manager (IPAM)	List		ec2:Region	
DescribeIpv6Pools	Grants permission to describe one or more IPv6 address pools	List		ec2:Region	
DescribeKeyPairs	Grants permission to describe one or more key pairs	List		ec2:Region	
DescribeLaunchTemplateVersions	Grants permission to describe one or more launch template versions	List		ec2:Region	ssm:GetParameters

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeLaunchTemplates	Grants permission to describe one or more launch templates	List		ec2:Region	
DescribeLocalGatewayRouteTablePermissions [permission only]	Grants permission to allow a service to describe local gateway route table permissions	List		ec2:Region	
DescribeLocalGatewayRouteTableVirtualInterfaceGroupAssociations	Grants permission to describe the associations between virtual interface groups and local gateway route tables	List		ec2:Region	
DescribeLocalGatewayRouteTableVpcAssociations	Grants permission to describe an association between VPCs and local gateway route tables	List		ec2:Region	
DescribeLocalGatewayRouteTables	Grants permission to describe one or more local gateway route tables	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeLocalGatewayVirtualInterfaceGroups	Grants permission to describe local gateway virtual interface groups	List		ec2:Region	
DescribeLocalGatewayVirtualInterfaces	Grants permission to describe local gateway virtual interfaces	List		ec2:Region	
DescribeLocalGateways	Grants permission to describe one or more local gateways	List		ec2:Region	
DescribeLockedSnapshots	Grants permission to describe the lock status for a snapshot	List		ec2:Region	
DescribeMacHosts	Grants permission to describe your EC2 Mac Dedicated hosts	List		ec2:Region	
DescribeMacModificationTasks	Grants permission to describe a System Integrity Protection (SIP) modification task or volume ownership delegation task for an Amazon EC2 Mac instance	List		ec2:Region	
DescribeManagedPrefixLists	Grants permission to describe your managed prefix lists and any AWS-managed prefix lists	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeMovingAddresses	Grants permission to describe Elastic IP addresses that are being moved to the EC2-VPC platform	List		ec2:Region	
DescribeNatGateways	Grants permission to describe one or more NAT gateways	List		ec2:Region	
DescribeNetworkAcls	Grants permission to describe one or more network ACLs	List		ec2:Region	
DescribeNetworkInsightsAccessScopeAnalyses	Grants permission to describe one or more Network Access Scope analyses	List		ec2:Region	
DescribeNetworkInsightsAccessScopes	Grants permission to describe the Network Access Scopes	List		ec2:Region	
DescribeNetworkInsightsAnalyses	Grants permission to describe one or more network insights analyses	List		ec2:Region	
DescribeNetworkInsightsPaths	Grants permission to describe one or more network insights paths	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeNetworkInterfaceAttribute	Grants permission to describe a network interface attribute	List		ec2:Region	
DescribeNetworkInterfacePermissions	Grants permission to describe the permissions that are associated with a network interface	List		ec2:Region	
DescribeNetworkInterfaces	Grants permission to describe one or more network interfaces	List		ec2:Region	
DescribeOutpostLags	Grants permission to describe Outpost LAGs	List		ec2:Region	
DescribePlacementGroups	Grants permission to describe one or more placement groups	List		ec2:Region	
DescribePrefixLists	Grants permission to describe available AWS services in a prefix list format	List		ec2:Region	
DescribePrincipalIdFormat	Grants permission to describe the ID format settings for the root user and all IAM roles and IAM users that have explicitly specified a longer ID (17-character ID) preference	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribePublicIpv4Pools	Grants permission to describe one or more IPv4 address pools	List		ec2:Region	
DescribeRegions	Grants permission to describe one or more AWS Regions that are currently available in your account	List		ec2:Region	
DescribeReplaceRootVolumeTasks	Grants permission to describe a root volume replacement task	List		ec2:Region	
DescribeReservedInstances	Grants permission to describe one or more purchased Reserved Instances in your account	List		ec2:Region	
DescribeReservedInstancesListings	Grants permission to describe your account's Reserved Instance listings in the Reserved Instance Marketplace	List		ec2:Region	
DescribeReservedInstancesModifications	Grants permission to describe the modifications made to one or more Reserved Instances	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeReservedInstancesOfferings	Grants permission to describe the Reserved Instance offerings that are available for purchase	List		ec2:Region	
DescribeRouteServerEndpoints	Grants permission to describe one or more route server endpoints	List		ec2:Region	
DescribeRouteServerPeers	Grants permission to describe one or more route server peers	List		ec2:Region	
DescribeRouteServers	Grants permission to describe one or more route servers	List		ec2:Region	
DescribeRouteTables	Grants permission to describe one or more route tables	List		ec2:Region	
DescribeScheduledInstanceAvailability	Grants permission to find available schedules for Scheduled Instances	List		ec2:Region	
DescribeScheduledInstances	Grants permission to describe one or more Scheduled Instances in your account	List		ec2:Region	
DescribeSecondaryInterfaces	Grants permission to describe one or more secondary interfaces	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeSecondaryNetworks	Grants permission to describe one or more secondary networks	List		ec2:Region	
DescribeSecondarySubnets	Grants permission to describe one or more secondary subnets	List		ec2:Region	
DescribeSecurityGroupReferences	Grants permission to describe the VPCs on the other side of a VPC peering connection that are referencing specified VPC security groups	List	security-group*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID ec2:Vpc	
				ec2:Region	
DescribeSecurityGroupRules	Grants permission to describe one or more of your security group rules	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeSecurityGroupVpcAssociations	Grants permission to describe security group VPC associations	List		ec2:Region	
DescribeSecurityGroups	Grants permission to describe one or more security groups	List		ec2:Region	
DescribeServiceLinkVirtualInterfaces	Grants permission to describe service link virtual interfaces	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeSnapshotAttribute	Grants permission to describe an attribute of a snapshot	List	snapshot*	aws:ResourceTag/${TagKey} ec2:Encrypted ec2:OutpostArn ec2:Owner ec2:ParentVolume ec2:ResourceTag/${TagKey} ec2:SnapshotID ec2:SnapshotTime ec2:SourceOutpostArn ec2:VolumeSize	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
DescribeSnapshotTierStatus	Grants permission to describe the storage tier status for Amazon EBS snapshots	List		ec2:Region	
DescribeSnapshots	Grants permission to describe one or more EBS snapshots	List		ec2:Region	
DescribeSpotDatafeedSubscription	Grants permission to describe the data feed for Spot Instances	List		ec2:Region	
DescribeSpotFleetInstances	Grants permission to describe the running instances for a Spot Fleet	List	spot-fleet-request*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeSpotFleetRequestHistory	Grants permission to describe the events for a Spot Fleet request during a specified time	List	spot-fleet-request*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DescribeSpotFleetRequests	Grants permission to describe one or more Spot Fleet requests	List		ec2:Region	
DescribeSpotInstanceRequests	Grants permission to describe one or more Spot Instance requests	List		ec2:Region	
DescribeSpotPriceHistory	Grants permission to describe the Spot Instance price history	List		ec2:Region	
DescribeStaleSecurityGroups	Grants permission to describe the stale security group rules for security groups in a specified VPC	List		ec2:Region	
DescribeStoreImageTasks	Grants permission to describe the progress of the AMI store tasks	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeSubnets	Grants permission to describe one or more subnets	List		ec2:Region	
DescribeTags	Grants permission to describe one or more tags for an Amazon EC2 resource	List		ec2:Region	
DescribeTrafficMirrorFilterRules	Grants permission to describe traffic mirror filters that determine the traffic that is mirrored	List		ec2:Region	
DescribeTrafficMirrorFilters	Grants permission to describe one or more traffic mirror filters	List		ec2:Region	
DescribeTrafficMirrorSessions	Grants permission to describe one or more traffic mirror sessions	List		ec2:Region	
DescribeTrafficMirrorTargets	Grants permission to describe one or more traffic mirror targets	List		ec2:Region	
DescribeTransitGatewayAttachments	Grants permission to describe one or more attachments between resources and transit gateways	List		ec2:Region	
DescribeTransitGatewayConnectPeers	Grants permission to describe one or more transit gateway connect peers	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeTransitGatewayConnects	Grants permission to describe one or more transit gateway connect attachments	List		ec2:Region	
DescribeTransitGatewayMeteringPolicies	Grants permission to describe one or more transit gateway metering policies	List		ec2:Region	
DescribeTransitGatewayMulticastDomains	Grants permission to describe one or more transit gateway multicast domains	List		ec2:Region	
DescribeTransitGatewayPeeringAttachments	Grants permission to describe one or more transit gateway peering attachments	List		ec2:Region	
DescribeTransitGatewayPolicyTables	Grants permission to describe a transit gateway policy table	List		ec2:Region	
DescribeTransitGatewayRouteTableAnnouncements	Grants permission to describe a transit gateway route table announcement	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeTransitGatewayRouteTables	Grants permission to describe one or more transit gateway route tables	List		ec2:Region	
DescribeTransitGatewayVpcAttachments	Grants permission to describe one or more VPC attachments on a transit gateway	List		ec2:Region	
DescribeTransitGateways	Grants permission to describe one or more transit gateways	List		ec2:Region	
DescribeTrunkInterfaceAssociations	Grants permission to describe one or more network interface trunk associations	List		ec2:Region	
DescribeVerifiedAccessEndpoints	Grants permission to describe the specified Verified Access endpoints or all Verified Access endpoints	List		ec2:Region	
DescribeVerifiedAccessGroups	Grants permission to describe the specified Verified Access groups or all Verified Access groups	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeVerifiedAccessInstanceLoggingConfigurations	Grants permission to describe the current logging configuration for the Verified Access instances	List		ec2:Region	
DescribeVerifiedAccessInstanceWebAclAssociations [permission only]	Grants permission to describe the AWS Web Application Firewall (WAF) web access control list (ACL) associations for a Verified Access instance	List		ec2:Region	
DescribeVerifiedAccessInstances	Grants permission to describe the specified Verified Access instances or all Verified Access instances	List		ec2:Region	
DescribeVerifiedAccessTrustProviders	Grants permission to describe details of existing Verified Access trust providers	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeVolumeAttribute	Grants permission to describe an attribute of an EBS volume	List	volume*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:Encrypted ec2:ManagedResourceOperator ec2:ParentSnapshot ec2:ParentVolume ec2:ResourceTag/${TagKey} ec2:VolumeID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:VolumeInitializationRate ec2:VolumeIops ec2:VolumeSize ec2:VolumeThroughput ec2:VolumeType	
				ec2:Region	
DescribeVolumeStatus	Grants permission to describe the status of one or more EBS volumes	List		ec2:Region	
DescribeVolumes	Grants permission to describe one or more EBS volumes	List		ec2:Region	
DescribeVolumesModifications	Grants permission to describe the current modification status of one or more EBS volumes	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeVpcAttribute	Grants permission to describe an attribute of a VPC	List	vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	
DescribeVpcBlockPublicAccessExclusions	Grants permission to describe an exclusion list for blocked public access on a VPC	List		ec2:Region	
DescribeVpcBlockPublicAccessOptions	Grants permission to describe options for blocked public access on a VPC	List		ec2:Region	
DescribeVpcClassicLink	Grants permission to describe the ClassicLink status of one or more VPCs	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeVpcClassicLinkDnsSupport	Grants permission to describe the ClassicLink DNS support status of one or more VPCs	List		ec2:Region	
DescribeVpcEncryptionControls	Grants permission to describe one or more VPC Encryption Controls	List		ec2:Region	
DescribeVpcEndpointAssociations	Grants permission to describe the VPC endpoint associations	List		ec2:Region	
DescribeVpcEndpointConnectionNotifications	Grants permission to describe the connection notifications for VPC endpoints and VPC endpoint services	List		ec2:Region	
DescribeVpcEndpointConnections	Grants permission to describe the VPC endpoint connections to your VPC endpoint services	List		ec2:Region	
DescribeVpcEndpointServiceConfigurations	Grants permission to describe VPC endpoint service configurations (your services)	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeVpcEndpointServicePermissions	Grants permission to describe the principals (service consumers) that are permitted to discover your VPC endpoint service	List	vpc-endpoint-service*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:VpceMultiRegion ec2:VpceSupportedRegion	
				ec2:Region	
DescribeVpcEndpointServices	Grants permission to describe all supported AWS services that can be specified when creating a VPC endpoint	List		ec2:Region	
DescribeVpcEndpoints	Grants permission to describe one or more VPC endpoints	List		ec2:Region	
DescribeVpcPeeringConnections	Grants permission to describe one or more VPC peering connections	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeVpcs	Grants permission to describe one or more VPCs	List		ec2:Region	
DescribeVpnConcentrators	Grants permission to describe one or more VPN concentrators	List		ec2:Region	
DescribeVpnConnections	Grants permission to describe one or more VPN connections	List		ec2:Region	
DescribeVpnGateways	Grants permission to describe one or more virtual private gateways	List		ec2:Region	
DetachApplianceFromNatGateway [permission only]	Grants permission to detach an appliance from a public/private Natgateway	Permissions management	natgateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DetachClassicLinkVpc	Grants permission to unlink (detach) a linked EC2-Classic instance from a VPC	Write	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceBandwidthWeighting ec2:InstanceID ec2:InstanceMarketType ec2:InstanceProfile ec2:InstanceType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	
DetachInternetGateway	Grants permission to detach an internet gateway from a VPC	Write	internet-gateway*	aws:ResourceTag/${TagKey} ec2:InternetGatewayID ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DetachNetworkInterface	Grants permission to detach a network interface from an instance	Write	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			network-interface*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:ManagedResourceOperator ec2:NetworkInterfaceID ec2:ResourceTag/${TagKey} ec2:Subnet ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DetachResourcesFromPlacementGroup [permission only]	Grants permission to detach resources from a placement group	Permissions management	placement-group*	aws:ResourceTag/${TagKey} ec2:PlacementGroupName ec2:PlacementGroupStrategy ec2:ResourceTag/${TagKey}	
				ec2:Region	
DetachVerifiedAccessTrustProvider	Grants permission to detach a trust provider from a Verified Access instance	Write	verified-access-instance*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			verified-access-trust-provider*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DetachVolume	Grants permission to detach an EBS volume from an instance	Write	volume*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:Encrypted ec2:ManagedResourceOperator ec2:ParentSnapshot ec2:ParentVolume ec2:ResourceTag/${TagKey} ec2:VolumeID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:VolumeInitializationRate ec2:VolumeIops ec2:VolumeSize ec2:VolumeThroughput ec2:VolumeType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			instance	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	
DetachVpnGateway	Grants permission to detach a virtual private gateway from a VPC	Write	vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpn-gateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DisableAddressTransfer	Grants permission to disable Elastic IP address transfer	Write	elastic-ip*	aws:ResourceTag/${TagKey} ec2:AllocationId ec2:Domain ec2:PublicIpAddress ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
DisableAllowedImagesSettings	Grants permission to disable allowed images settings	Write		ec2:Region	
DisableAwsNetworkPerformanceMetricSubscription	Grants permission to disable infrastructure performance metric subscriptions	Write		ec2:Region	
DisableCapacityManager	Grants permission to disable EC2 Capacity Manager for your account	Write		ec2:Region	
DisableEbsEncryptionByDefault	Grants permission to disable EBS encryption by default for your account	Write		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableFastLaunch	Grants permission to disable faster launching for Windows AMIs	Write	image*	aws:ResourceTag/${TagKey} ec2:ImageID ec2:ImageType ec2:Owner ec2:Public ec2:ResourceTag/${TagKey} ec2:RootDeviceType	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableFastSnapshotRestores	Grants permission to disable fast snapshot restores for one or more snapshots in specified Availability Zones	Write	snapshot*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:Encrypted ec2:Owner ec2:ParentVolume ec2:ResourceTag/${TagKey} ec2:SnapshotID ec2:SnapshotTime ec2:VolumeSize	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableImage	Grants permission to disable an AMI	Write	image*	aws:ResourceTag/${TagKey} ec2:ImageID ec2:ImageType ec2:Owner ec2:Public ec2:ResourceTag/${TagKey} ec2:RootDeviceType	
				ec2:Region	
DisableImageBlockPublicAccess	Grants permission to disable block public access for AMIs at the account level in the specified AWS Region	Permissions management		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableImageDeprecation	Grants permission to cancel the deprecation of the specified AMI	Write	image*	aws:ResourceTag/${TagKey} ec2:ImageID ec2:ImageType ec2:Owner ec2:Public ec2:ResourceTag/${TagKey} ec2:RootDeviceType	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableImageDeregistrationProtection	Grants permission to disable deregistration protection for an AMI. When deregistration protection is disabled, the AMI can be deregistered	Write	image*	aws:ResourceTag/${TagKey} ec2:ImageID ec2:ImageType ec2:Owner ec2:Public ec2:ResourceTag/${TagKey} ec2:RootDeviceType	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableInstanceSqlHaStandbyDetections	Grants permission to disable EC2 instance SQL HA standby detections	Write	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID ec2:InstanceMarketType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
DisableIpamOrganizationAdminAccount	Grants permission to disable an AWS Organizations member account as an Amazon VPC IP Address Manager (IPAM) admin account	Write		ec2:Region	organizations:DeregisterDelegatedAdministrator
DisableIpamPolicy	Grants permission to disable a policy in Amazon VPC IP Address Manager (IPAM) that controls public IPv4 address allocation	Write	ipam-policy*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DisableRouteServerPropagation	Grants permission to disable route server propagation	Write	route-server*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:RouteTableID ec2:Vpc	
				ec2:Region	
DisableSerialConsoleAccess	Grants permission to disable access to the EC2 serial console of all instances for your account	Write		ec2:Region	
DisableSnapshotBlockPublicAccess	Grants permission to disable the block public access for snapshots setting for a Region	Permissions management		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableTransitGatewayRouteTablePropagation	Grants permission to disable a resource attachment from propagating routes to the specified propagation route table	Write	transit-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayRouteTableId	
			transit-gateway-attachment	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-route-table-announcement	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayRouteTableAnnouncementId	
				ec2:Region	
DisableVgwRoutePropagation	Grants permission to disable a virtual private gateway from propagating routes to a specified route table of a VPC	Write	route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:RouteTableID ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpn-gateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DisableVpcClassicLink	Grants permission to disable ClassicLink for a VPC	Write	vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableVpcClassicLinkDnsSupport	Grants permission to disable ClassicLink DNS support for a VPC	Write	vpc	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateAddress	Grants permission to disassociate an Elastic IP address from an instance or network interface	Write	elastic-ip	aws:ResourceTag/${TagKey} ec2:AllocationId ec2:Domain ec2:PublicIpAddress ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			network-interface	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:ManagedResourceOperator ec2:NetworkInterfaceID ec2:ResourceTag/${TagKey} ec2:Subnet ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateCapacityReservationBillingOwner	Grants permission to cancel a pending request to assign billing of the unused capacity of a Capacity Reservation to a consumer account	Write	capacity-reservation*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:CapacityReservationFleet ec2:CreateDate ec2:DestinationCapacityReservationId ec2:EbsOptimized ec2:EndDate ec2:EndDateType ec2:InstanceCount	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMatchCriteria ec2:InstancePlatform ec2:InstanceType ec2:OutpostArn ec2:PlacementGroup ec2:ResourceTag/${TagKey} ec2:SourceCapacityReservationId ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateClientVpnTargetNetwork	Grants permission to disassociate a target network from a Client VPN endpoint	Write	client-vpn-endpoint*	aws:ResourceTag/${TagKey} ec2:ClientRootCertificateChainArn ec2:CloudwatchLogGroupArn ec2:CloudwatchLogStreamArn ec2:DirectoryArn ec2:ResourceTag/${TagKey} ec2:SamlProviderArn ec2:ServerCertificateArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
DisassociateEnclaveCertificateIamRole	Grants permission to disassociate an ACM certificate from a IAM role	Write	certificate*		
			role*		
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateIamInstanceProfile	Grants permission to disassociate an IAM instance profile from a running or stopped instance	Write	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	
DisassociateInstanceEventWindow	Grants permission to disassociate one or more targets from an event window	Write	instance-event-window*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DisassociateIpamByoasn	Grants permission to disassociate an Autonomous System Number (ASN) from a BYOIP CIDR	Write		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateIpamResourceDiscovery	Grants permission to disassociate a resource discovery from an Amazon VPC IPAM	Write	ipam-resource-discovery-association*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DisassociateNatGatewayAddress	Grants permission to disassociate a secondary Elastic IP address from a public NAT gateway	Write	elastic-ip*	aws:ResourceTag/${TagKey} ec2:AllocationId ec2:Domain ec2:PublicIpAddress ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			natgateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			network-interface	aws:ResourceTag/${TagKey} ec2:AuthorizedUser ec2:AvailabilityZone ec2:ManagedResourceOperator ec2:NetworkInterfaceID ec2:Permission ec2:ResourceTag/${TagKey} ec2:Subnet ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
DisassociateRouteServer	Grants permission to disassociate a route server from a VPC	Write	route-server*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			vpc*	aws:ResourceTag/${TagKey} ec2:Ipv4IpamPoolId ec2:Ipv6IpamPoolId ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
DisassociateRouteTable	Grants permission to disassociate a subnet from a route table	Write	internet-gateway	aws:ResourceTag/${TagKey} ec2:InternetGatewayID ec2:ResourceTag/${TagKey}	
			ipv4pool-ec2	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ipv6pool-ec2	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			route-table	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:RouteTableID ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			subnet	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc	
			vpn-gateway	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
DisassociateSecurityGroupVpc	Grants permission to disassociate a security group from a VPC	Write	security-group*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpc	aws:ResourceTag/${TagKey} ec2:Ipv4IpamPoolId ec2:Ipv6IpamPoolId ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateSubnetCidrBlock	Grants permission to disassociate a CIDR block from a subnet	Write	subnet*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateTransitGatewayMulticastDomain	Grants permission to disassociate one or more subnets from a transit gateway multicast domain	Write	subnet*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-attachment*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
			transit-gateway-multicast-domain*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayMulticastDomainId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateTransitGatewayPolicyTable	Grants permission to disassociate a policy table from a transit gateway	Write	transit-gateway-attachment*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
			transit-gateway-policy-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayPolicyTableId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateTransitGatewayRouteTable	Grants permission to disassociate a resource attachment from a transit gateway route table	Write	transit-gateway-attachment*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
			transit-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayRouteTableId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateTrunkInterface	Grants permission to disassociate a branch network interface to a trunk network interface	Write		ec2:Region	
DisassociateVerifiedAccessInstanceWebAcl [permission only]	Grants permission to disassociate an AWS Web Application Firewall (WAF) web access control list (ACL) from a Verified Access instance	Write	verified-access-instance*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
DisassociateVpcCidrBlock	Grants permission to disassociate a CIDR block from a VPC	Write	vpc	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
EnableAddressTransfer	Grants permission to enable Elastic IP address transfer	Write	elastic-ip*	aws:ResourceTag/${TagKey} ec2:AllocationId ec2:Domain ec2:PublicIpAddress ec2:ResourceTag/${TagKey}	
				ec2:Region	
EnableAllowedImagesSettings	Grants permission to enable allowed images settings	Write		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableAwsNetworkPerformanceMetricSubscription	Grants permission to enable infrastructure performance subscriptions	Write		ec2:Region	
EnableCapacityManager	Grants permission to enable EC2 Capacity Manager for your account	Write		ec2:Region	
EnableEbsEncryptionByDefault	Grants permission to enable EBS encryption by default for your account	Write		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableFastLaunch	Grants permission to enable faster launching for Windows AMIs	Write	image*	aws:ResourceTag/${TagKey} ec2:ImageID ec2:ImageType ec2:Owner ec2:Public ec2:ResourceTag/${TagKey} ec2:RootDeviceType	ec2:CreateLaunchTemplate ec2:CreateSnapshot ec2:CreateTags ec2:DeleteSnapshot ec2:DescribeImages ec2:DescribeInstanceAttribute ec2:DescribeInstanceStatus ec2:DescribeInstanceTypeOfferings ec2:DescribeInstances

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					ec2:DescribeLaunchTemplateVersions ec2:DescribeLaunchTemplates ec2:DescribeSnapshots ec2:DescribeSubnets ec2:RunInstances ec2:StopInstances ec2:TerminateInstances iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			launch-template	aws:ResourceTag/${TagKey} ec2:ManagedResourceOperator ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableFastSnapshotRestores	Grants permission to enable fast snapshot restores for one or more snapshots in specified Availability Zones	Write	snapshot*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:Encrypted ec2:Owner ec2:ParentVolume ec2:ResourceTag/${TagKey} ec2:SnapshotID ec2:SnapshotTime ec2:VolumeSize	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableImage	Grants permission to re-enable a disabled AMI	Write	image*	aws:ResourceTag/${TagKey} ec2:ImageID ec2:ImageType ec2:Owner ec2:Public ec2:ResourceTag/${TagKey} ec2:RootDeviceType	
				ec2:Region	
EnableImageBlockPublicAccess	Grants permission to enable block public access for AMIs at the account level in the specified AWS Region	Permissions management		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableImageDeprecation	Grants permission to enable deprecation of the specified AMI at the specified date and time	Write	image*	aws:ResourceTag/${TagKey} ec2:ImageID ec2:ImageType ec2:Owner ec2:Public ec2:ResourceTag/${TagKey} ec2:RootDeviceType	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableImageDeregistrationProtection	Grants permission to enable deregistration protection for an AMI. When deregistration protection is enabled, the AMI can't be deregistered	Write	image*	aws:ResourceTag/${TagKey} ec2:ImageID ec2:ImageType ec2:Owner ec2:Public ec2:ResourceTag/${TagKey} ec2:RootDeviceType	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableInstanceSqlHaStandbyDetections	Grants permission to enable EC2 instance SQL HA standby detections	Write	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID ec2:InstanceMarketType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
EnableIpamOrganizationAdminAccount	Grants permission to enable an AWS Organizations member account as an Amazon VPC IP Address Manager (IPAM) admin account	Write		ec2:Region	iam:CreateServiceLinkedRole organizations:EnableAWSServiceAccess organizations:RegisterDelegatedAdministrator
EnableIpamPolicy	Grants permission to enable an Amazon VPC IP Address Manager (IPAM) policy	Write	ipam-policy*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableReachabilityAnalyzerOrganizationSharing	Grants permission to enable organization sharing of reachability analyzer	Write		ec2:Region	iam:CreateServiceLinkedRole organizations:EnableAWSServiceAccess
EnableRouteServerPropagation	Grants permission to enable route server propagation	Write	route-server*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:RouteTableID ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
EnableSerialConsoleAccess	Grants permission to enable access to the EC2 serial console of all instances for your account	Write		ec2:Region	
EnableSnapshotBlockPublicAccess	Grants permission to enable or modify the block public access for snapshots setting for a Region	Permissions management		ec2:Region	
EnableTransitGatewayRouteTablePropagation	Grants permission to enable an attachment to propagate routes to a propagation route table	Write	transit-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayRouteTableId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-attachment	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
			transit-gateway-route-table-announcement	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayRouteTableAnnouncementId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableVgwRoutePropagation	Grants permission to enable a virtual private gateway to propagate routes to a VPC route table	Write	route-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:RouteTableID ec2:Vpc	
			vpn-gateway*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableVolumeIO	Grants permission to enable I/O operations for a volume that had I/O operations disabled	Write	volume*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:Encrypted ec2:ManagedResourceOperator ec2:ParentSnapshot ec2:ResourceTag/${TagKey} ec2:VolumeID ec2:VolumeIops	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:VolumeSize ec2:VolumeThroughput ec2:VolumeType	
				ec2:Region	
EnableVpcClassicLink	Grants permission to enable a VPC for ClassicLink	Write	vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableVpcClassicLinkDnsSupport	Grants permission to enable a VPC to support DNS hostname resolution for ClassicLink	Write	vpc	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ExportClientVpnClientCertificateRevocationList	Grants permission to download the client certificate revocation list for a Client VPN endpoint	Read	client-vpn-endpoint*	aws:ResourceTag/${TagKey} ec2:ClientRootCertificateChainArn ec2:CloudwatchLogGroupArn ec2:CloudwatchLogStreamArn ec2:DirectoryArn ec2:ResourceTag/${TagKey} ec2:SamlProviderArn ec2:ServerCertificateArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ExportClientVpnClientConfiguration	Grants permission to download the contents of the Client VPN endpoint configuration file for a Client VPN endpoint	Read	client-vpn-endpoint*	aws:ResourceTag/${TagKey} ec2:ClientRootCertificateChainArn ec2:CloudwatchLogGroupArn ec2:CloudwatchLogStreamArn ec2:DirectoryArn ec2:ResourceTag/${TagKey} ec2:SamlProviderArn ec2:ServerCertificateArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
ExportImage	Grants permission to export an Amazon Machine Image (AMI) to a VM file	Write	export-image-task*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags
			image*	aws:ResourceTag/${TagKey} ec2:ImageID ec2:ImageType ec2:Owner ec2:Public ec2:ResourceTag/${TagKey} ec2:RootDeviceType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
ExportTransitGatewayRoutes	Grants permission to export routes from a transit gateway route table to an Amazon S3 bucket	Write		ec2:Region	
ExportVerifiedAccessInstanceClientConfiguration	Grants permission to export a verified access instance client configuration	Read	verified-access-instance*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
GetActiveVpnTunnelStatus	Grants permission to retrieve the current security parameters for an active VPN tunnel	Read	vpn-connection*	ec2:ResourceTag/${TagKey}	
				ec2:Region	
GetAllowedImagesSettings	Grants permission to get the allowed settings for images	Read		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAssociatedEnclaveCertificateIamRoles	Grants permission to get the list of roles associated with an ACM certificate	Read	certificate*		
				ec2:Region	
GetAssociatedIpv6PoolCidrs	Grants permission to get information about the IPv6 CIDR block associations for a specified IPv6 address pool	Read	ipv6pool-ec2*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
GetAwsNetworkPerformanceData	Grants permission to get network performance data	Read		ec2:Region	
GetCapacityManagerAttributes	Grants permission to retrieve the current configuration and status of EC2 Capacity Manager	Read		ec2:Region	
GetCapacityManagerMetricData	Grants permission to retrieve capacity usage metrics for your EC2 resources	Read		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCapacityManagerMetricDimensions	Grants permission to retrieve the available dimension values for capacity metrics within a specified time range	Read		ec2:Region	
GetCapacityReservationUsage	Grants permission to get usage information about a Capacity Reservation	Read	capacity-reservation*	aws:ResourceTag/${TagKey} ec2:CapacityReservationFleet	
				ec2:Region	
GetCoipPoolUsage	Grants permission to describe the allocations from the specified customer-owned address pool	Read	coip-pool*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetConsoleOutput	Grants permission to get the console output for an instance	Read	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetConsoleScreenshot	Grants permission to retrieve a JPG-format screenshot of a running instance	Read	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:NewInstanceProfile ec2:PlacementGroup ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	
GetDeclarativePoliciesReportSummary	Grants permission to get the report summary of declarative policies	Read	declarative-policies-report*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
GetDefaultCreditSpecification	Grants permission to get the default credit option for CPU usage of a burstable performance instance family	Read		ec2:Region	
GetEbsDefaultKmsKeyId	Grants permission to get the ID of the default customer master key (CMK) for EBS encryption by default	Read		ec2:Region	
GetEbsEncryptionByDefault	Grants permission to describe whether EBS encryption by default is enabled for your account	Read		ec2:Region	
GetEnabledIpamPolicy	Grants permission to describe the currently enabled policy in Amazon VPC IP Address Manager (IPAM)	Read		ec2:Region	
GetFlowLogsIntegrationTemplate	Grants permission to generate a CloudFormation template to streamline the integration of VPC flow logs with Amazon Athena	Read	vpc-flow-log*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
GetGroupsForCapacityReservation	Grants permission to list the resource groups to which a Capacity Reservation has been added	List	capacity-reservation*	aws:ResourceTag/${TagKey} ec2:CapacityReservationFleet	
				ec2:Region	
GetHostReservationPurchasePreview	Grants permission to preview a reservation purchase with configurations that match those of a Dedicated Host	Read		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetImageAncestry	Grants permission to retrieve the ancestry chain of an AMI back to its root AMI	Read	image*	aws:ResourceTag/${TagKey} ec2:ImageID ec2:ImageType ec2:Owner ec2:Public ec2:ResourceTag/${TagKey} ec2:RootDeviceType	
				ec2:Region	
GetImageBlockPublicAccessState	Grants permission to get the current state of block public access for AMIs at the account level in the specified AWS Region	Read		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetInstanceMetadataDefaults	Grants permission to view the default instance metadata service (IMDS) settings set for your account in the specified Region	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetInstanceTpmEkPub	Grants permission to get the public endorsement key associated with the Nitro Trusted Platform Module (NitroTPM) for the specified instance	Read	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:ResourceTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	
GetInstanceTypesFromInstanceRequirements	Grants permission to view a list of instance types with specified instance attributes	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetInstanceUefiData	Grants permission to retrieve the binary representation of the UEFI variable store	Read	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:NewInstanceProfile ec2:PlacementGroup ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	
GetIpamAddressHistory	Grants permission to retrieve historical information about a CIDR within an Amazon VPC IP Address Manager (IPAM) scope	Read	ipam-scope*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
GetIpamDiscoveredAccounts	Grants permission to retrieve IPAM discovered accounts	Read	ipam-resource-discovery*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
GetIpamDiscoveredPublicAddresses	Grants permission to retrieve the public IP addresses that have been discovered by IPAM	Read	ipam-resource-discovery*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetIpamDiscoveredResourceCidrs	Grants permission to retrieve the resource CIDRs that are monitored as part of a resource discovery	Read	ipam-resource-discovery*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
GetIpamPolicyAllocationRules	Grants permission to describe the rules that define how Amazon VPC IP Address Manager (IPAM) pools allocate IP addresses to AWS resource types within an IPAM policy	List	ipam-policy*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetIpamPolicyOrganizationTargets	Grants permission to retrieve the AWS Organizations targets associated with an Amazon VPC IP Address Manager (IPAM) policy	List	ipam-policy*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
GetIpamPoolAllocations	Grants permission to get a list of all the CIDR allocations in an Amazon VPC IP Address Manager (IPAM) pool	List	ipam-pool*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetIpamPoolCidrs	Grants permission to get the CIDRs provisioned to an Amazon VPC IP Address Manager (IPAM) pool	Read	ipam-pool*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
GetIpamPrefixListResolverRules	Grants permission to get rules for an IPAM prefix list resolver	Read	ipam-prefix-list-resolver*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetIpamPrefixListResolverVersionEntries	Grants permission to get CIDR entries for a specific version of an IPAM prefix list resolver	Read	ipam-prefix-list-resolver*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
GetIpamPrefixListResolverVersions	Grants permission to get versions of an IPAM prefix list resolver	Read	ipam-prefix-list-resolver*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetIpamResourceCidrs	Grants permission to get information about the resources in an Amazon VPC IP Address Manager (IPAM) scope	Read	ipam-scope*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			ipam-pool	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetLaunchTemplateData	Grants permission to get the configuration data of the specified instance for use with a new launch template or launch template version	Read	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	
GetManagedPrefixListAssociations	Grants permission to get information about the resources that are associated with the specified managed prefix list	Read	prefix-list*	aws:ResourceTag/${TagKey} ec2:IpamPrefixListResolverTargetId ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetManagedPrefixListEntries	Grants permission to get information about the entries for a specified managed prefix list	Read	prefix-list*	aws:ResourceTag/${TagKey} ec2:IpamPrefixListResolverTargetId ec2:ResourceTag/${TagKey}	
				ec2:Region	
GetNetworkInsightsAccessScopeAnalysisFindings	Grants permission to get the findings for one or more Network Access Scope analyses	Read	network-insights-access-scope-analysis*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetNetworkInsightsAccessScopeContent	Grants permission to get the content for a specified Network Access Scope	Read	network-insights-access-scope*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetPasswordData	Grants permission to retrieve the encrypted administrator password for a running Windows instance	Read	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetReservedInstancesExchangeQuote	Grants permission to return a quote and exchange information for exchanging one or more Convertible Reserved Instances for a new Convertible Reserved Instance	Read	reserved-instances*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:InstanceType ec2:ReservedInstancesOfferingType ec2:ResourceTag/${TagKey} ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetResourcePolicy [permission only]	Grants permission to describe an IAM policy that enables cross-account sharing	Read	ipam-pool	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			placement-group	aws:ResourceTag/${TagKey} ec2:PlacementGroupName ec2:PlacementGroupStrategy ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			verified-access-group	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
GetRouteServerAssociations	Grants permission to get associations for a route server	Read	route-server*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetRouteServerPropagations	Grants permission to get propagations for a route server	Read	route-server*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			route-table	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:RouteTableID ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetRouteServerRoutingDatabase	Grants permission to get the routing database for a route server	Read	route-server*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
GetSecurityGroupsForVpc	Grants permission to retrieve a list of security groups for a specified VPC	Read	vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSerialConsoleAccessStatus	Grants permission to retrieve the access status of your account to the EC2 serial console of all instances	Read		ec2:Region	
GetSnapshotBlockPublicAccessState	Grants permission to retrieve the current state of the block public access for snapshots setting for a Region	Read		ec2:Region	
GetSpotPlacementScores	Grants permission to calculate the Spot placement score for a Region or Availability Zone based on the specified target capacity and compute requirements	Read		ec2:Region	
GetSubnetCidrReservations	Grants permission to retrieve information about the subnet CIDR reservations	Read		ec2:Region	
GetTransitGatewayAttachmentPropagations	Grants permission to list the route tables to which a resource attachment propagates routes	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTransitGatewayMeteringPolicyEntries	Grants permission to list the entries for a transit gateway metering policy	List	transit-gateway-metering-policy*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayMeteringPolicyId	
				ec2:Region	
GetTransitGatewayMulticastDomainAssociations	Grants permission to get information about the associations for a transit gateway multicast domain	List	transit-gateway-multicast-domain*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayMulticastDomainId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
GetTransitGatewayPolicyTableAssociations	Grants permission to get information about associations for a transit gateway policy table	List	transit-gateway-policy-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayPolicyTableId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTransitGatewayPolicyTableEntries	Grants permission to get information about associations for a transit gateway policy table entry	List	transit-gateway-policy-table*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayPolicyTableId	
				ec2:Region	
GetTransitGatewayPrefixListReferences	Grants permission to get information about prefix list references for a transit gateway route table	List		ec2:Region	
GetTransitGatewayRouteTableAssociations	Grants permission to get information about associations for a transit gateway route table	List		ec2:Region	
GetTransitGatewayRouteTablePropagations	Grants permission to get information about the route table propagations for a transit gateway route table	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetVerifiedAccessEndpointPolicy	Grants permission to show the Verified Access policy associated with the endpoint	List	verified-access-endpoint*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
GetVerifiedAccessEndpointTargets	Grants permission to get verified access endpoint targets	List	verified-access-endpoint*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetVerifiedAccessGroupPolicy	Grants permission to show the contents of the Verified Access policy associated with the group	List	verified-access-group*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
GetVerifiedAccessInstanceWebAcl [permission only]	Grants permission to show the AWS Web Application Firewall (WAF) web access control list (ACL) for a Verified Access instance	List	verified-access-instance*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetVpcResourcesBlockingEncryptionEnforcement	Grants permission to describe resources that would block VPC Encryption Control enforcement	List	vpc*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	
GetVpnConnectionDeviceSampleConfiguration	Grants permission to download an AWS-provided sample configuration file to be used with the customer gateway device	List	vpn-connection*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			vpn-connection-device-type*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
GetVpnConnectionDeviceTypes	Grants permission to obtain a list of customer gateway devices for which sample configuration files can be provided	List		ec2:Region	
GetVpnTunnelReplacementStatus	Grants permission to view available tunnel endpoint maintenance events	List	vpn-connection*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
ImportByoipCidrToIpam [permission only]	Grants permission to transfer existing BYOIP IPv4 CIDRs to IPAM	Write	ipam-pool*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ImportClientVpnClientCertificateRevocationList	Grants permission to upload a client certificate revocation list to a Client VPN endpoint	Write	client-vpn-endpoint*	aws:ResourceTag/${TagKey} ec2:ClientRootCertificateChainArn ec2:CloudwatchLogGroupArn ec2:CloudwatchLogStreamArn ec2:DirectoryArn ec2:ResourceTag/${TagKey} ec2:SamlProviderArn ec2:ServerCertificateArn	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
ImportImage	Grants permission to import single or multi-volume disk images or EBS snapshots into an Amazon Machine Image (AMI)	Write	image*	aws:RequestTag/${TagKey} aws:TagKeys ec2:ImageID ec2:ImageType ec2:Owner ec2:Public ec2:RootDeviceType	ec2:CreateTags
			import-image-task*	aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			snapshot	aws:ResourceTag/${TagKey} ec2:Owner ec2:ParentVolume ec2:ResourceTag/${TagKey} ec2:SnapshotID ec2:SnapshotTime ec2:VolumeSize	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ImportInstance	Grants permission to create an import instance task using metadata from a disk image	Write	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:CpuOptionsAmdSevSnp ec2:InstanceBandwidthWeighting ec2:InstanceID ec2:ManagedResourceOperator ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			volume*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:Encrypted ec2:ManagedResourceOperator ec2:ParentSnapshot ec2:ResourceTag/${TagKey} ec2:VolumeID ec2:VolumeIops ec2:VolumeSize	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:VolumeThroughput ec2:VolumeType	
			security-group	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			subnet	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc	
				ec2:Region	
ImportKeyPair	Grants permission to import a public key from an RSA key pair that was created with a third-party tool	Write	key-pair*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ImportSnapshot	Grants permission to import a disk into an EBS snapshot	Write	import-snapshot-task*	aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateTags
			snapshot*	aws:RequestTag/${TagKey} aws:TagKeys ec2:Owner ec2:ParentVolume ec2:SnapshotID ec2:SnapshotTime ec2:VolumeSize	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ImportVolume	Grants permission to create an import volume task using metadata from a disk image	Write	volume*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:Encrypted ec2:ManagedResourceOperator ec2:ParentSnapshot ec2:ResourceTag/${TagKey} ec2:VolumeID ec2:VolumeIops	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:VolumeSize ec2:VolumeThroughput ec2:VolumeType	
				ec2:Region	
InjectApiError [permission only]	Grants permission to temporarily inject errors for target API requests	Write		ec2:FisActionId ec2:FisTargetArns ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
InjectVolumeIOLatency [permission only]	Grants permission to temporarily inject latency to I/O operations for a target Amazon EBS volume	Write	volume*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:Encrypted ec2:ParentSnapshot ec2:ResourceTag/${TagKey} ec2:VolumeID ec2:VolumeIops ec2:VolumeSize	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:VolumeThroughput ec2:VolumeType	
				ec2:Region	
ListImagesInRecycleBin	Grants permission to list Amazon Machine Images (AMIs) that are currently in the Recycle Bin	List		ec2:Region	
ListSnapshotsInRecycleBin	Grants permission to list the Amazon EBS snapshots that are currently in the Recycle Bin	List		ec2:Region	
ListVolumesInRecycleBin	Grants permission to list EBS volumes in Recycle Bin	List		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
LockSnapshot	Grants permission to lock an Amazon EBS snapshot in either governance or compliance mode to protect it against accidental or malicious deletions	Write	snapshot*	aws:ResourceTag/${TagKey} ec2:Encrypted ec2:Owner ec2:ParentVolume ec2:ResourceTag/${TagKey} ec2:SnapshotCoolOffPeriod ec2:SnapshotID ec2:SnapshotLockDuration ec2:SnapshotTime ec2:VolumeSize	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
ModifyAddressAttribute	Grants permission to modify an attribute of the specified Elastic IP address	Write	elastic-ip*	aws:ResourceTag/${TagKey} ec2:AllocationId ec2:Attribute ec2:Attribute/${AttributeName} ec2:Domain ec2:PublicIpAddress ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyAvailabilityZoneGroup	Grants permission to modify the opt-in status of the Local Zone and Wavelength Zone group for your account	Write		ec2:Region	
ModifyCapacityReservation	Grants permission to modify a Capacity Reservation's capacity and the conditions under which it is to be released	Write	capacity-reservation*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:CapacityReservationFleet	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyCapacityReservationFleet	Grants permission to modify a Capacity Reservation Fleet	Write	capacity-reservation-fleet*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	ec2:ModifyCapacityReservation
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyClientVpnEndpoint	Grants permission to modify a Client VPN endpoint	Write	client-vpn-endpoint*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ClientRootCertificateChainArn ec2:CloudwatchLogGroupArn ec2:CloudwatchLogStreamArn ec2:DirectoryArn ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:SamlProviderArn ec2:ServerCertificateArn	
			security-group	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpc	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	
ModifyDefaultCreditSpecification	Grants permission to change the account level default credit option for CPU usage of burstable performance instances	Write		ec2:Region	
ModifyEbsDefaultKmsKeyId	Grants permission to change the default customer master key (CMK) for EBS encryption by default for your account	Write		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyFleet	Grants permission to modify an EC2 Fleet	Write	fleet*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			image	aws:ResourceTag/${TagKey} ec2:ImageID ec2:ImageType ec2:Owner ec2:Public ec2:ResourceTag/${TagKey} ec2:RootDeviceType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			launch-template	aws:ResourceTag/${TagKey} ec2:ManagedResourceOperator ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			subnet	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyFpgaImageAttribute	Grants permission to modify an attribute of an Amazon FPGA Image (AFI)	Write	fpga-image*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:Owner ec2:Public ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyHosts	Grants permission to modify a Dedicated Host	Write	dedicated-host*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
				ec2:Region	
ModifyIdFormat	Grants permission to modify the ID format for a resource	Write		ec2:Region	
ModifyIdentityIdFormat	Grants permission to modify the ID format of a resource for a specific principal in your account	Write		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyImageAttribute	Grants permission to modify an attribute of an Amazon Machine Image (AMI)	Write	image*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ImageID ec2:ImageType ec2:Owner ec2:Public ec2:ResourceTag/${TagKey} ec2:RootDeviceType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyInstanceAttribute	Grants permission to modify an attribute of an instance	Write	instance*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceBandwidthWeighting ec2:InstanceID ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPu	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				tResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			security-group	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			volume	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:Encrypted ec2:ManagedResourceOperator ec2:ParentSnapshot ec2:ResourceTag/${TagKey} ec2:VolumeID ec2:VolumeInitiali	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				zationRate ec2:VolumeIops ec2:VolumeSize ec2:VolumeThroughput ec2:VolumeType	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyInstanceCapacityReservationAttributes	Grants permission to modify the Capacity Reservation settings for a stopped instance	Write	instance*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceBandwidthWeighting ec2:InstanceID ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPu	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				tResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
			capacity-reservation	aws:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyInstanceConnectEndpoint	Grants permission to modify an existing EC2 Instance Connect Endpoint	Write	instance-connect-endpoint*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			security-group	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyInstanceCpuOptions	Grants permission to modify the CPU options on an instance	Write	instance*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceBandwidthWeighting ec2:InstanceID ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPu	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				tResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyInstanceCreditSpecification	Grants permission to modify the credit option for CPU usage on an instance	Write	instance*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceBandwidthWeighting ec2:InstanceID ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPu	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				tResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyInstanceEventStartTime	Grants permission to modify the start time for a scheduled EC2 instance event	Write	instance*	aws:ResourceTag/${TagKey} ec2:Attribute/${AttributeName} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceID ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:PlacementGroup ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyInstanceEventWindow	Grants permission to modify the specified event window	Write	instance-event-window*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyInstanceMaintenanceOptions	Grants permission to modify the recovery behaviour for an instance	Write	instance*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceBandwidthWeighting ec2:InstanceID ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPu	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				tResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyInstanceMetadataDefaults	Grants permission to modify the default instance metadata service (IMDS) settings for your account in the specified Region	Write		ec2:Attribute/${AttributeName} ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyInstanceMetadataOptions	Grants permission to modify the metadata options for an instance	Write	instance*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceBandwidthWeighting ec2:InstanceID ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPu	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				tResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyInstanceNetworkPerformanceOptions	Grants permission to modify the network performance options for an instance	Write	instance*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceBandwidthWeighting ec2:InstanceID ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPu	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				tResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyInstancePlacement	Grants permission to modify the placement attributes for an instance	Write	instance*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceBandwidthWeighting ec2:InstanceID ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPu	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				tResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
			dedicated-host	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			placement-group	aws:ResourceTag/${TagKey} ec2:PlacementGroupName ec2:PlacementGroupStrategy ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyIpam	Grants permission to modify the configurations of an Amazon VPC IP Address Manager (IPAM)	Write	ipam*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
				ec2:Region	
ModifyIpamPolicyAllocationRules	Grants permission to modify the rules that define how Amazon VPC IP Address Manager (IPAM) pools allocate IP addresses to AWS resource types within an IPAM policy	Write	ipam-policy*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ipam-pool	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
ModifyIpamPool	Grants permission to modify the configurations of an Amazon VPC IP Address Manager (IPAM) pool	Write	ipam-pool*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
ModifyIpamPrefixListResolver	Grants permission to modify an IPAM prefix list resolver	Write	ipam-prefix-list-resolver*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
			ipam-scope	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
ModifyIpamPrefixListResolverTarget	Grants permission to modify an IPAM prefix list resolver target	Write	ipam-prefix-list-resolver-target*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyIpamResourceCidr	Grants permission to modify the configurations of an Amazon VPC IP Address Manager (IPAM) resource CIDR	Write	ipam-scope*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyIpamResourceDiscovery	Grants permission to modify a resource discovery	Write	ipam-resource-discovery*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyIpamScope	Grants permission to modify the configurations of an Amazon VPC IP Address Manager (IPAM) scope	Write	ipam-scope*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyLaunchTemplate	Grants permission to modify a launch template	Write	launch-template*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ManagedResourceOperator ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyLocalGatewayRoute	Grants permission to modify a local gateway route	Write	local-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
			local-gateway-virtual-interface-group	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			network-interface	aws:ResourceTag/${TagKey} ec2:AuthorizedUser ec2:AvailabilityZone ec2:ManagedResourceOperator ec2:NetworkInterfaceID ec2:Permission ec2:ResourceTag/${TagKey} ec2:Subnet ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			prefix-list	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyManagedPrefixList	Grants permission to modify a managed prefix list	Write	prefix-list*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:IpamPrefixListResolverTargetId ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyNetworkInterfaceAttribute	Grants permission to modify an attribute of a network interface	Write	network-interface*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:AvailabilityZone ec2:ManagedResourceOperator ec2:NetworkInterfaceID ec2:ResourceTag/${TagKey} ec2:Subnet	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			instance	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
			security-group	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			subnet	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyOdbNetworkPeering [permission only]	Grants permission to allow Oracle Database@AWS to modify the settings of a peering connection between an ODB network and a VPC	Permissions management	vpc*	aws:ResourceTag/${TagKey} ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyPrivateDnsNameOptions	Grants permission to modify the options for instance hostnames for the specified instance	Write	instance*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceBandwidthWeighting ec2:InstanceID ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPu

				tResponseHopLimit ec2:MetadataHttpTokens ec2:NewInstanceProfile ec2:PlacementGroup ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyPublicIpDnsNameOptions	Grants permission to modify public hostname options for a network interface	Write	network-interface*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:AvailabilityZone ec2:ResourceTag/${TagKey} ec2:Subnet ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyReservedInstances	Grants permission to modify attributes of one or more Reserved Instances	Write	reserved-instances*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:AvailabilityZone ec2:InstanceType ec2:ReservedInstancesOfferingType ec2:ResourceTag/${TagKey} ec2:Tenancy	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
ModifyRouteServer	Grants permission to modify a route server	Write	route-server*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
ModifySecurityGroupRules	Grants permission to modify the rules of a security group	Write	security-group*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			security-group-rule*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			prefix-list	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifySnapshotAttribute	Grants permission to add or remove permission settings for a snapshot	Permissions management	snapshot*	aws:ResourceTag/${TagKey} ec2:Add/group ec2:Add/userId ec2:Attribute ec2:Attribute/${AttributeName} ec2:AvailabilityZone ec2:Owner ec2:ParentVolume ec2:Remove/group ec2:Remove/userId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ResourceTag/${TagKey} ec2:SnapshotID ec2:SnapshotTime ec2:VolumeSize	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifySnapshotTier	Grants permission to archive Amazon EBS snapshots	Write	snapshot*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:Encrypted ec2:Owner ec2:ParentVolume ec2:ResourceTag/${TagKey} ec2:SnapshotID ec2:SnapshotTime	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:VolumeSize	
				ec2:Region	
ModifySpotFleetRequest	Grants permission to modify a Spot Fleet request	Write	spot-fleet-request*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			launch-template	aws:ResourceTag/${TagKey} ec2:ManagedResourceOperator ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			subnet	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifySubnetAttribute	Grants permission to modify an attribute of a subnet	Write	subnet*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyTrafficMirrorFilterNetworkServices	Grants permission to allow or restrict mirroring network services	Write	traffic-mirror-filter*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyTrafficMirrorFilterRule	Grants permission to modify a traffic mirror rule	Write	traffic-mirror-filter*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			traffic-mirror-filter-rule*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyTrafficMirrorSession	Grants permission to modify a traffic mirror session	Write	traffic-mirror-session*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
			traffic-mirror-filter	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			traffic-mirror-target	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyTransitGateway	Grants permission to modify a transit gateway	Write	transit-gateway*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey} ec2:transitGatewayId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-route-table	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayRouteTableId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyTransitGatewayMeteringPolicy	Grants permission to modify a transit gateway metering policy	Write	transit-gateway-metering-policy*	aws:ResourceTag/${TagKey} ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey} ec2:transitGatewayMeteringPolicyId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-attachment	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyTransitGatewayPrefixListReference	Grants permission to modify a transit gateway prefix list reference	Write	prefix-list*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-route-table*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey} ec2:transitGatewayRouteTableId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-attachment	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyTransitGatewayVpcAttachment	Grants permission to modify a VPC attachment on a transit gateway	Write	transit-gateway-attachment*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			subnet	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVerifiedAccessEndpoint	Grants permission to modify the configuration of a Verified Access endpoint	Write	verified-access-endpoint*	aws:ResourceTag/${TagKey} ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			subnet	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc	
			verified-access-group	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
ModifyVerifiedAccessEndpointPolicy	Grants permission to modify the specified Verified Access endpoint policy	Write	verified-access-endpoint*	aws:ResourceTag/${TagKey} ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVerifiedAccessGroup	Grants permission to modify the specified Verified Access Group configuration	Write	verified-access-group*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
			verified-access-instance	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVerifiedAccessGroupPolicy	Grants permission to modify the specified Verified Access group policy	Write	verified-access-group*	aws:ResourceTag/${TagKey} ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVerifiedAccessInstance	Grants permission to modify the configuration of the specified Verified Access instance	Write	verified-access-instance*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVerifiedAccessInstanceLoggingConfiguration	Grants permission to modify the logging configuration for the specified Verified Access instance	Write	verified-access-instance*	aws:ResourceTag/${TagKey} ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVerifiedAccessTrustProvider	Grants permission to modify the configuration of the specified Verified Access trust provider	Write	verified-access-trust-provider*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVolume	Grants permission to modify the parameters of an EBS volume	Write	volume*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:Encrypted ec2:ManagedResourceOperator ec2:ParentSnapshot ec2:ParentVolume	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ResourceTag/${TagKey} ec2:VolumeID ec2:VolumeInitializationRate ec2:VolumeIops ec2:VolumeSize ec2:VolumeThroughput ec2:VolumeType	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVolumeAttribute	Grants permission to modify an attribute of a volume	Write	volume*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:Encrypted ec2:ManagedResourceOperator ec2:ParentSnapshot ec2:ParentVolume	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ResourceTag/${TagKey} ec2:VolumeID ec2:VolumeInitializationRate ec2:VolumeIops ec2:VolumeSize ec2:VolumeThroughput ec2:VolumeType	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVpcAttribute	Grants permission to modify an attribute of a VPC	Write	vpc*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVpcBlockPublicAccessExclusion	Grants permission to modify an exclusion list for blocked public access on a VPC	Write	vpc-block-public-access-exclusion*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
				ec2:Region	
ModifyVpcBlockPublicAccessOptions	Grants permission to modify options for blocked public access on a VPC	Write		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVpcEncryptionControl	Grants permission to modify an existing VPC Encryption Control	Write	vpc-encryption-control*	aws:ResourceTag/${TagKey} ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVpcEndpoint	Grants permission to modify an attribute of a VPC endpoint	Write	vpc-endpoint*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey} ec2:VpceMultiRegion ec2:VpceServiceRegion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			route-table	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:RouteTableID	
			security-group	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			subnet	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:ResourceTag/${TagKey} ec2:SubnetID ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVpcEndpointConnectionNotification	Grants permission to modify a connection notification for a VPC endpoint or VPC endpoint service	Write	vpc-endpoint	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			vpc-endpoint-service	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:VpceMultiRegion ec2:VpceSupportedRegion	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVpcEndpointServiceConfiguration	Grants permission to modify the attributes of a VPC endpoint service configuration	Write	vpc-endpoint-service*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey} ec2:VpceMultiRegion ec2:VpceServicePrivateDnsName ec2:VpceSupportedRegion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
ModifyVpcEndpointServicePayerResponsibility	Grants permission to modify the payer responsibility for a VPC endpoint service	Write	vpc-endpoint-service*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey} ec2:VpceMultiRegion ec2:VpceSupportedRegion	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVpcEndpointServicePermissions	Grants permission to modify the permissions for a VPC endpoint service	Permissions management	vpc-endpoint-service*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey} ec2:VpceMultiRegion ec2:VpceSupportedRegion	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVpcPeeringConnectionOptions	Grants permission to modify the VPC peering connection options on one side of a VPC peering connection	Write	vpc-peering-connection*	aws:ResourceTag/${TagKey} ec2:AccepterVpc ec2:Attribute ec2:Attribute/${AttributeName} ec2:RequesterVpc ec2:ResourceTag/${TagKey} ec2:VpcPeeringConnectionID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVpcTenancy	Grants permission to modify the instance tenancy attribute of a VPC	Write	vpc*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey} ec2:Tenancy ec2:VpcID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVpnConnection	Grants permission to modify the target gateway of a Site-to-Site VPN connection	Write	vpn-connection*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:AuthenticationType ec2:DPDTimeoutSeconds ec2:GatewayType ec2:IKEVersions ec2:InsideTunnelCidr	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InsideTunnelIpv6Cidr ec2:Phase1DHGroup ec2:Phase1EncryptionAlgorithms ec2:Phase1IntegrityAlgorithms ec2:Phase1LifetimeSeconds ec2:Phase2DHGroup ec2:Phase2EncryptionAlgorithms ec2:Phase2IntegrityAlgorithms	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Phase2LifetimeSeconds ec2:RekeyFuzzPercentage ec2:RekeyMarginTimeSeconds ec2:ReplayWindowSizePackets ec2:ResourceTag/${TagKey} ec2:RoutingType	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVpnConnectionOptions	Grants permission to modify the connection options for your Site-to-Site VPN connection	Write	vpn-connection*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVpnTunnelCertificate	Grants permission to modify the certificate for a Site-to-Site VPN connection	Write	vpn-connection*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyVpnTunnelOptions	Grants permission to modify the options for a Site-to-Site VPN connection	Write	vpn-connection*	aws:ResourceTag/${TagKey} ec2:Attribute ec2:Attribute/${AttributeName} ec2:AuthenticationType ec2:DPDTimeoutSeconds ec2:GatewayType ec2:IKEVersions ec2:InsideTunnelCidr	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InsideTunnelIpv6Cidr ec2:Phase1DHGroup ec2:Phase1EncryptionAlgorithms ec2:Phase1IntegrityAlgorithms ec2:Phase1LifetimeSeconds ec2:Phase2DHGroup ec2:Phase2EncryptionAlgorithms ec2:Phase2IntegrityAlgorithms	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Phase2LifetimeSeconds ec2:RekeyFuzzPercentage ec2:RekeyMarginTimeSeconds ec2:ReplayWindowSizePackets ec2:ResourceTag/${TagKey} ec2:RoutingType	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
MonitorInstances	Grants permission to enable detailed monitoring for a running instance	Write	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	
MoveAddressToVpc	Grants permission to move an Elastic IP address from the EC2-Classic platform to the EC2-VPC platform	Write		ec2:Region	
MoveByoipCidrToIpam	Grants permission to move a BYOIP IPv4 CIDR to Amazon VPC IP Address Manager (IPAM) from a public IPv4 pool	Write	ipam-pool*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
MoveCapacityReservationInstances	Grants permission to move available capacity from a source Capacity Reservation to a destination Capacity Reservation	Write	capacity-reservation*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:CapacityReservationFleet ec2:CreateDate ec2:DestinationCapacityReservationId ec2:EbsOptimized ec2:EndDate ec2:EndDateType ec2:InstanceCount	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMatchCriteria ec2:InstancePlatform ec2:InstanceType ec2:OutpostArn ec2:PlacementGroup ec2:ResourceTag/${TagKey} ec2:SourceCapacityReservationId ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PauseVolumeIO [permission only]	Grants permission to temporarily pause I/O operations for a target Amazon EBS volume	Write	volume*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:Encrypted ec2:ManagedResourceOperator ec2:ParentSnapshot ec2:ResourceTag/${TagKey} ec2:VolumeID ec2:VolumeIops	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:VolumeSize ec2:VolumeThroughput ec2:VolumeType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			instance	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID ec2:InstanceMarketType	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	
ProvisionByoipCidr	Grants permission to provision an address range for use in AWS through bring your own IP addresses (BYOIP), and to create a corresponding address pool	Write		ec2:Region	
ProvisionIpamByoasn	Grants permission to provision an Autonomous System Number (ASN) for use in an Amazon Web Services account	Write	ipam*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ProvisionIpamPoolCidr	Grants permission to provision a CIDR to an Amazon VPC IP Address Manager (IPAM) pool	Write	ipam-pool*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			ipam-external-resource-verification-token	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
ProvisionPublicIpv4PoolCidr	Grants permission to provision a CIDR to a public IPv4 pool	Write	ipam-pool*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			ipv4pool-ec2*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	
PurchaseCapacityBlock	Grants permission to purchase a Capacity Block offering	Write	capacity-reservation*	aws:RequestTag/${TagKey} aws:TagKeys ec2:CapacityReservationFleet	ec2:CreateTags
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PurchaseCapacityBlockExtension	Grants permission to purchase a Capacity Block extension	Write	capacity-reservation*	aws:ResourceTag/${TagKey} ec2:CapacityReservationFleet	
				ec2:Region	
PurchaseHostReservation	Grants permission to purchase a reservation with configurations that match those of a Dedicated Host	Write	dedicated-host*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	ec2:CreateTags
				ec2:Region	
PurchaseReservedInstancesOffering	Grants permission to purchase a Reserved Instance offering	Write		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PurchaseScheduledInstances	Grants permission to purchase one or more Scheduled Instances with a specified schedule	Write		ec2:Region	
PutResourcePolicy [permission only]	Grants permission to attach an IAM policy that enables cross-account sharing to a resource	Permissions management	ipam-pool	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
			placement-group	aws:ResourceTag/${TagKey} ec2:PlacementGroupName ec2:PlacementGroupStrategy ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			verified-access-group	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RebootInstances	Grants permission to request a reboot of one or more instances	Write	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens ec2:PlacementGroup	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:ProductCode ec2:ResourceTag/${TagKey} ec2:RootDeviceType ec2:Tenancy	
				ec2:Region	
RegisterImage	Grants permission to register an Amazon Machine Image (AMI)	Write	image*	aws:RequestTag/${TagKey} aws:TagKeys ec2:ImageID ec2:Owner	ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			snapshot	aws:ResourceTag/${TagKey} ec2:OutpostArn ec2:Owner ec2:ParentVolume ec2:ResourceTag/${TagKey} ec2:SnapshotID ec2:SnapshotTime ec2:SourceOutpostArn ec2:VolumeSize	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RegisterInstanceEventNotificationAttributes	Grants permission to add tags to the set of tags to include in notifications about scheduled events for your instances	Write		ec2:Region	
RegisterTransitGatewayMulticastGroupMembers	Grants permission to register one or more network interfaces as a member of a group IP address in a transit gateway multicast domain	Write	network-interface*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:ManagedResourceOperator ec2:NetworkInterfaceID ec2:ResourceTag/${TagKey} ec2:Subnet ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-multicast-domain*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayMulticastDomainId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RegisterTransitGatewayMulticastGroupSources	Grants permission to register one or more network interfaces as a source of a group IP address in a transit gateway multicast domain	Write	network-interface*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:ManagedResourceOperator ec2:NetworkInterfaceID ec2:ResourceTag/${TagKey} ec2:Subnet ec2:Vpc	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			transit-gateway-multicast-domain*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayMulticastDomainId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RejectCapacityReservationBillingOwnership	Grants permission to reject a request to assign billing of the available capacity of a shared Capacity Reservation to your account	Write	capacity-reservation*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:CapacityReservationFleet ec2:CreateDate ec2:DestinationCapacityReservationId ec2:EbsOptimized ec2:EndDate ec2:EndDateType ec2:InstanceCount	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMatchCriteria ec2:InstancePlatform ec2:InstanceType ec2:OutpostArn ec2:PlacementGroup ec2:ResourceTag/${TagKey} ec2:SourceCapacityReservationId ec2:Tenancy	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RejectTransitGatewayMulticastDomainAssociations	Grants permission to reject requests to associate cross-account subnets with a transit gateway multicast domain	Write	transit-gateway-attachment	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
			transit-gateway-multicast-domain	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayMulticastDomainId	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RejectTransitGatewayPeeringAttachment	Grants permission to reject a transit gateway peering attachment request	Write	transit-gateway-attachment*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	
				ec2:Region	
RejectTransitGatewayVpcAttachment	Grants permission to reject a request to attach a VPC to a transit gateway	Write	transit-gateway-attachment*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:transitGatewayAttachmentId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
RejectVpcEndpointConnections	Grants permission to reject one or more VPC endpoint connection requests to a VPC endpoint service	Write	vpc-endpoint-service*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:VpceMultiRegion ec2:VpceSupportedRegion	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RejectVpcPeeringConnection	Grants permission to reject a VPC peering connection request	Write	vpc-peering-connection*	aws:ResourceTag/${TagKey} ec2:AccepterVpc ec2:RequesterVpc ec2:ResourceTag/${TagKey} ec2:VpcPeeringConnectionID	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ReleaseAddress	Grants permission to release an Elastic IP address	Write	elastic-ip	aws:ResourceTag/${TagKey} ec2:AllocationId ec2:Domain ec2:PublicIpAddress ec2:ResourceTag/${TagKey}	
				ec2:Region	
ReleaseHosts	Grants permission to release one or more On-Demand Dedicated Hosts	Write	dedicated-host*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Region	
ReleaseIpamPoolAllocation	Grants permission to release an allocation within an Amazon VPC IP Address Manager (IPAM) pool	Write	ipam-pool*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ReplaceIamInstanceProfileAssociation	Grants permission to replace an IAM instance profile for an instance	Write	instance*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CpuOptionsAmdSevSnp ec2:EbsOptimized ec2:InstanceAutoRecovery ec2:InstanceBandwidthWeighting ec2:InstanceID	iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstanceMarketType ec2:InstanceMetadataTags ec2:InstanceProfile ec2:InstanceType ec2:ManagedResourceOperator ec2:MetadataHttpEndpoint ec2:MetadataHttpPutResponseHopLimit ec2:MetadataHttpTokens	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

UpdateCapacityManagerOrganizationsAccess	Grants permission to update the Organizations access setting for EC2 Capacity Manager	Write		ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateInterruptibleCapacityReservationAllocation	Grants permission to update the number of instances allocated to an interruptible reservation, allowing you to add more capacity or reclaim capacity to your source Capacity Reservation	Write	capacity-reservation*	aws:ResourceTag/${TagKey} ec2:AvailabilityZone ec2:AvailabilityZoneId ec2:CreateDate ec2:EbsOptimized ec2:EndDate ec2:EndDateType ec2:InstanceCount ec2:InstanceMatchCriteria	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:InstancePlatform ec2:InstanceType ec2:InterruptibleCapacityReservationId ec2:InterruptionType ec2:IsInterruptible ec2:ResourceTag/${TagKey} ec2:SourceCapacityReservationId ec2:TargetInstanceCount	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ec2:Tenancy	
				ec2:Region	
UpdateSecurityGroupRuleDescriptionsEgress	Grants permission to update descriptions for one or more outbound rules in a VPC security group	Write	security-group*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID ec2:Vpc	
				ec2:Region	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateSecurityGroupRuleDescriptionsIngress	Grants permission to update descriptions for one or more inbound rules in a security group	Write	security-group*	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2:SecurityGroupID ec2:Vpc	
				ec2:Region	
WithdrawByoipCidr	Grants permission to stop advertising an address range that was provisioned for use in AWS through bring your own IP addresses (BYOIP)	Write		ec2:Region	

Resource types defined by Amazon EC2

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
elastic-ip	arn:${Partition}:ec2:${Region}:${Account}:elastic-ip/${AllocationId}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys ec2:AllocationId ec2:Attribute ec2:Attribute/${AttributeName} ec2:Domain ec2:PublicIpAddress ec2:Region ec2:ResourceTag/${TagKey}

Condition keys for Amazon EC2

Amazon EC2 defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString
ec2:AccepterVpc	Filters access by the ARN of an accepter VPC in a VPC peering connection	ARN

Condition keys	Description	Type
ec2:Add/group	Filters access by the group being added to a snapshot	String
ec2:Add/userId	Filters access by the account id being added to a snapshot	String
ec2:AllocationId	Filters access by the allocation ID of the Elastic IP address	String
ec2:AssociatePublicIpAddress	Filters access by whether the user wants to associate a public IP address with the instance	Bool
ec2:Attribute	Filters access by an attribute of a resource	String
ec2:Attribute/${AttributeName}	Filters access by an attribute being set on a resource	String
ec2:AuthenticationType	Filters access by the authentication type for the VPN tunnel endpoints	String
ec2:AuthorizedService	Filters access by the AWS service that has permission to use a resource	String
ec2:AuthorizedUser	Filters access by an IAM principal that has permission to use a resource	String
ec2:AutoPlacement	Filters access by the Auto Placement properties of a Dedicated Host	String
ec2:AvailabilityZone	Filters access by the name of an Availability Zone in an AWS Region	String
ec2:AvailabilityZoneId	Filters access by the ID of an Availability Zone in an AWS Region	String

Condition keys	Description	Type
ec2:CapacityReservationFleet	Filters access by the ARN of the Capacity Reservation Fleet	ARN
ec2:ClientRootCertificateChainArn	Filters access by the ARN of the client root certificate chain	ARN
ec2:CloudwatchLogGroupArn	Filters access by the ARN of the CloudWatch Logs log group	ARN
ec2:CloudwatchLogStreamArn	Filters access by the ARN of the CloudWatch Logs log stream	ARN
ec2:CommitmentDuration	Filters access by commitment duration of the Capacity Reservation	Numeric
ec2:CpuOptionsAmdSevSnp	Filters access by the state of AMD SEV-SNP CPU Options. Currently, only US East (Ohio) and Europe (Ireland) are supported	String
ec2:CreateAction	Filters access by the name of a resource-creating API action	String
ec2:CreateDate	Filters access by the date and time at which the Capacity Reservation was created	Date
ec2:DPDTimeoutSeconds	Filters access by the duration after which DPD timeout occurs on a VPN tunnel	Numeric
ec2:DestinationCapacityReservationId	Filters access by the ID of the Capacity Reservation that you want to move capacity into	ARN

Condition keys	Description	Type
ec2:DhcpOptionsID	Filters access by the ID of a dynamic host configuration protocol (DHCP) options set	String
ec2:DirectoryArn	Filters access by the ARN of the directory	ARN
ec2:Domain	Filters access by the domain of the Elastic IP address	String
ec2:EbsOptimized	Filters access by whether the instance is enabled for EBS optimization	Bool
ec2:ElasticGpuType	Filters access by the type of Elastic Graphics accelerator	String
ec2:Encrypted	Filters access by whether the EBS volume is encrypted	Bool
ec2:EndDate	Filters access by the date and time at which the Capacity Reservation ends	Date
ec2:EndDateType	Filters access by the way in which the Capacity Reservation ends	String
ec2:EphemeralStorage	Filters access by whether the instance is enabled for ephemeral storage	Bool
ec2:FisActionId	Filters access by the ID of an AWS FIS action	String
ec2:FisTargetArns	Filters access by the ARN of an AWS FIS target	ArrayOfARN
ec2:GatewayType	Filters access by the gateway type for a VPN endpoint on the AWS side of a VPN connection	String
ec2:HostRecovery	Filters access by whether host recovery is enabled for a Dedicated Host	String
ec2:IKEVersions	Filters access by the internet key exchange (IKE) versions that are permitted for a VPN tunnel	ArrayOfString

Condition keys	Description	Type
ec2:ImageID	Filters access by the ID of an image	String
ec2:ImageType	Filters access by the type of image (machine, aki, or ari)	String
ec2:InsideTunnelCidr	Filters access by the range of inside IP addresses for a VPN tunnel	String
ec2:InsideTunnelIpv6Cidr	Filters access by a range of inside IPv6 addresses for a VPN tunnel	String
ec2:InstanceAutoRecovery	Filters access by whether the instance type supports auto recovery	String
ec2:InstanceBandwidthWeighting	Filters access by the bandwidth weighting of an instance	String
ec2:InstanceCount	Filters access by the number of instances	Numeric
ec2:InstanceID	Filters access by the ID of an instance	String
ec2:InstanceMarketType	Filters access by the market or purchasing option of an instance (capacity-block, on-demand, or spot)	String
ec2:InstanceMatchCriteria	Filters access by the type of instance launches that the Capacity Reservation accepts	String
ec2:InstanceMetadataTags	Filters access by whether the instance allows access to instance tags from the instance metadata	String
ec2:InstancePlatform	Filters access by the type of operating system for which the Capacity Reservation reserves capacity	ARN
ec2:InstanceProfile	Filters access by the ARN of an instance profile	ARN

Condition keys	Description	Type
ec2:InstanceType	Filters access by the type of instance	String
ec2:InternetGatewayID	Filters access by the ID of an internet gateway	String
ec2:InterruptibleCapacityReservationId	Filters access by the ID of an interruptible Capacity Reservation	String
ec2:InterruptionType	Filters access by the type of interruption	String
ec2:IpamPrefixListResolverTargetId	Filters access by the IPAM prefix list resolver target ID that is syncing CIDRs to a managed prefix list	String
ec2:Ipv4IpamPoolId	Filters access by the ID of an IPAM pool provided for IPv4 CIDR block allocation	String
ec2:Ipv6IpamPoolId	Filters access by the ID of an IPAM pool provided for IPv6 CIDR block allocation	String
ec2:IsInterruptible	Filters access by whether Capacity Reservations are interruptible	Bool
ec2:IsLaunchTemplateResource	Filters access by whether users are able to override resources that are specified in the launch template	Bool
ec2:KeyPairName	Filters access by the name of a key pair	String
ec2:KeyPairType	Filters access by the type of a key pair	String

Condition keys	Description	Type
ec2:KmsKeyId	Filters access by the ID of an AWS KMS key provided in the request	String
ec2:LaunchTemplate	Filters access by the ARN of a launch template	ARN
ec2:Location	Filters access by the destination for the snapshot copy	String
ec2:ManagedResourceOperator	Filters access by the presence of an EC2 operator provisioning a managed resource	String
ec2:MetadataHttpEndpoint	Filters access by whether the HTTP endpoint is enabled for the instance metadata service	String
ec2:MetadataHttpPutResponseHopLimit	Filters access by the allowed number of hops when calling the instance metadata service	Numeric
ec2:MetadataHttpTokens	Filters access by whether tokens are required when calling the instance metadata service (optional or required)	String
ec2:NetworkAclID	Filters access by the ID of a network access control list (ACL)	String
ec2:NetworkInterfaceID	Filters access by the ID of an elastic network interface	String
ec2:NewInstanceProfile	Filters access by the ARN of the instance profile being attached	ARN
ec2:OutpostArn	Filters access by the ARN of the Outpost	ARN
ec2:Owner	Filters access by the owner of the resource (amazon, aws-marketplace, or an AWS account ID)	String

Condition keys	Description	Type
ec2:ParentSnapshot	Filters access by the ARN of the parent snapshot	ARN
ec2:ParentVolume	Filters access by the ARN of the parent volume from which the snapshot was created	ARN
ec2:Permission	Filters access by the type of permission for a resource (INSTANCE-ATTACH or EIP-ASSOCIATE)	String
ec2:Phase1DHGroup	Filters access by the Diffie-Hellman group numbers that are permitted for a VPN tunnel for the phase 1 IKE negotiations	ArrayOfString
ec2:Phase1EncryptionAlgorithms	Filters access by the encryption algorithms that are permitted for a VPN tunnel for the phase 1 IKE negotiations	ArrayOfString
ec2:Phase1IntegrityAlgorithms	Filters access by the integrity algorithms that are permitted for a VPN tunnel for the phase 1 IKE negotiations	ArrayOfString
ec2:Phase1LifetimeSeconds	Filters access by the lifetime in seconds for phase 1 of the IKE negotiations for a VPN tunnel	Numeric
ec2:Phase2DHGroup	Filters access by the Diffie-Hellman group numbers that are permitted for a VPN tunnel for the phase 2 IKE negotiations	ArrayOfString
ec2:Phase2EncryptionAlgorithms	Filters access by the encryption algorithms that are permitted for a VPN tunnel for the phase 2 IKE negotiations	ArrayOfString
ec2:Phase2IntegrityAlgorithms	Filters access by the integrity algorithms that are permitted for a VPN tunnel for the phase 2 IKE negotiations	ArrayOfString

Condition keys	Description	Type
ec2:Phase2LifetimeSeconds	Filters access by the lifetime in seconds for phase 2 of the IKE negotiations for a VPN tunnel	Numeric
ec2:PlacementGroup	Filters access by the ARN of the placement group	ARN
ec2:PlacementGroupName	Filters access by the name of a placement group	String
ec2:PlacementGroupStrategy	Filters access by the instance placement strategy used by the placement group (cluster, spread, or partition)	String
ec2:ProductCode	Filters access by the product code that is associated with the AMI	String
ec2:Public	Filters access by whether the image has public launch permissions	Bool
ec2:PublicIpAddress	Filters access by a public IP address	String
ec2:Quantity	Filters access by the number of Dedicated Hosts in a request	Numeric
ec2:Region	Filters access by the name of the AWS Region	String
ec2:RekeyFuzzPercentage	Filters access by the percentage of increase of the rekey window (determined by the rekey margin time) within which the rekey time is randomly selected for a VPN tunnel	Numeric
ec2:RekeyMarginTimeSeconds	Filters access by the margin time before the phase 2 lifetime expires for a VPN tunnel	Numeric

Condition keys	Description	Type
ec2:Remove/group	Filters access by the group being removed from a snapshot	String
ec2:Remove/userId	Filters access by the account id being removed from a snapshot	String
ec2:ReplayWindowSizePackets	Filters access by the number of packets in an IKE replay window	String
ec2:RequesterVpc	Filters access by the ARN of a requester VPC in a VPC peering connection	ARN
ec2:ReservedInstancesOfferingType	Filters access by the payment option of the Reserved Instance offering (No Upfront, Partial Upfront, or All Upfront)	String
ec2:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
ec2:RoleDelivery	Filters access by the version of the instance metadata service for retrieving IAM role credentials for EC2	Numeric
ec2:RootDeviceType	Filters access by the root device type of the instance (ebs or instance-store)	String
ec2:RouteTableID	Filters access by the ID of a route table	String
ec2:RoutingType	Filters access by the routing type for the VPN connection	String
ec2:SamlProviderArn	Filters access by the ARN of the IAM SAML identity provider	ARN

Condition keys	Description	Type
ec2:SecurityGroupID	Filters access by the ID of a security group	String
ec2:ServerCertificateArn	Filters access by the ARN of the server certificate	ARN
ec2:SnapshotCoolOffPeriod	Filters access by the compliance mode cooling-off period	Numeric
ec2:SnapshotID	Filters access by the ID of a snapshot	String
ec2:SnapshotLockDuration	Filters access by the snapshot lock duration	Numeric
ec2:SnapshotTime	Filters access by the initiation time of a snapshot	String
ec2:SourceAvailabilityZone	Filters access by the name of the Availability Zone from which the request originated	String
ec2:SourceCapacityReservationId	Filters access by the ID of the Capacity Reservation from which you want to move capacity	ARN
ec2:SourceInstanceARN	Filters access by the ARN of the instance from which the request originated	ARN
ec2:SourceOutpostArn	Filters access by the ARN of the Outpost from which the request originated	ARN
ec2:Subnet	Filters access by the ARN of the subnet	ARN
ec2:SubnetID	Filters access by the ID of a subnet	String
ec2:TargetInstanceCount	Filters access by the number of instances the interruptible Capacity Reservation is assigned	Numeric

Condition keys	Description	Type
ec2:Tenancy	Filters access by the tenancy of the VPC or instance (default, dedicated, or host)	String
ec2:VolumeID	Filters access by the ID of a volume	String
ec2:VolumeInitializationRate	Filters access by the initialization rate of the volume, in MiBps	Numeric
ec2:VolumeIops	Filters access by the the number of input/output operations per second (IOPS) provisioned for the volume	Numeric
ec2:VolumeSize	Filters access by the size of the volume, in GiB	Numeric
ec2:VolumeThroughput	Filters access by the throughput of the volume, in MiBps	Numeric
ec2:VolumeType	Filters access by the type of volume (gp2, gp3, io1, io2, st1, sc1, or standard)	String
ec2:Vpc	Filters access by the ARN of the VPC	ARN
ec2:VpcID	Filters access by the ID of a virtual private cloud (VPC)	String
ec2:VpcPeeringConnectionID	Filters access by the ID of a VPC peering connection	String
ec2:VpceMultiRegion	Filters access by multi region of the VPC endpoint service	String
ec2:VpcePrivateDnsPreference	Filters access by the private DNS preference	String

Condition keys	Description	Type
ec2:VpcePrivateDnsSpecifiedDomains	Filters access by the private DNS domains	ArrayOfString
ec2:VpceServiceName	Filters access by the name of the VPC endpoint service	String
ec2:VpceServiceOwner	Filters access by the service owner of the VPC endpoint service (amazon, aws-marketplace, or an AWS account ID)	String
ec2:VpceServicePrivateDnsName	Filters access by the private DNS name of the VPC endpoint service	String
ec2:VpceServiceRegion	Filters access by the region of the VPC endpoint service	String
ec2:VpceSupportedRegion	Filters access by the supported region of the VPC endpoint service	String
ec2:transitGatewayAttachmentId	Filters access by the ID of a transit gateway attachment	String
ec2:transitGatewayConnectPeerId	Filters access by the ID of a transit gateway connect peer	String
ec2:transitGatewayId	Filters access by the ID of a transit gateway	String
ec2:transitGatewayMeteringPolicyId	Filters access by the ID of a metering policy id	String

Condition keys	Description	Type
ec2:transitGatewayMulticastDomainId	Filters access by the ID of a transit gateway multicast domain	String
ec2:transitGatewayPolicyTableId	Filters access by the ID of a transit gateway policy table	String
ec2:transitGatewayRouteTableAnnouncementId	Filters access by the ID of a transit gateway route table announcement	String
ec2:transitGatewayRouteTableId	Filters access by the ID of a transit gateway route table	String

Actions, resources, and condition keys for Amazon EC2 Auto Scaling

Amazon EC2 Auto Scaling (service prefix: `autoscaling`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Condition keys for Amazon EC2 Auto Scaling

Actions defined by Amazon EC2 Auto Scaling

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AttachInstances	Grants permission to attach one or more EC2 instances to the specified Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
AttachLoadBalancerTargetGroups	Grants permission to attach one or more target groups to the specified Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
				autoscaling:TargetGroupARNs	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AttachLoadBalancers	Grants permission to attach one or more load balancers to the specified Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
				autoscaling:LoadBalancerNames	
AttachTrafficSources	Grants permission to attach one or more traffic sources to an Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
				autoscaling:TrafficSourceIdentifiers	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchDeleteScheduledAction	Grants permission to delete the specified scheduled actions	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
BatchPutScheduledUpdateGroupAction	Grants permission to create or update multiple scheduled scaling actions for an Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
CancelInstanceRefresh	Grants permission to cancel an instance refresh operation in progress	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CompleteLifecycleAction	Grants permission to complete the lifecycle action for the specified token or instance with the specified result	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
CreateAutoScalingGroup	Grants permission to create an Auto Scaling group with the specified name and attributes	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	iam:CreateServiceLinkedRole iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				autoscaling:ImageId autoscaling:CapacityReservationIds autoscaling:CapacityReservationResourceGroupArns autoscaling:InstanceTypes autoscaling:LaunchConfigurationName autoscaling:LaunchTemplateVersionSpecified autoscaling:LoadBa	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				lancerNames autoscaling:MaxSize autoscaling:MinSize autoscaling:TargetGroupARNs autoscaling:TrafficSourceIdentifiers autoscaling:VPCZoneIdentifiers aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateLaunchConfiguration	Grants permission to create a launch configuration	Write	launchConfiguration*		
				autoscaling:ImageId	
				autoscaling:InstanceType	
				autoscaling:SpotPrice	
				autoscaling:MetadataHttpTokens	
				autoscaling:MetadataHttpPutResponseHopLimit	
				autoscaling:MetadataHttpEndpoint	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateOrUpdateTags	Grants permission to create or update tags for the specified Auto Scaling group	Tagging	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAutoScalingGroup	Grants permission to delete the specified Auto Scaling group	Write	autoScalingGroup*	autoscaling:ForceDelete autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteLaunchConfiguration	Grants permission to delete the specified launch configuration	Write	launchConfiguration*		
DeleteLifecycleHook	Grants permission to deletes the specified lifecycle hook	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
DeleteNotificationConfiguration	Grants permission to delete the specified notification	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeletePolicy	Grants permission to delete the specified Auto Scaling policy	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
DeleteScheduledAction	Grants permission to delete the specified scheduled action	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
DeleteTags	Grants permission to delete the specified tags	Tagging	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteWarmPool	Grants permission to delete the warm pool associated with the Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
DescribeAccountLimits	Grants permission to describe the current Auto Scaling resource limits for your AWS account	List			
DescribeAccountSettings	Grants permission to describe the current Amazon EC2 Auto Scaling account settings for your account	List			
DescribeAdjustmentTypes	Grants permission to describe the policy adjustment types for use with PutScalingPolicy	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeAutoScalingGroups	Grants permission to describe one or more Auto Scaling groups. If a list of names is not provided, the call describes all Auto Scaling groups	List			
DescribeAutoScalingInstances	Grants permission to describe one or more Auto Scaling instances. If a list is not provided, the call describes all instances	List			
DescribeAutoScalingNotificationTypes	Grants permission to describe the notification types that are supported by Auto Scaling	List			
DescribeInstanceRefreshes	Grants permission to describe one or more instance refreshes for an Auto Scaling group	List			
DescribeLaunchConfigurations	Grants permission to describe one or more launch configurations. If you omit the list of names, then the call describes all launch configurations	List			
DescribeLifecycleHookTypes	Grants permission to describe the available types of lifecycle hooks	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeLifecycleHooks	Grants permission to describe the lifecycle hooks for the specified Auto Scaling group	List			
DescribeLoadBalancerTargetGroups	Grants permission to describe the target groups for the specified Auto Scaling group	List			
DescribeLoadBalancers	Grants permission to describe the load balancers for the specified Auto Scaling group	List			
DescribeMetricCollectionTypes	Grants permission to describe the available CloudWatch metrics for Auto Scaling	List			
DescribeNotificationConfigurations	Grants permission to describe the notification actions associated with the specified Auto Scaling group	List			
DescribePolicies	Grants permission to describe the policies for the specified Auto Scaling group	List			
DescribeScalingActivities	Grants permission to describe one or more scaling activities for the specified Auto Scaling group	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeScalingProcessTypes	Grants permission to describe the scaling process types for use with ResumeProcesses and SuspendProcesses	List			
DescribeScheduledActions	Grants permission to describe the actions scheduled for your Auto Scaling group that haven't run	List			
DescribeTags	Grants permission to describe the specified tags	Read			
DescribeTerminationPolicyTypes	Grants permission to describe the termination policies supported by Auto Scaling	List			
DescribeTrafficSources	Grants permission to describe the target groups for the specified Auto Scaling group	List			
DescribeWarmPool	Grants permission to describe the warm pool associated with the Auto Scaling group	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DetachInstances	Grants permission to remove one or more instances from the specified Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
DetachLoadBalancerTargetGroups	Grants permission to detach one or more target groups from the specified Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
				autoscaling:TargetGroupARNs	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DetachLoadBalancers	Grants permission to remove one or more load balancers from the specified Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
				autoscaling:LoadBalancerNames	
DetachTrafficSources	Grants permission to detach one or more traffic sources from an Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
				autoscaling:TrafficSourceIdentifiers	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableMetricsCollection	Grants permission to disable monitoring of the specified metrics for the specified Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
EnableMetricsCollection	Grants permission to enable monitoring of the specified metrics for the specified Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
EnterStandby	Grants permission to move the specified instances into Standby mode	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ExecutePolicy	Grants permission to execute the specified policy	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
ExitStandby	Grants permission to move the specified instances out of Standby mode	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
GetPredictiveScalingForecast	Grants permission to retrieve the forecast data for a predictive scaling policy	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
LaunchInstances	Grants permission to launch one or more EC2 instances in the specified Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
PutAccountSetting	Grants permission to modify an account setting for your account	Write			
PutLifecycleHook	Grants permission to create or update a lifecycle hook for the specified Auto Scaling Group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutNotificationConfiguration	Grants permission to configure an Auto Scaling group to send notifications when specified events take place	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
PutScalingPolicy	Grants permission to create or update a policy for an Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
PutScheduledUpdateGroupAction	Grants permission to create or update a scheduled scaling action for an Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				autoscaling:MaxSize autoscaling:MinSize	
PutWarmPool	Grants permission to create or update the warm pool associated with the specified Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
RecordLifecycleActionHeartbeat	Grants permission to record a heartbeat for the lifecycle action associated with the specified token or instance	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ResumeProcesses	Grants permission to resume the specified suspended Auto Scaling processes, or all suspended process, for the specified Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
RollbackInstanceRefresh	Grants permission to rollback an instance refresh operation in progress	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
SetDesiredCapacity	Grants permission to set the size of the specified Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SetInstanceHealth	Grants permission to set the health status of the specified instance	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
SetInstanceProtection	Grants permission to update the instance protection settings of the specified instances	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
StartInstanceRefresh	Grants permission to start a new instance refresh operation	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				autoscaling:ImageId	
SuspendProcesses	Grants permission to suspend the specified Auto Scaling processes, or all processes, for the specified Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	
TerminateInstanceInAutoScalingGroup	Grants permission to terminate the specified instance and optionally adjust the desired group size	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAutoScalingGroup	Grants permission to update the configuration for the specified Auto Scaling group	Write	autoScalingGroup*	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}	iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				autoscaling:ImageId autoscaling:CapacityReservationIds autoscaling:CapacityReservationResourceGroupArns autoscaling:InstanceTypes autoscaling:LaunchConfigurationName autoscaling:LaunchTemplateVersionSpecified	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				autoscaling:MaxSize autoscaling:MinSize autoscaling:VPCZoneIdentifiers	

Resource types defined by Amazon EC2 Auto Scaling

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
autoScalingGroup	`arn:${Partition}:autoscaling:${Region}:${Account}:autoScalingGroup:${GroupId}:autoScalingGroupName/${GroupFriendlyName}`	autoscaling:ResourceTag/${TagKey} aws:ResourceTag/${TagKey}
launchConfiguration	`arn:${Partition}:autoscaling:${Region}:${Account}:launchConfiguration:${`	

Resource types	ARN	Condition keys
	`Id}:launchConfigurationName/${Launch ConfigurationName}`	

Condition keys for Amazon EC2 Auto Scaling

Amazon EC2 Auto Scaling defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
autoscaling:CapacityReservationIds	Filters access based on the Capacity Reservation IDs	ArrayOfString
autoscaling:CapacityReservationResourceGroupArns	Filters access based on the ARN of a Capacity Reservation resource group	ArrayOfString
autoscaling:ForceDelete	Filters access based on whether the force delete option is specified when deleting an Auto Scaling group	Bool
autoscaling:ImageId	Filters access based on the AMI ID for the launch configuration	String
autoscaling:InstanceType	Filters access based on the instance type for the launch configuration	String

Condition keys	Description	Type
autoscaling:InstanceTypes	Filters access based on the instance types present as overrides to a launch template for a mixed instances policy. Use it to qualify which instance types can be explicitly defined in the policy	String
autoscaling:LaunchConfigurationName	Filters access based on the name of a launch configuration	String
autoscaling:LaunchTemplateVersionSpecified	Filters access based on whether users can specify any version of a launch template or only the Latest or Default version	Bool
autoscaling:LoadBalancerNames	Filters access based on the name of the load balancer	ArrayOfString
autoscaling:MaxSize	Filters access based on the maximum scaling size in the request	Numeric
autoscaling:MetadataHttpEndpoint	Filters access based on whether the HTTP endpoint is enabled for the instance metadata service	String
autoscaling:MetadataHttpPutResponseHopLimit	Filters access based on the allowed number of hops when calling the instance metadata service	Numeric
autoscaling:MetadataHttpTokens	Filters access based on whether tokens are required when calling the instance metadata service (optional or required)	String

Condition keys	Description	Type
autoscaling:MinSize	Filters access based on the minimum scaling size in the request	Numeric
autoscaling:ResourceTag/${TagKey}	Filters access based on the tags associated with the resource	String
autoscaling:SpotPrice	Filters access based on the price for Spot Instances for the launch configuration	Numeric
autoscaling:TargetGroupARNs	Filters access based on the ARN of a target group	ArrayOfARN
autoscaling:TrafficSourceIdentifiers	Filters access based on the identifiers of the traffic sources	ArrayOfString
autoscaling:VPCZoneIdentifiers	Filters access based on the identifier of a VPC zone	ArrayOfString
aws:RequestTag/${TagKey}	Filters access based on the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access based on the tags associated with the resource	String
aws:TagKeys	Filters access based on the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon EC2 Image Builder

Amazon EC2 Image Builder (service prefix: `imagebuilder`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon EC2 Image Builder

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelImageCreation	Grants permission to cancel an image creation	Write	image*		
CancelLifecycleExecution	Grants permission to cancel a lifecycle execution	Write	lifecycleExecution*		
CreateComponent	Grants permission to create a new component	Write	component*		imagebuilder:TagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					kms:Encrypt kms:GenerateDataKey kms:GenerateDataKeyWithoutPlaintext s3:GetObject s3:ListBucket

UpdateLifecyclePolicy	Grants permission to update an existing lifecycle policy	Write	lifecyclePolicy*		iam:PassRole
				imagebuilder:LifecyclePolicyResourceType	

Resource types defined by Amazon EC2 Image Builder

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
component	`arn:${Partition}:imagebuilder:${Region}:${Account}:component/${ComponentName}/${ComponentVersion}/${ComponentBuildVersion}`	aws:ResourceTag/${TagKey}
distributionConfiguration	`arn:${Partition}:imagebuilder:${Region}:${Account}:distribution-configuration/${DistributionConfigurationName}`	aws:ResourceTag/${TagKey}
image	`arn:${Partition}:imagebuilder:${Region}:${Account}:image/${ImageName}/${ImageVersion}/${ImageBuildVersion}`	aws:ResourceTag/${TagKey}
imageVersion	`arn:${Partition}:imagebuilder:${Region}:${Account}:image/${ImageName}/${ImageVersion}`	aws:ResourceTag/${TagKey}
imageRecipe	`arn:${Partition}:imagebuilder:${Region}:${Account}:image-recipe/${ImageRecipeName}/${ImageRecipeVersion}`	aws:ResourceTag/${TagKey}
containerRecipe	`arn:${Partition}:imagebuilder:${Region}:${Account}:container-recipe/${ContainerRecipeName}/${ContainerRecipeVersion}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
imagePipeline	arn:${Partition}:imagebuilder:${Region}:${Account}:image-pipeline/${ImagePipelineName}	aws:ResourceTag/${TagKey}
infrastructureConfiguration	arn:${Partition}:imagebuilder:${Region}:${Account}:infrastructure-configuration/${ResourceId}	aws:ResourceTag/${TagKey}
lifecycleExecution	arn:${Partition}:imagebuilder:${Region}:${Account}:lifecycle-execution/${LifecycleExecutionId}	
lifecyclePolicy	arn:${Partition}:imagebuilder:${Region}:${Account}:lifecycle-policy/${LifecyclePolicyName}	aws:ResourceTag/${TagKey}
workflow	arn:${Partition}:imagebuilder:${Region}:${Account}:workflow/${WorkflowType}/${WorkflowName}/${WorkflowVersion}/${WorkflowBuildVersion}	aws:ResourceTag/${TagKey}
workflowExecution	arn:${Partition}:imagebuilder:${Region}:${Account}:workflow-execution/${WorkflowExecutionId}	
workflowStepExecution	arn:${Partition}:imagebuilder:${Region}:${Account}:workflow-step-execution/${WorkflowStepExecutionId}	
allComponentBuildVersions	arn:${Partition}:imagebuilder:${Region}:${Account}:component/${ComponentName}/${ComponentVersion}/*	

Resource types	ARN	Condition keys
allImageBuildVersions	arn:${Partition}:imagebuilder:${Region}:${Account}:image/${ImageName}/${ImageVersion}/*	
allWorkflowBuildVersions	arn:${Partition}:imagebuilder:${Region}:${Account}:workflow/${WorkflowType}/${WorkflowName}/${WorkflowVersion}/*	

Condition keys for Amazon EC2 Image Builder

Amazon EC2 Image Builder defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
imagebuilder:CreatedResourceTag/${TagKey}	Filters access by the tag key-value pairs attached to the resource created by Image Builder	String

Condition keys	Description	Type
imagebuilder:CreatedResourceTagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
imagebuilder:Ec2MetadataHttpTokens	Filters access by the EC2 Instance Metadata HTTP Token Requirement specified in the request	String
imagebuilder:LifecyclePolicyResourceType	Filters access by the Lifecycle Policy Resource Type specified in the request	String
imagebuilder:StatusTopicArn	Filters access by the SNS Topic Arn in the request to which terminal state notifications will be published	ARN

Actions, resources, and condition keys for Amazon EC2 Instance Connect

Amazon EC2 Instance Connect (service prefix: `ec2-instance-connect`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

- Actions defined by Amazon EC2 Instance Connect
- Resource types defined by Amazon EC2 Instance Connect

- Condition keys for Amazon EC2 Instance Connect

Actions defined by Amazon EC2 Instance Connect

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
OpenTunnel	Grants permission to establish SSH connection to an EC2 instance using EC2 Instance Connect Endpoint	Write	instance-connect-endpoint*		
			instance-connect-endpoint	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey} ec2-instance-connect:remotePort ec2-instance-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				connect:privateIpAddress ec2-instance-connect:MaxTunnelDuration	
SendSSHPublicKey	Grants permission to push an SSH public key to the specified EC2 instance to be used for standard SSH	Write	instance*		
				ec2:osuser	
SendSerialConsoleSSHPublicKey	Grants permission to push an SSH public key to the specified EC2 instance to be used for serial console SSH	Write	instance*		

Resource types defined by Amazon EC2 Instance Connect

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
instance	arn:${Partition}:ec2:${Region}:${Account}:instance/${InstanceId}	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}
instance-connect-endpoint	arn:${Partition}:ec2:${Region}:${Account}:instance-connect-endpoint/${InstanceConnectEndpointId}	aws:ResourceTag/${TagKey} ec2:ResourceTag/${TagKey}

Condition keys for Amazon EC2 Instance Connect

Amazon EC2 Instance Connect defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by tags associated with the resource	String
ec2-instance-connect:maxTunnelDuration	Filters access by maximum session duration associated with the instance	Numeric
ec2-instance-connect:privateIpAddress	Filters access by private IP Address associated with the instance	IPAddress

Condition keys	Description	Type
ec2-instance-connect:remotePort	Filters access by port number associated with the instance	Numeric
ec2:ResourceTag/${TagKey}	Filters access by tags associated with the resource	String
ec2:osuser	Filters access by specifying the default user name for the AMI that you used to launch your instance	String

Actions, resources, and condition keys for Amazon ECS MCP Service

Amazon ECS MCP Service (service prefix: `ecs-mcp`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- Condition keys for Amazon ECS MCP Service

Actions defined by Amazon ECS MCP Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
InvokeReadOnlyTools	Grants permission to call read-only tools in MCP service	Read			
UseMcp	Grants permission to use MCP service	Read			

Resource types defined by Amazon ECS MCP Service

Amazon ECS MCP Service does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon ECS MCP Service, specify `"Resource": "*"` in your policy.

Condition keys for Amazon ECS MCP Service

ECS MCP has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon EKS Auth

Amazon EKS Auth (service prefix: `eks-auth`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon EKS Auth

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssumeRoleForPodIdentity	Grants permission to exchange a Kubernetes service account token for temporary AWS credentials	Read	cluster*		

Resource types defined by Amazon EKS Auth

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
cluster	`arn:${Partition}:eks:${Region}:${Account}:cluster/${ClusterName}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon EKS Auth

Amazon EKS Auth defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair	String

Actions, resources, and condition keys for Amazon EKS MCP Server

Amazon EKS MCP Server (service prefix: `eks-mcp`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon EKS MCP Server

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy,

you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CallPrivilegedTool	Grants permission to call privileged tools in MCP service	Write			
CallReadOnlyTool	Grants permission to call read-only tools in MCP service	Read			
InvokeMcp	Grants permission to use MCP service	Read			

Resource types defined by Amazon EKS MCP Server

Amazon EKS MCP Server does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon EKS MCP Server, specify `"Resource": "*"` in your policy.

Condition keys for Amazon EKS MCP Server

EKS MCP has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Elastic Beanstalk

AWS Elastic Beanstalk (service prefix: `elasticbeanstalk`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Elastic Beanstalk

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AbortEnvironmentUpdate	Grants permission to cancel in-progress environment configuration update or application version deployment	Write	environment*	elasticbeanstalk:InApplication	
AddTags	Grants permission to add tags to an Elastic Beanstalk resource and to update tag values	Tagging	application		
			applicationversion		
			configurationtemplate		
			environment		
			platform		
				aws:RequestTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} aws:TagKeys	
ApplyEnvironmentManagedAction	Grants permission to apply a scheduled managed action immediately	Write	environment*	elasticbeanstalk:InApplication	
AssociateEnvironmentOperationsRole	Grants permission to associate an operations role with an environment	Write	environment*		
CheckDNSAvailability	Grants permission to check CNAME availability	Read			
ComposeEnvironments	Grants permission to create or update a group of environments, each running a separate component of a single application	Write	application*		
			applicationversion*	elasticbeanstalk:InApplication	
CreateApplication	Grants permission to create a new application	Write	application*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateApplicationVersion	Grants permission to create an application version for an application	Write	application*		
			applicationversion*	elasticbeanstalk:InApplication aws:RequestTag/${TagKey} aws:TagKeys	
CreateConfigurationTemplate	Grants permission to create a configuration template	Write	configurationtemplate*	elasticbeanstalk:InApplication	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				elasticbeanstalk:FromApplication elasticbeanstalk:FromApplicationVersion elasticbeanstalk:FromConfigurationTemplate elasticbeanstalk:FromEnvironment elasticbeanstalk:FromSolutionStack elasticbeanstalk:FromPlatform	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateEnvironment	Grants permission to launch an environment for an application	Write	environment*	elasticbeanstalk:InApplication	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				elasticbeanstalk:FromApplicationVersion elasticbeanstalk:FromConfigurationTemplate elasticbeanstalk:FromSolutionStack elasticbeanstalk:FromPlatform aws:RequestTag/${TagKey} aws:TagKeys	
CreatePlatformVersion	Grants permission to create a new version of a custom platform	Write	platform*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateStorageLocation	Grants permission to create the Amazon S3 storage location for the account	Write			
DeleteApplication	Grants permission to delete an application along with all associated versions and configurations	Write	application*		
DeleteApplicationVersion	Grants permission to delete an application version from an application	Write	applicationversion*	elasticbeanstalk:InApplication	
DeleteConfigurationTemplate	Grants permission to delete a configuration template	Write	configurationtemplate*	elasticbeanstalk:InApplication	
DeleteEnvironmentConfiguration	Grants permission to delete the draft configuration associated with the running environment	Write	environment*	elasticbeanstalk:InApplication	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeletePlatformVersion	Grants permission to delete a version of a custom platform	Write	platform*		
DescribeAccountAttributes	Grants permission to retrieve a list of account attributes, including resource quotas	Read			
DescribeApplicationVersions	Grants permission to retrieve a list of application versions stored in an AWS Elastic Beanstalk storage bucket	List	applicationversion	elasticbeanstalk:InApplication	
DescribeApplications	Grants permission to retrieve the descriptions of existing applications	List	application		
DescribeConfigurationOptions	Grants permission to retrieve descriptions of environment configuration options	Read	configurationtemplate	elasticbeanstalk:InApplication	
			environment	elasticbeanstalk:InApplication	
			solutionstack		
DescribeConfigurationSettings	Grants permission to retrieve a description of the settings for a configuration set	Read	configurationtemplate	elasticbeanstalk:InApplication	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			environment	elasticbeanstalk:InApplication	
DescribeEnvironmentHealth	Grants permission to retrieve information about the overall health of an environment	Read	environment		
DescribeEnvironmentManagedActionHistory	Grants permission to retrieve a list of an environment's completed and failed managed actions	Read	environment	elasticbeanstalk:InApplication	
DescribeEnvironmentManagedActions	Grants permission to retrieve a list of an environment's upcoming and in-progress managed actions	Read	environment	elasticbeanstalk:InApplication	
DescribeEnvironmentResources	Grants permission to retrieve a list of AWS resources for an environment	Read	environment	elasticbeanstalk:InApplication	
DescribeEnvironments	Grants permission to retrieve descriptions for existing environments	List	environment	elasticbeanstalk:InApplication	
DescribeEvents	Grants permission to retrieve a list of event descriptions matching a set of criteria	Read	application		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			applicationversion	elasticbeanstalk:InApplication	
			configurationtemplate	elasticbeanstalk:InApplication	
			environment	elasticbeanstalk:InApplication

				elasticbeanstalk:FromApplicationVersion elasticbeanstalk:FromConfigurationTemplate elasticbeanstalk:FromSolutionStack elasticbeanstalk:FromPlatform	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateTagsForResource	Doesn't grant permission to update tags. To grant permission to add tags to an Elastic Beanstalk resource, remove tags, and to update tag values, specify elasticbeanstalk:AddTags and elasticbeanstalk:RemoveTags	Tagging	application		
			applicationversion		
			configurationtemplate		
			environment		
			platform		
				aws:RequestTag/${TagKey} aws:TagKeys	
ValidateConfigurationSettings	Grants permission to check the validity of a set of configuration settings for a configuration template or an environment	Read	configurationtemplate	elasticbeanstalk:InApplication	
			environment	elasticbeanstalk:InApplication	

Resource types defined by AWS Elastic Beanstalk

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
application	`arn:${Partition}:elasticbeanstalk:${Region}:${Account}:application/${ApplicationName}`	aws:ResourceTag/${TagKey}
applicationversion	`arn:${Partition}:elasticbeanstalk:${Region}:${Account}:applicationversion/${ApplicationName}/${VersionLabel}`	aws:ResourceTag/${TagKey} elasticbeanstalk:InApplication
configurationtemplate	`arn:${Partition}:elasticbeanstalk:${Region}:${Account}:configurationtemplate/${ApplicationName}/${TemplateName}`	aws:ResourceTag/${TagKey} elasticbeanstalk:InApplication
environment	`arn:${Partition}:elasticbeanstalk:${Region}:${Account}:environment/${ApplicationName}/${EnvironmentName}`	aws:ResourceTag/${TagKey} elasticbeanstalk:InApplication
solutionstack	`arn:${Partition}:elasticbeanstalk:${Region}::solutionstack/${SolutionStackName}`	

Resource types	ARN	Condition keys
platform	`arn:${Partition}:elasticbeanstalk:${Region}::platform/${PlatformNameWithVersion}`	

Condition keys for AWS Elastic Beanstalk

AWS Elastic Beanstalk defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters actions based on the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters actions based on tag key-value pairs attached to the resource	String
aws:TagKeys	Filters actions based on the presence of tag keys in the request	ArrayOfString
elasticbeanstalk:FromApplication	Filters access by an application as a dependency or a constraint on an input parameter	ARN
elasticbeanstalk:FromApplicationVersion	Filters access by an application version as a dependency or a constraint on an input parameter	ARN

Condition keys	Description	Type
elasticbeanstalk:FromConfigurationTemplate	Filters access by a configuration template as a dependency or a constraint on an input parameter	ARN
elasticbeanstalk:FromEnvironment	Filters access by an environment as a dependency or a constraint on an input parameter	ARN
elasticbeanstalk:FromPlatform	Filters access by a platform as a dependency or a constraint on an input parameter	ARN
elasticbeanstalk:FromSolutionStack	Filters access by a solution stack as a dependency or a constraint on an input parameter	ARN
elasticbeanstalk:InApplication	Filters access by the application that contains the resource that the action operates on	ARN

Actions, resources, and condition keys for Amazon Elastic Block Store

Amazon Elastic Block Store (service prefix: ebs) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Elastic Block Store

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CompleteSnapshot	Grants permission to seal and complete the snapshot after all of the required blocks of data have been written to it	Write	snapshot*		
				aws:ResourceTag/${TagKey}	
GetSnapshotBlock	Grants permission to return the data of a block in an Amazon Elastic Block Store (EBS) snapshot	Read	snapshot*		
				aws:ResourceTag/${TagKey}	
ListChangedBlocks	Grants permission to list the blocks that are different between two Amazon Elastic Block Store (EBS) snapshots of the same volume/snapshot lineage	Read	snapshot*		
				aws:ResourceTag/${TagKey}	
ListSnapshotBlocks		Read	snapshot*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	Grants permission to list the blocks in an Amazon Elastic Block Store (EBS) snapshot			aws:ResourceTag/${TagKey}	
PutSnapshotBlock	Grants permission to write a block of data to a snapshot created by the StartSnapshot operation	Write	snapshot*		
				aws:ResourceTag/${TagKey}	
StartSnapshot	Grants permission to create a new EBS snapshot	Write	snapshot		ec2:CreateTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys ebs:Description ebs:ParentSnapshot ebs:VolumeSize	

Resource types defined by Amazon Elastic Block Store

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
snapshot	`arn:${Partition}:ec2:${Region}::snapshot/${SnapshotId}`	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys ebs:Description ebs:ParentSnapshot ebs:VolumeSize

Condition keys for Amazon Elastic Block Store

Amazon Elastic Block Store defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString

Condition keys	Description	Type
ebs:Description	Filters access by the description of the snapshot being created	String
ebs:ParentSnapshot	Filters access by the ARN of the parent snapshot	ARN
ebs:VolumeSize	Filters access by the size of the volume for the snapshot being created, in GiB	Numeric

Actions, resources, and condition keys for Amazon Elastic Container Registry

Amazon Elastic Container Registry (service prefix: `ecr`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Elastic Container Registry

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchCheckLayerAvailability	Grants permission to check the availability of multiple image layers in a specified registry and repository	Read	repository*		
BatchDeleteImage	Grants permission to delete a list of specified images within a specified repository	Write	repository*		
BatchGetImage	Grants permission to get detailed information for specified images within a specified repository	Read	repository*		
BatchGetRepositoryScanningConfiguration	Grants permission to retrieve repository scanning configuration for a list of repositories	Read	repository*		
BatchImportUpstreamImage [permission only]	Grants permission to retrieve the image from the upstream registry and import it to your private registry	Write	repository*		
CompleteLayerUpload	Grants permission to inform Amazon ECR that the image layer upload for a specified registry, repository name, and upload ID, has completed	Write	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreatePullThroughCacheRule	Grants permission to create new pull-through cache rule	Write			iam:CreateServiceLinkedRole
CreateRepository	Grants permission to create an image repository	Write	repository*		ecr:TagResource
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateRepositoryCreationTemplate	Grants permission to create the repository creation template	Write			ecr:CreateRepository ecr:PutLifecyclePolicy ecr:SetRepositoryPolicy iam:CreateServiceLinkedRole iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteLifecyclePolicy	Grants permission to delete the specified lifecycle policy	Write	repository*		
DeletePullThroughCacheRule	Grants permission to delete the pull-through cache rule	Write			
DeleteRegistryPolicy	Grants permission to delete the registry policy	Permissions management			
DeleteRepository	Grants permission to delete an existing image repository	Write	repository*		
DeleteRepositoryCreationTemplate	Grants permission to delete the repository creation template	Write			
DeleteRepositoryPolicy	Grants permission to delete the repository policy from a specified repository	Permissions management	repository*		
DeleteSigningConfiguration	Grants permission to delete the signing configuration for the registry	Write			
DeregisterPullTimeUpdateExclusion	Grants permission to deregister a pull time update exclusion	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeImageReplicationStatus	Grants permission to retrieve replication status about an image in a registry, including failure reason if replication fails	Read	repository*		
DescribeImageScanFindings	Grants permission to describe the image scan findings for the specified image	Read	repository*		
DescribeImageSigningStatus	Grants permission to retrieve signing status about an image in a specified registry	Read	repository*		
DescribeImages	Grants permission to get metadata about the images in a repository, including image size, image tags, and creation date	List	repository*		
DescribePullThroughCacheRules	Grants permission to describe the pull-through cache rules	List			
DescribeRegistry	Grants permission to describe the registry settings	Read			
DescribeRepositories	Grants permission to describe image repositories in a registry	Read	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeRepositoryCreationTemplates	Grants permission to describe the repository creation template	Read			
GetAccountSetting	Grants permission to retrieve account settings	Read		ecr:AccountSetting	
GetAuthorizationToken	Grants permission to retrieve a token that is valid for a specified registry for 12 hours	Read			
GetDownloadUrlForLayer	Grants permission to retrieve the download URL corresponding to an image layer	Read	repository*		
GetImageCopyStatus [permission only]	Grants permission to retrieve the status about an image copy	Read	repository*		
GetLifecyclePolicy	Grants permission to retrieve the specified lifecycle policy	Read	repository*		
GetLifecyclePolicyPreview	Grants permission to retrieve the results of the specified lifecycle policy preview request	Read	repository*		
GetRegistryPolicy	Grants permission to retrieve the registry policy	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetRegistryScanningConfiguration	Grants permission to retrieve registry scanning configuration	Read			
GetRepositoryPolicy	Grants permission to retrieve the repository policy for a specified repository	Read	repository*		
GetSigningConfiguration	Grants permission to retrieve the signing configuration for the registry	Read			
InitiateLayerUpload	Grants permission to notify Amazon ECR that you intend to upload an image layer	Write	repository*		
ListImages	Grants permission to list all the image IDs for a given repository	List	repository*		
ListPullTimeUpdateExclusions	Grants permission to list pull time update exclusions for the registry	List			
ListTagsForResource	Grants permission to list the tags for an Amazon ECR resource	Read	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
PutAccountSetting	Grants permission to update account settings	Write		ecr:AccountSetting	
PutImage	Grants permission to create or update the image manifest associated with an image	Write	repository*		
PutImageScanningConfiguration	Grants permission to update the image scanning configuration for a repository	Write	repository*		
PutImageTagMutability	Grants permission to update the image tag mutability settings for a repository	Write	repository*		
PutLifecyclePolicy	Grants permission to create or update a lifecycle policy	Write	repository*		
PutRegistryPolicy	Grants permission to update the registry policy	Permissions management			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutRegistryScanningConfiguration	Grants permission to update registry scanning configuration	Write			
PutReplicationConfiguration	Grants permission to update the replication configuration for the registry	Write			iam:CreateServiceLinkedRole
PutSigningConfiguration	Grants permission to update the signing configuration for the registry	Write			
RegisterPullTimeUpdateExclusion	Grants permission to register a pull time update exclusion	Write			
ReplicateImage [permission only]	Grants permission to replicate images to the destination registry	Write	repository*		
SetRepositoryPolicy	Grants permission to apply a repository policy on a specified repository to control access permissions	Permissions management	repository*		
StartImageScan	Grants permission to start an image scan	Write	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartLifecyclePolicyPreview	Grants permission to start a preview of the specified lifecycle policy	Write	repository*		
TagResource	Grants permission to tag an Amazon ECR resource	Tagging	repository*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag an Amazon ECR resource	Tagging	repository*		
				aws:TagKeys	
UpdateImageStorageClass	Grants permission to get update the storage class of a specified image within a specified repository	Write	repository*		
UpdatePullThroughCacheRule	Grants permission to update the pull-through cache rule	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateRepositoryCreationTemplate	Grants permission to update the repository creation template	Write			ecr:CreateRepository ecr:PutLifecyclePolicy ecr:SetRepositoryPolicy iam:CreateServiceLinkedRole iam:PassRole
UploadLayerPart	Grants permission to upload an image layer part to Amazon ECR	Write	repository*		
ValidatePullThroughCacheRule	Grants permission to validate the pull-through cache rule	Read			

Resource types defined by Amazon Elastic Container Registry

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
repository	`arn:${Partition}:ecr:${Region}:${Account}:repository/${RepositoryName}`	aws:ResourceTag/${TagKey} ecr:ResourceTag/${TagKey}

Condition keys for Amazon Elastic Container Registry

Amazon Elastic Container Registry defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters access by tag-value associated with the resource	String
aws:TagKeys	Filters access by the presence of mandatory tags in the request	ArrayOfString
ecr:AccountSetting	Filters access by the ECR account setting name	String

Condition keys	Description	Type
ecr:ResourceTag/${TagKey}	Filters access by tag-value associated with the resource	String

Actions, resources, and condition keys for Amazon Elastic Container Registry Public

Amazon Elastic Container Registry Public (service prefix: `ecr-public`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Elastic Container Registry Public

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchCheckLayerAvailability	Grants permission to check the availability of multiple image layers in a specified registry and repository	Read	repository*		
BatchDeleteImage	Grants permission to delete a list of specified images within a specified repository	Write	repository*		
CompleteLayerUpload	Grants permission to inform Amazon ECR that the image layer upload for a specified registry, repository name, and upload ID, has completed	Write	repository*		
CreateRepository	Grants permission to create an image repository	Write	repository*		ecr-public:TagResource
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteRepository	Grants permission to delete an existing image repository	Write	repository*		
DeleteRepositoryPolicy	Grants permission to delete the repository policy from a specified repository	Write	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeImageTags	Grants permission to describe all the image tags for a given repository	List	repository*		
DescribeImages	Grants permission to get metadata about the images in a repository, including image size, image tags, and creation date	Read	repository*		
DescribeRegistries	Grants permission to retrieve the catalog data associated with a registry	List	registry*		
DescribeRepositories	Grants permission to describe image repositories in a registry	List	repository		
GetAuthorizationToken	Grants permission to retrieve a token that is valid for a specified registry for 12 hours	Read			
GetRegistryCatalogData	Grants permission to retrieve the catalog data associated with a registry	Read	registry*		
GetRepositoryCatalogData	Grants permission to retrieve the catalog data associated with a repository	Read	repository*		
GetRepositoryPolicy	Grants permission to retrieve the repository policy for a specified repository	Read	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
InitiateLayerUpload	Grants permission to notify Amazon ECR that you intend to upload an image layer	Write	repository*		
ListTagsForResource	Grants permission to list the tags for an Amazon ECR resource	Read	repository*		
PutImage	Grants permission to create or update the image manifest associated with an image	Write	repository*		
PutRegistryCatalogData	Grants permission to create and update the catalog data associated with a registry	Write	registry*		
PutRepositoryCatalogData	Grants permission to update the catalog data associated with a repository	Write	repository*		
SetRepositoryPolicy	Grants permission to apply a repository policy on a specified repository to control access permissions	Permissions management	repository*		
TagResource	Grants permission to tag an Amazon ECR resource	Tagging	repository*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag an Amazon ECR resource	Tagging	repository*		
				aws:TagKeys	
UploadLayerPart	Grants permission to upload an image layer part to Amazon ECR Public	Write	repository*		

Resource types defined by Amazon Elastic Container Registry Public

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
repository	`arn:${Partition}:ecr-public::${Account}:repository/${RepositoryName}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
		ecr-public:ResourceTag/${TagKey}
registry	arn:${Partition}:ecr-public::${Account}:registry/${RegistryId}	

Condition keys for Amazon Elastic Container Registry Public

Amazon Elastic Container Registry Public defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters create requests based on the allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters actions based on tag-value associated with the resource	String
aws:TagKeys	Filters create requests based on the presence of mandatory tags in the request	ArrayOfString
ecr-public:ResourceTag/${TagKey}	Filters actions based on tag-value associated with the resource	String

Actions, resources, and condition keys for Amazon Elastic Container Service

Amazon Elastic Container Service (service prefix: `ecs`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Elastic Container Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCapacityProvider	Grants permission to create a new capacity provider. Capacity providers are associated with an Amazon ECS cluster and are used in capacity provider strategies to facilitate cluster auto scaling	Write	capacity-provider*	aws:ResourceTag/${TagKey}	
				ecs:propagate-tags ecs:instance-	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				metadata-tags-propagation aws:RequestTag/${TagKey} aws:TagKeys	
CreateCluster	Grants permission to create a new Amazon ECS cluster	Write	cluster*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys ecs:capacity-provider ecs:fargate-ephemeral-storage-kms-key	
CreateExpressGatewayService	Grants permission to create a new Amazon ECS Express Gateway service with cluster and task definition	Write	service*	ecs:cluster aws:ResourceTag/${TagKey}	ecs:RegisterTaskDefinition iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys ecs:task-definition ecs:subnet ecs:enable-ecs-managed-tags ecs:propagate-tags ecs:task-cpu ecs:task-memory	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateService	Grants permission to run and maintain a desired number of tasks from a specified task definition via service creation	Write	service*	ecs:cluster aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys ecs:capacity-provider ecs:task-definition ecs:enable-ebs-volumes ecs:enable-execute-command ecs:enable-service-connect ecs:namespace	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ecs:enable-vpc-lattice ecs:enable-ecs-managed-tags ecs:propagate-tags ecs:auto-assign-public-ip ecs:subnet ecs:task-cpu ecs:task-memory	
CreateTaskSet	Grants permission to create a new Amazon ECS task set	Write	task-set*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys ecs:cluster ecs:capacity-provider ecs:service ecs:task-definition	
DeleteAccountSetting	Grants permission to modify the ARN and resource ID format of a resource for a specified IAM user, IAM role, or the root user for an account. You can specify whether the new ARN and resource ID format are disabled for new resources that are created	Write		ecs:account-setting	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAttributes	Grants permission to delete one or more custom attributes from an Amazon ECS resource	Write	container-instance*		
				aws:ResourceTag/${TagKey} ecs:cluster	
DeleteCapacityProvider	Grants permission to delete the specified capacity provider	Write	capacity-provider*		
				aws:ResourceTag/${TagKey}	
DeleteCluster	Grants permission to delete the specified cluster	Write	cluster*	aws:ResourceTag/${TagKey}	
DeleteExpressGatewayService	Grants permission to delete a specified Express Gateway service	Write	service*	ecs:cluster aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteService	Grants permission to delete a specified service within a cluster	Write	service*		
				aws:ResourceTag/${TagKey} ecs:cluster	
DeleteTaskDefinitions	Grants permission to delete the specified task definitions by family and revision	Write	task-definition*		
				aws:ResourceTag/${TagKey}	
DeleteTaskSet	Grants permission to delete the specified task set	Write	task-set*		
				aws:ResourceTag/${TagKey} ecs:cluster ecs:service	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeregisterContainerInstance	Grants permission to deregister an Amazon ECS container instance from the specified cluster	Write	cluster*	aws:ResourceTag/${TagKey}	
DeregisterTaskDefinition	Grants permission to deregister the specified task definition by family and revision	Write			
DescribeCapacityProviders	Grants permission to describe one or more Amazon ECS capacity providers	Read	capacity-provider*		
				aws:ResourceTag/${TagKey}	
DescribeClusters	Grants permission to describes one or more of your clusters	Read	cluster*	aws:ResourceTag/${TagKey}	
DescribeContainerInstances	Grants permission to describes Amazon ECS container instances	Read	container-instance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} ecs:cluster	
DescribeExpressGatewayService	Grants permission to describe the specified Express Gateway service	Read	service*	ecs:cluster aws:ResourceTag/${TagKey}	
DescribeServiceDeployments	Grants permission to describe one or more of your service deployments	Read	service*	ecs:cluster aws:ResourceTag/${TagKey}	
			service-deployment*	ecs:cluster ecs:service aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeServiceRevisions	Grants permission to describe one or more of your service revisions	Read	service*	ecs:cluster aws:ResourceTag/${TagKey}	
			service-revision*	ecs:cluster ecs:service aws:ResourceTag/${TagKey}	
DescribeServices	Grants permission to describe the specified services running in your cluster	Read	service*		
				aws:ResourceTag/${TagKey} ecs:cluster	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeTaskDefinition	Grants permission to describe a task definition. You can specify a family and revision to find information about a specific task definition, or you can simply specify the family to find the latest ACTIVE revision in that family	Read			
DescribeTaskSets	Grants permission to describe Amazon ECS task sets	Read	task-set*		
				aws:ResourceTag/${TagKey} ecs:cluster ecs:service	
DescribeTasks	Grants permission to describe a specified task or tasks	Read	task*		
				aws:ResourceTag/${TagKey} ecs:cluster	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DiscoverPollEndpoint	Grants permission to get an endpoint for the Amazon ECS agent to poll for updates	Write			
ExecuteCommand	Grants permission to run a command remotely on an Amazon ECS container	Write	cluster*		
			task*		
				aws:ResourceTag/${TagKey} ecs:cluster ecs:container-name ecs:task	
GetTaskProtection	Grants permission to retrieve the protection status of tasks in an Amazon ECS service	Read	task*		
				aws:ResourceTag/${TagKey} ecs:cluster	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAccountSettings	Grants permission to list the account settings for an Amazon ECS resource for a specified principal	Read			
ListAttributes	Grants permission to lists the attributes for Amazon ECS resources within a specified target type and cluster	List	cluster*	aws:ResourceTag/${TagKey}	
ListClusters	Grants permission to get a list of existing clusters	List			
ListContainerInstances	Grants permission to get a list of container instances in a specified cluster	List	cluster*	aws:ResourceTag/${TagKey}	
ListServiceDeployments	Grants permission to get a list of service deployments for a specified service	List	service*	aws:ResourceTag/${TagKey} ecs:cluster	
ListServices	Grants permission to get a list of services that are running in a specified cluster	List		ecs:cluster	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListServicesByNamespace	Grants permission to get a list of services that are running in a specified AWS Cloud Map Namespace	List		ecs:namespace	
ListTagsForResource	Grants permission to get a list of tags for the specified resource	Read	capacity-provider		
			cluster		
			container-instance		
			service		
			task		
			task-definition		
			task-set		
				aws:ResourceTag/${TagKey}	
ListTaskDefinitionFamilies	Grants permission to get a list of task definition families that are registered to your account (which may include task definition families that no longer have any ACTIVE task definitions)	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTaskDefinitions	Grants permission to get a list of task definitions that are registered to your account	List			
ListTasks	Grants permission to get a list of tasks for a specified cluster	List	container-instance*		
				aws:ResourceTag/${TagKey} ecs:cluster	
Poll [permission only]	Grants permission to an agent to connect with the Amazon ECS service to report status and get commands	Write	container-instance*		
				ecs:cluster	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutAccountSetting	Grants permission to modify the ARN and resource ID format of a resource for a specified IAM user, IAM role, or the root user for an account. You can specify whether the new ARN and resource ID format are enabled for new resources that are created. Enabling this setting is required to use new Amazon ECS features such as resource tagging	Write		ecs:account-setting	
PutAccountSettingDefault	Grants permission to modify the ARN and resource ID format of a resource type for all IAM users on an account for which no individual account setting has been set. Enabling this setting is required to use new Amazon ECS features such as resource tagging	Write		ecs:account-setting	
PutAttributes	Grants permission to create or update an attribute on an Amazon ECS resource	Write	container-instance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} ecs:cluster	
PutClusterCapacityProviders	Grants permission to modify the available capacity providers and the default capacity provider strategy for a cluster	Write	cluster*	aws:ResourceTag/${TagKey}	
				ecs:capacity-provider	
PutSystemLogEvents	Grants permission to collect system logs from the container instances	Write	cluster*	aws:ResourceTag/${TagKey}	
			container-instance*	aws:ResourceTag/${TagKey} ecs:cluster ecs:capacity-provider	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RegisterContainerInstance	Grants permission to register an EC2 instance into the specified cluster	Write	cluster*	aws:ResourceTag/${TagKey}	
				aws:RequestTag/${TagKey} aws:TagKeys	
RegisterTaskDefinition	Grants permission to register a new task definition from the supplied family and container Definitions	Write	task-definition*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys ecs:compute-compatibility ecs:privileged ecs:task-cpu ecs:task-memory	
RunTask	Grants permission to start a task using random placement and the default Amazon ECS scheduler	Write	task-definition*		iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys ecs:cluster ecs:capacity-provider ecs:enable-ebs-volumes ecs:enable-execute-command	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartTask	Grants permission to start a new task from the specified task definition on the specified container instance or instances	Write	task-definition*		iam:PassRole
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys ecs:cluster ecs:container-instances ecs:enable-ebs-volumes ecs:enable-execute-command	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartTelemetrySession	Grants permission to start a telemetry session	Write	container-instance*		
				ecs:cluster	
StopServiceDeployment	Grants permission to stop an ongoing service deployment	Write	service*	ecs:cluster aws:ResourceTag/${TagKey}	
			service-deployment*	ecs:cluster ecs:service aws:ResourceTag/${TagKey}	
StopTask	Grants permission to stop a running task	Write	task*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} ecs:cluster	
SubmitAttachmentStateChanges	Grants permission to send an acknowledgement that attachments changed states	Write	cluster*	aws:ResourceTag/${TagKey}	
SubmitContainerStateChange	Grants permission to send an acknowledgement that a container changed states	Write	cluster*	aws:ResourceTag/${TagKey}	
SubmitTaskStateChange	Grants permission to send an acknowledgement that a task changed states	Write	cluster*	aws:ResourceTag/${TagKey}	
TagResource	Grants permission to tag the specified resource	Tagging	capacity-provider		
			cluster		
			container-instance		
			service		
			task		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			task-definition		
			task-set		
				aws:TagKeys aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} ecs:CreateAction

				ecs:propagate-tags ecs:auto-assign-public-ip ecs:subnet ecs:task-cpu ecs:task-memory	
UpdateServicePrimaryTaskSet	Grants permission to modify the primary task set used in a service	Write	service*		
				aws:ResourceTag/${TagKey} ecs:cluster	
UpdateTaskProtection	Grants permission to modify the protection status of a task	Write	task*		
				aws:ResourceTag/${TagKey} ecs:cluster	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateTaskSet	Grants permission to update the specified task set	Write	task-set*		
				aws:ResourceTag/${TagKey} ecs:cluster ecs:service	

Resource types defined by Amazon Elastic Container Service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
cluster	`arn:${Partition}:ecs:${Region}:${Account}:cluster/${ClusterName}`	aws:ResourceTag/${TagKey} ecs:ResourceTag/${TagKey}
container-instance	`arn:${Partition}:ecs:${Region}:${Account}:container-instance/${ClusterName}/${ContainerInstanceId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
		ecs:ResourceTag/${TagKey}
service	arn:${Partition}:ecs:${Region}:${Account}:service/${ClusterName}/${ServiceName}	aws:ResourceTag/${TagKey} ecs:ResourceTag/${TagKey}
service-deployment	arn:${Partition}:ecs:${Region}:${Account}:service-deployment/${ClusterName}/${ServiceName}/${ServiceDeploymentId}	aws:ResourceTag/${TagKey} ecs:cluster ecs:service
service-revision	arn:${Partition}:ecs:${Region}:${Account}:service-revision/${ClusterName}/${ServiceName}/${ServiceRevisionId}	aws:ResourceTag/${TagKey} ecs:cluster ecs:service
task	arn:${Partition}:ecs:${Region}:${Account}:task/${ClusterName}/${TaskId}	aws:ResourceTag/${TagKey} ecs:ResourceTag/${TagKey}
task-definition	arn:${Partition}:ecs:${Region}:${Account}:task-definition/${TaskDefinitionFamilyName}:${TaskDefinitionRevisionNumber}	aws:ResourceTag/${TagKey} ecs:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
capacity-provider	arn:${Partition}:ecs:${Region}:${Account}:capacity-provider/${CapacityProviderName}	aws:ResourceTag/${TagKey} ecs:ResourceTag/${TagKey}
task-set	arn:${Partition}:ecs:${Region}:${Account}:task-set/${ClusterName}/${ServiceName}/${TaskSetId}	aws:ResourceTag/${TagKey} ecs:ResourceTag/${TagKey}

Condition keys for Amazon Elastic Container Service

Amazon Elastic Container Service defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Condition keys	Description	Type
ecs:CreateAction	Filters access by the name of a resource-creating API action	String
ecs:ResourceTag/${TagKey}	Filters access by the tag key-value pairs attached to the resource	String
ecs:account-setting	Filters access by the Amazon ECS account setting name	String
ecs:auto-assign-public-ip	Filters access by the public IP assignment configuration of your Amazon ECS task or Amazon ECS service that uses awsvpc network mode	Bool
ecs:capacity-provider	Filters access by the ARN of an Amazon ECS capacity provider	ArrayOfARN
ecs:cluster	Filters access by the ARN of an Amazon ECS cluster	ARN
ecs:compute-compatibility	Filters access by the required compatibilities field provided in the request	ArrayOfString
ecs:container-instances	Filters access by the ARN of an Amazon ECS container instance	ARN
ecs:container-name	Filters access by the name of an Amazon ECS container which is defined in the ECS task definition	String
ecs:enable-ebs-volumes	Filters access by the Amazon ECS managed Amazon EBS volume capability of your ECS task or service	String
ecs:enable-ecs-managed-tags	Filters access by the enableECSManagedTags configuration of your Amazon ECS task or Amazon ECS service	Bool
ecs:enable-execute-command	Filters access by the execute-command capability of your Amazon ECS task or Amazon ECS service	String

Condition keys	Description	Type
ecs:enable-service-connect	Filters access by the enable field value in the Service Connect configuration	String
ecs:enable-vpc-lattice	Filters access by the VPC lattice capability of your Amazon ECS service	String
ecs:fargate-ephemeral-storage-kms-key	Filters access by the AWS KMS key id provided in the request	String
ecs:instance-metadata-tags-propagation	Filters access by the instance metadata tags propagation setting of your Amazon ECS capacity provider	Bool
ecs:namespace	Filters access by the ARN of AWS Cloud Map namespace which is defined in the Service Connect Configuration	ARN
ecs:privileged	Filters access by the privileged field provided in the request	String
ecs:propagate-tags	Filters access by the tag propagation configuration of your Amazon ECS task or Amazon ECS service	String
ecs:service	Filters access by the ARN of an Amazon ECS service	ARN
ecs:subnet	Filters access by the subnet configuration of your Amazon ECS task or Amazon ECS service that uses awsvpc network mode	ArrayOfString
ecs:task	Filters access by the ARN of an Amazon ECS task	ARN
ecs:task-cpu	Filters access by the task cpu, as an integer with 1024 = 1 vCPU, provided in the request	Numeric
ecs:task-definition	Filters access by the ARN of an Amazon ECS task definition	ARN

Condition keys	Description	Type
ecs:task-memory	Filters access by the task memory, as an integer representing MiB, provided in the request	Numeric

Actions, resources, and condition keys for AWS Elastic Disaster Recovery

AWS Elastic Disaster Recovery (service prefix: `drs`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS Elastic Disaster Recovery

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateFailbackClientToRecoveryInstanceForDrs [permission only]	Grants permission to get associate failback client to recovery instance	Write	RecoveryInstanceResource*		
AssociateSourceNetworkStack	Grants permission to associate CloudFormation stack with source network	Write	SourceNetworkResource*		cloudformation:DescribeStackResource cloudformation:DescribeStacks drs:GetLaunchConfiguration ec2:CreateLaunchTemplateVersion ec2:DescribeLaunchTemplateVersions

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					ec2:DescribeLaunchTemplates ec2:DescribeSecurityGroups ec2:DescribeSubnets ec2:DescribeVpcs ec2:ModifyLaunchTemplate
				aws:RequestTag/${TagKey} aws:TagKeys	
BatchCreateVolumeSnapshotGroupForDrs [permission only]	Grants permission to batch create volume snapshot group	Write	RecoveryInstanceResource*		
			SourceServerResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchDeleteSnapshotRequestForDrs [permission only]	Grants permission to batch delete snapshot request	Write			
CreateConvertedSnapshotForDrs [permission only]	Grants permission to create converted snapshot	Write	SourceServerResource*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateExtendedSourceServer	Grants permission to extend a source server	Write		aws:RequestTag/${TagKey} aws:TagKeys	drs:DescribeSourceServers drs:GetReplicationConfiguration

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateLaunchConfigurationTemplate	Grants permission to create launch configuration template	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateRecoveryInstanceForDrs [permission only]	Grants permission to create recovery instance	Write	SourceServerResource*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateReplicationConfigurationTemplate	Grants permission to create replication configuration template	Write		aws:RequestTag/${TagKey} aws:TagKeys	ec2:CreateSecurityGroup ec2:DescribeSecurityGroups ec2:DescribeSubnets ec2:GetEbsDefaultKmsKeyId ec2:GetEbsEncryptionByDefault kms:CreateGrant kms:DescribeKey
CreateSourceNetwork	Grants permission to create a source network	Write		aws:RequestTag/${TagKey} aws:TagKeys	ec2:DescribeInstances ec2:DescribeVpcs

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSourceServerForDrs [permission only]	Grants permission to create a source server	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteJob	Grants permission to delete a job	Write	JobResource*		
DeleteLaunchAction	Grants permission to delete a launch action	Write	LaunchConfigurationTemplateResource		
			SourceServerResource		
DeleteLaunchConfigurationTemplate	Grants permission to delete launch configuration template	Write	LaunchConfigurationTemplateResource*		
DeleteRecoveryInstance	Grants permission to delete recovery instance	Write	RecoveryInstanceResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteReplicationConfigurationTemplate	Grants permission to delete replication configuration template	Write	ReplicationConfigurationTemplateResource*		
DeleteSourceNetwork	Grants permission to delete source network	Write	SourceNetworkResource*		
DeleteSourceServer	Grants permission to delete source server	Write	SourceServerResource*		
DescribeJobLogItems	Grants permission to describe job log items	Read	JobResource*		
DescribeJobs	Grants permission to describe jobs	Read			
DescribeLaunchConfigurationTemplates	Grants permission to describe launch configuration template	Read			
DescribeRecoveryInstances	Grants permission to describe recovery instances	Read			drs:DescribeSourceServers ec2:DescribeInstances

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeRecoverySnapshots	Grants permission to describe recovery snapshots	Read	SourceServerResource*		
DescribeReplicationConfigurationTemplates	Grants permission to describe replication configuration template	Read			
DescribeReplicationServerAssociationsForDrs [permission only]	Grants permission to describe replication server associations	Read			
DescribeSnapshotRequestsForDrs [permission only]	Grants permission to describe snapshot requests	Read			
DescribeSourceNetworks	Grants permission to describe source networks	Read			
DescribeSourceServers	Grants permission to describe source servers	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisconnectRecoveryInstance	Grants permission to disconnect recovery instance	Write	RecoveryInstanceResource*		
DisconnectSourceServer	Grants permission to disconnect source server	Write	SourceServerResource*		
ExportSourceNetworkCfnTemplate	Grants permission to export CloudFormation template which contains source network resources	Write	SourceNetworkResource*		s3:GetBucketLocation s3:GetObject s3:PutObject
				aws:RequestTag/${TagKey} aws:TagKeys	
GetAgentCommandForDrs [permission only]	Grants permission to get agent command	Read	RecoveryInstanceResource*		
			SourceServerResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAgentConfirmedResumeInfoForDrs [permission only]	Grants permission to get agent confirmed resume info	Read	RecoveryInstanceResource*		
			SourceServerResource*		
GetAgentInstallationAssetsForDrs [permission only]	Grants permission to get agent installation assets	Read			
GetAgentReplicationInfoForDrs [permission only]	Grants permission to get agent replication info	Read	RecoveryInstanceResource*		
			SourceServerResource*		
GetAgentRuntimeConfigurationForDrs [permission only]	Grants permission to get agent runtime configuration	Read	RecoveryInstanceResource*		
			SourceServerResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAgentSnapshotCreditsForDrs [permission only]	Grants permission to get agent snapshot credits	Read	RecoveryInstanceResource*		
			SourceServerResource*		
GetChannelCommandsForDrs [permission only]	Grants permission to get channel commands	Read			
GetFailbackCommandForDrs [permission only]	Grants permission to get failback command	Read	RecoveryInstanceResource*		
GetFailbackLaunchRequestedForDrs [permission only]	Grants permission to get failback launch requested	Read	RecoveryInstanceResource*		
GetFailbackReplicationConfiguration	Grants permission to get failback replication configuration	Read	RecoveryInstanceResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetLaunchConfiguration	Grants permission to get launch configuration	Read	SourceServerResource*		
GetReplicationConfiguration	Grants permission to get replication configuration	Read	SourceServerResource*		
GetSuggestedFailbackClientDeviceMappingForDrs [permission only]	Grants permission to get suggested failback client device mapping	Read	RecoveryInstanceResource*		
InitializeService	Grants permission to initialize service	Write			iam:AddRoleToInstanceProfile iam:CreateInstanceProfile iam:CreateServiceLinkedRole iam:GetInstanceProfile

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
IssueAgentCertificateForDrs [permission only]	Grants permission to issue an agent certificate	Write	RecoveryInstanceResource*		
			SourceServerResource*		
ListExtensibleSourceServers	Grants permission to list extensible source servers	Read			drs:DescribeSourceServers
ListLaunchActions	Grants permission to list launch actions	Read	LaunchConfigurationTemplateResource		
			SourceServerResource		
ListStagingAccounts	Grants permission to list staging accounts	Read			
ListTagsForResource	Grants permission to list tags for a resource	Read			
NotifyAgentAuthenticationForDrs [permission only]	Grants permission to notify agent authentication	Write	RecoveryInstanceResource*		
			SourceServerResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
NotifyAgentConnectedForDrs [permission only]	Grants permission to notify agent is connected	Write	RecoveryInstanceResource*		
			SourceServerResource*		
NotifyAgentDisconnectedForDrs [permission only]	Grants permission to notify agent is disconnected	Write	RecoveryInstanceResource*		
			SourceServerResource*		
NotifyAgentReplicationProgressForDrs [permission only]	Grants permission to notify agent replication progress	Write	RecoveryInstanceResource*		
			SourceServerResource*		
NotifyConsistencyAttainedForDrs [permission only]	Grants permission to notify consistency attained	Write	RecoveryInstanceResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
NotifyReplicationServerAuthenticationForDrs [permission only]	Grants permission to notify replication server authentication	Write	RecoveryInstanceResource*		
NotifyVolumeEventForDrs [permission only]	Grants permission to notify replicator volume events	Write	SourceServerResource*		
PutLaunchAction	Grants permission to put a launch action	Write	LaunchConfigurationTemplateResource		ssm:DescribeDocument
			SourceServerResource		
RetryDataReplication	Grants permission to retry data replication	Write	SourceServerResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ReverseReplication	Grants permission to reverse replication	Write	RecoveryInstanceResource*		drs:DescribeReplicationConfigurationTemplates drs:DescribeSourceServers ec2:DescribeInstances
				aws:RequestTag/${TagKey} aws:TagKeys	
SendAgentLogsForDrs [permission only]	Grants permission to send agent logs	Write	RecoveryInstanceResource*		
			SourceServerResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SendAgentMetricsForDrs [permission only]	Grants permission to send agent metrics	Write	RecoveryInstanceResource*		
			SourceServerResource*		
SendChannelCommandResultForDrs [permission only]	Grants permission to send channel command result	Write			
SendClientLogsForDrs [permission only]	Grants permission to send client logs	Write			
SendClientMetricsForDrs [permission only]	Grants permission to send client metrics	Write			
SendVolumeStatsForDrs [permission only]	Grants permission to send volume throughput statistics	Write	SourceServerResource*		
StartFailbackLaunch	Grants permission to start failback launch	Write	RecoveryInstanceResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

			ReplicationConfigurationTemplateResource		
			SourceNetworkResource		
			SourceServerResource		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
UpdateAgentBacklogForDrs [permission only]	Grants permission to update agent backlog	Write	RecoveryInstanceResource*		
			SourceServerResource*		
UpdateAgentConversionInfoForDrs [permission only]	Grants permission to update agent conversion info	Write	RecoveryInstanceResource*		
			SourceServerResource*		
UpdateAgentReplicationInfoForDrs [permission only]	Grants permission to update agent replication info	Write	RecoveryInstanceResource*		
			SourceServerResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAgentReplicationProcessStateForDrs [permission only]	Grants permission to update agent replication process state	Write	RecoveryInstanceResource*		
			SourceServerResource*		
UpdateAgentSourcePropertiesForDrs [permission only]	Grants permission to update agent source properties	Write	RecoveryInstanceResource*		
			SourceServerResource*		
UpdateFailbackClientDeviceMappingForDrs [permission only]	Grants permission to update failback client device mapping	Write	RecoveryInstanceResource*		
UpdateFailbackClientLastSeenForDrs [permission only]	Grants permission to update failback client last seen	Write	RecoveryInstanceResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateFailbackReplicationConfiguration	Grants permission to update failback replication configuration	Write	RecoveryInstanceResource*		
UpdateLaunchConfiguration	Grants permission to update launch configuration	Write	SourceServerResource*		ec2:DescribeInstances
UpdateLaunchConfigurationTemplate	Grants permission to update launch configuration	Write	LaunchConfigurationTemplateResource*		
UpdateReplicationCertificateForDrs [permission only]	Grants permission to update a replication certificate	Write	RecoveryInstanceResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateReplicationConfiguration	Grants permission to update replication configuration	Write	SourceServerResource*		ec2:CreateSecurityGroup ec2:DescribeSecurityGroups ec2:DescribeSubnets ec2:GetEbsDefaultKmsKeyId ec2:GetEbsEncryptionByDefault kms:CreateGrant kms:DescribeKey

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateReplicationConfigurationTemplate	Grants permission to update replication configuration template	Write	ReplicationConfigurationTemplateResource*		ec2:CreateSecurityGroup ec2:DescribeSecurityGroups ec2:DescribeSubnets ec2:GetEbsDefaultKmsKeyId ec2:GetEbsEncryptionByDefault kms:CreateGrant kms:DescribeKey

Resource types defined by AWS Elastic Disaster Recovery

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
JobResource	`arn:${Partition}:drs:${Region}:${Account}:job/${JobID}`	aws:ResourceTag/${TagKey}
RecoveryInstanceResource	`arn:${Partition}:drs:${Region}:${Account}:recovery-instance/${RecoveryInstanceID}`	aws:ResourceTag/${TagKey} drs:EC2InstanceARN
ReplicationConfigurationTemplateResource	`arn:${Partition}:drs:${Region}:${Account}:replication-configuration-template/${ReplicationConfigurationTemplateID}`	aws:ResourceTag/${TagKey}
LaunchConfigurationTemplateResource	`arn:${Partition}:drs:${Region}:${Account}:launch-configuration-template/${LaunchConfigurationTemplateID}`	aws:ResourceTag/${TagKey}
SourceServerResource	`arn:${Partition}:drs:${Region}:${Account}:source-server/${SourceServerID}`	aws:ResourceTag/${TagKey}
SourceNetworkResource	`arn:${Partition}:drs:${Region}:${Account}:source-network/${SourceNetworkID}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Elastic Disaster Recovery

AWS Elastic Disaster Recovery defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions

under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
drs:CreateAction	Filters access by the name of a resource-creating API action	String
drs:EC2InstanceARN	Filters access by the EC2 instance the request originated from	ARN

Actions, resources, and condition keys for Amazon Elastic File System

Amazon Elastic File System (service prefix: `elasticfilesystem`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.

- Condition keys for Amazon Elastic File System

Actions defined by Amazon Elastic File System

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Backup [permission only]	Grants permission to start a backup job for an existing file system	Write	file-system*		
ClientMount [permission only]	Grants permission to allow an NFS client read-access to a file system	Read	file-system*		
				elasticfilesystem:AccessPointArn elasticfilesystem:AccessedViaMountTarget	
ClientRootAccess [permission only]	Grants permission to allow an NFS client root-access to a file system	Write	file-system*		
				elasticfilesystem:	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				AccessPointArn elasticfilesystem:AccessedViaMountTarget	
ClientWrite [permission only]	Grants permission to allow an NFS client write-access to a file system	Write	file-system*		
				elasticfilesystem:AccessPointArn elasticfilesystem:AccessedViaMountTarget	
CreateAccessPoint	Grants permission to create an access point for the specified file system	Write	file-system*		elasticfilesystem:TagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateFileSystem	Grants permission to create a new, empty file system	Write		aws:RequestTag/${TagKey} aws:TagKeys elasticfilesystem:Encrypted	elasticfilesystem:TagResource
CreateMountTarget	Grants permission to create a mount target for a file system	Write	file-system*		
CreateReplicationConfiguration	Grants permission to create a new replication configuration	Write	file-system*		
CreateTags	Grants permission to create or overwrite tags associated with a file system; deprecated, see TagResource	Tagging	file-system*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAccessPoint	Grants permission to delete the specified access point	Write	access-point*		
DeleteFileSystem	Grants permission to delete a file system, permanently severing access to its contents	Write	file-system*		
DeleteFileSystemPolicy	Grants permission to delete the resource-level policy for a file system	Permissions management	file-system*		
DeleteMountTarget	Grants permission to delete the specified mount target	Write	file-system*		
DeleteReplicationConfiguration	Grants permission to delete a replication configuration	Write	file-system*		
DeleteTags	Grants permission to delete the specified tags from a file system; deprecated, see UntagResource	Tagging	file-system*		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeAccessPoints	Grants permission to view the descriptions of Amazon EFS access points	List	access-point		
			file-system		
DescribeAccountPreferences	Grants permission to view the account preferences in effect for an account	List			
DescribeBackupPolicy	Grants permission to view the BackupPolicy object for an Amazon EFS file system	Read	file-system*		
DescribeFileSystemPolicy	Grants permission to view the resource-level policy for an Amazon EFS file system	Read	file-system		
DescribeFileSystems	Grants permission to view the description of an Amazon EFS file system specified by file system CreationToken or FileSystemId; or to view the description of all file systems owned by the caller's AWS account in the AWS region of the endpoint that is being called	List	file-system		
DescribeLifecycleConfiguration	Grants permission to view the LifecycleConfiguration object for an Amazon EFS file system	Read	file-system*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeMountTargetSecurityGroups	Grants permission to view the security groups in effect for a mount target	Read	file-system*		
DescribeMountTargets	Grants permission to view the descriptions of all mount targets, or a specific mount target, for a file system	Read	file-system*		
			access-point		
DescribeReplicationConfigurations	Grants permission to view the description of an Amazon EFS replication configuration specified by FileSystemId; or to view the description of all replication configurations owned by the caller's AWS account in the AWS region of the endpoint that is being called	List	file-system		
DescribeTags	Grants permission to view the tags associated with a file system	Read	file-system*		
ListTagsForResource	Grants permission to view the tags associated with the specified Amazon EFS resource	Read	access-point		
			file-system		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyMountTargetSecurityGroups	Grants permission to modify the set of security groups in effect for a mount target	Write	file-system*		
PutAccountPreferences	Grants permission to set the account preferences of an account	Write			
PutBackupPolicy	Grants permission to enable or disable automatic backups with AWS Backup by creating a new BackupPolicy object	Write	file-system*		
PutFileSystemPolicy	Grants permission to apply a resource-level policy that defines the actions allowed or denied from given actors for the specified file system	Permissions management	file-system*		
PutLifecycleConfiguration	Grants permission to enable lifecycle management by creating a new Lifecycle Configuration object	Write	file-system*		
ReplicationRead [permission only]	Grants permission to read file system data for replication	Read	file-system*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ReplicationWrite [permission only]	Grants permission to replicate data to a file system	Write	file-system*		
Restore [permission only]	Grants permission to start a restore job for a backup of a file system	Write	file-system*		
TagResource	Grants permission to create or overwrite tags associated with the specified Amazon EFS resource	Tagging	access-point		
			file-system		
				aws:RequestTag/${TagKey} aws:TagKeys elasticfilesystem:CreateAction	
UntagResource	Grants permission to delete the specified tags from an Amazon EFS resource	Tagging	access-point		
			file-system		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
UpdateFileSystem	Grants permission to update the throughput mode or the amount of provisioned throughput of an existing file system	Write	file-system*		
UpdateFileSystemProtection	Grants permission to update the file system protection of an existing file system	Write	file-system*		

Resource types defined by Amazon Elastic File System

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
file-system	`arn:${Partition}:elasticfilesystem:${Region}:${Account}:file-system/${FileSystemId}`	aws:ResourceTag/${TagKey}
access-point	`arn:${Partition}:elasticfilesystem:${Region}:${Account}:access-point/${AccessPointId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Elastic File System

Amazon Elastic File System defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString
elasticfilesystem:AccessPointArn	Filters access by the ARN of the access point used to mount the file system	ARN
elasticfilesystem:AccessedViaMountTarget	Filters access by whether the file system is accessed via mount targets	Bool
elasticfilesystem:CreateAction	Filters access by the name of a resource-creating API action	String
elasticfilesystem:Encrypted	Filters access by whether users can create only encrypted or unencrypted file systems	Bool

Actions, resources, and condition keys for Amazon Elastic Kubernetes Service

Amazon Elastic Kubernetes Service (service prefix: `eks`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon Elastic Kubernetes Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AccessKubernetesApi [permission only]	Grants permission to view Kubernetes objects via AWS EKS console	Read	cluster*		
AssociateAccessPolicy	Grants permission to associate an Amazon EKS access policy to an Amazon EKS access entry	Write	access-entry*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				eks:policyArn eks:namespaces eks:accessScope	
AssociateEncryptionConfig	Grants permission to associate encryption configuration to a cluster	Write	cluster*		
AssociateIdentityProviderConfig	Grants permission to associate an identity provider configuration to a cluster	Write	cluster*		
				aws:RequestTag/${TagKey} aws:TagKeys eks:clientId eks:issuerUrl	
CreateAccessEntry	Grants permission to create an Amazon EKS access entry	Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys eks:principalArn eks:kubernetesGroups eks:username eks:accessEntryType	
CreateAddon	Grants permission to create an Amazon EKS add-on	Write	cluster*		
			podidentityassociation		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateCapability	Grants permission to create a capability for an Amazon EKS cluster	Write	cluster*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCluster	Grants permission to create an Amazon EKS cluster	Write		aws:RequestTag/${TagKey} aws:TagKeys eks:bootstrapClusterCreatorAdminPermissions eks:bootstrapSelfManagedAddons eks:authenticationMode eks:supportType eks:computeConfigEnabled eks:elasticLoadBalancingEnabled	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				eks:blockStorageEnabled eks:loggingType/${type}	
CreateEksAnywhereSubscription	Grants permission to create an EKS Anywhere subscription	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateFargateProfile	Grants permission to create an AWS Fargate profile	Write	cluster*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateNodegroup	Grants permission to create an Amazon EKS Nodegroup	Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreatePodIdentityAssociation	Grants permission to create an EKS Pod Identity association	Write	cluster*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAccessEntry	Grants permission to delete an Amazon EKS access entry	Write	access-entry*		
DeleteAddon	Grants permission to delete an Amazon EKS add-on	Write	addon*		
			podidentityassociation		
DeleteCapability	Grants permission to delete a capability from an Amazon EKS cluster	Write	capability*		
DeleteCluster	Grants permission to delete an Amazon EKS cluster	Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteEksAnywhereSubscription	Grants permission to describe an EKS Anywhere subscription	Write	eks-anywhere-subscription*		
DeleteFargateProfile	Grants permission to delete an AWS Fargate profile	Write	fargateprofile*		
DeleteNodegroup	Grants permission to delete an Amazon EKS Nodegroup	Write	nodegroup*		
DeletePodIdentityAssociation	Grants permission to delete an EKS Pod Identity association	Write	podidentityassociation*		
DeregisterCluster	Grants permission to deregister an External cluster	Write	cluster*		
DescribeAccessEntry	Grants permission to describe an Amazon EKS access entry	Read	access-entry*		
DescribeAddon	Grants permission to retrieve descriptive information about an Amazon EKS add-on	Read	addon*		
DescribeAddonConfiguration	Grants permission to list configuration options about an Amazon EKS add-on	Read			
DescribeAddonVersions	Grants permission to retrieve descriptive version information about the add-ons that Amazon EKS Add-ons supports	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeCapability	Grants permission to describe a capability for an Amazon EKS cluster	Read	capability*		
DescribeCluster	Grants permission to retrieve descriptive information about an Amazon EKS cluster	Read	cluster*		
DescribeClusterVersions	Grants permission to retrieve descriptive information about Kubernetes versions that Amazon EKS clusters support	Read			
DescribeEksAnywhereSubscription	Grants permission to describe an EKS Anywhere subscription	Read	eks-anywhere-subscription*		
DescribeFargateProfile	Grants permission to retrieve descriptive information about an AWS Fargate profile associated with a cluster	Read	fargateprofile*		
DescribeIdentityProviderConfig	Grants permission to retrieve descriptive information about an Idp config associated with a cluster	Read	identityproviderconfig*		
DescribeInsight	Grants permission to retrieve descriptive information of a detected insight for a specified cluster	Read	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeInsightsRefresh	Grants permission to retrieve the status of the latest on-demand cluster insights refresh operation	Read	cluster*		
DescribeNodegroup	Grants permission to retrieve descriptive information about an Amazon EKS nodegroup	Read	nodegroup*		
DescribePodIdentityAssociation	Grants permission to describe an EKS Pod Identity association	Read	podidentityassociation*		
DescribeUpdate	Grants permission to retrieve a given update for a given Amazon EKS cluster/nodegroup/add-on (in the specified or default region)	Read	cluster*		
			addon		
			capability		
			nodegroup		
DisassociateAccessPolicy	Grants permission to disassociate an Amazon EKS access policy from an Amazon EKS acces entry	Write	access-entry*		
				eks:policyArn eks:namespaces eks:accessScope	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateIdentityProviderConfig	Grants permission to delete an asssociated Idp config	Write	identityproviderconfig*		
ListAccessEntries	Grants permission to list all Amazon EKS access entries	List	cluster*		
ListAccessPolicies	Grants permission to list Amazon EKS access policies	List			
ListAddons	Grants permission to list the Amazon EKS add-ons in your AWS account (in the specified or default region) for a given cluster	List	cluster*		
ListAssociatedAccessPolicies	Grants permission to list associated access policy on and Amazon EKS access entry	List	access-entry*		
ListCapabilities	Grants permission to list capabilities for an Amazon EKS cluster	List	cluster*		
ListClusters	Grants permission to list the Amazon EKS clusters in your AWS account (in the specified or default region)	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDashboardData	Grants permission to list dashboard data. The Amazon EKS Dashboard aggregates information about cluster resources across multiple accounts and regions. The dashboard includes information about EC2 Instances and EKS Cluster versions	Read	dashboard*		
ListDashboardResources	Grants permission to list dashboard resources. The Amazon EKS Dashboard aggregates information about cluster resources across multiple accounts and regions. The dashboard includes information about EC2 Instances and EKS Cluster versions	Read	dashboard*		
ListEksAnywhereSubscriptions	Grants permission to list EKS Anywhere subscriptions	List			
ListFargateProfiles	Grants permission to list the AWS Fargate profiles in your AWS account (in the specified or default region) associated with a given cluster	List	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListIdentityProviderConfigs	Grants permission to list the Idp configs in your AWS account (in the specified or default region) associated with a given cluster	List	cluster*		
ListInsights	Grants permission to list all detected insights for a specified cluster	List	cluster*		
ListNodegroups	Grants permission to list the Amazon EKS nodegroups in your AWS account (in the specified or default region) attached to given cluster	List	cluster*		
ListPodIdentityAssociations	Grants permission to list EKS Pod Identity associations	List	cluster*		
ListTagsForResource	Grants permission to list tags for the specified resource	Read	addon		
			capability		
			cluster		
			dashboard		
			eks-anywhere-subscription		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			fargateprofile		
			identityproviderconfig		
			nodegroup		
ListUpdates	Grants permission to list the updates for a given Amazon EKS cluster/nodegroup/add-on (in the specified or default region)	List	cluster*		
			addon		
			capability		
			nodegroup		
MutateViaKubernetesApi [permission only]	Grants permission to modify Kubernetes objects via AWS console	Write	cluster*		eks:AccessKubernetesApi
RegisterCluster	Grants permission to register an External cluster	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartInsightsRefresh	Grants permission to initiate an on-demand refresh operation for cluster insights, getting the latest analysis outside of the standard refresh schedule	Write	cluster*		
TagResource	Grants permission to tag the specified resource	Tagging	access-entry		
			addon		
			capability		
			cluster		
			dashboard		
			eks-anywhere-subscription		
			fargateprofile		
			identityproviderconfig		
			nodegroup		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			podidentityassociation		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag the specified resource	Tagging	access-entry		
			addon		
			capability		
			cluster		
			dashboard

UpdateAccessEntry	Grants permission to update an Amazon EKS access entry	Write	access-entry*		
UpdateAddon	Grants permission to update Amazon EKS add-on configurations, such as the VPC-CNI version	Write	addon*		
			podidentityassociation		
UpdateCapability	Grants permission to update a capability for an Amazon EKS cluster	Write	capability*		
UpdateClusterConfig	Grants permission to update Amazon EKS cluster configurations (eg: API server endpoint access)	Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				eks:authenticationMode eks:supportType eks:computeConfigEnabled eks:elasticLoadBalancingEnabled eks:blockStorageEnabled eks:loggingType/${type}	
UpdateClusterVersion	Grants permission to update the Kubernetes version of an Amazon EKS cluster	Write	cluster*		
UpdateEksAnywhereSubscription	Grants permission to update an EKS Anywhere subscription	Write	eks-anywhere-subscription*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateNodegroupConfig	Grants permission to update Amazon EKS nodegroup configurations (eg: min/max/desired capacity or labels)	Write	nodegroup*		
UpdateNodegroupVersion	Grants permission to update the Kubernetes version of an Amazon EKS nodegroup	Write	nodegroup*		
UpdatePodIdentityAssociation	Grants permission to update an EKS Pod Identity association	Write	podidentityassociation*		

Resource types defined by Amazon Elastic Kubernetes Service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
cluster	`arn:${Partition}:eks:${Region}:${Account}:cluster/${ClusterName}`	aws:ResourceTag/${TagKey}
nodegroup	`arn:${Partition}:eks:${Region}:${Account}:nodegroup/${ClusterName}/${NodegroupName}/${UUID}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
addon	arn:${Partition}:eks:${Region}:${Account}:addon/${ClusterName}/${AddonName}/${UUID}	aws:ResourceTag/${TagKey}
fargateprofile	arn:${Partition}:eks:${Region}:${Account}:fargateprofile/${ClusterName}/${FargateProfileName}/${UUID}	aws:ResourceTag/${TagKey}
identityproviderconfig	arn:${Partition}:eks:${Region}:${Account}:identityproviderconfig/${ClusterName}/${IdentityProviderType}/${IdentityProviderConfigName}/${UUID}	aws:ResourceTag/${TagKey}
eks-anywhere-subscription	arn:${Partition}:eks:${Region}:${Account}:eks-anywhere-subscription/${UUID}	aws:ResourceTag/${TagKey}
podidentityassociation	arn:${Partition}:eks:${Region}:${Account}:podidentityassociation/${ClusterName}/${UUID}	aws:ResourceTag/${TagKey}
access-entry	arn:${Partition}:eks:${Region}:${Account}:access-entry/${ClusterName}/${IamIdentityType}/${IamIdentityAccountID}/${IamIdentityName}/${UUID}	aws:ResourceTag/${TagKey} eks:accessEntryType eks:clusterName eks:kubernetesGroups eks:principalArn eks:username

Resource types	ARN	Condition keys
access-policy	arn:${Partition}:eks::aws:cluster-access-policy/${AccessPolicyName}	
dashboard	arn:${Partition}:eks:${Region}:${Account}:dashboard/${DashboardName}	aws:ResourceTag/${TagKey}
capability	arn:${Partition}:eks:${Region}:${Account}:capability/${ClusterName}/${CapabilityType}/${CapabilityName}/${UUID}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Elastic Kubernetes Service

Amazon Elastic Kubernetes Service defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a key that is present in the request the user makes to the EKS service	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair	String
aws:TagKeys	Filters access by the list of all the tag key names present in the request the user makes to the EKS service	ArrayOfString
eks:accessEntryType	Filters access by the access entry type present in the access entry requests the user makes to the EKS service	String

Condition keys	Description	Type
eks:accessScope	Filters access by the accessScope present in the associate / disassociate access policy requests the user makes to the EKS service	String
eks:authenticationMode	Filters access by the authenticationMode present in the create / update cluster request	String
eks:blockStorageEnabled	Filters access by the block storage enabled parameter in the create / update cluster request	Bool
eks:bootstrapClusterCreatorAdminPermissions	Filters access by the bootstrapClusterCreatorAdminPermissions present in the create cluster request	Bool
eks:bootstrapSelfManagedAddons	Filters access by the bootstrapSelfManagedAddons present in the create cluster request	Bool
eks:clientId	Filters access by the clientId present in the associate IdentityProviderConfig request the user makes to the EKS service	String
eks:clusterName	Filters access by the clusterName present in the access entry requests the user makes to the EKS service	String
eks:computeConfigEnabled	Filters access by the compute config enabled parameter in the create / update cluster request	Bool
eks:elasticLoadBalancingEnabled	Filters access by the elastic load balancing enabled parameter in the create / update cluster request	Bool
eks:issuerUrl	Filters access by the issuerUrl present in the associate IdentityProviderConfig request the user makes to the EKS service	String

Condition keys	Description	Type
eks:kubernetesGroups	Filters access by the kubernetesGroups present in the access entry requests the user makes to the EKS service	ArrayOfString
eks:loggingType/${type}	Filters access by the cluster logging enabled and type parameter in the create / update cluster request	Bool
eks:namespaces	Filters access by the namespaces present in the associate / disassociate access policy requests the user makes to the EKS service	ArrayOfString
eks:policyArn	Filters access by the policyArn present in the access entry requests the user makes to the EKS service	ARN
eks:principalArn	Filters access by the principalArn present in the access entry requests requests the user makes to the EKS service	ARN
eks:supportType	Filters access by the supportType present in the create / update cluster request	String
eks:username	Filters access by the Kubernetes username present in the access entry requests the user makes to the EKS service	String

Actions, resources, and condition keys for AWS Elastic Load Balancing

AWS Elastic Load Balancing (service prefix: `elasticloadbalancing`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

- Actions defined by AWS Elastic Load Balancing

- Resource types defined by AWS Elastic Load Balancing
- Condition keys for AWS Elastic Load Balancing

Actions defined by AWS Elastic Load Balancing

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddTags	Grants permission to add the specified tags to the specified load balancer. Each load balancer can have a maximum of 10 tags	Tagging	loadbalancer*		
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				elasticloadbalancing:CreateAction	
ApplySecurityGroupsToLoadBalancer	Grants permission to associate one or more security groups with your load balancer in a virtual private cloud (VPC)	Write	loadbalancer*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey} elasticloadbalancing:SecurityGroup	
AttachLoadBalancerToSubnets	Grants permission to add one or more subnets to the set of configured subnets for the specified load balancer	Write	loadbalancer*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey} elasticloadbalancing:Subnet	
Configure HealthCheck	Grants permission to specify the health check settings to use when evaluating the health state of your back-end instances	Write	loadbalancer*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAppCookieStickinessPolicy	Grants permission to generate a stickiness policy with sticky session lifetimes that follow that of an application-generated cookie	Write	loadbalancer*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
CreateLBCookieStickinessPolicy	Grants permission to generate a stickiness policy with sticky session lifetimes controlled by the lifetime of the browser (user-agent) or a specified expiration period	Write	loadbalancer*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateLoadBalancer	Grants permission to create a load balancer	Write	loadbalancer		elasticloadbalancing:AddTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey} elasticloadbalancing:SecurityGroup elasticloadbalancing:Subnet elasticloadbalancing:Scheme	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				elasticloadbalancing:ListenerProtocol	
CreateLoadBalancerListeners	Grants permission to create one or more listeners for the specified load balancer	Write	loadbalancer*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey} elasticloadbalancing:ListenerProtocol	
CreateLoadBalancerPolicy	Grants permission to create a policy with the specified attributes for the specified load balancer	Write	loadbalancer*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey} elasticloadbalancing:SecurityPolicy	
DeleteLoadBalancer	Grants permission to delete the specified load balancer	Write	loadbalancer*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteLoadBalancerListeners	Grants permission to delete the specified listeners from the specified load balancer	Write	loadbalancer*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
DeleteLoadBalancerPolicy	Grants permission to delete the specified policy from the specified load balancer. This policy must not be enabled for any listeners	Write	loadbalancer*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeregisterInstancesFromLoadBalancer	Grants permission to deregister the specified instances from the specified load balancer	Write	loadbalancer*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
DescribeInstanceHealth	Grants permission to describe the state of the specified instances with respect to the specified load balancer	Read			
DescribeLoadBalancerAttributes	Grants permission to describe the attributes for the specified load balancer	Read			
DescribeLoadBalancerPolicies	Grants permission to describe the specified policies	Read			
DescribeLoadBalancerPolicyTypes	Grants permission to describe the specified load balancer policy types	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeLoadBalancers	Grants permission to describe the specified the load balancers. If no load balancers are specified, the call describes all of your load balancers	List			
DescribeTags	Grants permission to describe the tags associated with the specified load balancers	Read			
DetachLoadBalancerFromSubnets	Grants permission to remove the specified subnets from the set of configured subnets for the load balancer	Write	loadbalancer*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableAvailabilityZonesForLoadBalancer	Grants permission to remove the specified Availability Zones from the set of Availability Zones for the specified load balancer	Write	loadbalancer*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
EnableAvailabilityZonesForLoadBalancer	Grants permission to add the specified Availability Zones to the set of Availability Zones for the specified load balancer	Write	loadbalancer*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
ModifyLoadBalancerAttributes	Grants permission to modify the attributes of the specified load balancer	Write	loadbalancer*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
RegisterInstancesWithLoadBalancer	Grants permission to add the specified instances to the specified load balancer	Write	loadbalancer*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
RemoveTags	Grants permission to remove one or more tags from the specified load balancer	Tagging	loadbalancer*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
SetLoadBalancerListenerSSLCertificate	Grants permission to set the certificate that terminates the specified listener's SSL connections	Write	loadbalancer*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
SetLoadBalancerPoliciesForBackendServer	Grants permission to replace the set of policies associated with the specified port on which the back-end server is listening with a new set of policies	Write	loadbalancer*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SetLoadBalancerPoliciesOfListener	Grants permission to replace the current set of policies for the specified load balancer port with the specified set of policies	Write	loadbalancer*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey} elasticloadbalancing:SecurityPolicy	

Resource types defined by AWS Elastic Load Balancing

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
loadbalancer	`arn:${Partition}:elasticloadbalancing:${Region}:${Account}:loadbalancer/${LoadBalancerName}`	aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}

Condition keys for AWS Elastic Load Balancing

AWS Elastic Load Balancing defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString
elasticloadbalancing:CreateAction	Filters access by the name of a resource-creating API action	String
elasticloadbalanci	Filters access by the listener protocols that are allowed in the request	ArrayOfString

Condition keys	Description	Type
ng:ListenerProtocol		
elasticloadbalancing:ResourceTag/	Filters access by the preface string for a tag key and value pair that are attached to a resource	String
elasticloadbalancing:ResourceTag/${TagKey}	Filters access by the preface string for a tag key and value pair that are attached to a resource	String
elasticloadbalancing:Scheme	Filters access by the load balancer scheme that are allowed in the request	String
elasticloadbalancing:SecurityGroup	Filters access by the security-group IDs that are allowed in the request	ArrayOfString
elasticloadbalancing:SecurityPolicy	Filters access by the SSL Security Policies that are allowed in the request	ArrayOfString
elasticloadbalancing:Subnet	Filters access by the subnet IDs that are allowed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Elastic Load Balancing V2

AWS Elastic Load Balancing V2 (service prefix: `elasticloadbalancing`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS Elastic Load Balancing V2

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddListenerCertificates	Grants permission to add the specified certificates to the specified secure listener	Write	listener/app*		
			listener/net*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:Resour	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				ceTag/${TagKey}	
AddTags	Grants permission to add the specified tags to the specified load balancer. Each load balancer can have a maximum of 10 tags	Tagging	listener-rule/app		
			listener-rule/net		
			listener/app		
			listener/gwy		
			listener/net		
			loadbalancer/app/		
			loadbalancer/gwy/		
			loadbalancer/net/		
			targetgroup		
			truststore		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey} elasticloadbalancing:CreateAction	
AddTrustStoreRevocations	Grants permission to add revocations to a trust store	Write	truststore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
AllowVendedLogDeliveryForResource [permission only]	Grants permission to configure vended log delivery for load balancers	Permissions management			
CreateListener	Grants permission to create a listener for the specified Application Load Balancer	Write	loadbalancer/app/		elasticloadbalancing:AddTags
			loadbalancer/gwy/		
			loadbalancer/net/		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey} elasticloadbalancing:SecurityPolicy elasticloadbalancing:ListenerProtocol	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateLoadBalancer	Grants permission to create a load balancer	Write	loadbalancer/app/		elasticloadbalancing:AddTags
			loadbalancer/gwy/		
			loadbalancer/net/		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey} elasticloadbalancing:SecurityGroup elasticloadbalancing:Subnet elasticloadbalancing:Scheme	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateRule	Grants permission to create a rule for the specified listener	Write	listener/app*		elasticloadbalancing:AddTags
			listener/net*		
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
CreateTargetGroup	Grants permission to create a target group	Write	targetgroup*		elasticloadbalancing:AddTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
CreateTrustStore	Grants permission to create a trust store	Write	truststore		elasticloadbalancing:AddTags

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
CreateWebACLAssociation [permission only]	Grants permission to associate WAF WebACL to the specified load balancer	Write	loadbalancer/app/*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
DeleteListener	Grants permission to delete the specified listener	Write	listener/app*		
			listener/gwy*		
			listener/net*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteLoadBalancer	Grants permission to delete the specified load balancer	Write	loadbalancer/app/		
			loadbalancer/gwy/		
			loadbalancer/net/		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
DeleteRule	Grants permission to delete the specified rule	Write	listener-rule/app*		
			listener-rule/net*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
DeleteSharedTrustStoreAssociation	Grants permission to delete the specified shared trust store association	Write	truststore*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
DeleteTargetGroup	Grants permission to delete the specified target group	Write	targetgroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
DeleteTrustStore	Grants permission to delete the specified trust store	Write	truststore*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
DeleteWebACLAssociation [permission only]	Grants permission to disassociate WAF WebACL from the specified load balancer	Write	loadbalancer/app/*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
DeregisterTargets	Grants permission to deregister the specified targets from the specified target group	Write	targetgroup*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
DescribeAccountLimits	Grants permission to describe the Elastic Load Balancing resource limits for the AWS account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeCapacityReservation	Grants permission to describe the capacity reservation for a load balancer	Read			
DescribeListenerAttributes	Grants permission to describe the attributes for the specified listener	Read			
DescribeListenerCertificates	Grants permission to describe the certificates for the specified secure listener	Read			
DescribeListeners	Grants permission to describe the specified listeners or the listeners for the specified Application Load Balancer	Read			
DescribeLoadBalancerAttributes	Grants permission to describe the attributes for the specified load balancer	Read			
DescribeLoadBalancers	Grants permission to describe the specified the load balancers. If no load balancers are specified, the call describes all of your load balancers	List			
DescribeRules	Grants permission to describe the specified rules or the rules for the specified listener	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeSSLPolicies	Grants permission to describe the specified policies or all policies used for SSL negotiation	Read			
DescribeTags	Grants permission to describe the tags associated with the specified resource	Read			
DescribeTargetGroupAttributes	Grants permission to describe the attributes for the specified target group	Read			
DescribeTargetGroups	Grants permission to describe the specified target groups or all of your target groups	Read			
DescribeTargetHealth	Grants permission to describe the health of the specified targets or all of your targets	Read			
DescribeTrustStoreAssociations	Grants permission to describe the associations with a trust store	Read			
DescribeTrustStoreRevocations	Grants permission to describe the specified trust stores revocations or all of your revocations related to a trust store	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeTrustStores	Grants permission to describe the specified trust stores or all of your trust stores	Read			
DescribeWebACLAssociation [permission only]	Grants permission to describe all load balancers associated to a WAF WebACL in your account	List			
GetLoadBalancerWebACL [permission only]	Grants permission to retrieve the WAF WebACL associated to the specified load balancer	Read	loadbalancer/app/*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
GetResourcePolicy	Grants permission to retrieve the resource policy associated with the resource	Read	truststore		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
GetTrustStoreCaCertificatesBundle	Grants permission to retrieve a trust store CA certificates bundle	Read	truststore*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
GetTrustStoreRevocationContent	Grants permission to retrieve a trust store revocation content	Read	truststore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
ModifyCapacityReservation	Grants permission to modify the capacity reservation for a load balancer	Write	loadbalancer/app/		
			loadbalancer/gwy/		
			loadbalancer/net/		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyIpPools	Grants permission to modify the ip pools for a load balancer	Write	loadbalancer/app/		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
ModifyListener	Grants permission to modify the specified properties of the specified listener	Write	listener/app*		
			listener/gwy*		
			listener/net*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey} elasticloadbalancing:SecurityPolicy elasticloadbalancing:ListenerProtocol	
ModifyListenerAttributes	Grants permission to modify the attributes of the specified listener	Write	listener/app*		
			listener/gwy*		
			listener/net*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
ModifyLoadBalancerAttributes	Grants permission to modify the attributes of the specified load balancer	Write	loadbalancer/app/		
			loadbalancer/gwy/		
			loadbalancer/net/		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyRule	Grants permission to modify the specified rule	Write	listener-rule/app*		
			listener-rule/net*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
ModifyTargetGroup	Grants permission to modify the health checks used when evaluating the health state of the targets in the specified target group	Write	targetgroup*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyTargetGroupAttributes	Grants permission to modify the specified attributes of the specified target group	Write	targetgroup*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
ModifyTrustStore	Grants permission to modify the specified trust store	Write	truststore*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
RegisterTargets	Grants permission to register the specified targets with the specified target group	Write	targetgroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
RemoveListenerCertificates	Grants permission to remove the specified certificates of the specified secure listener	Write	listener/app*		
			listener/net*		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
RemoveTags	Grants permission to remove one or more tags from the specified load balancer	Tagging	listener-rule/app		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			listener-rule/net		
			listener/app		
			listener/gwy		
			listener/net		
			loadbalancer/app/		
			loadbalancer/gwy/		
			loadbalancer/net/		
			targetgroup		
			truststore		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
RemoveTrustStoreRevocations	Grants permission to remove revocations from a trust store	Write	truststore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	
SetIpAddressType	Grants permission to set the type of IP addresses used by the subnets of the specified load balancer	Write	loadbalancer/app/		
			loadbalancer/gwy/		
			loadbalancer/net/		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SetRulePriorities	Grants permission to set the priorities of the specified rules	Write	listener-rule/app*		
			listener-rule/net*		
SetSecurityGroups	Grants permission to associate the specified security groups with the specified load balancer	Write	loadbalancer/app/		
			loadbalancer/net/		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey} elasticloadbalancing:SecurityGroup	
SetSubnets	Grants permission to enable the Availability Zone for the specified subnets for the specified load balancer	Write	loadbalancer/app/		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			loadbalancer/gwy/		
			loadbalancer/net/		
				aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey} elasticloadbalancing:Subnet	
SetWebAcl [permission only]	Grants permission to give WebAcl permission to WAF	Write			

Resource types defined by AWS Elastic Load Balancing V2

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
listener/gwy	arn:${Partition}:elasticloadbalancing:${Region}:${Account}:listener/gwy/${LoadBalancerName}/${LoadBalancerId}/${ListenerId}	aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}
listener/app	arn:${Partition}:elasticloadbalancing:${Region}:${Account}:listener/app/${LoadBalancerName}/${LoadBalancerId}/${ListenerId}	aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}
listener-rule/app	arn:${Partition}:elasticloadbalancing:${Region}:${Account}:listener-rule/app/${LoadBalancerName}/${LoadBalancerId}/${ListenerId}/${ListenerRuleId}	aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}
listener/net	arn:${Partition}:elasticloadbalancing:${Region}:${Account}:listener/net/${LoadBalancerName}/${LoadBalancerId}/${ListenerId}	aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}
listener-rule/net	arn:${Partition}:elasticloadbalancing:${Region}:${Account}:listener-rule/net/${LoadBalancerName}/${LoadBalancerId}/${ListenerId}/${ListenerRuleId}	aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
loadbalancer/gwy/	arn:${Partition}:elasticloadbalancing:${Region}:${Account}:loadbalancer/gwy/${LoadBalancerName}/${LoadBalancerId}	aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}
loadbalancer/app/	arn:${Partition}:elasticloadbalancing:${Region}:${Account}:loadbalancer/app/${LoadBalancerName}/${LoadBalancerId}	aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}
loadbalancer/net/	arn:${Partition}:elasticloadbalancing:${Region}:${Account}:loadbalancer/net/${LoadBalancerName}/${LoadBalancerId}	aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}
targetgroup	arn:${Partition}:elasticloadbalancing:${Region}:${Account}:targetgroup/${TargetGroupName}/${TargetGroupId}	aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}
truststore	arn:${Partition}:elasticloadbalancing:${Region}:${Account}:truststore/${TrustStoreName}/${TrustStoreId}	aws:ResourceTag/${TagKey} elasticloadbalancing:ResourceTag/${TagKey}

Condition keys for AWS Elastic Load Balancing V2

AWS Elastic Load Balancing V2 defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString
elasticloadbalancing:CreateAction	Filters access by the name of a resource-creating API action	String
elasticloadbalancing:ListenerProtocol	Filters access by the listener protocol that is allowed in the request	String
elasticloadbalancing:ResourceTag/${TagKey}	Filters access by the preface string for a tag key and value pair that are attached to a resource	String
elasticloadbalancing:Scheme	Filters access by the load balancer scheme that is allowed in the request	String

Condition keys	Description	Type
elasticloadbalancing:SecurityGroup	Filters access by the security-group IDs that are allowed in the request	ArrayOfString
elasticloadbalancing:SecurityPolicy	Filters access by the SSL Security Policies that are allowed in the request	ArrayOfString
elasticloadbalancing:Subnet	Filters access by the subnet IDs that are allowed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Elastic MapReduce

Amazon Elastic MapReduce (service prefix: `elasticmapreduce`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

- Condition keys for Amazon Elastic MapReduce

Actions defined by Amazon Elastic MapReduce

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy,

you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Note

The DescribeJobFlows API is deprecated and will eventually be removed. We recommend you use ListClusters, DescribeCluster, ListSteps, ListInstanceGroups and ListBootstrapActions instead

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AccessAllEventLogs	Grants permission to view all event logs in a persistent application history server	Write	cluster*		
AddInstanceFleet	Grants permission to add an instance fleet to a running cluster	Write	cluster*		
AddInstanceGroups	Grants permission to add instance groups to a running cluster	Write	cluster*		
AddJobFlowSteps	Grants permission to add new steps to a running cluster	Write	cluster*		
				elasticmapreduce:ExecutionRoleArn	
AddTags	Grants permission to add tags to an Amazon EMR resource	Tagging	cluster		
			editor		
			notebook-execution		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			studio		
				aws:RequestTag/${TagKey} aws:TagKeys elasticmapreduce:RequestTag/${TagKey}	
AttachEditor [permission only]	Grants permission to attach an EMR notebook to a compute engine	Write	editor*		
CancelSteps	Grants permission to cancel a pending step or steps in a running cluster	Write	cluster*		
CreateEditor [permission only]	Grants permission to create an EMR notebook	Write	cluster		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys elasticmapreduce:RequestTag/${TagKey}	
CreatePersistentAppUI	Grants permission to create a persistent application history server	Write	cluster*		
CreateRepository [permission only]	Grants permission to create an EMR notebook repository	Write			
CreateSecurityConfiguration	Grants permission to create a security configuration	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateStudio	Grants permission to create an EMR Studio	Write		aws:RequestTag/${TagKey} aws:TagKeys elasticmapreduce:RequestTag/${TagKey}	
CreateStudioPresignedUrl	Grants permission to launch an EMR Studio using IAM authentication mode	Write	studio*		
CreateStudioSessionMapping	Grants permission to create an EMR Studio session mapping	Write	studio*		
DeleteEditor [permission only]	Grants permission to delete an EMR notebook	Write	editor*		
DeleteRepository [permission only]	Grants permission to delete an EMR notebook repository	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteSecurityConfiguration	Grants permission to delete a security configuration	Write			
DeleteStudio	Grants permission to delete an EMR Studio	Write	studio*		
DeleteStudioSessionMapping	Grants permission to delete an EMR Studio session mapping	Write	studio*		
DeleteWorkspaceAccess [permission only]	Grants permission to block an identity from opening a collaborative workspace	Permissions management	editor*		
DescribeCluster	Grants permission to get details about a cluster, including status, hardware and software configuration, VPC settings, and so on	Read	cluster*		
DescribeEditor [permission only]	Grants permission to view information about a notebook, including status, user, role, tags, location, and more	Read	editor*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeJobFlows	Grants permission to describe details of clusters (job flows). This API is deprecated and will eventually be removed. We recommend you use ListClusters, DescribeCluster, ListSteps, ListInstanceGroups and ListBootstrapActions instead	Read	cluster*		
DescribeNotebookExecution	Grants permission to view information about a notebook execution	Read	notebook-execution*		
DescribePersistentAppUI	Grants permission to describe a persistent application history server	Read	cluster*		
DescribeReleaseLabel	Grants permission to view information about an EMR release, such as which applications are supported	Read			
DescribeRepository [permission only]	Grants permission to describe an EMR notebook repository	Read			
DescribeSecurityConfiguration	Grants permission to get details of a security configuration	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeStep	Grants permission to get details about a cluster step	Read	cluster*		
DescribeStudio	Grants permission to view information about an EMR Studio	Read	studio*		
DetachEditor [permission only]	Grants permission to detach an EMR notebook from a compute engine	Write	editor*		
GetAutoTerminationPolicy	Grants permission to retrieve the auto-termination policy associated with a cluster	Read	cluster*		
GetBlockPublicAccessConfiguration	Grants permission to retrieve the EMR block public access configuration for the AWS account in the Region	Read			
GetClusterSessionCredentials	Grants permission to retrieve HTTP basic credentials associated with a given execution IAM Role for a fine-grained access control enabled EMR Cluster	Write	cluster*		
				elasticmapreduce:ExecutionRoleArn	
GetManagedScalingPolicy	Grants permission to retrieve the managed scaling policy associated with a cluster	Read	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetOnClusterAppUIPresignedURL	Grants permission to get a presigned URL for an application history server running on the cluster	Write	cluster*		
GetPersistentAppUIPresignedURL	Grants permission to get a presigned URL for a persistent application history server	Write	cluster*		
				elasticmapreduce:ExecutionRoleArn	
GetStudioSessionMapping	Grants permission to view information about an EMR Studio session mapping	Read	studio*		
LinkRepository [permission only]	Grants permission to link an EMR notebook repository to EMR notebooks	Write			
ListBootstrapActions	Grants permission to get details about the bootstrap actions associated with a cluster	Read	cluster*		
ListClusters	Grants permission to get the status of accessible clusters	List			
ListEditors [permission only]	Grants permission to list summary information for accessible EMR notebooks	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListInstanceFleets	Grants permission to get details of instance fleets in a cluster	Read	cluster*		
ListInstanceGroups	Grants permission to get details of instance groups in a cluster	Read	cluster*		
ListInstances	Grants permission to get details about the Amazon EC2 instances in a cluster	Read	cluster*		
ListNotebookExecutions	Grants permission to list summary information for notebook executions	List			
ListReleaseLabels	Grants permission to list and filter the available EMR releases in the current region	List			
ListRepositories [permission only]	Grants permission to list existing EMR notebook repositories	List			
ListSecurityConfigurations	Grants permission to list available security configurations in this account by name, along with creation dates and times	List			
ListSteps	Grants permission to list steps associated with a cluster	Read	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListStudioSessionMappings	Grants permission to list summary information about EMR Studio session mappings	List			
ListStudios	Grants permission to list summary information about EMR Studios	List			
ListSupportedInstanceTypes	Grants permission to list the Amazon EC2 instance types that an Amazon EMR release supports	List			
ListWorkspaceAccessIdentities [permission only]	Grants permission to list identities that are granted access to a workspace	List	editor*		
ModifyCluster	Grants permission to change cluster settings such as number of steps that can be executed concurrently for a cluster	Write	cluster*		
ModifyInstanceFleet	Grants permission to change the target On-Demand and target Spot capacities for a instance fleet	Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ModifyInstanceGroups	Grants permission to change the number and configuration of EC2 instances for an instance group	Write	cluster		
OpenEditorInConsole [permission only]	Grants permission to launch the Jupyter notebook editor for an EMR notebook from within the console	Write	editor*		
			cluster		
PutAutoScalingPolicy	Grants permission to create or update an automatic scaling policy for a core instance group or task instance group	Write	cluster*		
PutAutoTerminationPolicy	Grants permission to create or update the auto-termination policy associated with a cluster	Write	cluster*		
PutBlockPublicAccessConfiguration	Grants permission to create or update the EMR block public access configuration for the AWS account in the Region	Permissions management			
PutManagedScalingPolicy	Grants permission to create or update the managed scaling policy associated with a cluster	Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutWorkspaceAccess [permission only]	Grants permission to allow an identity to open a collaborative workspace	Permissions management	editor*		
RemoveAutoScalingPolicy	Grants permission to remove an automatic scaling policy from an instance group	Write	cluster*		
RemoveAutoTerminationPolicy	Grants permission to remove the auto-termination policy associated with a cluster	Write	cluster*		
RemoveManagedScalingPolicy	Grants permission to remove the managed scaling policy associated with a cluster	Write	cluster*		
RemoveTags	Grants permission to remove tags from an Amazon EMR resource	Tagging	cluster		
			editor		
			notebook-execution		
			studio		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RunJobFlow	Grants permission to create and launch a cluster (job flow)	Write		aws:RequestTag/${TagKey} aws:TagKeys elasticmapreduce:RequestTag/${TagKey}	iam:PassRole
SetKeepJobFlowAliveWhenNoSteps	Grants permission to add and remove auto terminate after step execution for a cluster	Write	cluster*		
SetTerminationProtection	Grants permission to add and remove termination protection for a cluster	Write	cluster*		
SetUnhealthyNodeReplacement	Grants permission to enable or disable unhealthy node replacement for a cluster	Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SetVisibleToAllUsers	Grants permission to set whether all AWS Identity and Access Management (IAM) users in the AWS account can view a cluster. This API is deprecated and your cluster may be visible to all users in your account. To restrict cluster access using an IAM policy, see AWS Identity and Access Management for Amazon EMR (https://docs.aws.amazon.com/emr/latest/ManagementGuide/emr-plan-access-iam.html)	Write	cluster*		
StartEditor [permission only]	Grants permission to start an EMR notebook	Write	editor* cluster		
StartNotebookExecution	Grants permission to start an EMR notebook execution	Write	cluster* editor*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys elasticmapreduce:RequestTag/${TagKey}	
StopEditor [permission only]	Grants permission to shut down an EMR notebook	Write	editor*		
StopNotebookExecution	Grants permission to stop notebook execution	Write	notebook-execution*		
TerminateJobFlows	Grants permission to terminate a cluster (job flow)	Write	cluster*		
UnlinkRepository [permission only]	Grants permission to unlink an EMR notebook repository from EMR notebooks	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateEditor [permission only]	Grants permission to update an EMR notebook	Write	editor*		
UpdateRepository [permission only]	Grants permission to update an EMR notebook repository	Write			
UpdateStudio	Grants permission to update information about an EMR Studio	Write	studio*		
UpdateStudioSessionMapping	Grants permission to update an EMR Studio session mapping	Write	studio*		
ViewEventsFromAllClustersInConsole [permission only]	Grants permission to use the EMR console to view events from all clusters	List			

Resource types defined by Amazon Elastic MapReduce

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
cluster	arn:${Partition}:elasticmapreduce:${Region}:${Account}:cluster/${ClusterId}	aws:ResourceTag/${TagKey} elasticmapreduce:ResourceTag/${TagKey}
editor	arn:${Partition}:elasticmapreduce:${Region}:${Account}:editor/${EditorId}	aws:ResourceTag/${TagKey} elasticmapreduce:ResourceTag/${TagKey}
notebook-execution	arn:${Partition}:elasticmapreduce:${Region}:${Account}:notebook-execution/${NotebookExecutionId}	aws:ResourceTag/${TagKey} elasticmapreduce:ResourceTag/${TagKey}
studio	arn:${Partition}:elasticmapreduce:${Region}:${Account}:studio/${StudioId}	aws:ResourceTag/${TagKey} elasticmapreduce:ResourceTag/${TagKey}

Condition keys for Amazon Elastic MapReduce

Amazon Elastic MapReduce defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by whether the tag and value pair is provided with the action	String
aws:ResourceTag/${TagKey}	Filters access by the tag and value pair associated with an Amazon EMR resource	String
aws:TagKeys	Filters access by whether the tag keys are provided with the action regardless of tag value	ArrayOfString
elasticmapreduce:ExecutionRoleArn	Filters access by whether the execution role ARN is provided with the action	ARN
elasticmapreduce:RequestTag/${TagKey}	Filters access by whether the tag and value pair is provided with the action	String
elasticmapreduce:ResourceTag/${TagKey}	Filters access by the tag and value pair associated with an Amazon EMR resource	String

Actions, resources, and condition keys for Amazon Elastic Transcoder

Amazon Elastic Transcoder (service prefix: `elastictranscoder`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- View a list of the API operations available for this service.

- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon Elastic Transcoder

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelJob	Cancel a job that Elastic Transcoder has not begun to process	Write	job*		
CreateJob	Create a job	Write	pipeline*		
			preset*		
CreatePipeline	Create a pipeline	Write			
CreatePreset	Create a preset	Write			
DeletePipeline	Delete a pipeline	Write	pipeline*		
DeletePreset	Delete a preset	Write	preset*		
ListJobsByPipeline	Get a list of the jobs that you assigned to a pipeline	List	pipeline*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListJobsByStatus	Get information about all of the jobs associated with the current AWS account that have a specified status	List			
ListPipelines	Get a list of the pipelines associated with the current AWS account	List			
ListPresets	Get a list of all presets associated with the current AWS account	List			
ReadJob	Get detailed information about a job	Read	job*		
ReadPipeline	Get detailed information about a pipeline	Read	pipeline*		
ReadPreset	Get detailed information about a preset	Read	preset*		
TestRole	Test the settings for a pipeline to ensure that Elastic Transcoder can create and process jobs	Write			
UpdatePipeline	Update settings for a pipeline	Write	pipeline*		
UpdatePipelineNotifications	Update only Amazon Simple Notification Service (Amazon SNS) notifications for a pipeline	Write	pipeline*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdatePipelineStatus	Pause or reactivate a pipeline, so the pipeline stops or restarts processing jobs, update the status for the pipeline	Write	pipeline*		

Resource types defined by Amazon Elastic Transcoder

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
job	`arn:${Partition}:elastictranscoder:${Region}:${Account}:job/${JobId}`	
pipeline	`arn:${Partition}:elastictranscoder:${Region}:${Account}:pipeline/${PipelineId}`	
preset	`arn:${Partition}:elastictranscoder:${Region}:${Account}:preset/${PresetId}`	

Condition keys for Amazon Elastic Transcoder

Elastic Transcoder has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Elastic VMware Service

Amazon Elastic VMware Service (service prefix: `evs`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon ElastiCache

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Note

When you create an ElastiCache policy in IAM you must use the "*" wildcard character for the Resource block. For information about using the following ElastiCache API actions in an IAM policy, see ElastiCache Actions and IAM in the *Amazon ElastiCache User Guide*.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

ResetCacheParameterGroup	Grants permission to modify parameters of a cache parameter group back to their default values	Write	parametergroup*		
				aws:ResourceTag/${TagKey} elasticache:CacheParameterGroupName	
RevokeCacheSecurityGroupIngress	Grants permission to remove an EC2 security group ingress from a ElastiCache security group	Write	securitygroup*		
				aws:ResourceTag/${TagKey}	
StartMigration	Grants permission to start a migration of data from hosted Redis on Amazon EC2 to ElastiCache for Redis	Write	replicationgroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
TestFailover	Grants permission to test automatic failover on a specified node group in a replication group	Write	replicationgroup*		ec2:CreateNetworkInterface ec2:DeleteNetworkInterface ec2:DescribeNetworkInterfaces ec2:DescribeSubnets ec2:DescribeVpcs
				aws:ResourceTag/${TagKey}	
TestMigration	Grants permission to test a migration of data from hosted Redis on Amazon EC2 to ElastiCache for Redis	Write	replicationgroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	

Resource types defined by Amazon ElastiCache

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Note

The resource name in the ARN string should be lowercase to be effective.

Resource types	ARN	Condition keys
parameter group	`arn:${Partition}:elasticache:${Region}:${Account}:parametergroup:${CacheParameterGroupName}`	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys elasticache:CacheParameterGroupName

Resource types	ARN	Condition keys

Condition keys for Amazon ElastiCache

Amazon ElastiCache defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

> **Note**
>
> To construct Condition elements using condition keys of String type, use the case insensitive condition operators StringEqualsIgnoreCase or StringNotEqualsIgnoreCase to compare a key to a string value.
> For information about conditions in an IAM policy to control access to ElastiCache, see ElastiCache Keys in the *Amazon ElastiCache User Guide*.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters actions based on the tags that are passed in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters actions based on the tags associated with the resource	String
aws:TagKeys	Filters actions based on the tag keys that are passed in the request	ArrayOfString
elasticache:AtRestEncryptionEnabled	Filters access by the AtRestEncryptionEnabled parameter present in the request or default false value if parameter is not present	Bool
elasticache:AuthTokenEnabled	Filters access by the presence of non empty AuthToken parameter in the request	Bool
elasticache:AutomaticFailoverEnabled	Filters access by the AutomaticFailoverEnabled parameter in the request	Bool
elasticache:CacheNodeType	Filters access by the cacheNodeType parameter present in the request. This key can be used to restrict which cache node types can be used on cluster creation or scaling operations	String
elasticache:CacheParameterGroupName	Filters access by the CacheParameterGroupName parameter in the request	String
elasticache:ClusterModeEnabled	Filters access by the cluster mode parameter present in the request. Default value for single node group (shard) creations is false	Bool

Condition keys	Description	Type
elasticache:DataStorageUnit	Filters access by the CacheUsageLimits.DataStorage.Unit parameter in the CreateServerlessCache and ModifyServerlessCache request	String
elasticache:EngineType	Filters access by the engine type present in creation requests. For replication group creations, default engine 'redis' is used as key if parameter is not present	String
elasticache:EngineVersion	Filters access by the engineVersion parameter present in creation or cluster modification requests	String
elasticache:KmsKeyId	Filters access by the Key ID of the KMS key	String
elasticache:MaximumDataStorage	Filters access by the CacheUsageLimits.DataStorage.Maximum parameter in the CreateServerlessCache and ModifyServerlessCache request	Numeric
elasticache:MaximumECPUPerSecond	Filters access by the CacheUsageLimits.ECPUPerSecond.Maximum parameter in the CreateServerlessCache and ModifyServerlessCache request	Numeric
elasticache:MinimumDataStorage	Filters access by the CacheUsageLimits.DataStorage.Minimum parameter in the CreateServerlessCache and ModifyServerlessCache request	Numeric
elasticache:MinimumECPUPerSecond	Filters access by the CacheUsageLimits.ECPUPerSecond.Minimum parameter in the CreateServerlessCache and ModifyServerlessCache request	Numeric
elasticache:MultiAZEnabled	Filters access by the AZMode parameter, MultiAZEnabled parameter or the number of availability zones that the cluster or replication group can be placed in	Bool

Condition keys	Description	Type
elasticache:NumNodeGroups	Filters access by the NumNodeGroups or NodeGroupCount parameter specified in the request. This key can be used to restrict the number of node groups (shards) clusters can have after creation or scaling operations	Numeric
elasticache:ReplicasPerNodeGroup	Filters access by the number of replicas per node group (shards) specified in creations or scaling requests	Numeric
elasticache:SnapshotRetentionLimit	Filters access by the SnapshotRetentionLimit parameter in the request	Numeric
elasticache:TransitEncryptionEnabled	Filters access by the TransitEncryptionEnabled parameter present in the request. For replication group creations, default value 'false' is used as key if parameter is not present	Bool
elasticache:UserAuthenticationMode	Filters access by the UserAuthenticationMode parameter in the request	String

Actions, resources, and condition keys for AWS Elemental Appliances and Software

AWS Elemental Appliances and Software (service prefix: `elemental-appliances-software`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.

- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS Elemental Appliances and Software

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CompleteUpload [permission only]	Grants permission to complete an upload of an attachment for a quote or order	Write			
CreateOrderV1 [permission only]	Grants permission to create an order	Write			
CreateQuote [permission only]	Grants permission to create a quote	Write	quote*		
GetAvsCorrectAddress [permission only]	Grants permission to validate an address	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetBillingAddresses [permission only]	Grants permission to list the billing addresses in the AWS Account	Read			
GetDeliveryAddressesV2 [permission only]	Grants permission to list the delivery addresses in the AWS Account	Read			
GetOrder [permission only]	Grants permission to describe an order	Read			
GetOrdersV2 [permission only]	Grants permission to list the orders in the AWS Account	Read			
GetQuote [permission only]	Grants permission to describe a quote	Read	quote*		
GetTaxes [permission only]	Grants permission to calculate taxes for an order	Read			
ListQuotes [permission only]	Grants permission to list the quotes in the AWS Account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartUpload [permission only]	Grants permission to start an upload of an attachment for a quote or order	Write			
SubmitOrderV1 [permission only]	Grants permission to submit an order	Write			
UpdateQuote [permission only]	Grants permission to modify a quote	Write	quote*		

Resource types defined by AWS Elemental Appliances and Software

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
quote	`arn:${Partition}:elemental-appliances-software:${Region}:${Account}:quote/${ResourceId}`	

Condition keys for AWS Elemental Appliances and Software

Elemental Appliances and Software has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Elemental Appliances and Software Activation Service

AWS Elemental Appliances and Software Activation Service (service prefix: `elemental-activations`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Actions defined by AWS Elemental Appliances and Software Activation Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CompleteAccountReg	Grants permission to complete the process of	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
istration [permission only]	registering customer account for AWS Elemental Appliances and Software Purchases				
CompleteFileUpload [permission only]	Grants permission to complete the process of uploading a Software file for AWS Elemental Appliances and Software Purchases	Write			
ConfirmAccount [permission only]	Grants permission to confirm asset ownership	Write			
DownloadKickstart [permission only]	Grants permission to download the kickstart files for AWS Elemental Appliances and Software purchases	Read			
DownloadSoftware [permission only]	Grants permission to download the Software files for AWS Elemental Appliances and Software Purchases	Read			
GenerateLicense [permission only]	Grants permission to generate a software license for an AWS Elemental Appliances and Software purchase	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GenerateLicenses [permission only]	Grants permission to generate Software Licenses for AWS Elemental Appliances and Software Purchases	Write			
GetArtifactGroupSoftwareVersions [permission only]	Grants permission to describe the software version of an artifact group	Read			
GetAsset [permission only]	Grants permission to describe an asset	Read			
GetAssets [permission only]	Grants permission to describe assets associated to the requesting account	Read			
GetProductAdvisories [permission only]	Grants permission to get all product advisories	Read			
GetSoftwareVersions [permission only]	Grants permission to describe available software versions	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartFileUpload [permission only]	Grants permission to start the process of uploading a Software file for AWS Elemental Appliances and Software Purchases	Write			

Resource types defined by AWS Elemental Appliances and Software Activation Service

AWS Elemental Appliances and Software Activation Service does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Elemental Appliances and Software Activation Service, specify `"Resource": "*"` in your policy.

Condition keys for AWS Elemental Appliances and Software Activation Service

Elemental Activations has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Elemental Inference

AWS Elemental Inference (service prefix: `elemental-inference`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Elemental Inference

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateFeed	Grants permission to associate a feed with an AWS resource	Write	feed*		
CreateFeed	Grants permission to create a new feed	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteFeed	Grants permission to delete a feed	Write	feed*		
DisassociateFeed	Grants permission to disassociate a feed from an AWS resource	Write	feed*		
GetFeed	Grants permission to get feed details	Read	feed*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetMetadata	Grants permission to retrieve metadata for a specific feed output	Read	feed*		
ListFeeds	Grants permission to list feeds in the account	List			
ListTagsForResource	Grants permission to list tags on a resource	Read			
PutMedia	Grants permission to upload media data for a specified feed	Write	feed*		
TagResource	Grants permission to add tags to a resource	Tagging	feed		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from a resource	Tagging	feed		
				aws:TagKeys	
UpdateFeed	Grants permission to update feed configuration	Write	feed*		

Resource types defined by AWS Elemental Inference

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
feed	`arn:${Partition}:elemental-inference:${Region}:${Account}:feed/${Id}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Elemental Inference

AWS Elemental Inference defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by tags associated with the resource	String
aws:TagKeys	Filters access by tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Elemental MediaConnect

AWS Elemental MediaConnect (service prefix: `mediaconnect`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.

Actions defined by AWS Elemental MediaConnect

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddBridgeOutputs	Grants permission to add outputs to an existing bridge	Write	Bridge*		
AddBridgeSources	Grants permission to add sources to an existing bridge	Write	Bridge*		
AddFlowMediaStreams	Grants permission to add media streams to any flow	Write	Flow*		
			MediaStream*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
AddFlowOutputs	Grants permission to add outputs to any flow	Write	Flow*

Resource types defined by AWS Elemental MediaConnect

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Bridge	arn:${Partition}:mediaconnect:${Region}:${Account}:bridge:${BridgeId}:${BridgeName}	
Entitlement	arn:${Partition}:mediaconnect:${Region}:${Account}:entitlement:${FlowId}:${EntitlementName}	aws:ResourceTag/${TagKey}
Flow	arn:${Partition}:mediaconnect:${Region}:${Account}:flow:${FlowId}:${FlowName}	aws:ResourceTag/${TagKey}
Gateway	arn:${Partition}:mediaconnect:${Region}:${Account}:gateway:${GatewayId}:${GatewayName}	
GatewayInstance	arn:${Partition}:mediaconnect:${Region}:${Account}:gateway:${GatewayId}:${GatewayName}:instance:${InstanceId}	
MediaStream	arn:${Partition}:mediaconnect:${Region}:${Account}:flow:${FlowId}:${FlowName}/mediaStream/${MediaStreamName}	aws:ResourceTag/${TagKey}
Offering	arn:${Partition}:mediaconnect:${Region}:offering:${OfferingId}	
Output	arn:${Partition}:mediaconnect:${Region}:${Account}:output:${OutputId}:${OutputName}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
Reservation	arn:${Partition}:mediaconnect:${Region}:${Account}:reservation:${ReservationId}:${ReservationName}	
RouterInput	arn:${Partition}:mediaconnect:${Region}:${Account}:routerInput:${RouterInputId}	aws:ResourceTag/${TagKey}
RouterNetworkInterface	arn:${Partition}:mediaconnect:${Region}:${Account}:routerNetworkInterface:${RouterNetworkInterfaceId}	aws:ResourceTag/${TagKey}
RouterOutput	arn:${Partition}:mediaconnect:${Region}:${Account}:routerOutput:${RouterOutputId}	aws:ResourceTag/${TagKey}
Source	arn:${Partition}:mediaconnect:${Region}:${Account}:source:${SourceId}:${SourceName}	aws:ResourceTag/${TagKey}
VpcInterface	arn:${Partition}:mediaconnect:${Region}:${Account}:flow:${FlowId}:${FlowName}/vpcInterface/${VpcInterfaceName}	aws:ResourceTag/${TagKey}

Condition keys for AWS Elemental MediaConnect

AWS Elemental MediaConnect defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by tags associated with the resource	String
aws:TagKeys	Filters access by tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Elemental MediaConvert

AWS Elemental MediaConvert (service prefix: `mediaconvert`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Elemental MediaConvert

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Associate Certificate	Grants permission to associate an AWS Certificate Manager (ACM) Amazon Resource Name (ARN) with AWS Elemental MediaConvert	Write			
CancelJob	Grants permission to cancel an AWS Elemental MediaConvert job that is waiting in queue	Write	Job*		
CreateJob	Grants permission to create and submit an AWS Elemental MediaConvert job	Write	JobTemplate		
			Preset		
			Queue		
				aws:RequestTag/${TagKey} aws:TagKeys mediaconvert:HttpInputsAllowed mediaconvert:Https	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				InputsAllowed mediaconvert:S3InputsAllowed	
CreateJobTemplate	Grants permission to create an AWS Elemental MediaConvert custom job template	Write	Preset		
			Queue		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreatePreset	Grants permission to create an AWS Elemental MediaConvert custom output preset	Write		aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateQueue	Grants permission to create an AWS Elemental MediaConvert job queue	Write		aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	
CreateResourceShare	Grants permission to share an AWS Elemental MediaConvert job	Write	Job		
DeleteJobTemplate	Grants permission to delete an AWS Elemental MediaConvert custom job template	Write	JobTemplate*		
DeletePolicy	Grants permission to delete an AWS Elemental MediaConvert policy	Write			
DeletePreset	Grants permission to delete an AWS Elemental MediaConvert custom output preset	Write	Preset*		
DeleteQueue	Grants permission to delete an AWS Elemental MediaConvert job queue	Write	Queue*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeEndpoints	Grants permission to subscribe to the AWS Elemental MediaConvert service, by sending a request for an account-specific endpoint. All transcoding requests must be sent to the endpoint that the service returns	List			
DisassociateCertificate	Grants permission to remove an association between the Amazon Resource Name (ARN) of an AWS Certificate Manager (ACM) certificate and an AWS Elemental MediaConvert resource	Write			
GetJob	Grants permission to get an AWS Elemental MediaConvert job	Read	Job*		
GetJobTemplate	Grants permission to get an AWS Elemental MediaConvert job template	Read	JobTemplate*		
GetPolicy	Grants permission to get an AWS Elemental MediaConvert policy	Read			
GetPreset	Grants permission to get an AWS Elemental MediaConvert output preset	Read	Preset*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetQueue	Grants permission to get an AWS Elemental MediaConvert job queue	Read	Queue*		
ListJobTemplates	Grants permission to list AWS Elemental MediaConvert job templates	List			
ListJobs	Grants permission to list AWS Elemental MediaConvert jobs	List	Queue		
ListPresets	Grants permission to list AWS Elemental MediaConvert output presets	List			
ListQueues	Grants permission to list AWS Elemental MediaConvert job queues	List			
ListTagsForResource	Grants permission to retrieve the tags for a MediaConvert queue, preset, or job template	Read	Job		
			JobTemplate		
			Preset		
			Queue		
ListVersions	Grants permission to list AWS Elemental MediaConvert job engine versions	List			
Probe	Grants permission to probe a file	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutPolicy	Grants permission to put an AWS Elemental MediaConvert policy	Write			
SearchJobs	Grants permission to search AWS Elemental MediaConvert jobs	List	Queue		
TagResource	Grants permission to add tags to a MediaConvert queue, preset, or job template	Tagging	Job		
			JobTemplate		
			Preset		
			Queue		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from a MediaConvert queue, preset, or job template	Tagging	Job		
			JobTemplate		
			Preset		
			Queue		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
UpdateJobTemplate	Grants permission to update an AWS Elemental MediaConvert custom job template	Write	JobTemplate*		
			Preset		
			Queue		
UpdatePreset	Grants permission to update an AWS Elemental MediaConvert custom output preset	Write	Preset*		
UpdateQueue	Grants permission to update an AWS Elemental MediaConvert job queue	Write	Queue*		

Resource types defined by AWS Elemental MediaConvert

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Job	`arn:${Partition}:mediaconvert:${Region}:${Account}:jobs/${JobId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
Queue	arn:${Partition}:mediaconvert:${Region}:${Account}:queues/${QueueName}	aws:ResourceTag/${TagKey}
Preset	arn:${Partition}:mediaconvert:${Region}:${Account}:presets/${PresetName}	aws:ResourceTag/${TagKey}
JobTemplate	arn:${Partition}:mediaconvert:${Region}:${Account}:jobTemplates/${JobTemplateName}	aws:ResourceTag/${TagKey}
CertificateAssociation	arn:${Partition}:mediaconvert:${Region}:${Account}:certificates/${CertificateArn}	

Condition keys for AWS Elemental MediaConvert

AWS Elemental MediaConvert defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by tag keys in the request	ArrayOfString

Condition keys	Description	Type
mediaconvert:HttpInputsAllowed	Filters access by an HTTP input policy present in the account	Bool
mediaconvert:HttpsInputsAllowed	Filters access by an HTTPS input policy present in the account	Bool
mediaconvert:S3InputsAllowed	Filters access by an S3 input policy present in the account	Bool

Actions, resources, and condition keys for AWS Elemental MediaLive

AWS Elemental MediaLive (service prefix: `medialive`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Elemental MediaLive

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptInputDeviceTransfer	Grants permission to accept an input device transfer	Write	input-device*		
BatchDelete	Grants permission to delete channels, inputs, input security groups, and multiplexes	Write			
BatchStart	Grants permission to start channels and multiplexes	Write			
BatchStop	Grants permission to stop channels and multiplexes	Write			
BatchUpdateSchedule	Grants permission to add and remove actions from a channel's schedule	Write	channel*		
CancelInputDeviceTransfer	Grants permission to cancel an input device transfer	Write	input-device*		
ClaimDevice	Grants permission to claim an input device	Write	input-device*		
CreateChannel	Grants permission to create a channel	Write	channel*		
			input*		
				aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
CreateChannelPlacementGroup	Grants permission to create a cluster	Write	channel-placement-group*		
			cluster*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateCloudWatchAlarmTemplate	Grants permission to create a cloudwatch alarm template	Write	cloudwatch-alarm-template*		
			cloudwatch-alarm-template-group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateCloudWatchAlarmTemplateGroup	Grants permission to create a cloudwatch alarm template group	Write	cloudwatch-alarm-template-group*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateCluster	Grants permission to create a cluster	Write	cluster*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateEventBridgeRuleTemplate	Grants permission to create a eventbridge rule template	Write	eventbridge-rule-template*		
			eventbridge-rule-template-group*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateEventBridgeRuleTemplateGroup	Grants permission to create a eventbridge rule template group	Write	eventbridge-rule-template-group*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateInput	Grants permission to create an input	Write	input*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			input-security-group*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateInputSecurityGroup	Grants permission to create an input security group	Write	input-security-group*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateMultiplex	Grants permission to create a multiplex	Write	multiplex*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateMultiplexProgram	Grants permission to create a multiplex program	Write	multiplex*		
CreateNetwork	Grants permission to create a network	Write	network*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateNode	Grants permission to create a node	Write	cluster*		
			node*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateNodeRegistrationScript	Grants permission to create a node registration script	Write	cluster*		
CreatePartnerInput	Grants permission to create a partner input	Write	input*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSdiSource	Grants permission to create a SDI source	Write	sdi-source*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSignalMap	Grants permission to create a signal map	Write	signal-map*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTags	Grants permission to create tags for channels, inputs, input security groups, multiplexes, reservations, nodes, networks, clusters, channel placement groups, signal maps, SDI sources, template groups, and templates	Tagging	channel		
			channel-placement-group		
			cloudwatch-alarm-template		
			cloudwatch-alarm-template-group		
			cluster		
			eventbridge-rule-template		
			eventbridge-rule-template-group		
			input		
			input-security-group

Resource types defined by AWS Elemental MediaLive

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
channel	arn:${Partition}:medialive:${Region}:${Account}:channel:${ChannelId}	aws:ResourceTag/${TagKey}
input	arn:${Partition}:medialive:${Region}:${Account}:input:${InputId}	aws:ResourceTag/${TagKey}
input-device	arn:${Partition}:medialive:${Region}:${Account}:inputDevice:${DeviceId}	
input-security-group	arn:${Partition}:medialive:${Region}:${Account}:inputSecurityGroup:${InputSecurityGroupId}	aws:ResourceTag/${TagKey}
multiplex	arn:${Partition}:medialive:${Region}:${Account}:multiplex:${MultiplexId}	aws:ResourceTag/${TagKey}
reservation	arn:${Partition}:medialive:${Region}:${Account}:reservation:${ReservationId}	aws:ResourceTag/${TagKey}
offering	arn:${Partition}:medialive:${Region}:${Account}:offering:${OfferingId}	
signal-map	arn:${Partition}:medialive:${Region}:${Account}:signal-map:${SignalMapId}	aws:ResourceTag/${TagKey}
cloudwatch-alarm-template-group	arn:${Partition}:medialive:${Region}:${Account}:cloudwatch-alarm-template-group:${CloudWatchAlarmTemplateGroupId}	aws:ResourceTag/${TagKey}
cloudwatch-alarm-template	arn:${Partition}:medialive:${Region}:${Account}:cloudwatch-alarm-template:${CloudWatchAlarmTemplateId}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
eventbridge-rule-template-group	arn:${Partition}:medialive:${Region}:${Account}:eventbridge-rule-template-group:${EventBridgeRuleTemplateGroupId}	aws:ResourceTag/${TagKey}
eventbridge-rule-template	arn:${Partition}:medialive:${Region}:${Account}:eventbridge-rule-template:${EventBridgeRuleTemplateId}	aws:ResourceTag/${TagKey}
cluster	arn:${Partition}:medialive:${Region}:${Account}:cluster:${ClusterId}	aws:ResourceTag/${TagKey}
node	arn:${Partition}:medialive:${Region}:${Account}:node:${ClusterId}/${NodeId}	aws:ResourceTag/${TagKey}
network	arn:${Partition}:medialive:${Region}:${Account}:network:${NetworkId}	aws:ResourceTag/${TagKey}
channel-placement-group	arn:${Partition}:medialive:${Region}:${Account}:channelPlacementGroup:${ClusterId}/${ChannelPlacementGroupId}	aws:ResourceTag/${TagKey}
sdi-source	arn:${Partition}:medialive:${Region}:${Account}:sdiSource:${SdiSourceId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Elemental MediaLive

AWS Elemental MediaLive defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Elemental MediaPackage

AWS Elemental MediaPackage (service prefix: `mediapackage`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Elemental MediaPackage

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy,

you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ConfigureLogs	Grants permission to configure access logs for a Channel	Write	channels*		iam:CreateServiceLinkedRole
CreateChannel	Grants permission to create a channel in AWS Elemental MediaPackage	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateHarvestJob	Grants permission to create a harvest job in AWS Elemental MediaPackage	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateOriginEndpoint	Grants permission to create an endpoint in AWS Elemental MediaPackage	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteChannel	Grants permission to delete a channel in AWS Elemental MediaPackage	Write	channels*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteOriginEndpoint	Grants permission to delete an endpoint in AWS Elemental MediaPackage	Write	origin_endpoints*		
DescribeChannel	Grants permission to view the details of a channel in AWS Elemental MediaPackage	Read	channels*		
DescribeHarvestJob	Grants permission to view the details of a harvest job in AWS Elemental MediaPackage	Read	harvest_jobs*		
DescribeOriginEndpoint	Grants permission to view the details of an endpoint in AWS Elemental MediaPackage	Read	origin_endpoints*		
ListChannels	Grants permission to view a list of channels in AWS Elemental MediaPackage	Read			
ListHarvestJobs	Grants permission to view a list of harvest jobs in AWS Elemental MediaPackage	Read			
ListOriginEndpoints	Grants permission to view a list of endpoints in AWS Elemental MediaPackage	Read			
ListTagsForResource	Grants permission to list the tags assigned to a Channel or OriginEndpoint	Read	channels		
			harvest_jobs		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			origin_endpoints		
RotateChannelCredentials	Grants permission to rotate credentials for the first IngestEndpoint of a Channel in AWS Elemental MediaPackage	Write	channels*		
RotateIngestEndpointCredentials	Grants permission to rotate IngestEndpoint credentials for a Channel in AWS Elemental MediaPackage	Write	channels*		
TagResource	Grants permission to tag a MediaPackage resource	Tagging	channels		
			harvest_jobs		
			origin_endpoints		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to delete tags to a Channel or OriginEndpoint	Tagging	channels		
			harvest_jobs		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			origin_endpoints		
				aws:TagKeys	
UpdateChannel	Grants permission to make changes to a channel in AWS Elemental MediaPackage	Write	channels*		
UpdateOriginEndpoint	Grants permission to make changes to an endpoint in AWS Elemental MediaPackage	Write	origin_endpoints*		

Resource types defined by AWS Elemental MediaPackage

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
channels	`arn:${Partition}:mediapackage:${Region}:${Account}:channels/${ChannelIdentifier}`	aws:ResourceTag/${TagKey}
origin_endpoints	`arn:${Partition}:mediapackage:${Region}:${Account}:origin_endpoints/${OriginEndpointIdentifier}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
harvest_jobs	arn:${Partition}:mediapackage:${Region}:${Account}:harvest_jobs/${HarvestJobIdentifier}	aws:ResourceTag/${TagKey}

Condition keys for AWS Elemental MediaPackage

AWS Elemental MediaPackage defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tag for a MediaPackage request	String
aws:ResourceTag/${TagKey}	Filters access by the tag for a MediaPackage resource	String
aws:TagKeys	Filters access by the tag keys for a MediaPackage resource or request	ArrayOfString

Actions, resources, and condition keys for AWS Elemental MediaPackage V2

AWS Elemental MediaPackage V2 (service prefix: mediapackagev2) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Elemental MediaPackage V2

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelHarvestJob	Grants permission to cancel a harvest job	Write	Channel*		
			ChannelGroup*		
			HarvestJob*		
			OriginEndpoint*		
CreateChannel	Grants permission to create a channel in a channel group	Write	Channel*		
			ChannelGroup*		
				aws:RequestTag/

Resource types defined by AWS Elemental MediaPackage V2

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
ChannelGroup	arn:${Partition}:mediapackagev2:${Region}:${Account}:channelGroup/${ChannelGroupName}	aws:ResourceTag/${TagKey}
ChannelPolicy	arn:${Partition}:mediapackagev2:${Region}:${Account}:channelGroup/${ChannelGroupName}/channel/${ChannelName}	
Channel	arn:${Partition}:mediapackagev2:${Region}:${Account}:channelGroup/${ChannelGroupName}/channel/${ChannelName}	aws:ResourceTag/${TagKey}
OriginEndpointPolicy	arn:${Partition}:mediapackagev2:${Region}:${Account}:channelGroup/${ChannelGroupName}/channel/${ChannelName}/originEndpoint/${OriginEndpointName}	
OriginEndpoint	arn:${Partition}:mediapackagev2:${Region}:${Account}:channelGroup/${ChannelGroupName}/channel/${ChannelName}/originEndpoint/${OriginEndpointName}	aws:ResourceTag/${TagKey}
HarvestJob	arn:${Partition}:mediapackagev2:${Region}:${Account}:channelGroup/${ChannelGroupName}/channel/${ChannelName}/originEndpoint/${OriginEndpointName}/harvestJob/${HarvestJobName}	aws:ResourceTag/${TagKey}

Condition keys for AWS Elemental MediaPackage V2

AWS Elemental MediaPackage V2 defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions

under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by tags associated with the resource	String
aws:TagKeys	Filters access by tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Elemental MediaPackage VOD

AWS Elemental MediaPackage VOD (service prefix: `mediapackage-vod`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Elemental MediaPackage VOD

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ConfigureLogs	Grants permission to configure egress access logs for a PackagingGroup	Write	packaging-groups*		iam:CreateServiceLinkedRole
CreateAsset	Grants permission to create an asset in AWS Elemental MediaPackage	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreatePackagingConfiguration	Grants permission to create a packaging configuration in AWS Elemental MediaPackage	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreatePackagingGroup	Grants permission to create a packaging group in AWS Elemental MediaPackage	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAsset	Grants permission to delete an asset in AWS Elemental MediaPackage	Write	assets*		
DeletePackagingConfiguration	Grants permission to delete a packaging configuration in AWS Elemental MediaPackage	Write	packaging-configurations*		
DeletePackagingGroup	Grants permission to delete a packaging group in AWS Elemental MediaPackage	Write	packaging-groups*		
DescribeAsset	Grants permission to view the details of an asset in AWS Elemental MediaPackage	Read	assets*		
DescribePackagingConfiguration	Grants permission to view the details of a packaging configuration in AWS Elemental MediaPackage	Read	packaging-configurations*		
DescribePackagingGroup	Grants permission to view the details of a packaging group in AWS Elemental MediaPackage	Read	packaging-groups*		
ListAssets	Grants permission to view a list of assets in AWS Elemental MediaPackage	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListPackagingConfigurations	Grants permission to view a list of packaging configurations in AWS Elemental MediaPackage	List			
ListPackagingGroups	Grants permission to view a list of packaging groups in AWS Elemental MediaPackage	List			
ListTagsForResource	Grants permission to list the tags assigned to a Packaging Group, PackagingConfiguration, or Asset	Read	assets		
			packaging-configurations		
			packaging-groups		
TagResource	Grants permission to assign tags to a PackagingGroup, PackagingConfiguration, or Asset	Tagging	assets		
			packaging-configurations		
			packaging-groups		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UntagResource	Grants permission to delete tags from a PackagingGroup, PackagingConfiguration, or Asset	Tagging	assets		
			packaging-configurations		
			packaging-groups		
				aws:TagKeys	
UpdatePackagingGroup	Grants permission to update a packaging group in AWS Elemental MediaPackage	Write	packaging-groups*		

Resource types defined by AWS Elemental MediaPackage VOD

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
assets	`arn:${Partition}:mediapackage-vod:${Region}:${Account}:assets/${AssetIdentifier}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
packaging-configurations	arn:${Partition}:mediapackage-vod:${Region}:${Account}:packaging-configurations/${PackagingConfigurationIdentifier}	aws:ResourceTag/${TagKey}
packaging-groups	arn:${Partition}:mediapackage-vod:${Region}:${Account}:packaging-groups/${PackagingGroupIdentifier}	aws:ResourceTag/${TagKey}

Condition keys for AWS Elemental MediaPackage VOD

AWS Elemental MediaPackage VOD defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters actions based on the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters actions based on tag key-value pairs attached to the resource	String
aws:TagKeys	Filters actions based on the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS Elemental MediaStore

AWS Elemental MediaStore (service prefix: `mediastore`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Elemental MediaStore

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateContainer	Grants permission to create a container	Write		aws:TagKeys aws:RequestTag/${TagKey}	
DeleteContainer	Grants permission to delete a container	Write	container*

UpdateSourceLocation	Grants permission to update the source location with the specified source location name	Write	sourceLocation*		
UpdateVodSource	Grants permission to update the VOD source with the specified VOD source name on the source location with the specified source location name	Write	vodSource*		

Resource types defined by AWS Elemental MediaTailor

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
playbackConfiguration	arn:${Partition}:mediatailor:${Region}:${Account}:playbackConfiguration/${ResourceId}	aws:ResourceTag/${TagKey}
prefetchSchedule	arn:${Partition}:mediatailor:${Region}:${Account}:prefetchSchedule/${ResourceId}	
channel	arn:${Partition}:mediatailor:${Region}:${Account}:channel/${ChannelName}	aws:ResourceTag/${TagKey}
program	arn:${Partition}:mediatailor:${Region}:${Account}:program/${ChannelName}/${ProgramName}	
sourceLocation	arn:${Partition}:mediatailor:${Region}:${Account}:sourceLocation/${SourceLocationName}	aws:ResourceTag/${TagKey}
vodSource	arn:${Partition}:mediatailor:${Region}:${Account}:vodSource/${SourceLocationName}/${VodSourceName}	aws:ResourceTag/${TagKey}
liveSource	arn:${Partition}:mediatailor:${Region}:${Account}:liveSource/${SourceLocationName}/${LiveSourceName}	aws:ResourceTag/${TagKey}

Condition keys for AWS Elemental MediaTailor

AWS Elemental MediaTailor defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS Elemental Support Cases

AWS Elemental Support Cases (service prefix: `elemental-support-cases`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Elemental Support Cases

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy,

you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddCaseComment [permission only]	Grants permission to add a comment to a support case	Write	case*		
CheckCasePermission [permission only]	Grants permission to verify whether the caller has the permissions to perform support case operations	Write			
CompleteMultipartUpload [permission only]	Grants permission to complete a multipart file upload to a support case	Write	case*		
CreateCase [permission only]	Grants permission to create a support case	Write		aws:TagKeys aws:RequestTag/${TagKey}	
CreateS3CLIUploadCommand [permission only]	Grants permission to create a cli command to allow a file upload to a support case	Write	case*		
CreateS3DownloadUrl	Grants permission to download a file from a support case	Write	case*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
[permission only]					
GetCase [permission only]	Grants permission to describe a support case in your account	Read	case*		
GetCasePermission [permission only]	Grants permission to verify whether the caller has the permissions to perform support case operations	Read			
GetCases [permission only]	Grants permission to list the support cases in your account	Read			
GetUICache [permission only]	Grants permission to retrieve cached case user data for use in the Console	Read			
ListTagsForCase [permission only]	Grants permission to list tags on a support case	Read	case*		
StartMultipartUpload [permission only]	Grants permission to start a multipart file upload to a support case	Write	case*		
TagCase [permission only]	Grants permission to add a tag on a support case	Tagging	case*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagCase [permission only]	Grants permission to remove a tag on a support case	Tagging	case*		
				aws:TagKeys	
UpdateCase [permission only]	Grants permission to update a support case	Write	case*		
UpdateCaseStatus [permission only]	Grants permission to update a support case status	Write	case*		
UpdateMultipartUpload [permission only]	Grants permission to update a multipart file upload to a support case	Write	case*		

Resource types defined by AWS Elemental Support Cases

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
case	`arn:${Partition}:elemental-support-cases::${Account}:case/${ResourceId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Elemental Support Cases

AWS Elemental Support Cases defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by tags associated with the resource	String
aws:TagKeys	Filters access by tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Elemental Support Content

AWS Elemental Support Content (service prefix: `elemental-support-content`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS Elemental Support Content

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Query [permission only]	Grants permission to search support content	Read			

Resource types defined by AWS Elemental Support Content

AWS Elemental Support Content does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Elemental Support Content, specify `"Resource": "*"` in your policy.

Condition keys for AWS Elemental Support Content

Elemental Support Content has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon EMR on EKS (EMR Containers)

Amazon EMR on EKS (EMR Containers) (service prefix: `emr-containers`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon EMR Serverless

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AccessInteractiveEndpoints [permission only]	Grants permission to execute interactive workloads on an application	Write	application*		iam:PassRole
AccessLivyEndpoints [permission only]	Grants permission to execute interactive workloads on Livy Endpoint enabled on an EMR Serverless Application	Write	application*		iam:PassRole
AccessSystemProfileLogs [permission only]	Grants permission to access system profile logs	Write	jobRun*		
CancelJobRun	Grants permission to cancel a job run	Write	jobRun*		
CreateApplication	Grants permission to create an Application	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteApplication	Grants permission to delete an application	Write	application*		
GetApplication	Grants permission to get application	Read	application*		
GetDashboardForJobRun	Grants permission to get job run dashboard	Read	jobRun*		
GetJobRun	Grants permission to get a job run	Read	jobRun*		
ListApplications	Grants permission to list applications	List			
ListJobRunAttempts	Grants permission to list job run attempts associated with a job run	List	jobRun*		
ListJobRuns	Grants permission to list job runs associated with an application	List	application*		
ListTagsForResource	Grants permission to list tags for the specified resource	Read	application		
			jobRun		
StartApplication	Grants permission to Start an application	Write	application*		
StartJobRun	Grants permission to start a job run	Write	application*		iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
StopApplication	Grants permission to Stop an application	Write	application*		
TagResource	Grants permission to tag the specified resource	Tagging	application		
			jobRun		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag the specified resource	Tagging	application		
			jobRun		
				aws:TagKeys	
UpdateApplication	Grants permission to Update an application	Write	application*		

Resource types defined by Amazon EMR Serverless

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
application	`arn:${Partition}:emr-serverless:${Region}:${Account}:/applications/${ApplicationId}`	aws:ResourceTag/${TagKey}
jobRun	`arn:${Partition}:emr-serverless:${Region}:${Account}:/applications/${ApplicationId}/jobruns/${JobRunId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon EMR Serverless

Amazon EMR Serverless defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String

Condition keys	Description	Type
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS End User Messaging SMS and Voice V2

AWS End User Messaging SMS and Voice V2 (service prefix: `sms-voice`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS End User Messaging SMS and Voice V2

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which

the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateOriginationIdentity	Grants permission to associate an origination phone number or sender ID to a pool	Write	Pool*		
			PhoneNumber		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			SenderId		
AssociateProtectConfiguration	Grants permission to associate a protect configuration to a configuration set	Write	ConfigurationSet*		
			ProtectConfiguration*		
CreateConfigurationSet	Grants permission to create a configuration set	Write		aws:RequestTag/${TagKey} aws:TagKeys	sms-voice:TagResource
CreateEventDestination	Grants permission to create an event destination within a configuration set	Write	ConfigurationSet*		iam:PassRole
CreateOptOutList	Grants permission to create an opt-out list	Write		aws:RequestTag/${TagKey} aws:TagKeys	sms-voice:TagResource
CreatePool	Grants permission to create a pool	Write	PhoneNumber		sms-voice:TagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			SenderId		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateProtectConfiguration	Grants permission to create a protect configuration	Write		aws:RequestTag/${TagKey} aws:TagKeys	sms-voice:TagResource
CreateRegistration	Grants permission to create a registration	Write		aws:RequestTag/${TagKey} aws:TagKeys	sms-voice:TagResource
CreateRegistrationAssociation	Grants permission to associate a registration with a phone number or another registration	Write	Registration*		
			PhoneNumber		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateRegistrationAttachment	Grants permission to create a registration attachment	Write		aws:RequestTag/${TagKey} aws:TagKeys	sms-voice:TagResource
CreateRegistrationVersion	Grants permission to create a registration version	Write	Registration*		
CreateVerifiedDestinationNumber	Grants permission to create a verified destination number	Write		aws:RequestTag/${TagKey} aws:TagKeys	sms-voice:TagResource
DeleteAccountDefaultProtectConfiguration	Grants permission to delete the account default protect configuration	Write			
DeleteConfigurationSet	Grants permission to delete a configuration set	Write	ConfigurationSet*		
DeleteDefaultMessageType	Grants permission to delete the default message type for a configuration set	Write	ConfigurationSet*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteDefaultSenderId	Grants permission to delete the default sender ID for a configuration set	Write	ConfigurationSet*		
DeleteEventDestination	Grants permission to delete an event destination within a configuration set	Write	ConfigurationSet*		
DeleteKeyword	Grants permission to delete a keyword for a pool or origination phone number	Write	PhoneNumber		
			Pool		
DeleteMediaMessageSpendLimitOverride	Grants permission to delete an override for your account's media messaging monthly spend limit	Write			
DeleteOptOutList	Grants permission to delete an opt-out list	Write	OptOutList*		
DeleteOptedOutNumber	Grants permission to delete a destination phone number from an opt-out list	Write	OptOutList*		
DeletePool	Grants permission to delete a pool	Write	Pool*		
DeleteProtectConfiguration	Grants permission to delete a protect configuration	Write	ProtectConfiguration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteProtectConfigurationRuleSetNumberOverride	Grants permission to delete a phone number override for a protect configuration	Write	ProtectConfiguration*		
DeleteRegistration	Grants permission to delete a registration	Write	Registration*		
DeleteRegistrationAttachment	Grants permission to delete a registration attachment	Write	RegistrationAttachment*		
DeleteRegistrationFieldValue	Grants permission to delete an optional registration field value	Write	Registration*		
DeleteResourcePolicy	Grants permission to delete a resource policy	Permissions management	OptOutList		
			PhoneNumber		
			Pool		
			SenderId		
DeleteTextMessageSpendLimitOverride	Grants permission to delete an override for your account's text messaging monthly spend limit	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

UpdateProtectConfigurationCountryRuleSet	Grants permission to update a country rule set for a protect configuration	Write	ProtectConfiguration*		
UpdateSenderId	Grants permission to update a sender ID's configuration	Write	SenderId*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
VerifyDestinationNumber	Grants permission to verify a destination phone number	Write	VerifiedDestinationNumber*		

Resource types defined by AWS End User Messaging SMS and Voice V2

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
ConfigurationSet	`arn:${Partition}:sms-voice:${Region}:${Account}:configuration-set/${ConfigurationSetName}`	aws:ResourceTag/${TagKey}
OptOutList	`arn:${Partition}:sms-voice:${Region}:${Account}:opt-out-list/${OptOutListName}`	aws:ResourceTag/${TagKey}
PhoneNumber	`arn:${Partition}:sms-voice:${Region}:${Account}:phone-number/${PhoneNumberId}`	aws:ResourceTag/${TagKey}
Pool	`arn:${Partition}:sms-voice:${Region}:${Account}:pool/${PoolId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
ProtectConfiguration	arn:${Partition}:sms-voice:${Region}:${Account}:protect-configuration/${ProtectConfigurationId}	aws:ResourceTag/${TagKey}
SenderId	arn:${Partition}:sms-voice:${Region}:${Account}:sender-id/${SenderId}/${IsoCountryCode}	aws:ResourceTag/${TagKey}
Registration	arn:${Partition}:sms-voice:${Region}:${Account}:registration/${RegistrationId}	aws:ResourceTag/${TagKey}
RegistrationAttachment	arn:${Partition}:sms-voice:${Region}:${Account}:registration-attachment/${RegistrationAttachmentId}	aws:ResourceTag/${TagKey}
VerifiedDestinationNumber	arn:${Partition}:sms-voice:${Region}:${Account}:verified-destination-number/${VerifiedDestinationNumberId}	aws:ResourceTag/${TagKey}
Message	arn:${Partition}:sms-voice:${Region}:${Account}:message/${MessageId}	

Condition keys for AWS End User Messaging SMS and Voice V2

AWS End User Messaging SMS and Voice V2 defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS End User Messaging Social

AWS End User Messaging Social (service prefix: `social-messaging`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS End User Messaging Social

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateWhatsAppBusinessAccount	Grants permission to associate a WhatsApp Business Account with your AWS account	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
CreateWhatsAppMessageTemplate	Grants permission to create a WhatsApp message template	Write	waba*		
CreateWhatsAppMessageTemplateFromLibrary	Grants permission to create a WhatsApp message template from Meta's template library	Write	waba*		
CreateWhatsAppMessageTemplateMedia	Grants permission to create media for WhatsApp message templates	Write	waba*		
DeleteWhatsAppMessageMedia	Grants permission to delete a media object from WhatsApp	Write	phone-number-id*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteWhatsAppMessageTemplate	Grants permission to delete a WhatsApp message template	Write	waba*		
DisassociateWhatsAppBusinessAccount	Grants permission to disassociate a WhatsApp Business Account from your AWS account	Write	waba*		
GetLinkedWhatsAppBusinessAccount	Grants permission to view the details of a WhatsApp Business Account	Read	waba*		
GetLinkedWhatsAppBusinessAccountPhoneNumber	Grants permission to view the details of a phone number	Read	phone-number-id*		
GetWhatsAppMessageMedia	Grants permission to get a media object from WhatsApp	Write	phone-number-id*		
GetWhatsAppMessageTemplate	Grants permission to get details of a WhatsApp message template	Read	waba*		
ListLinkedWhatsAppBusinessAccounts	Grants permission to view all of your WhatsApp Business Accounts	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTagsForResource	Grants permission to list tags for a resource	Read	phone-number-id		
			waba		
ListWhatsAppMessageTemplates	Grants permission to list WhatsApp message templates	List	waba*		
ListWhatsAppTemplateLibrary	Grants permission to list available templates from Meta's template library	List	waba*		
PostWhatsAppMessageMedia	Grants permission to upload a media object to WhatsApp	Write	phone-number-id*		
PutWhatsAppBusinessAccountEventDestinations	Grants permission to update a WhatsApp Business Accounts event destination	Write	waba*		
SendWhatsAppMessage	Grants permission to send a message through WhatsApp	Write	phone-number-id*		
TagResource	Grants permission to add a tag to a resource	Tagging	phone-number-id		
			waba		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove a tag from a resource	Tagging	phone-number-id		
			waba		
				aws:ResourceTag/${TagKey} aws:TagKeys	
UpdateWhatsAppMessageTemplate	Grants permission to update a WhatsApp message template	Write	waba*		

Resource types defined by AWS End User Messaging Social

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
phone-number-id	`arn:${Partition}:social-messaging:${Region}:${Account}:phone-number-id/${OriginationPhoneNumberId}`	aws:ResourceTag/${TagKey}
waba	`arn:${Partition}:social-messaging:${Region}:${Account}:waba/${WabaId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS End User Messaging Social

AWS End User Messaging Social defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type

Topics

Actions defined by AWS Entity Resolution

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which

the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddPolicyStatement	Grants permission to give an AWS service or another account permission to use	Permissions management			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	an AWS Entity Resolution resources				
BatchDeleteUniqueId	Grants permission to batch delete unique Id	Write	MatchingWorkflow*		
CreateIdMappingWorkflow	Grants permission to create a idmapping workflow	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateIdNamespace	Grants permission to create a IdNamespace	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateMatchingWorkflow	Grants permission to create a matching workflow	Write		aws:RequestTag/${TagKey} aws:TagKeys

			SchemaMapping		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateIdMappingWorkflow	Grants permission to update a idmapping workflow	Write	IdMappingWorkflow*		
UpdateIdNamespace	Grants permission to update a IdNamespace	Write	IdNamespace*		
UpdateMatchingWorkflow	Grants permission to update a matching workflow	Write	MatchingWorkflow*		
UpdateSchemaMapping	Grants permission to update a schema mapping	Write	SchemaMapping*		
UseIdNamespace	Grants permission to give an AWS service or another account permission to use IdNamespace within a workflow	Permissions management			
UseWorkflow	Grants permission to give an AWS service or another account permission to use workflow within a IdNamespace	Permissions management			

Resource types defined by AWS Entity Resolution

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
MatchingWorkflow	arn:${Partition}:entityresolution:${Region}:${Account}:matchingworkflow/${WorkflowName}	aws:ResourceTag/${TagKey}
SchemaMapping	arn:${Partition}:entityresolution:${Region}:${Account}:schemamapping/${SchemaName}	aws:ResourceTag/${TagKey}
IdMappingWorkflow	arn:${Partition}:entityresolution:${Region}:${Account}:idmappingworkflow/${WorkflowName}	aws:ResourceTag/${TagKey}
ProviderService	arn:${Partition}:entityresolution:${Region}:${Account}:providerservice/${ProviderName}/${ProviderServiceName}	aws:ResourceTag/${TagKey}
IdNamespace	arn:${Partition}:entityresolution:${Region}:${Account}:idnamespace/${IdNamespaceName}	aws:ResourceTag/${TagKey}

Condition keys for AWS Entity Resolution

AWS Entity Resolution defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a key that is present in the request the user makes to the entity resolution service	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair	String
aws:TagKeys	Filters access by the list of all the tag key names present in the request the user makes to the entity resolution service	ArrayOfString

Actions, resources, and condition keys for Amazon EventBridge

Amazon EventBridge (service prefix: `events`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon EventBridge

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ActivateEventSource	Grants permission to activate partner event sources	Write	event-source*		
AllowVendedLogDeliveryForResource [permission only]	Grants permission to configure vended log delivery for EventBridge	Write	event-bus*		
CancelReplay	Grants permission to cancel a replay	Write	replay*		
CreateApiDestination	Grants permission to create a new api destination	Write	api-destination*		
			connection*		
CreateArchive	Grants permission to create a new archive	Write	archive*		
			event-bus*		
			alias		
			key		
CreateConnection	Grants permission to create a new connection	Write	connection*

UpdateConnection	Grants permission to update a connection	Write	connection*		
UpdateEndpoint	Grants permission to update an endpoint	Write	endpoint*		
				events:EventBusArn	
UpdateEventBus	Grants permission to update event buses	Write	event-bus*		

Resource types defined by Amazon EventBridge

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
event-source	`arn:${Partition}:events:${Region}::event-source/${EventSourceName}`	

Resource types	ARN	Condition keys
event-bus	arn:${Partition}:events:${Region}:${Account}:event-bus/${EventBusName}	aws:ResourceTag/${TagKey}
rule-on-default-event-bus	arn:${Partition}:events:${Region}:${Account}:rule/${RuleName}	aws:ResourceTag/${TagKey}
rule-on-custom-event-bus	arn:${Partition}:events:${Region}:${Account}:rule/${EventBusName}/${RuleName}	aws:ResourceTag/${TagKey}
archive	arn:${Partition}:events:${Region}:${Account}:archive/${ArchiveName}	
replay	arn:${Partition}:events:${Region}:${Account}:replay/${ReplayName}	
connection	arn:${Partition}:events:${Region}:${Account}:connection/${ConnectionName}	
api-destination	arn:${Partition}:events:${Region}:${Account}:api-destination/${ApiDestinationName}	
endpoint	arn:${Partition}:events:${Region}:${Account}:endpoint/${EndpointName}	
create-snapshot	arn:${Partition}:events:${Region}:${Account}:target/create-snapshot	
reboot-instance	arn:${Partition}:events:${Region}:${Account}:target/reboot-instance	
stop-instance	arn:${Partition}:events:${Region}:${Account}:target/stop-instance	

Resource types	ARN	Condition keys
terminate-instance	arn:${Partition}:events:${Region}:${Account}:target/terminate-instance	
alias	arn:${Partition}:kms:${Region}:${Account}:alias/${Alias}	
key	arn:${Partition}:kms:${Region}:${Account}:key/${KeyId}	

Condition keys for Amazon EventBridge

Amazon EventBridge defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the allowed set of values for each of the tags to event bus and rule actions	String
aws:ResourceTag/${TagKey}	Filters access by tag-value associated with the resource to event bus and rule actions	String
aws:TagKeys	Filters access by the tags in the request to event bus and rule actions	ArrayOfString
events:EventBusArn	Filters access by the ARN of the event buses that can be associated with an endpoint to CreateEndpoint and UpdateEndpoint actions	ArrayOfARN

Condition keys	Description	Type
events:ManagedBy	Filters access by AWS services. If a rule is created by an AWS service on your behalf, the value is the principal name of the service that created the rule	String
events:TargetArn	Filters access by the ARN of a target that can be put to a rule to PutTargets actions. TargetARN doesn't include DeadLetterConfigArn	ArrayOfARN
events:creatorAccount	Filters access by the account the rule was created in to rule actions	String
events:detail-type	Filters access by the literal string of the detail-type of the event to PutEvents and PutRule actions	ArrayOfString
events:detail.eventTypeCode	Filters access by the literal string for the detail.eventTypeCode field of the event to PutRule actions	String
events:detail.service	Filters access by the literal string for the detail.service field of the event to PutRule actions	String
events:detail.userIdentity.principalId	Filters access by the literal string for the detail.useridentity.principalid field of the event to PutRule actions	String
events:eventBusInvocation	Filters access by whether the event was generated via API or cross-account bus invocation to PutEvents actions	String
events:source	Filters access by the AWS service or AWS partner event source that generated the event to PutEvents and PutRule actions. Matches the literal string of the source field of the event	ArrayOfString

Actions, resources, and condition keys for Amazon EventBridge Pipes

Amazon EventBridge Pipes (service prefix: `pipes`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon EventBridge Pipes

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreatePipe	Grants permission to create a pipe	Write	pipe*		iam:PassRole
				aws:RequestTag/${TagKey} aws:ResourceTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} aws:TagKeys	
DeletePipe	Grants permission to delete a pipe	Write	pipe*		
				aws:ResourceTag/${TagKey}	
DescribePipe	Grants permission to describe a pipe	Read	pipe*		
				aws:ResourceTag/${TagKey}	
ListPipes	Grants permission to list all pipes in your account	List			
ListTagsForResource	Grants permission to list the tags for a resource	Read	pipe*		
				aws:ResourceTag/${TagKey}	
StartPipe	Grants permission to start a pipe	Write	pipe*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey}	
StopPipe	Grants permission to stop a pipe	Write	pipe*		
				aws:ResourceTag/${TagKey}	
TagResource	Grants permission to add tags to a resource	Tagging	pipe*		
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from a resource	Tagging	pipe*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:TagKeys	
UpdatePipe	Grants permission to update a pipe	Write	pipe*		iam:PassRole
				aws:ResourceTag/${TagKey}	

Resource types defined by Amazon EventBridge Pipes

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
pipe	`arn:${Partition}:pipes:${Region}:${Account}:pipe/${Name}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon EventBridge Pipes

Amazon EventBridge Pipes defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters access by tag-value associated with the resource	String
aws:TagKeys	Filters access by the presence of mandatory tags in the request	ArrayOfString

Actions, resources, and condition keys for Amazon EventBridge Scheduler

Amazon EventBridge Scheduler (service prefix: `scheduler`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon EventBridge Scheduler

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSchedule	Grants permission to create an Amazon EventBridge Scheduler schedule	Write	schedule*		iam:PassRole
				aws:ResourceTag/${TagKey}	
CreateScheduleGroup	Grants permission to create an Amazon EventBridge Scheduler schedule group	Write	schedule-group*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteSchedule	Grants permission to delete an Amazon EventBridge Scheduler schedule	Write	schedule*		
				aws:ResourceTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey}	
DeleteScheduleGroup	Grants permission to delete an Amazon EventBridge Scheduler schedule group	Write	schedule-group*		scheduler:DeleteSchedule
				aws:ResourceTag/${TagKey}	
GetSchedule	Grants permission to view details about an Amazon EventBridge Scheduler schedule	Read	schedule*		
				aws:ResourceTag/${TagKey}	
GetScheduleGroup	Grants permission to view details about an Amazon EventBridge Scheduler schedule group	Read	schedule-group*		
				aws:ResourceTag/${TagKey}	
ListScheduleGroups	Grants permission to list the Amazon EventBridge Scheduler schedule groups in your account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListSchedules	Grants permission to list the Amazon EventBridge Scheduler schedules in your account	List			
ListTagsForResource	Grants permission to lists tag for an Amazon EventBridge Scheduler resource	Read	schedule-group		
				aws:ResourceTag/${TagKey}	
TagResource	Grants permission to tag an Amazon EventBridge Scheduler resource	Tagging	schedule-group*		
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
UntagResource	Grants permission to untag an Amazon EventBridge Scheduler resource	Tagging	schedule-group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:ResourceTag/${TagKey}	
UpdateSchedule	Grants permission to modify an Amazon EventBridge Scheduler schedule	Write	schedule*		iam:PassRole
				aws:ResourceTag/${TagKey}	

Resource types defined by Amazon EventBridge Scheduler

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
schedule-group	`arn:${Partition}:scheduler:${Region}:${Account}:schedule-group/${GroupName}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
schedule	arn:${Partition}:scheduler:${Region}:${Account}:schedule/${GroupName}/${ScheduleName}	

Condition keys for Amazon EventBridge Scheduler

Amazon EventBridge Scheduler defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon EventBridge Schemas

Amazon EventBridge Schemas (service prefix: schemas) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Fault Injection Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateExperimentTemplate	Grants permission to create an AWS FIS experiment template	Write	action*		
			experiment-template*		
				aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys

			experiment		
			experiment-template		
ListTargetAccountConfigurations	Grants permission to list target account configurations for AWS FIS experiment templates	List	experiment-template*		
ListTargetResourceTypes	Grants permission to list the resource types	List			
StartExperiment	Grants permission to run an AWS FIS experiment	Write	experiment*		iam:CreateServiceLinkedRole
			experiment-template*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
StopExperiment	Grants permission to stop an AWS FIS experiment	Write	experiment*		
TagResource	Grants permission to tag AWS FIS resources	Tagging	action		
			experiment		
			experiment-template		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to untag AWS FIS resources	Tagging	action		
			experiment		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			experiment-template		
				aws:TagKeys	
UpdateExperimentTemplate	Grants permission to update the specified AWS FIS experiment template	Write	experiment-template*		
			action		
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateSafetyLeverState	Grants permission to update the state of the safety lever	Write	safety-lever*		
UpdateTargetAccountConfiguration	Grants permission to update an AWS FIS target account configuration	Write	experiment-template*		

Resource types defined by AWS Fault Injection Service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
action	`arn:${Partition}:fis:${Region}:${Account}:action/${Id}`	aws:ResourceTag/${TagKey}
experiment	`arn:${Partition}:fis:${Region}:${Account}:experiment/${Id}`	aws:ResourceTag/${TagKey}
experiment-template	`arn:${Partition}:fis:${Region}:${Account}:experiment-template/${Id}`	aws:ResourceTag/${TagKey}
safety-lever	`arn:${Partition}:fis:${Region}:${Account}:safety-lever/${Id}`	

Condition keys for AWS Fault Injection Service

AWS Fault Injection Service defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString
fis:Operations	Filters access by the list of operations on the AWS service that is being affected by the AWS FIS action	ArrayOfString
fis:Percentage	Filters access by the percentage of calls being affected by the AWS FIS action	Numeric
fis:Service	Filters access by the AWS service that is being affected by the AWS FIS action	String
fis:Targets	Filters access by the list of resource ARNs being targeted by the AWS FIS action	ArrayOfString

Actions, resources, and condition keys for Amazon FinSpace

Amazon FinSpace (service prefix: `finspace`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon FinSpace

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ConnectKxCluster [permission only]	Grants permission to connect to a kdb cluster	Write	kxCluster*		
CreateEnvironment	Grants permission to create a FinSpace environment	Write	environment*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateKxChangeset	Grants permission to create a changeset for a kdb database	Write	kxDatabase*		
CreateKxCluster	Grants permission to create a cluster in a managed kdb environment	Write	kxCluster*		ec2:DescribeSubnets finspace:MountKxDatabase

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateKxDatabase	Grants permission to create a kdb database in a managed kdb environment	Write	kxDatabase*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateKxDataview	Grants permission to create a dataview in a managed kdb environment	Write	kxDataview*		
				aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateKxEnvironment	Grants permission to create a managed kdb environment	Write		aws:TagKeys aws:RequestTag/${TagKey}	
CreateKxScalingGroup	Grants permission to create a scaling group in a managed kdb environment	Write	kxScalingGroup*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateKxUser	Grants permission to create a user in a managed kdb environment	Write	kxEnvironment*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateKxVolume	Grants permission to create a volume in a managed kdb environment	Write	kxVolume*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateUser	Grants permission to create a FinSpace user	Write	environment*		
			user*		
				aws:TagKeys aws:RequestTag/${TagKey}	
DeleteEnvironment	Grants permission to delete a FinSpace environment	Write	environment*		
DeleteKxCluster	Grants permission to delete a kdb cluster	Write	kxCluster*		
DeleteKxClusterNode	Grants permission to delete a node from a kdb cluster	Write	kxCluster*		
DeleteKxDatabase	Grants permission to delete a kdb database	Write	kxDatabase*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteKxDataview	Grants permission to delete a dataview in a managed kdb environment	Write	kxDataview*		
DeleteKxEnvironment	Grants permission to delete a managed kdb environment	Write	kxEnvironment*		
DeleteKxScalingGroup	Grants permission to delete a scaling group in a managed kdb environment	Write	kxScalingGroup*		
DeleteKxUser	Grants permission to delete a kdb user	Write	kxUser*		
DeleteKxVolume	Grants permission to delete a volume in a managed kdb environment	Write	kxVolume*		
GetEnvironment	Grants permission to describe a FinSpace environment	Read	environment*		
GetKxChangeset	Grants permission to describe a changeset for a kdb database	Read	kxDatabase*		
GetKxCluster	Grants permission to describe a cluster in a managed kdb environment	Read	kxCluster*		
GetKxConnectionString	Grants permission to retrieve a connection string for kdb clusters	Read	kxCluster*		finspace:ConnectKxCluster

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetKxDatabase	Grants permission to describe a kdb database	Read	kxDatabase*		
GetKxDataview	Grants permission to describe a databiew in a managed kdb environment	Read	kxDataview*		
GetKxEnvironment	Grants permission to describe a managed kdb environment	Read	kxEnvironment*		
GetKxScalingGroup	Grants permission to describe a scaling group in a managed kdb environment	Read	kxScalingGroup*		
GetKxUser	Grants permission to describe a kdb user	Read	kxUser*		
GetKxVolume	Grants permission to describe a volume in a managed kdb environment	Read	kxVolume*		
GetLoadSampleDataSetGroupIntoEnvironmentStatus	Grants permission to request status of the loading of sample data bundle	Read	environment*		
GetUser	Grants permission to describe a FinSpace user	Read	environment*		
			user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListEnvironments	Grants permission to list FinSpace environments in the AWS account	List	environment*		
ListKxChangesets	Grants permission to list changesets for a kdb database	List	kxDatabase*		
ListKxClusterNodes	Grants permission to list cluster nodes in a managed kdb environment	List	kxCluster*		
ListKxClusters	Grants permission to list clusters in a managed kdb environment	List	kxEnvironment*		
ListKxDatabases	Grants permission to list kdb databases in a managed kdb environment	List	kxEnvironment*		
ListKxDataviews	Grants permission to list dataviews in a database	List	kxDatabase*		
ListKxEnvironments	Grants permission to list managed kdb environments	List			
ListKxScalingGroups	Grants permission to list scaling groups in a managed kdb environment	List	kxEnvironment*		
ListKxUsers	Grants permission to list users in a managed kdb environment	List	kxEnvironment*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListKxVolumes	Grants permission to list volumes in a managed kdb environment	List	kxEnvironment*		
ListTagsForResource	Grants permission to return a list of tags for a resource	List	environment*		
			kxCluster*		
			kxDatabase*		
			kxDataview*		
			kxEnvironment*		
			kxScalingGroup*		
			kxUser*		
			kxVolume*		
ListUsers	Grants permission to list FinSpace users in an environment	List	environment*		
			user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
LoadSampleDataSetGroupIntoEnvironment	Grants permission to load sample data bundle into your FinSpace environment	Write	environment*		
MountKxDatabase [permission only]	Grants permission to mount a database to a kdb cluster	Write	kxDatabase*		
ResetUserPassword	Grants permission to reset the password for a FinSpace user	Write	environment*		
			user*		
TagResource	Grants permission to tag a resource	Tagging	environment		
			kxCluster		
			kxDatabase		
			kxDataview		
			kxEnvironment		
			kxScalingGroup		
			kxUser

UpdateKxClusterDatabases	Grants permission to update databases for a cluster in a managed kdb environment	Write	kxCluster*		
UpdateKxDatabase	Grants permission to update a kdb database	Write	kxDatabase*		
UpdateKxDataview	Grants permission to update a dataview in a managed kdb environment	Write	kxDataview*		
UpdateKxEnvironment	Grants permission to update a managed kdb environment	Write	kxEnvironment*		
UpdateKxEnvironmentNetwork	Grants permission to update the network for a managed kdb environment	Write	kxEnvironment*		
UpdateKxUser	Grants permission to update a kdb user	Write	kxUser*		
UpdateKxVolume	Grants permission to update a volume in a managed kdb environment	Write	kxVolume*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateUser	Grants permission to update a FinSpace user	Write	environment*		
			user*		

Resource types defined by Amazon FinSpace

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
environment	`arn:${Partition}:finspace:${Region}:${Account}:environment/${EnvironmentId}`	aws:ResourceTag/${TagKey}
user	`arn:${Partition}:finspace:${Region}:${Account}:user/${UserId}`	aws:ResourceTag/${TagKey}
kxEnvironment	`arn:${Partition}:finspace:${Region}:${Account}:kxEnvironment/${EnvironmentId}`	aws:ResourceTag/${TagKey}
kxUser	`arn:${Partition}:finspace:${Region}:${Account}:kxEnvironment/${EnvironmentId}/kxUser/${UserName}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
kxCluster	arn:${Partition}:finspace:${Region}:${Account}:kxEnvironment/${EnvironmentId}/kxCluster/${KxCluster}	aws:ResourceTag/${TagKey}
kxDatabase	arn:${Partition}:finspace:${Region}:${Account}:kxEnvironment/${EnvironmentId}/kxDatabase/${KxDatabase}	aws:ResourceTag/${TagKey}
kxScalingGroup	arn:${Partition}:finspace:${Region}:${Account}:kxEnvironment/${EnvironmentId}/kxScalingGroup/${KxScalingGroup}	aws:ResourceTag/${TagKey}
kxDataview	arn:${Partition}:finspace:${Region}:${Account}:kxEnvironment/${EnvironmentId}/kxDatabase/${KxDatabase}/kxDataview/${KxDataview}	aws:ResourceTag/${TagKey}
kxVolume	arn:${Partition}:finspace:${Region}:${Account}:kxEnvironment/${EnvironmentId}/kxVolume/${KxVolume}	aws:ResourceTag/${TagKey}

Condition keys for Amazon FinSpace

Amazon FinSpace defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon FinSpace API

Amazon FinSpace API (service prefix: `finspace-api`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon FinSpace API

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetProgrammaticAccessCredentials	Grants permission to retrieve FinSpace programmatic access credentials	Read	credential*		

Resource types defined by Amazon FinSpace API

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
credential	`arn:${Partition}:finspace-api:${Region}:${Account}:/credentials/programmatic`	

Condition keys for Amazon FinSpace API

FinSpace API has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Firewall Manager

AWS Firewall Manager (service prefix: `fms`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateAdminAccount	Grants permission to set the AWS Firewall Manager administrator account and enables the service in all organization accounts	Write			
AssociateThirdPartyFirewall	Grants permission to set the Firewall Manager administrator as a tenant administrator of a third-party firewall service	Write			
BatchAssociateResource	Grants permission to associate resources to an AWS Firewall Manager resource set	Write	resource-set*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchDisassociateResource	Grants permission to disassociate resources from an AWS Firewall Manager resource set	Write	resource-set*		
DeleteAppsList	Grants permission to permanently deletes an AWS Firewall Manager applications list	Write	applications-list*		
DeleteNotificationChannel	Grants permission to delete an AWS Firewall Manager association with the IAM role and the Amazon Simple Notification Service (SNS) topic that is used to notify the FM administrator about major FM events and errors across the organization	Write			
DeletePolicy	Grants permission to permanently delete an AWS Firewall Manager policy	Write	policy*		
				aws:ResourceTag/${TagKey}	
DeleteProtocolsList	Grants permission to permanently deletes an AWS Firewall Manager protocols list	Write	protocols-list*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteResourceSet	Grants permission to permanently delete an AWS Firewall Manager resource set	Write	resource-set*		
				aws:ResourceTag/${TagKey}	
DisassociateAdminAccount	Grants permission to disassociate the account that has been set as the AWS Firewall Manager administrator account and and disables the service in all organization accounts	Write			
DisassociateThirdPartyFirewall	Grants permission to disassociate a Firewall Manager administrator from a third-party firewall tenant	Write			
GetAdminAccount	Grants permission to return the AWS Organizations account that is associated with AWS Firewall Manager as the AWS Firewall Manager administrator	Read			
GetAdminScope	Grants permission to return information about the specified account's administrative scope	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAppsList	Grants permission to return information about the specified AWS Firewall Manager applications list	Read	applications-list*		
GetComplianceDetail	Grants permission to retrieve detailed compliance information about the specified member account. Details include resources that are in and out of compliance with the specified policy	Read	policy*		
GetNotificationChannel	Grants permission to retrieve information about the Amazon Simple Notification Service (SNS) topic that is used to record AWS Firewall Manager SNS logs	Read			
GetPolicy	Grants permission to retrieve information about the specified AWS Firewall Manager policy	Read	policy*		
GetProtectionStatus	Grants permission to retrieve policy-level attack summary information in the event of a potential DDoS attack	Read	policy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetProtocolsList	Grants permission to return information about the specified AWS Firewall Manager protocols list	Read	protocols-list*		
GetResourceSet	Grants permission to retrieve information about the specified AWS Firewall Manager resource set	Read	resource-set*		
GetThirdPartyFirewallAssociationStatus	Grants permission to retrieve the onboarding status of a Firewall Manager administrator account to third-party firewall vendor tenant	Read			
GetViolationDetails	Grants permission to retrieve violations for a resource based on the specified AWS Firewall Manager policy and AWS account	Read	policy*		
ListAdminAccountsForOrganization	Grants permission to return a AdminAccounts object that lists the Firewall Manager administrators within the organization that are onboarded to Firewall Manager by Associate AdminAccount	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAdminsManagingAccount	Grants permission to list the accounts that are managing the specified AWS Organizations member account	List			
ListAppsLists	Grants permission to return an array of AppsListDataSummary objects	List			
ListComplianceStatus	Grants permission to retrieve an array of PolicyComplianceStatus objects in the response. Use PolicyComplianceStatus to get a summary of which member accounts are protected by the specified policy	List	policy*		
ListDiscoveredResources	Grants permission to retrieve an array of resources in the organization's accounts that are available to be associated with a resource set	List			
ListMemberAccounts	Grants permission to retrieve an array of member account ids if the caller is FMS admin account	List			
ListPolicies	Grants permission to retrieve an array of PolicySummary objects in the response	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListProtocolsLists	Grants permission to return an array of ProtocolsListDataSummary objects	List			
ListResourceSetResources	Grants permission to retrieve an array of resources that are currently associated to a resource set	List	resource-set*		
ListResourceSets	Grants permission to retrieve an array of ResourceSetSummary objects	List			
ListTagsForResource	Grants permission to list Tags for a given resource	Read	policy*		
ListThirdPartyFirewallFirewallPolicies	Grants permission to retrieve a list of all of the third-party firewall policies that are associated with the third-party firewall administrator's account	List			
PutAdminAccount	Grants permission to create or update an Firewall Manager administrator account	Write			
PutAppsList	Grants permission to create an AWS Firewall Manager applications list	Write	applications-list*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
PutNotificationChannel	Grants permission to designate the IAM role and Amazon Simple Notification Service (SNS) topic that AWS Firewall Manager (FM) could use to notify the FM administrator about major FM events and errors across the organization	Write			
PutPolicy	Grants permission to create an AWS Firewall Manager policy	Write	policy*		
				aws:RequestTag/${TagKey} aws:TagKeys	
PutProtocolsList	Grants permission to creates an AWS Firewall Manager protocols list	Write	protocols-list*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys

			policy		
			protocols-list		
			resource-set		
				aws:TagKeys	

Resource types defined by AWS Firewall Manager

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
policy	arn:${Partition}:fms:${Region}:${Account}:policy/${Id}	aws:ResourceTag/${TagKey}
applications-list	arn:${Partition}:fms:${Region}:${Account}:applications-list/${Id}	aws:ResourceTag/${TagKey}
protocols-list	arn:${Partition}:fms:${Region}:${Account}:protocols-list/${Id}	aws:ResourceTag/${TagKey}
resource-set	arn:${Partition}:fms:${Region}:${Account}:resource-set/${Id}	aws:ResourceTag/${TagKey}

Condition keys for AWS Firewall Manager

AWS Firewall Manager defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Forecast

Amazon Forecast (service prefix: `forecast`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon Forecast

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAutoPredictor	Grants permission to create an auto predictor	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateDataset	Grants permission to create a dataset	Write	dataset*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDatasetGroup	Grants permission to create a dataset group	Write	datasetGroup*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDatasetImportJob	Grants permission to create a dataset import job	Write	datasetImportJob*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateExplainability	Grants permission to create an explainability	Write	forecast*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateExplainabilityExport	Grants permission to create an explainability export using an explainability resource	Write	explainability*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateForecast	Grants permission to create a forecast	Write	predictor*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateForecastEndpoint [permission only]	Grants permission to create an endpoint using a Predictor resource	Write	predictor*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateForecastExportJob	Grants permission to create a forecast export job using a forecast resource	Write	forecast*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateMonitor	Grants permission to create an monitor using a Predictor resource	Write	predictor*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreatePredictor	Grants permission to create a predictor	Write	datasetGroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreatePredictorBacktestExportJob	Grants permission to create a predictor backtest export job using a predictor	Write	predictor*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateWhatIfAnalysis	Grants permission to create a what-if analysis	Write	forecast*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateWhatIfForecast	Grants permission to create a what-if forecast	Write	whatIfAnalysis*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateWhatIfForecastExport	Grants permission to create a what-if forecast export using what-if forecast resources	Write	whatIfForecast*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteDataset	Grants permission to delete a dataset	Write	dataset*		
DeleteDatasetGroup	Grants permission to delete a dataset group	Write	datasetGroup*		
DeleteDatasetImportJob	Grants permission to delete a dataset import job	Write	datasetImportJob*		
DeleteExplainability	Grants permission to delete an explainability	Write	explainability*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteExplainabilityExport	Grants permission to delete an explainability export	Write	explainabilityExport*		
DeleteForecast	Grants permission to delete a forecast	Write	forecast*		
DeleteForecastEndpoint [permission only]	Grants permission to delete an endpoint resource	Write	endpoint*		
DeleteForecastExportJob	Grants permission to delete a forecast export job	Write	forecastExport*		
DeleteMonitor	Grants permission to delete a monitor resource	Write	monitor*		
DeletePredictor	Grants permission to delete a predictor	Write	predictor*		
DeletePredictorBacktestExportJob	Grants permission to delete a predictor backtest export job	Write	predictorBacktestExportJob*		
DeleteResourceTree	Grants permission to delete a resource and its child resources	Write	dataset*		
			datasetGroup*		
			datasetImportJob*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			endpoint*		
			explainability*

UpdateDatasetGroup	Grants permission to update a dataset group	Write	dataset*		
			datasetGroup*		

Resource types defined by Amazon Forecast

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
dataset	arn:${Partition}:forecast:${Region}:${Account}:dataset/${ResourceId}	aws:ResourceTag/${TagKey}
datasetGroup	arn:${Partition}:forecast:${Region}:${Account}:dataset-group/${ResourceId}	aws:ResourceTag/${TagKey}
datasetImportJob	arn:${Partition}:forecast:${Region}:${Account}:dataset-import-job/${ResourceId}	aws:ResourceTag/${TagKey}
algorithm	arn:${Partition}:forecast:::algorithm/${ResourceId}	
predictor	arn:${Partition}:forecast:${Region}:${Account}:predictor/${ResourceId}	aws:ResourceTag/${TagKey}
predictorBacktestExportJob	arn:${Partition}:forecast:${Region}:${Account}:predictor-backtest-export-job/${ResourceId}	aws:ResourceTag/${TagKey}
forecast	arn:${Partition}:forecast:${Region}:${Account}:forecast/${ResourceId}	aws:ResourceTag/${TagKey}
forecastExport	arn:${Partition}:forecast:${Region}:${Account}:forecast-export-job/${ResourceId}	aws:ResourceTag/${TagKey}
explainability	arn:${Partition}:forecast:${Region}:${Account}:explainability/${ResourceId}	aws:ResourceTag/${TagKey}
explainabilityExport	arn:${Partition}:forecast:${Region}:${Account}:explainability-export/${ResourceId}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
monitor	arn:${Partition}:forecast:${Region}:${Account}:monitor/${ResourceId}	aws:ResourceTag/${TagKey}
whatIfAnalysis	arn:${Partition}:forecast:${Region}:${Account}:what-if-analysis/${ResourceId}	aws:ResourceTag/${TagKey}
whatIfForecast	arn:${Partition}:forecast:${Region}:${Account}:what-if-forecast/${ResourceId}	aws:ResourceTag/${TagKey}
whatIfForecastExport	arn:${Partition}:forecast:${Region}:${Account}:what-if-forecast-export/${ResourceId}	aws:ResourceTag/${TagKey}
endpoint	arn:${Partition}:forecast:${Region}:${Account}:forecast-endpoint/${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Forecast

Amazon Forecast defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Fraud Detector

Amazon Fraud Detector (service prefix: `frauddetector`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Condition keys for Amazon Fraud Detector

Actions defined by Amazon Fraud Detector

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of

access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchCreateVariable	Grants permission to create a batch of variables	Write		aws:RequestTag/${TagKey} aws:TagKeys	
BatchGetVariable	Grants permission to get a batch of variables	List	variable*		
CancelBatchImportJob	Grants permission to cancel the specified batch import job	Write	batch-import*		
CancelBatchPredictionJob	Grants permission to cancel the specified batch prediction job	Write	batch-prediction*		
CreateBatchImportJob	Grants permission to create a batch import job	Write	batch-import*		
			event-type*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateBatchPredictionJob	Grants permission to create a batch prediction job	Write	batch-prediction*		
			detector*		
			detector-version*		
			event-type*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDetectorVersion	Grants permission to create a detector version. The detector version starts in a DRAFT status	Write	detector*		
			external-model		
			model-version		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateList	Grants permission to create a list	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateModel	Grants permission to create a model using the specified model type	Write	event-type*		
			model*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateModelVersion	Grants permission to create a version of the model using the specified model type and model id	Write	model*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateRule	Grants permission to create a rule for use with the specified detector	Write	detector*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateVariable	Grants permission to create a variable	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteBatchImportJob	Grants permission to delete a batch import job	Write	batch-import*		
DeleteBatchPredictionJob	Grants permission to delete a batch prediction job	Write	batch-prediction*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteDetector	Grants permission to delete the detector. Before deleting a detector, you must first delete all detector versions and rule versions associated with the detector	Write	detector*		
DeleteDetectorVersion	Grants permission to delete the detector version. You cannot delete detector versions that are in ACTIVE status	Write	detector-version*		
DeleteEntityType	Grants permission to delete an entity type. You cannot delete an entity type that is included in an event type	Write	entity-type*		
DeleteEvent	Grants permission to deletes the specified event	Write	event-type*		
DeleteEventType	Grants permission to delete an event type. You cannot delete an event type that is used in a detector or a model	Write	event-type*		
DeleteEventsByEventType	Grants permission to delete events for the specified event type	Write	event-type*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteExternalModel	Grants permission to remove a SageMaker model from Amazon Fraud Detector. You can remove an Amazon SageMaker model if it is not associated with a detector version	Write	external-model*		
DeleteLabel	Grants permission to delete a label. You cannot delete labels that are included in an event type in Amazon Fraud Detector. You cannot delete a label assigned to an event ID. You must first delete the relevant event ID	Write	label*		
DeleteList	Grants permission to delete a list	Write	list*		
				aws:ResourceTag/${TagKey}	
DeleteModel	Grants permission to delete a model. You can delete models and model versions in Amazon Fraud Detector, provided that they are not associated with a detector version	Write	model*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteModelVersion	Grants permission to delete a model version. You can delete models and model versions in Amazon Fraud Detector, provided that they are not associated with a detector version	Write	model-version*		
DeleteOutcome	Grants permission to delete an outcome. You cannot delete an outcome that is used in a rule version	Write	outcome*		
DeleteRule	Grants permission to delete the rule. You cannot delete a rule if it is used by an ACTIVE or INACTIVE detector version	Write	rule*		
DeleteVariable	Grants permission to delete a variable. You cannot delete variables that are included in an event type in Amazon Fraud Detector	Write	variable*		
DescribeDetector	Grants permission to get all versions for a specified detector	Read	detector*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeModelVersions	Grants permission to get all of the model versions for the specified model type or for the specified model type and model ID. You can also get details for a single, specified model version	Read	model-version		
GetBatchImportJobValidationReport [permission only]	Grants permission to get the data validation report of a specific batch import job	Read	batch-import*		
GetBatchImportJobs	Grants permission to get all batch import jobs or a specific job if you specify a job ID	List	batch-import		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetBatchPredictionJobs	Grants permission to get all batch prediction jobs or a specific job if you specify a job ID. This is a paginated API. If you provide a null maxResults, this action retrieves a maximum of 50 records per page. If you provide a maxResults, the value must be between 1 and 50. To get the next page results, provide the pagination token from the GetBatchPredictionJobsResponse as part of your request. A null pagination token fetches the records from the beginning	List	batch-prediction		
GetDeleteEventsByEventTypeStatus	Grants permission to get a specific event type DeleteEventsByEventType API execution status	Read	event-type*		
GetDetectorVersion	Grants permission to get a particular detector version	Read	detector-version*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDetectors	Grants permission to get all detectors or a single detector if a detectorId is specified . This is a paginated API. If you provide a null maxResults, this action retrieves a maximum of 10 records per page. If you provide a maxResults, the value must be between 5 and 10. To get the next page results, provide the pagination token from the GetDetectorsResponse as part of your request. A null pagination token fetches the records from the beginning	List	detector		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetEntityTypes	Grants permission to get all entity types or a specific entity type if a name is specified. This is a paginated API. If you provide a null maxResults, this action retrieves a maximum of 10 records per page. If you provide a maxResults, the value must be between 5 and 10. To get the next page results, provide the pagination token from the GetEntityTypesResponse as part of your request. A null pagination token fetches the records from the beginning	List	entity-type		
GetEvent	Grants permission to get the details of the specified event	Read	event-type*		
GetEventPrediction	Grants permission to evaluate an event against a detector version. If a version ID is not provided, the detector's (ACTIVE) version is used	Read	detector*		
			detector-version*		
			event-type*		
GetEventPredictionMetadata	Grants permission to get more details of a particular prediction	Read	detector*		
			detector-version*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			event-type*		
GetEventTypes	Grants permission to get all event types or a specific event type if name is provided. This is a paginated API. If you provide a null maxResults, this action retrieves a maximum of 10 records per page. If you provide a maxResults, the value must be between 5 and 10. To get the next page results, provide the pagination token from the GetEventTypesResponse as part of your request. A null pagination token fetches the records from the beginning	List	event-type		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetExternalModels	Grants permission to get the details for one or more Amazon SageMaker models that have been imported into the service. This is a paginated API. If you provide a null maxResults, this actions retrieves a maximum of 10 records per page. If you provide a maxResults, the value must be between 5 and 10. To get the next page results, provide the pagination token from the GetExternalModelsResult as part of your request. A null pagination token fetches the records from the beginning	List	external-model		
GetKMSEncryptionKey	Grants permission to get the encryption key if a Key Management Service (KMS) customer master key (CMK) has been specified to be used to encrypt content in Amazon Fraud Detector	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetLabels	Grants permission to get all labels or a specific label if name is provided. This is a paginated API. If you provide a null maxResults, this action retrieves a maximum of 50 records per page. If you provide a maxResults, the value must be between 10 and 50. To get the next page results, provide the paginatio n token from the GetGetLab elsResponse as part of your request. A null pagination token fetches the records from the beginning	List	label		
GetListEl ements	Grants permission to get elements of a list	Read	list*		
				aws:Resou rceTag/ ${ TagKey}	
GetListsM etadata	Grants permission to get metadata about lists	List	list		
				aws:Resou rceTag/ ${ TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetModelVersion	Grants permission to get the details of the specified model version	Read	model-version*		
GetModels	Grants permission to get one or more models. Gets all models for the AWS account if no model type and no model id provided. Gets all models for the AWS account and model type, if the model type is specified but model id is not provided. Gets a specific model if (model type, model id) tuple is specified	List	model		
GetOutcomes	Grants permission to get one or more outcomes. This is a paginated API. If you provide a null maxResults, this actions retrieves a maximum of 100 records per page. If you provide a maxResults, the value must be between 50 and 100. To get the next page results, provide the pagination token from the GetOutcomesResult as part of your request. A null pagination token fetches the records from the beginning	List	outcome		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetRules	Grants permission to get all rules for a detector (paginated) if ruleId and ruleVersion are not specified. Gets all rules for the detector and the ruleId if present (paginated). Gets a specific rule if both the ruleId and the ruleVersion are specified	List	rule		
GetVariables	Grants permission to get all of the variables or the specific variable. This is a paginated API. Providing null maxSizePerPage results in retrieving maximum of 100 records per page. If you provide maxSizePerPage the value must be between 50 and 100. To get the next page result, a provide a pagination token from GetVariablesResult as part of your request. Null pagination token fetches the records from the beginning	List	variable		
ListEventPredictions	Grants permission to get a list of past predictions	List	detector		
			detector-version		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			event-type		
ListTagsForResource	Grants permission to list all tags associated with the resource. This is a paginated API. To get the next page results, provide the pagination token from the response as part of your request. A null pagination token fetches the records from the beginning	Read	batch-import		
			batch-prediction		
			detector		
			detector-version		
			entity-type		
			event-type		
			external-model		
			label		
			list		
			model		
			model-version		
			outcome		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			rule		
			variable		
PutDetector	Grants permission to create or update a detector	Write	detector*		
			event-type*		
				aws:RequestTag/${TagKey} aws:TagKeys	
PutEntityType	Grants permission to create or update an entity type. An entity represents who is performing the event. As part of a fraud prediction, you pass the entity ID to indicate the specific entity who performed the event. An entity type classifies the entity. Example classifications include customer, merchant, or account	Write	entity-type*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutEventType	Grants permission to create or update an event type. An event is a business activity that is evaluated for fraud risk. With Amazon Fraud Detector, you generate fraud predictions for events. An event type defines the structure for an event sent to Amazon Fraud Detector. This includes the variables sent as part of the event, the entity performing the event (such as a customer), and the labels that classify the event. Example event types include online payment transactions, account registrations, and authentications	Write	event-type*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutExternalModel	Grants permission to create or update an Amazon SageMaker model endpoint. You can also use this action to update the configuration of the model endpoint, including the IAM role and/or the mapped variables	Write	event-type*		
			external-model*		
				aws:RequestTag/${TagKey} aws:TagKeys	
PutKMSEncryptionKey	Grants permission to specify the Key Management Service (KMS) customer master key (CMK) to be used to encrypt content in Amazon Fraud Detector	Write			
PutLabel	Grants permission to create or update label. A label classifies an event as fraudulent or legitimate. Labels are associated with event types and used to train supervised machine learning models in Amazon Fraud Detector	Write	label*		
				aws:RequestTag/${TagKey} aws:TagKeys	
PutOutcome	Grants permission to create or update an outcome	Write	outcome*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
SendEvent	Grants permission to send event	Write	event-type*		
				aws:RequestTag/${TagKey} aws:TagKeys	
TagResource	Grants permission to assign tags to a resource	Tagging	batch-import		
			batch-prediction		
			detector		
			detector-version		
			entity-type

				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateDetectorVersion	Grants permission to update a detector version. The detector version attributes that you can update include models, external model endpoints, rules, rule execution mode, and description. You can only update a DRAFT detector version	Write	detector*		
			external-model		
			model-version		
UpdateDetectorVersionMetadata	Grants permission to update the detector version's description. You can update the metadata for any detector version (DRAFT, ACTIVE, or INACTIVE)	Write	detector-version*		
UpdateDetectorVersionStatus	Grants permission to update the detector version's status. You can perform the following promotions or demotions using UpdateDetectorVersionStatus: DRAFT to ACTIVE, ACTIVE to INACTIVE, and INACTIVE to ACTIVE	Write	detector-version*		
UpdateEventLabel	Grants permission to update an existing event record's label value	Write	event-type*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateList	Grants permission to update a list	Write	list*		
				aws:ResourceTag/${TagKey}	
UpdateModel	Grants permission to update a model. You can update the description attribute using this action	Write	model*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateModelVersion	Grants permission to update a model version. Updating a model version retrains an existing model version using updated training data and produces a new minor version of the model. You can update the training data set location and data access role attributes using this action. This action creates and trains a new minor version of the model, for example version 1.01, 1.02, 1.03	Write	model*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateModelVersionStatus	Grants permission to update the status of a model version	Write	model-version*		
UpdateRuleMetadata	Grants permission to update a rule's metadata. The description attribute can be updated	Write	rule*		
UpdateRuleVersion	Grants permission to update a rule version resulting in a new rule version. Updates a rule version resulting in a new rule version (version 1, 2, 3 ...)	Write	rule*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateVariable	Grants permission to update a variable	Write	variable*		

Resource types defined by Amazon Fraud Detector

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
batch-prediction	`arn:${Partition}:frauddetector:${Region}:${Account}:batch-prediction/${ResourcePath}`	aws:ResourceTag/${TagKey}
detector	`arn:${Partition}:frauddetector:${Region}:${Account}:detector/${ResourcePath}`	aws:ResourceTag/${TagKey}
detector-version	`arn:${Partition}:frauddetector:${Region}:${Account}:detector-version/${ResourcePath}`	aws:ResourceTag/${TagKey}
entity-type	`arn:${Partition}:frauddetector:${Region}:${Account}:entity-type/${ResourcePath}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
external-model	arn:${Partition}:frauddetector:${Region}:${Account}:external-model/${ResourcePath}	aws:ResourceTag/${TagKey}
event-type	arn:${Partition}:frauddetector:${Region}:${Account}:event-type/${ResourcePath}	aws:ResourceTag/${TagKey}
label	arn:${Partition}:frauddetector:${Region}:${Account}:label/${ResourcePath}	aws:ResourceTag/${TagKey}
model	arn:${Partition}:frauddetector:${Region}:${Account}:model/${ResourcePath}	aws:ResourceTag/${TagKey}
model-version	arn:${Partition}:frauddetector:${Region}:${Account}:model-version/${ResourcePath}	aws:ResourceTag/${TagKey}
outcome	arn:${Partition}:frauddetector:${Region}:${Account}:outcome/${ResourcePath}	aws:ResourceTag/${TagKey}
rule	arn:${Partition}:frauddetector:${Region}:${Account}:rule/${ResourcePath}	aws:ResourceTag/${TagKey}
variable	arn:${Partition}:frauddetector:${Region}:${Account}:variable/${ResourcePath}	aws:ResourceTag/${TagKey}
batch-import	arn:${Partition}:frauddetector:${Region}:${Account}:batch-import/${ResourcePath}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
list	arn:${Partition}:frauddetector:${Region}:${Account}:list/${ResourcePath}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Fraud Detector

Amazon Fraud Detector defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters actions based on the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters actions based on the tags associated with the resource	String
aws:TagKeys	Filters actions based on the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Free Tier

AWS Free Tier (service prefix: freetier) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.

- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS Free Tier

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAccountActivity	Grants permission to get a specific activity record	Read			
GetAccountPlanState	Grants permission to get all of the information related to the state of the account plan related to Free Tier	Read			
GetFreeTierAlertPreference [permission only]	Grants permission to get free tier alert preference (email address)	Read			
GetFreeTierUsage	Grants permission to get free tier usage limits and MTD usage status	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAccountActivities	Grants permission to list available activities	List			
PutFreeTierAlertPreference [permission only]	Grants permission to set free tier alert preference (email address)	Write			
UpgradeAccountPlan	Grants permission to trigger an upgrade of account plan	Write			

Resource types defined by AWS Free Tier

AWS Free Tier does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Free Tier, specify `"Resource": "*"` in your policy.

Condition keys for AWS Free Tier

Free Tier has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon FreeRTOS

Amazon FreeRTOS (service prefix: `freertos`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon FreeRTOS

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSoftwareConfiguration	Grants permission to create a software configuration	Write	configuration*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSubscription	Grants permission to create a subscription for FreeRTOS extended maintenance plan (EMP)	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteSoftwareConfiguration	Grants permission to delete the software configuration	Write	configuration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeHardwarePlatform	Grants permission to describe the hardware platform	Read			
DescribeSoftwareConfiguration	Grants permission to describe the software configuration	Read	configuration*		
DescribeSubscription	Grants permission to describes the subscription for FreeRTOS extended maintenance plan (EMP)	Read	subscription*		
GetEmpPatchUrl	Grants permission to get URL for sotware patch-release, patch-diff and release notes under FreeRTOS extended maintenance plan (EMP)	Read			
GetSoftwareURL	Grants permission to get the URL for Amazon FreeRTOS software download	Read			
GetSoftwareURLForConfiguration	Grants permission to get the URL for Amazon FreeRTOS software download based on the configuration	Read			
GetSubscriptionBillingAmount	Grants permission to fetch the subscription billing amount for FreeRTOS extended maintenance plan (EMP)	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListFreeRTOSVersions	Grants permission to lists versions of AmazonFreeRTOS	List			
ListHardwarePlatforms	Grants permission to list the hardware platforms	List			
ListHardwareVendors	Grants permission to list the hardware vendors	List			
ListSoftwareConfigurations	Grants permission to lists the software configurations	List			
ListSoftwarePatches	Grants permission to list software patches of subscription for FreeRTOS extended maintenance plan (EMP)	List			
ListSubscriptionEmails	Grants permission to list the subscription emails for FreeRTOS extended maintenance plan (EMP)	List			
ListSubscriptions	Grants permission to list the subscriptions for FreeRTOS extended maintenance plan (EMP)	List			
UpdateEmailRecipients	Grants permission to update list of subscription email address for FreeRTOS extended maintenance plan (EMP)	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateSoftwareConfiguration	Grants permission to update the software configuration	Write	configuration*		
VerifyEmail	Grants permission to verify the email for FreeRTOS extended maintenance plan (EMP)	Write			

Resource types defined by Amazon FreeRTOS

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
configuration	`arn:${Partition}:freertos:${Region}:${Account}:configuration/${ConfigurationName}`	aws:ResourceTag/${TagKey}
subscription	`arn:${Partition}:freertos:${Region}:${Account}:subscription/${SubscriptionID}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon FreeRTOS

Amazon FreeRTOS defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tag key present in the request that the user makes to Amazon FreeRTOS	String
aws:ResourceTag/${TagKey}	Filters access by tag key component attached to an Amazon FreeRTOS resource	String
aws:TagKeys	Filters access by the list of all the tag key names associated with the resource in the request	ArrayOfString

Actions, resources, and condition keys for Amazon FSx

Amazon FSx (service prefix: `fsx`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon FSx

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateFileGateway [permission only]	Grants permission to associate a File Gateway instance with an Amazon FSx for Windows File Server file system	Write	file-system*		
AssociateFileSystemAliases	Grants permission to associate DNS aliases with an Amazon FSx for Windows File Server file system	Write	file-system*		
BypassSnaplockEnterpriseRetention [permission only]	Grants permission to allow deletion of an FSx for ONTAP SnapLock Enterprise volume that contains WORM (write once, read many) files with active retention periods	Permissions management	volume*		
CancelDataRepositoryTask	Grants permission to cancel a data repository task	Write	task*		
CopyBackup	Grants permission to copy a backup	Write	backup*		fsx:TagResource
				aws:RequestTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} aws:TagKeys	
CopySnapshotAndUpdateVolume	Grants permission to update an existing volume by using a snapshot from another Amazon FSx for OpenZFS file system	Write	snapshot*		
			volume*		
CreateAndAttachS3AccessPoint	Grants permission to create and attach a S3 Access Point to a FSx File System	Write	volume		s3:CreateAccessPoint s3:GetAccessPoint s3:PutAccessPointPolicy
CreateBackup	Grants permission to create a new backup of an Amazon FSx file system or an Amazon FSx volume	Write	backup*		fsx:TagResource
			file-system		
			volume		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDataRepositoryAssociation	Grants permission to create a new data respository association for an Amazon FSx for Lustre file system	Write	association*	fsx:NfsDataRepositoryAuthenticationEnabled fsx:NfsDataRepositoryEncryptionInTransitEnabled	fsx:TagResource
			file-system*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateDataRepositoryTask	Grants permission to create a new data respository task for an Amazon FSx for Lustre file system	Write	file-system*		fsx:TagResource
			task*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateFileCache	Grants permission to create a new, empty, Amazon file cache	Write	file-cache*		ec2:DescribeSecurityGroups ec2:DescribeSubnets ec2:DescribeVpcs ec2:GetSecurityGroupsForVpc fsx:CreateDataRepositoryAssociation fsx:TagResource logs:CreateLogGroup logs:CreateLogStream logs:PutLogEvents

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					s3:ListBucket
			association	fsx:NfsDataRepositoryEncryptionInTransitEnabled fsx:NfsDataRepositoryAuthenticationEnabled	
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateFileSystem	Grants permission to create a new, empty, Amazon FSx file system	Write	file-system*		ec2:GetSecurityGroupsForVpc fsx:TagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateFileSystemFromBackup	Grants permission to create a new Amazon FSx file system from an existing backup	Write	backup*		ec2:GetSecurityGroupsForVpc fsx:TagResource
			file-system*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSnapshot	Grants permission to create a new snapshot on a volume	Write	snapshot*		fsx:TagResource
			volume*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateStorageVirtualMachine	Grants permission to create a new storage virtual machine in an Amazon FSx for Ontap file system	Write	file-system*		fsx:TagResource
			storage-virtual-machine*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateVolume	Grants permission to create a new volume	Write	volume*		fsx:TagResource
			snapshot		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys fsx:StorageVirtualMachineId fsx:ParentVolumeId	
CreateVolumeFromBackup	Grants permission to create a new volume from backup	Write	backup*		fsx:TagResource
			storage-virtual-machine*		
			volume*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys fsx:StorageVirtualMachineId	
DeleteBackup	Grants permission to delete a backup, deleting its contents. After deletion, the backup no longer exists, and its data is no longer available	Write	backup*		
DeleteDataRepositoryAssociation	Grants permission to delete a data repository association	Write	association*		
DeleteFileCache	Grants permission to delete a file cache, deleting its contents	Write	file-cache*		fsx:DeleteDataRepositoryAssociation
			association		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteFileSystem	Grants permission to delete a file system, deleting its contents and any existing automatic backups of the file system	Write	file-system*		fsx:CreateBackup fsx:TagResource
			backup		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteResourcePolicy [permission only]	Grants permission to manage cross-account sharing of FSx volumes through AWS Resource Access Manager (RAM). PutResourcePolicy and GetResourcePolicy are also required	Permissions management	volume*		
DeleteSnapshot	Grants permission to delete a snapshot on a volume	Write	snapshot*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteStorageVirtualMachine	Grants permission to delete a storage virtual machine, deleting its contents	Write	storage-virtual-machine*		
DeleteVolume	Grants permission to delete a volume, deleting its contents and any existing automatic backups of the volume	Write	volume*		fsx:TagResource
			backup		
				aws:RequestTag/${TagKey} aws:TagKeys fsx:StorageVirtualMachineId fsx:ParentVolumeId	
DescribeAssociatedFileGateways [permission only]	Grants permission to describe the File Gateway instances associated with an Amazon FSx for Windows File Server file system	Read	file-system*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeBackups	Grants permission to return the descriptions of all backups owned by your AWS account in the AWS Region of the endpoint that you're calling	Read			
DescribeDataRepositoryAssociations	Grants permission to return the descriptions of all data repository associations owned by your AWS account in the AWS Region of the endpoint that you're calling	Read			
DescribeDataRepositoryTasks	Grants permission to return the descriptions of all data repository tasks owned by your AWS account in the AWS Region of the endpoint that you're calling	Read			
DescribeFileCaches	Grants permission to return the descriptions of all file caches owned by your AWS account in the AWS Region of the endpoint that you're calling	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeFileSystemAliases	Grants permission to return the description of all DNS aliases owned by your Amazon FSx for Windows File Server file system	Read	file-system*		
DescribeFileSystems	Grants permission to return the descriptions of all file systems owned by your AWS account in the AWS Region of the endpoint that you're calling	Read			
DescribeS3AccessPointAttachments	Grants permission to return the descriptions of S3 Access Point Attachments	Read			
DescribeSharedVpcConfiguration	Grants permission to return the descriptions of whether FSx route table updates from participant accounts are allowed in your account	Read			
DescribeSnapshots	Grants permission to return the descriptions of all snapshots owned by your AWS account in the AWS Region of the endpoint you're calling	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeStorageVirtualMachines	Grants permission to return the descriptions of all storage virtual machines owned by your AWS account in the AWS Region of the endpoint that you're calling	Read			
DescribeVolumes	Grants permission to return the descriptions of all volumes owned by your AWS account in the AWS Region of the endpoint that you're calling	Read			
DetachAndDeleteS3AccessPoint	Grants permission to detach an S3 Access Point from an Amazon FSx File System and delete the S3 Access Point	Write	volume		s3:DeleteAccessPoint
DisassociateFileGateway [permission only]	Grants permission to disassociate a File Gateway instance from an Amazon FSx for Windows File Server file system	Write	file-system*		
DisassociateFileSystemAliases	Grants permission to disassociate file system aliases with an Amazon FSx for Windows File Server file system	Write	file-system*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetResourcePolicy [permission only]	Grants permission to manage cross-account sharing of FSx volumes through AWS Resource Access Manager (RAM). PutResourcePolicy and DeleteResourcePolicy are also required	Permissions management	volume*		
ListTagsForResource	Grants permission to list tags for an Amazon FSx resource	Read	association		
			backup		
			file-cache		
			file-system		
			snapshot		
			storage-virtual-machine		
			task		
			volume		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ManageBackupPrincipalAssociations [permission only]	Grants permission to manage backup principal associations through AWS Backup	Permissions management	backup*		
PutResourcePolicy [permission only]	Grants permission to manage cross-account sharing of FSx volumes through AWS Resource Access Manager (RAM). DeleteResourcePolicy and GetResourcePolicy are also required	Permissions management	volume*		
ReleaseFileSystemNfsV3Locks	Grants permission to release file system NFS V3 locks	Write	file-system*		
RestoreVolumeFromSnapshot	Grants permission to restore volume state from a snapshot	Write	snapshot* volume*		
StartMisconfiguredStateRecovery	Grants permission to start misconfigured state recovery	Write	file-system*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to tag an Amazon FSx resource	Tagging	association	fsx:NfsDataRepositoryAuthenticationEnabled fsx:NfsDataRepositoryEncryptionInTransitEnabled	
			backup		
			file-cache		
			file-system		
			snapshot		
			storage-virtual-machine		
			task		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			volume	fsx:ParentVolumeId fsx:StorageVirtualMachineId	
				aws:TagKeys aws:RequestTag/${TagKey}

			backup		
			file-cache		
			file-system		
			snapshot		
			storage-virtual-machine		
			task		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			volume		
				aws:TagKeys	
UpdateDataRepositoryAssociation	Grants permission to update data repository association configuration	Write	association*		
UpdateFileCache	Grants permission to update file cache configuration	Write	file-cache*		
UpdateFileSystem	Grants permission to update file system configuration	Write	file-system*		
UpdateSharedVpcConfiguration	Grants permission to enable or disable FSx route table updates from participant accounts in your account	Write			
UpdateSnapshot	Grants permission to update snapshot configuration	Write	snapshot*		
UpdateStorageVirtualMachine	Grants permission to update storage virtual machine configuration	Write	storage-virtual-machine*		
UpdateVolume	Grants permission to update volume configuration	Write	volume*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				fsx:StorageVirtualMachineId fsx:ParentVolumeId	

Resource types defined by Amazon FSx

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

> **Note**
>
> Amazon FSx for Windows File Server, Lustre, and Ontap share some of the same resource types, with the same ARN format for each.

Resource types	ARN	Condition keys
file-system	`arn:${Partition}:fsx:${Region}:${Account}:file-system/${FileSystemId}`	aws:ResourceTag/${TagKey}
file-cache	`arn:${Partition}:fsx:${Region}:${Account}:file-cache/${FileCacheId}`	aws:ResourceTag/${TagKey}
backup	`arn:${Partition}:fsx:${Region}:${Account}:backup/${BackupId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
storage-virtual-machine	arn:${Partition}:fsx:${Region}:${Account}:storage-virtual-machine/${FileSystemId}/${StorageVirtualMachineId}	aws:ResourceTag/${TagKey}
task	arn:${Partition}:fsx:${Region}:${Account}:task/${TaskId}	aws:ResourceTag/${TagKey}
association	arn:${Partition}:fsx:${Region}:${Account}:association/${FileSystemIdOrFileCacheId}/${DataRepositoryAssociationId}	aws:ResourceTag/${TagKey}
volume	arn:${Partition}:fsx:${Region}:${Account}:volume/${FileSystemId}/${VolumeId}	aws:ResourceTag/${TagKey}
snapshot	arn:${Partition}:fsx:${Region}:${Account}:snapshot/${VolumeId}/${SnapshotId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon FSx

Amazon FSx defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
fsx:IsBackupCopyDestination	Filters access by whether the backup is a destination backup for a CopyBackup operation	Bool
fsx:IsBackupCopySource	Filters access by whether the backup is a source backup for a CopyBackup operation	Bool
fsx:NfsDataRepositoryAuthenticationEnabled	Filters access by NFS data repositories which support authentication	Bool
fsx:NfsDataRepositoryEncryptionInTransitEnabled	Filters access by NFS data repositories which support encryption-in-transit	Bool
fsx:ParentVolumeId	Filters access by the containing parent volume for mutating volume operations	String
fsx:StorageVirtualMachineId	Filters access by the containing storage virtual machine for a volume for mutating volume operations	String

Actions, resources, and condition keys for Amazon GameLift Servers

Amazon GameLift Servers (service prefix: `gamelift`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon GameLift Servers

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptMatch	Grants permission to register player acceptance or rejection of a proposed FlexMatch match	Write			
ClaimGameServer	Grants permission to locate and reserve a game server to host a new game session	Write	gameServerGroup*		
CreateAlias	Grants permission to define a new alias for a fleet	Write		aws:RequestTag/${TagKey}	gamelift:TagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
CreateBuild	Grants permission to create a new game build using files stored in an Amazon S3 bucket	Write		aws:RequestTag/${TagKey} aws:TagKeys	gamelift:TagResource iam:PassRole s3:GetObject
CreateContainerFleet	Grants permission to create a new container fleet of computing resources to run your game servers	Write		aws:RequestTag/${TagKey} aws:TagKeys	ec2:DescribeAvailabilityZones ec2:DescribeRegions gamelift:TagResource iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateContainerGroupDefinition	Grants permission to create a new container group definition using images stored in an Amazon ECR repository	Write		aws:RequestTag/${TagKey} aws:TagKeys	ecr:BatchGetImage ecr:DescribeImages ecr:GetAuthorizationToken ecr:GetDownloadUrlForLayer gamelift:TagResource
CreateFleet	Grants permission to create a new fleet of computing resources to run your game servers	Write		aws:RequestTag/${TagKey} aws:TagKeys	ec2:DescribeAvailabilityZones ec2:DescribeRegions gamelift:TagResource iam:PassRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateFleetLocations	Grants permission to specify additional locations for a fleet	Write	containerFleet		ec2:DescribeAvailabilityZones ec2:DescribeRegions
			fleet		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateGameServerGroup	Grants permission to create a new game server group, set up a corresponding Auto Scaling group, and launche instances to host game servers	Write		aws:RequestTag/${TagKey} aws:TagKeys	autoscaling:CreateAutoScalingGroup autoscaling:DescribeAutoScalingGroups autoscaling:PutLifecycleHook autoscaling:PutScalingPolicy ec2:DescribeAvailabilityZones ec2:DescribeSubnets events:PutRule

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					events:PutTargets gamelift:TagResource iam:PassRole
CreateGameSession	Grants permission to start a new game session on a specified fleet	Write			
CreateGameSessionQueue	Grants permission to set up a new queue for processing game session placement requests	Write		aws:RequestTag/${TagKey} aws:TagKeys	gamelift:TagResource
CreateLocation	Grants permission to define a new location for a fleet	Write		aws:RequestTag/${TagKey} aws:TagKeys	gamelift:TagResource

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateMatchmakingConfiguration	Grants permission to create a new FlexMatch matchmaker	Write		aws:RequestTag/${TagKey} aws:TagKeys	gamelift:TagResource
CreateMatchmakingRuleSet	Grants permission to create a new matchmaking rule set for FlexMatch	Write		aws:RequestTag/${TagKey} aws:TagKeys	gamelift:TagResource
CreatePlayerSession	Grants permission to reserve an available game session slot for a player	Write			
CreatePlayerSessions	Grants permission to reserve available game session slots for multiple players	Write			
CreateScript	Grants permission to create a new Realtime Servers script	Write		aws:RequestTag/${TagKey} aws:TagKeys	gamelift:TagResource iam:PassRole s3:GetObject

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateVpcPeeringAuthorization	Grants permission to allow GameLift to create or delete a peering connection between a GameLift fleet VPC and a VPC on another AWS account	Write			ec2:AcceptVpcPeeringConnection ec2:AuthorizeSecurityGroupEgress ec2:AuthorizeSecurityGroupIngress ec2:CreateRoute ec2:DeleteRoute ec2:DescribeRouteTables ec2:DescribeSecurityGroups ec2:RevokeSecurityGroupEgress

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					ec2:RevokeSecurityGroupIngress
CreateVpcPeeringConnection	Grants permission to establish a peering connection between your GameLift fleet VPC and a VPC on another account	Write			
DeleteAlias	Grants permission to delete an alias	Write	alias*		
DeleteBuild	Grants permission to delete a game build	Write	build*		
DeleteContainerFleet	Grants permission to delete a container fleet	Write	containerFleet*		
DeleteContainerGroupDefinition	Grants permission to delete a container group definition	Write	containerGroupDefinition*		
DeleteFleet	Grants permission to delete an empty fleet	Write	fleet*		
DeleteFleetLocations	Grants permission to delete locations for a fleet	Write	containerFleet		
			fleet		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteGameServerGroup	Grants permission to permanently delete a game server group and terminate FleetIQ activity for the corresponding Auto Scaling group	Write	gameServerGroup*		autoscaling:DeleteAutoScalingGroup autoscaling:DescribeAutoScalingGroups autoscaling:ExitStandby autoscaling:ResumeProcesses autoscaling:SetInstanceProtection autoscaling:UpdateAutoScalingGroup
DeleteGameSessionQueue	Grants permission to delete an existing game session queue	Write	gameSessionQueue*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteLocation	Grants permission to delete a location	Write	location*		
DeleteMatchmakingConfiguration	Grants permission to delete an existing FlexMatch matchmaker	Write	matchmakingConfiguration*		
DeleteMatchmakingRuleSet	Grants permission to delete an existing FlexMatch matchmaking rule set	Write	matchmakingRuleSet*		
DeleteScalingPolicy	Grants permission to delete a set of auto-scaling rules	Write	containerFleet		
			fleet		
DeleteScript	Grants permission to delete a Realtime Servers script	Write	script*		
DeleteVpcPeeringAuthorization	Grants permission to cancel a VPC peering authorization	Write			
DeleteVpcPeeringConnection	Grants permission to remove a peering connection between VPCs	Write			
DeregisterCompute	Grants permission to deregister a compute against a fleet	Write	fleet*		
DeregisterGameServer	Grants permission to remove a game server from a game server group	Write	gameServerGroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeAlias	Grants permission to retrieve properties for an alias	Read	alias*		
DescribeBuild	Grants permission to retrieve properties for a game build	Read	build*		
DescribeCompute	Grants permission to retrieve information for a compute in a fleet	Read	containerFleet		
			fleet		
DescribeContainerFleet	Grants permission to retrieve the properties of an existing container fleet	Read	containerFleet*		
DescribeContainerGroupDefinition	Grants permission to retrieve the properties of an existing container group definition	Read	containerGroupDefinition*		
DescribeEC2InstanceLimits	Grants permission to retrieve the maximum allowed and current usage for EC2 instance types	Read			
DescribeFleetAttributes	Grants permission to retrieve general properties, including status, for fleets	Read			
DescribeFleetCapacity	Grants permission to retrieve the current capacity settings for managed fleets	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeFleetDeployment	Grants permission to retrieve the properties of an existing fleet deployment	Read	containerFleet*		
DescribeFleetEvents	Grants permission to retrieve entries from a fleet's event log	Read	containerFleet		
			fleet		
DescribeFleetLocationAttributes	Grants permission to retrieve general properties, including statuses, for a fleet's locations	Read	containerFleet		
			fleet		
DescribeFleetLocationCapacity	Grants permission to retrieve the current capacity setting for a fleet's location	Read	containerFleet		
			fleet		
DescribeFleetLocationUtilization	Grants permission to retrieve utilization statistics for fleet's location	Read	fleet*		
DescribeFleetPortSettings	Grants permission to retrieve the inbound connection permissions for a fleet	Read	fleet*		
DescribeFleetUtilization	Grants permission to retrieve utilization statistics for fleets	Read			
DescribeGameServer	Grants permission to retrieve properties for a game server	Read	gameServerGroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeGameServerGroup	Grants permission to retrieve properties for a game server group	Read	gameServerGroup*		
DescribeGameServerInstances	Grants permission to retrieve the status of EC2 instances in a game server group	Read	gameServerGroup*		
DescribeGameSessionDetails	Grants permission to retrieve properties for game sessions in a fleet, including the protection policy	Read			
DescribeGameSessionPlacement	Grants permission to retrieve details of a game session placement request	Read			
DescribeGameSessionQueues	Grants permission to retrieve properties for game session queues	Read			
DescribeGameSessions	Grants permission to retrieve properties for game sessions in a fleet	Read			
DescribeInstances	Grants permission to retrieve information about instances in a managed fleet	Read	containerFleet		
			fleet		
DescribeMatchmaking	Grants permission to retrieve details of matchmaking tickets	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeMatchmakingConfigurations	Grants permission to retrieve properties for FlexMatch matchmakers	Read			
DescribeMatchmakingRuleSets	Grants permission to retrieve properties for FlexMatch matchmaking rule sets	Read			
DescribePlayerSessions	Grants permission to retrieve properties for player sessions in a game session	Read			
DescribeRuntimeConfiguration	Grants permission to retrieve the current runtime configuration for a fleet	Read	fleet*		
DescribeScalingPolicies	Grants permission to retrieve all scaling policies that are applied to a fleet	Read	containerFleet		
			fleet		
DescribeScript	Grants permission to retrieve properties for a Realtime Servers script	Read	script*		
DescribeVpcPeeringAuthorizations	Grants permission to retrieve valid VPC peering authorizations	Read			
DescribeVpcPeeringConnections	Grants permission to retrieve details on active or pending VPC peering connections	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetComputeAccess	Grants permission to retrieve credentials to remotely access a compute in a managed fleet	Read	containerFleet		
			fleet		
GetComputeAuthToken	Grants permission to retrieve an authentication token that allows processes on a compute to send requests to the Amazon GameLift service	Read	containerFleet		
			fleet		
GetGameSessionLogUrl	Grants permission to retrieve the location of stored logs for a game session	Read			
GetInstanceAccess	Grants permission to request remote access to a specified fleet instance	Read	fleet*		
GetPlayerConnectionDetails	Grants permission to retrieve player connection endpoints and player gateway tokens for a game session	Read			
ListAliases	Grants permission to retrieve all aliases that are defined in the current Region	List			
ListBuilds	Grants permission to retrieve all game build in the current Region	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListCompute	Grants permission to retrieve all compute resources in the current Region	List	containerFleet		
			fleet		
ListContainerFleets	Grants permission to retrieve the properties of all existing container fleets in the current Region	List			
ListContainerGroupDefinitionVersions	Grants permission to retrieve the properties of all versions of an existing container group definition	List	containerGroupDefinition*		
ListContainerGroupDefinitions	Grants permission to retrieve the properties of all existing container group definitions in the current Region	List			
ListFleetDeployments	Grants permission to retrieve the properties of all existing fleet deployments in the current Region	List			
ListFleets	Grants permission to retrieve a list of fleet IDs for all fleets in the current Region	List			
ListGameServerGroups	Grants permission to retrieve all game server groups that are defined in the current Region	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListGameServers	Grants permission to retrieve all game servers that are currently running in a game server group	List	gameServerGroup*		
ListLocations	Grants permission to retrieve all locations in this account	List			
ListScripts	Grants permission to retrieve properties for all Realtime Servers scripts in the current region	List			
ListTagsForResource	Grants permission to retrieve tags for GameLift resources	Read	alias		
			build		
			containerFleet		
			containerGroupDefinition		
			fleet		
			gameServerGroup		
			gameSessionQueue		
			location		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			matchmakingConfiguration		
			matchmakingRuleSet		
			script		
PutScalingPolicy	Grants permission to create or update a fleet auto-scaling policy	Write	containerFleet		
			fleet		
RegisterCompute	Grants permission to register a compute against a fleet	Write	fleet*		
RegisterGameServer	Grants permission to notify GameLift FleetIQ when a new game server is ready to host gameplay	Write	gameServerGroup*		
RequestUploadCredentials	Grants permission to retrieve fresh upload credentials to use when uploading a new game build	Read	build*		
ResolveAlias	Grants permission to retrieve the fleet ID associated with an alias	Read	alias*		
ResumeGameServerGroup	Grants permission to reinstate suspended FleetIQ activity for a game server group	Write	gameServerGroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SearchGameSessions	Grants permission to retrieve game sessions that match a set of search criteria	Read			
StartFleetActions	Grants permission to resume auto-scaling activity on a fleet after it was suspended with StopFleetActions()	Write	containerFleet		
			fleet		
StartGameSessionPlacement	Grants permission to send a game session placement request to a game session queue	Write	gameSessionQueue*		
StartMatchBackfill	Grants permission to request FlexMatch matchmaking to fill available player slots in an existing game session	Write			
StartMatchmaking	Grants permission to request FlexMatch matchmaking for one or a group of players and initiate game session placement	Write			
StopFleetActions	Grants permission to suspend auto-scaling activity on a fleet	Write	containerFleet		
			fleet		
StopGameSessionPlacement	Grants permission to cancel a game session placement request that is in progress	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StopMatchmaking	Grants permission to cancel a matchmaking or match backfill request that is in progress	Write			
SuspendGameServerGroup	Grants permission to temporarily stop FleetIQ activity for a game server group	Write	gameServerGroup*		
TagResource	Grants permission to tag GameLift resources	Tagging	alias		
			build		
			containerFleet		
			containerGroupDefinition		
			fleet		
			gameServerGroup		
			gameSessionQueue		
			location		
			matchmakingConfiguration		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			matchmakingRuleSet		
			script		
				aws:RequestTag/${TagKey} aws:TagKeys	
Terminate GameSession	Grants permission to shut down an existing game session	Write			
UntagResource	Grants permission to untag GameLift resources	Tagging	alias		
			build		
			containerFleet		
			containerGroupDefinition		
			fleet		
			gameServerGroup		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			gameSessionQueue		
			location		
			matchmakingConfiguration		
			matchmakingRuleSet		
			script		
				aws:TagKeys	
UpdateAlias	Grants permission to update the properties of an existing alias	Write	alias*		
UpdateBuild	Grants permission to update an existing build's metadata	Write	build*		
UpdateContainerFleet	Grants permission to update an existing container fleet	Write	containerFleet*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateContainerGroupDefinition	Grants permission to update the properties of an existing container group definition	Write	containerGroupDefinition*		ecr:BatchGetImage ecr:DescribeImages ecr:GetAuthorizationToken ecr:GetDownloadUrlForLayer
UpdateFleetAttributes	Grants permission to update the general properties of an existing fleet	Write	fleet*		
UpdateFleetCapacity	Grants permission to adjust a managed fleet's capacity settings	Write	containerFleet		
			fleet		
UpdateFleetPortSettings	Grants permission to adjust a fleet's port settings	Write	fleet*		
UpdateGameServer	Grants permission to change game server properties, health status, or utilization status	Write	gameServerGroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateGameServerGroup	Grants permission to update properties for game server group, including allowed instance types	Write	gameServerGroup*		iam:PassRole
UpdateGameSession	Grants permission to update the properties of an existing game session	Write			
UpdateGameSessionQueue	Grants permission to update properties of an existing game session queue	Write	gameSessionQueue*		
UpdateMatchmakingConfiguration	Grants permission to update properties of an existing FlexMatch matchmaking configuration	Write	matchmakingConfiguration*		
UpdateRuntimeConfiguration	Grants permission to update how server processes are configured on instances in an existing fleet	Write	fleet*		
UpdateScript	Grants permission to update the metadata and content of an existing Realtime Servers script	Write	script*		iam:PassRole s3:GetObject
ValidateMatchmakingRuleSet	Grants permission to validate the syntax of a FlexMatch matchmaking rule set	Read			

Resource types defined by Amazon GameLift Servers

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
alias	`arn:${Partition}:gamelift:${Region}::alias/${AliasId}`	aws:ResourceTag/${TagKey}
build	`arn:${Partition}:gamelift:${Region}:${Account}:build/${BuildId}`	aws:ResourceTag/${TagKey}
containerGroupDefinition	`arn:${Partition}:gamelift:${Region}:${Account}:containergroupdefinition/${Name}`	aws:ResourceTag/${TagKey}
containerFleet	`arn:${Partition}:gamelift:${Region}:${Account}:containerfleet/${FleetId}`	aws:ResourceTag/${TagKey}
fleet	`arn:${Partition}:gamelift:${Region}:${Account}:fleet/${FleetId}`	aws:ResourceTag/${TagKey}
gameServerGroup	`arn:${Partition}:gamelift:${Region}:${Account}:gameservergroup/${GameServerGroupName}`	aws:ResourceTag/${TagKey}
gameSessionQueue	`arn:${Partition}:gamelift:${Region}:${Account}:gamesessionqueue/${GameSessionQueueName}`	aws:ResourceTag/${TagKey}
location	`arn:${Partition}:gamelift:${Region}:${Account}:location/${LocationId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
matchmakingConfiguration	arn:${Partition}:gamelift:${Region}:${Account}:matchmakingconfiguration/${MatchmakingConfigurationName}	aws:ResourceTag/${TagKey}
matchmakingRuleSet	arn:${Partition}:gamelift:${Region}:${Account}:matchmakingruleset/${MatchmakingRuleSetName}	aws:ResourceTag/${TagKey}
script	arn:${Partition}:gamelift:${Region}:${Account}:script/${ScriptId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon GameLift Servers

Amazon GameLift Servers defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon GameLift Streams

Amazon GameLift Streams (service prefix: `gameliftstreams`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon GameLift Streams

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddStreamGroupLocations	Grants permission to attach a StreamGroup remote location	Write	streamgroup*		ec2:DescribeRegions
AssociateApplications	Grants permission to associate Applications to a StreamGroup	Write	application*		
			streamgroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateApplication	Grants permission to create application	Write		aws:RequestTag/${TagKey} aws:TagKeys	gameliftstreams:TagResource s3:GetObject s3:ListBucket
CreateStreamGroup	Grants permission to create a StreamGroup	Write		aws:RequestTag/${TagKey} aws:TagKeys	gameliftstreams:TagResource
CreateStreamSessionConnection	Grants permission to create a stream session connection	Write	stream group*		
DeleteApplication	Grants permission to delete an application	Write	application*		
DeleteStreamGroup	Grants permission to delete a StreamGroup	Write	stream group*		
DisassociateApplications	Grants permission to disassociate Applications from a StreamGroup	Write	application* stream group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ExportStreamSessionFiles	Grants permission to export stream session files that your application generates	Write	stream group*		s3:PutObject
GetApplication	Grants permission to get an application	Read	application*		
GetStreamGroup	Grants `permission` to get a StreamGroup	Read	stream group*		
GetStreamSession	Grants permission to get a stream session	Read	stream group*		
ListApplications	Grants permission to list applications	List			
ListStreamGroups	Grants permission to list StreamGroups	List			
ListStreamSessions	Grants permission to list stream sessions	Read	stream group*		
ListStreamSessionsByAccount	Grants permission to list stream sessions	Read			
ListTagsForResource	Grants permission to list tags for a resource	Read	application		
			stream group		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RemoveStreamGroupLocations	Grants permission to detach a StreamGroup remote location	Write	stream group*		
StartStreamSession	Grants permission to create a stream session	Write	stream group*		
TagResource	Grants permission to tag a resource	Tagging	application		
			stream group		
				aws:RequestTag/${TagKey} aws:TagKeys	
TerminateStreamSession	Grants permission to terminate a stream session	Write	stream group*		
UntagResource	Grants permission to untag a resource	Tagging	application		
			stream group		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateApplication	Grants permission to update an application	Write	application*		
UpdateStreamGroup	Grants permission to update a StreamGroup	Write	streamgroup*		

Resource types defined by Amazon GameLift Streams

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
application	`arn:${Partition}:gameliftstreams:${Region}:${Account}:application/${ApplicationId}`	aws:ResourceTag/${TagKey}
streamgroup	`arn:${Partition}:gameliftstreams:${Region}:${Account}:streamgroup/${StreamGroupId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon GameLift Streams

Amazon GameLift Streams defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Global Accelerator

AWS Global Accelerator (service prefix: `globalaccelerator`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Global Accelerator

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddCustomRoutingEndpoints	Grants permission to add a virtual private cloud (VPC) subnet endpoint to a custom routing accelerator endpoint group	Write	endpointgroup*		
AddEndpoints	Grants permission to add an endpoint to a standard accelerator endpoint group	Write	endpointgroup*		globalaccelerator:UpdateEndpointGroup
AdvertiseByoipCidr	Grants permission to advertises an IPv4 address range that is provisioned for use with your accelerator through bring your own IP addresses (BYOIP)	Write			
AllowCustomRoutingTraffic	Grants permission to allows custom routing of user traffic to a private destination IP:PORT in a specific VPC subnet	Write	endpointgroup*		
CreateAccelerator	Grants permission to create a standard accelerator	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCrossAccountAttachment	Grants permission to create a CrossAccountAttachment	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateCustomRoutingAccelerator	Grants permission to create a Custom Routing accelerator	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateCustomRoutingEndpointGroup	Grants permission to create an endpoint group for the specified listener for a custom routing accelerator	Write	listener*		
CreateCustomRoutingListener	Grants permission to create a listener to process inbound connections from clients to a custom routing accelerator	Write	accelerator*		
CreateEndpointGroup	Grants permission to add an endpoint group to a standard accelerator listener	Write	listener*		
CreateListener	Grants permission to add a listener to a standard accelerator	Write	accelerator*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAccelerator	Grants permission to delete a standard accelerator	Write	accelerator*		
DeleteCrossAccountAttachment	Grants permission to delete a CrossAccountAttachment	Write	attachment*		
DeleteCustomRoutingAccelerator	Grants permission to delete a custom routing accelerator	Write	accelerator*		
DeleteCustomRoutingEndpointGroup	Grants permission to delete an endpoint group from a listener for a custom routing accelerator	Write	endpointgroup*		
DeleteCustomRoutingListener	Grants permission to delete a listener for a custom routing accelerator	Write	listener*		
DeleteEndpointGroup	Grants permission to delete an endpoint group associated with a standard accelerator listener	Write	endpointgroup*		
DeleteListener	Grants permission to delete a listener from a standard accelerator	Write	listener*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DenyCustomRoutingTraffic	Grants permission to disallows custom routing of user traffic to a private destination IP:PORT in a specific VPC subnet	Write	endpointgroup*		
DeprovisionByoipCidr	Grants permission to releases the specified address range that you provisioned for use with your accelerator through bring your own IP addresses (BYOIP)	Write			
DescribeAccelerator	Grants permissions to describe a standard accelerator	Read	accelerator*		
DescribeAcceleratorAttributes	Grants permission to describe a standard accelerator attributes	Read	accelerator*		
DescribeCrossAccountAttachment	Grants permissions to describe a CrossAccountAttachment	Read	attachment*		
DescribeCustomRoutingAccelerator	Grants permission to describe a custom routing accelerator	Read	accelerator*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeCustomRoutingAcceleratorAttributes	Grants permission to describe the attributes of a custom routing accelerator	Read	accelerator*		
DescribeCustomRoutingEndpointGroup	Grants permission to describe an endpoint group for a custom routing accelerator	Read	endpointgroup*		
DescribeCustomRoutingListener	Grants permission to describe a listener for a custom routing accelerator	Read	listener*		
DescribeEndpointGroup	Grants permission to describe a standard accelerator endpoint group	Read	endpointgroup*		
DescribeListener	Grants permission to describe a standard accelerator listener	Read	listener*		
ListAccelerators	Grants permission to list all standard accelerators	List			
ListByoipCidrs	Grants permission to list the BYOIP cidrs	List			
ListCrossAccountAttachments	Grants permission to list all CrossAccountAttachments	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListCrossAccountResourceAccounts	Grants permission to list accounts with CrossAccountAttachments listing caller as a principal	List			
ListCrossAccountResources	Grants permission to list all CrossAccountAttachment resources usable by caller	List			
ListCustomRoutingAccelerators	Grants permission to list the custom routing accelerators for an AWS account	List			
ListCustomRoutingEndpointGroups	Grants permission to list the endpoint groups that are associated with a listener for a custom routing accelerator	List	listener*		
ListCustomRoutingListeners	Grants permission to list the listeners for a custom routing accelerator	List	accelerator*		
ListCustomRoutingPortMappings	Grants permission to list the port mappings for a custom routing accelerator	List	accelerator*		
ListCustomRoutingPortMappingsByDestination	Grants permission to list the port mappings for a specific endpoint IP address (a destination address) in a subnet	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListEndpointGroups	Grants permission to list all endpoint groups associated with a standard accelerator listener	List	listener*		
ListListeners	Grants permission to list all listeners associated with a standard accelerator	List	accelerator*		
ListTagsForResource	Grants permission to list tags for a globalaccelerator resource	Read	accelerator		
			attachment		
ProvisionByoipCidr	Grants permission to provisions an address range for use with your accelerator through bring your own IP addresses (BYOIP)	Write			
RemoveCustomRoutingEndpoints	Grants permission to remove virtual private cloud (VPC) subnet endpoints from a custom routing accelerator endpoint group	Write	endpointgroup*		
RemoveEndpoints	Grants permission to remove an endpoint from a standard accelerator endpoint group	Write	endpointgroup*		globalaccelerator:UpdateEndpointGroup

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to add tags to a globalaccelerator resource	Tagging	accelerator		
			attachment		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from a globalaccelerator resource	Tagging	accelerator		
			attachment		
				aws:TagKeys	
UpdateAccelerator	Grants permission to update a standard accelerator	Write	accelerator*		
UpdateAcceleratorAttributes	Grants permission to update a standard accelerator attributes	Write	accelerator*		
UpdateCrossAccountAttachment	Grants permission to update a CrossAccountAttachment	Write	attachment*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateCustomRoutingAccelerator	Grants permission to update a custom routing accelerator	Write	accelerator*		
UpdateCustomRoutingAcceleratorAttributes	Grants permission to update the attributes for a custom routing accelerator	Write	accelerator*		
UpdateCustomRoutingListener	Grants permission to update a listener for a custom routing accelerator	Write	listener*		
UpdateEndpointGroup	Grants permission to update an endpoint group on a standard accelerator listener	Write	endpointgroup*		
UpdateListener	Grants permission to update a listener on a standard accelerator	Write	listener*		
WithdrawByoipCidr	Grants permission to stops advertising a BYOIP IPv4 address	Write			

Resource types defined by AWS Global Accelerator

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
accelerator	arn:${Partition}:globalaccelerator::${Account}:accelerator/${ResourceId}	aws:ResourceTag/${TagKey}
listener	arn:${Partition}:globalaccelerator::${Account}:accelerator/${ResourceId}/listener/${ListenerId}	aws:ResourceTag/${TagKey}
endpointgroup	arn:${Partition}:globalaccelerator::${Account}:accelerator/${ResourceId}/listener/${ListenerId}/endpoint-group/${EndpointGroupId}	aws:ResourceTag/${TagKey}
attachment	arn:${Partition}:globalaccelerator::${Account}:attachment/${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Global Accelerator

AWS Global Accelerator defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String

Condition keys	Description	Type
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS Glue

AWS Glue (service prefix: `glue`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS Glue

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a

resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AuthorizeInboundIntegration [permission only]	Grants permission to Glue to continuously validate that the target Arn can receive data replicated from the source ARN	Write	integration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchCreatePartition	Grants permission to create one or more partitions	Write	database*		
			rootcatalog*		
			table*		
			catalog		
				glue:LakeFormationPermissions	
BatchDeleteConnection	Grants permission to delete one or more connections	Write	connection*		
			rootcatalog*		
				glue:LakeFormationPermissions	
BatchDeletePartition	Grants permission to delete one or more partitions	Write	database*		
			rootcatalog*		
			table*		
			catalog		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				glue:LakeFormationPermissions	
BatchDeleteTable	Grants permission to delete one or more tables	Write	database*		
			rootcatalog*		
			table*		
			catalog		
				glue:LakeFormationPermissions	
BatchDeleteTableVersion	Grants permission to delete one or more versions of a table	Write	database*		
			rootcatalog*		
			table*		
			catalog		
				glue:LakeFormationPermissions	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetBlueprints	Grants permission to retrieve one or more blueprints	Read	blueprint*		
BatchGetCrawlers	Grants permission to retrieve one or more crawlers	Read	crawler*		
BatchGetCustomEntityTypes	Grants permission to retrieve one or more Custom Entity Types	Read			
BatchGetDevEndpoints	Grants permission to retrieve one or more development endpoints	Read	devendpoint*		
BatchGetJobs	Grants permission to retrieve one or more jobs	Read	job*		
BatchGetPartition	Grants permission to retrieve one or more partitions	Read	database*		
			rootcatalog*		
			table*		
			catalog		
				glue:LakeFormationPermissions	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetStageFiles	Grants permission to batch get stage files for SparkUI	Permissions management			
BatchGetTableOptimizer	Grants permission to return the configuration for the specified table optimizers	Read	database*		glue:GetTable
			rootcatalog*		
			table*		
BatchGetTriggers	Grants permission to retrieve one or more triggers	Read	trigger*		
BatchGetWorkflows	Grants permission to retrieve one or more workflows	Read	workflow*		
BatchStopJobRun	Grants permission to stop one or more job runs for a job	Write	job*		
BatchUpdatePartition	Grants permission to update one or more partitions	Write	database*		
			rootcatalog*		
			table*		
			catalog		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				glue:LakeFormationPermissions	
CancelDataQualityRuleRecommendationRun	Grants permission to stop a running Data Quality rule recommendation run	Write	dataQualityRuleset*		
CancelDataQualityRulesetEvaluationRun	Grants permission to stop a running Data Quality ruleset evaluation run	Write	dataQualityRuleset*		
CancelMLTaskRun	Grants permission to stop a running ML Task Run	Write	mlTransform*		
CancelStatement	Grants permission to cancel a statement in an interactive session	Write	session*		
CheckSchemaVersionValidity	Grants permission to retrieve a check the validity of schema version	Read			
CreateBlueprint	Grants permission to create a blueprint	Write	blueprint*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateCatalog	Grants permission to create a catalog	Write	catalog* rootcatalog*		
				aws:RequestTag/${TagKey} aws:TagKeys glue:LakeFormationPermissions glue:FederatedAuthorizationSource	
CreateClassifier	Grants permission to create a classifier	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateColumnStatisticsTaskSettings	Grants permission to create settings for a column statistics task	Write	database*		
			rootcatalog*		
			table*		
CreateConnection	Grants permission to create a connection	Write	rootcatalog*		
			connectionType		
				aws:RequestTag/${TagKey} aws:TagKeys glue:LakeFormationPermissions	
CreateCrawler	Grants permission to create a crawler	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateCustomEntityType	Grants permission to create a Custom Entity Type	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateDataQualityRuleset	Grants permission to create a Data Quality ruleset	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateDatabase	Grants permission to create a database	Write	database*		
			rootcatalog*		
			catalog		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys glue:LakeFormationPermissions glue:FederatedAuthorizationSource	
CreateDevEndpoint	Grants permission to create a development endpoint	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateGlueIdentityCenterConfiguration	Grants permission to connect Glue with Identity Center	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateInboundIntegration [permission only]	Grants permission to the source principal to create an inbound integration for data to be replicated from the source into the target	Write			
CreateIntegration	Grants permission to create an integration	Write	catalog*		kms:CreateGrant kms:DescribeKey
			connection*		
			database*		
			integration*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateIntegrationResourceProperty	Grants permission to create integration resource property	Write	catalog*		
			connection*		
			database*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			integrationResourcePropertyarn*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateIntegrationTableProperties	Grants permission to create integration table properties	Write	catalog*		
			connection*		
			database*		
CreateJob	Grants permission to create a job	Write	job*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys glue:VpcIds glue:SubnetIds glue:SecurityGroupIds	
CreateMLTransform	Grants permission to create an ML Transform	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreatePartition	Grants permission to create a partition	Write	database*		
			rootcatalog*		
			table*		
			catalog		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				glue:LakeFormationPermissions	
CreatePartitionIndex	Grants permission to create a specified partition index in an existing table	Write	database*		
			rootcatalog*		
			table*		
			catalog		
				glue:LakeFormationPermissions	
CreateRegistry	Grants permission to create a new schema registry	Write	registry*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSchema	Grants permission to create a new schema container	Write	registry*		
			schema*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateScript	Grants permission to create a script	Write			
CreateSecurityConfiguration	Grants permission to create a security configuration	Write			
CreateSession	Grants permission to create an interactive session	Write	session*		
				aws:RequestTag/${TagKey} aws:TagKeys glue:VpcIds glue:SubnetIds glue:SecurityGroupIds	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTable	Grants permission to create a table	Write	database*		
			rootcatalog*		
			table*		
			catalog		
				glue:LakeFormationPermissions glue:FederatedAuthorizationSource	
CreateTableOptimizer	Grants permission to create a new table optimizer for a specific function. Compaction is the only currently supported optimizer type	Write	database*		glue:GetTable
			rootcatalog*		
			table*		
CreateTrigger	Grants permission to create a trigger	Write	trigger*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateUsageProfile	Grants permission to create a usage profile	Write	usageProfile*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateUserDefinedFunction	Grants permission to create a function definition	Write	database*		
			rootcatalog*		
			catalog		
				glue:LakeFormationPermissions	
CreateWorkflow	Grants permission to create a workflow	Write	workflow*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteBlueprint	Grants permission to delete a blueprint	Write	blueprint*		
DeleteCatalog	Grants permission to delete a catalog	Write	rootcatalog*		
			catalog		
				glue:LakeFormationPermissions glue:FederatedAuthorizationSource	
DeleteClassifier	Grants permission to delete a classifier	Write			
DeleteColumnStatisticsForPartition	Grants permission to delete the partition column statistics of a column	Write	database*		
			rootcatalog*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			table*		
			catalog		
				glue:LakeFormationPermissions	
DeleteColumnStatisticsForTable	Grants permission to delete the table statistics of columns	Write	database*		
			rootcatalog*		
			table*

Resource types defined by AWS Glue

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
rootcatalog	`arn:${Partition}:glue:${Region}:${Account}:catalog`	
catalog	`arn:${Partition}:glue:${Region}:${Account}:catalog/${CatalogName}`	aws:ResourceTag/${TagKey}
database	`arn:${Partition}:glue:${Region}:${Account}:database/${DatabaseName}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
table	arn:${Partition}:glue:${Region}:${Account}:table/${DatabaseName}/${TableName}	
tableversion	arn:${Partition}:glue:${Region}:${Account}:tableVersion/${DatabaseName}/${TableName}/${TableVersionName}	
connection	arn:${Partition}:glue:${Region}:${Account}:connection/${ConnectionName}	aws:ResourceTag/${TagKey}
userdefinedfunction	arn:${Partition}:glue:${Region}:${Account}:userDefinedFunction/${DatabaseName}/${UserDefinedFunctionName}	
devendpoint	arn:${Partition}:glue:${Region}:${Account}:devEndpoint/${DevEndpointName}	aws:ResourceTag/${TagKey}
job	arn:${Partition}:glue:${Region}:${Account}:job/${JobName}	aws:ResourceTag/${TagKey}
trigger	arn:${Partition}:glue:${Region}:${Account}:trigger/${TriggerName}	aws:ResourceTag/${TagKey}
crawler	arn:${Partition}:glue:${Region}:${Account}:crawler/${CrawlerName}	aws:ResourceTag/${TagKey}
workflow	arn:${Partition}:glue:${Region}:${Account}:workflow/${WorkflowName}	aws:ResourceTag/${TagKey}
blueprint	arn:${Partition}:glue:${Region}:${Account}:blueprint/${BlueprintName}	aws:ResourceTag/${TagKey}
mlTransform	arn:${Partition}:glue:${Region}:${Account}:mlTransform/${TransformId}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
registry	arn:${Partition}:glue:${Region}:${Account}:registry/${RegistryName}	aws:ResourceTag/${TagKey}
schema	arn:${Partition}:glue:${Region}:${Account}:schema/${SchemaName}	aws:ResourceTag/${TagKey}
session	arn:${Partition}:glue:${Region}:${Account}:session/${SessionId}	aws:ResourceTag/${TagKey}
usageProfile	arn:${Partition}:glue:${Region}:${Account}:usageProfile/${UsageProfileId}	aws:ResourceTag/${TagKey}
dataQualityRuleset	arn:${Partition}:glue:${Region}:${Account}:dataQualityRuleset/${RulesetName}	aws:ResourceTag/${TagKey}
customEntityType	arn:${Partition}:glue:${Region}:${Account}:customEntityType/${CustomEntityTypeId}	aws:ResourceTag/${TagKey}
completion	arn:${Partition}:glue:${Region}:${Account}:completion/${CompletionId}	
integration	arn:${Partition}:glue:${Region}:${Account}:integration:${IntegrationId}	aws:ResourceTag/${TagKey}
connectionType	arn:${Partition}:glue:${Region}:${Account}:connectionType:${ConnectionTypeName}	aws:ResourceTag/${TagKey}
integrationResourceProperty	arn:${Partition}:glue:${Region}:${Account}:integrationresourceproperty/${ResourceType}/${ResourceName}	aws:ResourceTag/${TagKey}

Condition keys for AWS Glue

AWS Glue defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
glue:CredentialIssuingService	Filters access by the service from which the credentials of the request is issued	String
glue:EnabledForRedshiftAutoDiscovery	Filters access by the presence of the key configured for role's identity-based policy	Bool
glue:FederatedAuthorizationSource	Filters access by whether the resource belongs to federated authorization	String
glue:LakeFormationPermissions	Filters access by whether Lake Formation permission checks will be performed for a given caller and the Glue resource	String

Condition keys	Description	Type
glue:RoleAssumedBy	Filters access by the service from which the credentials of the request is obtained by assuming the customer role	String
glue:SecurityGroupIds	Filters access by the ID of security groups configured for the Glue job	ArrayOfString
glue:SubnetIds	Filters access by the ID of subnets configured for the Glue job	ArrayOfString
glue:VpcIds	Filters access by the ID of the VPC configured for the Glue job	ArrayOfString

Actions, resources, and condition keys for AWS Glue DataBrew

AWS Glue DataBrew (service prefix: `databrew`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Condition keys for AWS Glue DataBrew

Actions defined by AWS Glue DataBrew

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchDeleteRecipeVersion	Grants permission to delete one or more recipe versions	Write	Recipe*		
CreateDataset	Grants permission to create a dataset	Write		aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	
CreateProfileJob	Grants permission to create a profile job	Write		aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	
CreateProject	Grants permission to create a project	Write		aws:RequestTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	
CreateRecipe	Grants permission to create a recipe	Write		aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateRecipeJob	Grants permission to create a recipe job	Write		aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	
CreateRuleset	Grants permission to create a ruleset	Write		aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSchedule	Grants permission to create a schedule	Write		aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}

UpdateRuleset	Grants permission to modify a ruleset	Write	Ruleset*		
UpdateSchedule	Grants permission to modify a schedule	Write	Schedule*		

Resource types defined by AWS Glue DataBrew

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Project	arn:${Partition}:databrew:${Region}:${Account}:project/${ResourceId}	aws:ResourceTag/${TagKey}
Dataset	arn:${Partition}:databrew:${Region}:${Account}:dataset/${ResourceId}	aws:ResourceTag/${TagKey}
Ruleset	arn:${Partition}:databrew:${Region}:${Account}:ruleset/${ResourceId}	aws:ResourceTag/${TagKey}
Recipe	arn:${Partition}:databrew:${Region}:${Account}:recipe/${ResourceId}	aws:ResourceTag/${TagKey}
Job	arn:${Partition}:databrew:${Region}:${Account}:job/${ResourceId}	aws:ResourceTag/${TagKey}
Schedule	arn:${Partition}:databrew:${Region}:${Account}:schedule/${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for AWS Glue DataBrew

AWS Glue DataBrew defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Ground Station

AWS Ground Station (service prefix: `groundstation`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Ground Station

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of

access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelContact	Grants permission to cancel a contact	Write	Contact*		
CreateConfig	Grants permission to create a configuration	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateDataflowEndpointGroup	Grants permission to create a data flow endpoint group	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateDataflowEndpointGroupV2	Grants permission to create a data flow endpoint group using the V2 operation	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateEphemeris	Grants permission to create an ephemeris item	Write		aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
CreateMissionProfile	Grants permission to create a mission profile	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteConfig	Grants permission to delete a config	Write	Config*		
DeleteDataflowEndpointGroup	Grants permission to delete a data flow endpoint group	Write	DataflowEndpointGroup*		
DeleteEphemeris	Grants permission to delete an ephemeris item	Write	EphemerisItem*		
DeleteMissionProfile	Grants permission to delete a mission profile	Write	MissionProfile*		
DescribeContact	Grants permission to describe a contact	Read	Contact*		
DescribeEphemeris	Grants permission to describe an ephemeris item	Read	EphemerisItem*		
GetAgentConfiguration	Grants permission to get the configuration of an agent	Read	Agent*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAgentTaskResponseUrl	Grants permission to retrieve presigned S3 logging URLs	Read	Agent*		
GetConfig	Grants permission to return a configuration	Read	Config*		
GetDataflowEndpointGroup	Grants permission to return a data flow endpoint group	Read	DataflowEndpointGroup*		
GetMinuteUsage	Grants permission to return minutes usage	Read			
GetMissionProfile	Grants permission to retrieve a mission profile	Read	MissionProfile*		
GetSatellite	Grants permission to return information about a satellite	Read	Satellite*		
ListConfigs	Grants permission to return a list of past configurations	List			
ListContacts	Grants permission to return a list of contacts	List			
ListDataflowEndpointGroups	Grants permission to list data flow endpoint groups	List			
ListEphemerides	Grants permission to list ephemerides	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListGroundStations	Grants permission to list ground stations	List			
ListMissionProfiles	Grants permission to return a list of mission profiles	List			
ListSatellites	Grants permission to list satellites	List			
ListTagsForResource	Grants permission to list tags for a resource	Read	Config		
			Contact		
			DataflowEndpointGroup		
			MissionProfile		
RegisterAgent	Grants permission to register an agent	Write			
ReserveContact	Grants permission to reserve a contact	Write		aws:RequestTag/${TagKey} aws:TagKeys	
TagResource	Grants permission to assign a resource tag	Tagging	Config		
			Contact		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			DataflowEndpointGroup		
			EphemerisItem		
			MissionProfile		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to unassign a resource tag	Tagging	Config		
			Contact		
			DataflowEndpointGroup		
			EphemerisItem		
			MissionProfile		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAgentStatus	Grants permission to update the status of an agent	Write	Agent*		
UpdateConfig	Grants permission to update a configuration	Write	Config*		
UpdateEphemeris	Grants permission to update an ephemeris item	Write	EphemerisItem*		
UpdateMissionProfile	Grants permission to update a mission profile	Write	MissionProfile*		

Resource types defined by AWS Ground Station

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Config	`arn:${Partition}:groundstation:${Region}:${Account}:config/${ConfigType}/${ConfigId}`	aws:ResourceTag/${TagKey} groundstation:ConfigId groundstation:ConfigType

Resource types	ARN	Condition keys
Contact	arn:${Partition}:groundstation:${Region}:${Account}:contact/${ContactId}	aws:ResourceTag/${TagKey} groundstation:ContactId
DataflowEndpointGroup	arn:${Partition}:groundstation:${Region}:${Account}:dataflow-endpoint-group/${DataflowEndpointGroupId}	aws:ResourceTag/${TagKey} groundstation:DataflowEndpointGroupId
EphemerisItem	arn:${Partition}:groundstation:${Region}:${Account}:ephemeris/${EphemerisId}	aws:ResourceTag/${TagKey} groundstation:EphemerisId
GroundStationResource	arn:${Partition}:groundstation:${Region}:${Account}:groundstation:${GroundStationId}	groundstation:GroundStationId
MissionProfile	arn:${Partition}:groundstation:${Region}:${Account}:mission-profile/${MissionProfileId}	aws:ResourceTag/${TagKey} groundstation:MissionProfileId
Satellite	arn:${Partition}:groundstation:${Region}:${Account}:satellite/${SatelliteId}	groundstation:SatelliteId
Agent	arn:${Partition}:groundstation:${Region}:${Account}:agent/${AgentId}	groundstation:AgentId

Condition keys for AWS Ground Station

AWS Ground Station defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
groundstation:AgentId	Filters access by the ID of an agent	String
groundstation:ConfigId	Filters access by the ID of a config	String
groundstation:ConfigType	Filters access by the type of a config	String
groundstation:ContactId	Filters access by the ID of a contact	String
groundstation:DataflowEndpointGroupId	Filters access by the ID of a dataflow endpoint group	String

Condition keys	Description	Type
groundstation:EphemerisId	Filters access by the ID of an ephemeris	String
groundstation:GroundStationId	Filters access by the ID of a ground station	String
groundstation:MissionProfileId	Filters access by the ID of a mission profile	String
groundstation:SatelliteId	Filters access by the ID of a satellite	String

Actions, resources, and condition keys for Amazon GroundTruth Labeling

Amazon GroundTruth Labeling (service prefix: `groundtruthlabeling`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon GroundTruth Labeling

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociatePatchToManifestJob [permission only]	Grants permission to associate a patch file with the manifest file to update the manifest file	Write			
CreateBatch [permission only]	Grants permission to create a GT+ Batch	Write			
CreateIntakeForm [permission only]	Grants permission to create intake form	Write			
CreateProject [permission only]	Grants permission to create a GT+ Project	Write			
CreateWorkflowDefinition [permission only]	Grants permission to create a GT+ Workflow Definition	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeConsoleJob [permission only]	Grants permission to get status of GroundTruthLabeling Jobs	Read			
GenerateLIDARPreviewTaskConfigJob [permission only]	Grants permission to generate LiDAR Preview Task	Write			
GetBatch [permission only]	Grants permission to get a GT + Batch	Read			
GetIntakeFormStatus [permission only]	Grants permission to get a intake forms	Read			
ListBatches [permission only]	Grants permission to list a GT + Batchs	Read			
ListDatasetObjects [permission only]	Grants permission to list dataset objects in a manifest file	Read			
ListProjects [permission only]	Grants permission to list a GT + Projects	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RunFilterOrSampleDatasetJob [permission only]	Grants permission to filter records from a manifest file using S3 select. Get sample entries based on random sampling	Write			
RunGenerateManifestByCrawlingJob [permission only]	Grants permission to list a S3 prefix and create manifest files from objects in that location	Write			
RunGenerateManifestMetricsJob [permission only]	Grants permission to generate metrics from objects in manifest	Write			
UpdateBatch [permission only]	Grants permission to update a GT+ Batch	Write			

Resource types defined by Amazon GroundTruth Labeling

Amazon GroundTruth Labeling does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon GroundTruth Labeling, specify `"Resource": "*"` in your policy.

Condition keys for Amazon GroundTruth Labeling

GroundTruth Labeling has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon GuardDuty

Amazon GuardDuty (service prefix: `guardduty`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Actions defined by Amazon GuardDuty

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which

the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptAdministratorInvitation	Grants permission to accept invitations to become a GuardDuty member account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptInvitation	Grants permission to accept invitations to become a GuardDuty member account	Write			
ArchiveFindings	Grants permission to archive GuardDuty findings	Write			
CreateDetector	Grants permission to create a detector	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
CreateFilter	Grants permission to create GuardDuty filters. A filters defines finding attributes and conditions used to filter findings	Write	filter*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateIPSet	Grants permission to create an IPSet	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	iam:DeleteRolePolicy iam:PutRolePolicy
CreateMalwareProtectionPlan	Grants permission to create a new Malware Protection plan	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
CreateMembers	Grants permission to create GuardDuty member accounts, where the account used to create a member becomes the GuardDuty administrator account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreatePublishingDestination	Grants permission to create a publishing destination	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	s3:GetObject s3:ListBucket
CreateSampleFindings	Grants permission to create sample findings	Write			
CreateThreatEntitySet	Grants permission to create GuardDuty ThreatEntitySets, where a ThreatEntitySet consists of known malicious IP addresses and/or domains used by GuardDuty to generate findings	Write		aws:RequestTag/${TagKey} aws:TagKeys	s3:GetObject
CreateThreatIntelSet	Grants permission to create GuardDuty ThreatIntelSets, where a ThreatIntelSet consists of known malicious IP addresses used by GuardDuty to generate findings	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTrustedEntitySet	Grants permission to create a TrustedEntitySet	Write		aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	s3:GetObject
DeclineInvitations	Grants permission to decline invitations to become a GuardDuty member account	Write			
DeleteDetector	Grants permission to delete GuardDuty detectors	Write	detector*		
DeleteFilter	Grants permission to delete GuardDuty filters	Write	filter*		
DeleteIPSet	Grants permission to delete GuardDuty IPSets	Write	ipset*		
DeleteInvitations	Grants permission to delete invitations to become a GuardDuty member account	Write			
DeleteMalwareProtectionPlan	Grants permission to delete a Malware Protection plan	Write	malwareprotectionplan*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteMembers	Grants permission to delete GuardDuty member accounts	Write			
DeletePublishingDestination	Grants permission to delete a publishing destination	Write	publishingDestination*		
DeleteThreatEntitySet	Grants permission to delete GuardDuty ThreatEntitySets	Write	threatentityset*		
DeleteThreatIntelSet	Grants permission to delete GuardDuty ThreatIntelSets	Write	threatintelset*		
DeleteTrustedEntitySet	Grants permission to delete GuardDuty TrustedEntitySets	Write	trustedentityset*		
DescribeMalwareScans	Grants permission to retrieve details about malware scans	Read			
DescribeOrganizationConfiguration	Grants permission to retrieve details about the delegated administrator associated with a GuardDuty detector	Read			
DescribePublishingDestination	Grants permission to retrieve details about a publishing destination	Read	publishingDestination*		
DisableOrganizationAdminAccount	Grants permission to disable the organization delegated administrator for GuardDuty	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateFromAdministratorAccount	Grants permission to disassociate a GuardDuty member account from its GuardDuty administrator account	Write			
DisassociateFromMasterAccount	Grants permission to disassociate a GuardDuty member account from its GuardDuty administrator account	Write			
DisassociateMembers	Grants permission to disassociate GuardDuty member accounts from their administrator GuardDuty account	Write			
EnableOrganizationAdminAccount	Grants permission to enable an organization delegated administrator for GuardDuty	Write			
GetAdministratorAccount	Grants permission to retrieve details of the GuardDuty administrator account associated with a member account	Read			
GetCoverageStatistics	Grants permission to list Amazon GuardDuty coverage statistics for the specified GuardDuty account in a Region	Read	detector*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDetector	Grants permission to retrieve GuardDuty detectors	Read	detector*		
GetFilter	Grants permission to retrieve GuardDuty filters	Read	filter*		
GetFindings	Grants permission to retrieve GuardDuty findings	Read			
GetFindingsStatistics	Grants permission to retrieve a list of GuardDuty finding statistics	Read			
GetIPSet	Grants permission to retrieve GuardDuty IPSets	Read	ipset*		
GetInvitationsCount	Grants permission to retrieve the count of all GuardDuty invitations sent to a specified account, which does not include the accepted invitation	Read			
GetMalwareProtectionPlan	Grants permission to retrieve a Malware Protection plan details	Read	malwareprotectionplan*		
GetMalwareScan	Grants permission to retrieve a malware scan's details	Read			
GetMalwareScanSettings	Grants permission to retrieve the malware scan settings	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetMasterAccount	Grants permission to retrieve details of the GuardDuty administrator account associated with a member account	Read			
GetMemberDetectors	Grants permission to describe which data sources are enabled for member accounts detectors	Read			
GetMembers	Grants permission to retrieve the member accounts associated with an administrator account	Read			
GetOrganizationStatistics	Grants permission to retrieve GuardDuty protection plan coverage statistics for member accounts in a Region	Read			
GetRemainingFreeTrialDays	Grants permission to provide the number of days left for each data source used in the free trial period	Read			
GetThreatEntitySet	Grants permission to retrieve GuardDuty ThreatEntitySets	Read	threatentityset*		
GetThreatIntelSet	Grants permission to retrieve GuardDuty ThreatIntelSets	Read	threatintelset*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTrustedEntitySet	Grants permission to retrieve GuardDuty TrustedEntitySets	Read	trustedentityset*		
GetUsageStatistics	Grants permission to list Amazon GuardDuty usage statistics over the last 30 days for the specified detector ID	Read			
InviteMembers	Grants permission to invite other AWS accounts to enable GuardDuty and become GuardDuty member accounts	Write			
ListCoverage	Grants permission to list all the resource details for a given account in a Region	List	detector*		
ListDetectors	Grants permission to retrieve a list of GuardDuty detectors	List			
ListFilters	Grants permission to retrieve a list of GuardDuty filters	List			
ListFindings	Grants permission to retrieve a list of GuardDuty findings	List			
ListIPSets	Grants permission to retrieve a list of GuardDuty IPSets	List			
ListInvitations	Grants permission to retrieve a list of all of the GuardDuty membership invitations that were sent to an AWS account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListMalwareProtectionPlans	Grants permission to retrieve a list of Malware Protection plans	List			
ListMalwareScans	Grants permission to retrieve a list of malware scans	List			
ListMembers	Grants permission to retrieve a list of GuardDuty member accounts associated with an administrator account	List			
ListOrganizationAdminAccounts	Grants permission to list details about the organization delegated administrator for GuardDuty	List			
ListPublishingDestinations	Grants permission to retrieve a list of publishing destinations	List			
ListTagsForResource	Grants permission to retrieve a list of tags associated with a GuardDuty resource	Read	detector		
			filter		
			ipset		
			malwareprotectionplan		
			publishingDestination		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

UpdateTrustedEntitySet	Grants permission to update GuardDuty TrustedEntitySets	Write	trustedentityset*		s3:GetObject

Resource types defined by Amazon GuardDuty

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
detector	arn:${Partition}:guardduty:${Region}:${Account}:detector/${DetectorId}	aws:ResourceTag/${TagKey}
filter	arn:${Partition}:guardduty:${Region}:${Account}:detector/${DetectorId}/filter/${FilterName}	aws:ResourceTag/${TagKey}
ipset	arn:${Partition}:guardduty:${Region}:${Account}:detector/${DetectorId}/ipset/${IPSetId}	aws:ResourceTag/${TagKey}
threatintelset	arn:${Partition}:guardduty:${Region}:${Account}:detector/${DetectorId}/threatintelset/${ThreatIntelSetId}	aws:ResourceTag/${TagKey}
trustedentityset	arn:${Partition}:guardduty:${Region}:${Account}:detector/${DetectorId}/trustedentityset/${TrustedEntitySetId}	aws:ResourceTag/${TagKey}
threatentityset	arn:${Partition}:guardduty:${Region}:${Account}:detector/${DetectorId}/threatentityset/${ThreatEntitySetId}	aws:ResourceTag/${TagKey}
publishingDestination	arn:${Partition}:guardduty:${Region}:${Account}:detector/${DetectorId}/publishingdestination/${PublishingDestinationId}	aws:ResourceTag/${TagKey}
malwareprotectionplan	arn:${Partition}:guardduty:${Region}:${Account}:malware-protection-plan/${MalwareProtectionPlanId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon GuardDuty

Amazon GuardDuty defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS Health APIs and Notifications

AWS Health APIs and Notifications (service prefix: `health`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Health APIs and Notifications

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeAffectedAccountsForOrganization	Grants permission to retrieve a list of accounts that have been affected by the specified events in organization	Read			organizations:ListAccounts
DescribeAffectedEntities	Grants permission to retrieve a list of entities that have been affected by the specified events	Read	event*		
				health:eventTypeCode health:service	
DescribeAffectedEntitiesForOrganization	Grants permission to retrieve a list of entities that have been affected by the specified events and accounts in organization	Read			organizations:ListAccounts
DescribeEntityAggregates	Grants permission to retrieve the number of entities that are affected by each of the specified events	Read			
DescribeEntityAggr	Grants permission to retrieve the number of entities that are affected by each of	Read			organizations:ListAccounts

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
egatesForOrganization	the specified events in an organization				
DescribeEventAggregates	Grants permission to retrieve the number of events of each event type (issue, scheduled change, and account notification)	Read			
DescribeEventDetails	Grants permission to retrieve detailed information about one or more specified events	Read	event*		
				health:eventTypeCode health:service	
DescribeEventDetailsForOrganization	Grants permission to retrieve detailed information about one or more specified events for provided accounts in organization	Read			organizations:ListAccounts
DescribeEventTypes	Grants permission to retrieve the event types that meet the specified filter criteria	Read			
DescribeEvents	Grants permission to retrieve information about events that meet the specified filter criteria	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeEventsForOrganization	Grants permission to retrieve information about events that meet the specified filter criteria in organization	Read			organizations:ListAccounts
DescribeHealthServiceStatusForOrganization	Grants permission to retrieve the status of enabling or disabling the Organizational View feature	Read			organizations:ListAccounts
DisableHealthServiceAccessForOrganization	Grants permission to disable the Organizational View feature	Permissions management			organizations:DisableAWSServiceAccess organizations:ListAccounts
EnableHealthServiceAccessForOrganization	Grants permission to enable the Organizational View feature	Permissions management			iam:CreateServiceLinkedRole organizations:EnableAWSServiceAccess organizations:ListAccounts

Resource types defined by AWS Health APIs and Notifications

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
event	`arn:${Partition}:health:*::event/${Service}/${EventTypeCode}/*`	

Condition keys for AWS Health APIs and Notifications

AWS Health APIs and Notifications defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
health:eventTypeCode	Filters access by event type	String
health:service	Filters access by impacted service	String

Actions, resources, and condition keys for AWS HealthImaging

AWS HealthImaging (service prefix: `medical-imaging`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS HealthImaging

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CopyImageSet	Grants permission to copy an image set	Write	datastore*		
			imageset*		
CreateDatastore	Grants permission to create a data store to ingest imaging data	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteDatastore	Grants permission to delete a data store	Write	datastore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteImageSet	Grants permission to delete an image set	Write	datastore*		
			imageset*		
GetDICOMBulkdata	Grants permission to get dicom bulkdata in binary format	Read	datastore*		
				medical-imaging:StudyInstanceUID medical-imaging:SeriesInstanceUID	
GetDICOMImportJob	Grants permission to get an import job's properties	Read	datastore*		
GetDICOMInstance	Grants permission to get dicom instance in dcm format	Read	datastore*		
				medical-imaging:StudyInstanceUID medical-imaging:SeriesInstanceUID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDICOMInstanceFrames	Grants permission to get dicom instance frames in format requested by the customer	Read	datastore*		
				medical-imaging:StudyInstanceUID medical-imaging:SeriesInstanceUID	
GetDICOMInstanceMetadata	Grants permission to get dicom instance metadata in DICOM JSON format	Read	datastore*		
				medical-imaging:StudyInstanceUID medical-imaging:SeriesInstanceUID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDICOMSeriesMetadata	Grants permission to retrieve metadata for all DICOM instances belonging to a given DICOM series in DICOM JSON format	Read	datastore*		
				medical-imaging:StudyInstanceUID medical-imaging:SeriesInstanceUID	
GetDatastore	Grants permission to get data store properties	Read	datastore*		
GetImageFrame	Grants permission to get image frame properties	Read	datastore*		
			imageset*		
GetImageSet	Grants permission to get image set properties	Read	datastore*		
			imageset*		
GetImageSetMetadata	Grants permission to get image set metadata properties	Read	datastore*		
			imageset*		
ListDICOMImportJobs	Grants permission to list import jobs for a data store	List	datastore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDatastores	Grants permission to list data stores	List			
ListImageSetVersions	Grants permission to list versions of an image set	List	datastore*		
			imageset*		
ListTagsForResource	Grants permission to list tags for a medical imaging resource	List	datastore		
			imageset		
SearchDICOMInstances	Grants permission to search dicom instances that returns data in DICOM JSON format	Read	datastore*		
				medical-imaging:StudyInstanceUID medical-imaging:SeriesInstanceUID	
SearchDICOMSeries	Grants permission to search dicom series that returns data in DICOM JSON format	Read	datastore*		
				medical-imaging:StudyInstanceUID	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SearchDICOMStudies	Grants permission to search dicom studies that returns data in DICOM JSON format	Read	datastore*		
SearchImageSets	Grants permission to search image sets	Read	datastore*		
StartDICOMImportJob	Grants permission to start a DICOM import job	Write	datastore*		
StoreDICOM	Grants permission to store dicom instances that returns result in DICOM JSON format	Write	datastore*		
StoreDICOMStudy	Grants permission to store a dicom study that returns result in DICOM JSON format	Write	datastore*		
				medical-imaging:StudyInstanceUID	
TagResource	Grants permission to add tags to a medical imaging resource	Tagging	datastore		
			imageset		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from a medical imaging resource	Tagging	datastore		
			imageset		
				aws:TagKeys	
UpdateImageSetMetadata	Grants permission to update image set metadata properties	Write	datastore*		
			imageset*		

Resource types defined by AWS HealthImaging

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
datastore	`arn:${Partition}:medical-imaging:${Region}:${Account}:datastore/${DatastoreId}`	aws:ResourceTag/${TagKey}
imageset	`arn:${Partition}:medical-imaging:${Region}:${Account}:datastore/${DatastoreId}/imageset/${ImageSetId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS HealthImaging

AWS HealthImaging defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString
medical-imaging:SeriesInstanceUID	Filters access by the SeriesInstanceUID parameter in the request	String

Condition keys	Description	Type
medical-imaging:StudyInstanceUID	Filters access by the StudyInstanceUID parameter in the request	String

Actions, resources, and condition keys for AWS HealthLake

AWS HealthLake (service prefix: `healthlake`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS HealthLake

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelFHIRExportJobWithDelete	Grants permission to cancel an on going FHIR Export job with Delete	Write	datastore*		
ConfirmAttributionList	Grants permission to allow customers to indicate to a Producer that the Consumer does not have any more changes to be made to the Attribution List	Write	datastore*		
CreateFHIRDatastore	Grants permission to create a datastore that can ingest and export FHIR data	Write		aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys	
CreateResource	Grants permission to create resource	Write	datastore*		
DeleteFHIRDatastore	Grants permission to delete a datastore	Write	datastore*		
DeleteResource	Grants permission to delete resource	Write	datastore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeFHIRBulkDeleteJob	Grants permission to describe a FHIR Bulk Delete Job	Read	datastore*		
DescribeFHIRDatastore	Grants permission to get the properties associated with the FHIR datastore, including the datastore ID, datastore ARN, datastore name, datastore status, created at, datastore type version, and datastore endpoint	Read	datastore*		
DescribeFHIRExportJob	Grants permission to display the properties of a FHIR export job, including the ID, ARN, name, and the status of the datastore	Read	datastore*		
DescribeFHIRExportJobWithGet	Grants permission to display the properties of a FHIR export job, including the ID, ARN, name, and the status of the datastore with Get	Read	datastore*		
DescribeFHIRImportJob	Grants permission to display the properties of a FHIR import job, including the ID, ARN, name, and the status of the datastore	Read	datastore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ExpandValueSetWithGet	Grants permission to search and expand ValueSet resource	Read	datastore*		
ExpandValueSetWithPost	Grants permission to search and expand ValueSet resource	Read	datastore*		
GenerateDocumentWithGet	Grants permission to generate a clinical document resource	Write	datastore*		
GenerateDocumentWithPost	Grants permission to generate a clinical document resource	Write	datastore*		
GetCapabilities	Grants permission to get the capabilities of a FHIR datastore	Read	datastore*		
GetExportedFile	Grants permission to access exported files from a FHIR Export job initiated with Get	Read	datastore*		
GetHistoryByResourceId	Grants permission to read resource history	Read	datastore*		
InquirePreAuthClaim	Grants permission to inquire about the status of a prior authorization Claim	Read	datastore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListFHIRDatastores	Grants permission to list all FHIR datastores that are in the user's account, regardless of datastore status	List			
ListFHIRExportJobs	Grants permission to get a list of export jobs for the specified datastore	List	datastore*		
ListFHIRImportJobs	Grants permission to get a list of import jobs for the specified datastore	List	datastore*		
ListTagsForResource	Grants permission to get a list of tags for the specified datastore	List	datastore		
LookupCodeSystemWithGet	Grants permission to retrieve Codes for a CodeSystem resource	Read	datastore*		
LookupCodeSystemWithPost	Grants permission to retrieve Codes for a CodeSystem resource	Read	datastore*		
MemberAdd	Grants permission to attribute a member with a specific provider group	Write	datastore*		
MemberMatch	Grants permission to enable cross-system patient matching	Write	datastore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
MemberRemove	Grants permission to remove a member from a group	Write	datastore*		
PatchResource	Grants permission to patch a resource	Write	datastore*		
ProcessBundle	Grants permission to bundle multiple resource operations	Write	datastore*		
QuestionnairePackage	Grants permission to retrieve Questionnaire packages with dependency Library and ValueSet resources	Read	datastore*		
ReadResource	Grants permission to read resource	Read	datastore*		
RetrieveAttributionStatus	Grants permission to retrieve member attribution status	Write	datastore*		
SearchEverything	Grants permission to search all resources related to a patient	Read	datastore*		
SearchWithGet	Grants permission to search resources with GET method	Read	datastore*		
SearchWithPost	Grants permission to search resources with POST method	Read	datastore*		
StartFHIRBulkDeleteJob	Grants permission to begin a FHIR Bulk Delete Job	Write	datastore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartFHIRExportJob	Grants permission to begin a FHIR Export job	Write	datastore*		
StartFHIRExportJobWithGet	Grants permission to begin a FHIR Export job with Get	Write	datastore*		
StartFHIRExportJobWithPost	Grants permission to begin a FHIR Export job with Post	Write	datastore*		
StartFHIRImportJob	Grants permission to begin a FHIR Import job	Write	datastore*		
SubmitPreAuthClaim	Grants permission to submit a prior authorization Claim request	Write	datastore*		
TagResource	Grants permission to add tags to a datastore	Tagging	datastore		
				aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UntagResource	Grants permission to remove tags associated with a datastore	Tagging	datastore		
				aws:TagKeys	
UpdateResource	Grants permission to update resource	Write	datastore *		
ValidateResource	Grants permission to validate a resource	Read	datastore *		
VersionReadResource	Grants permission to read version of a resource	Read	datastore *		

Resource types defined by AWS HealthLake

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
datastore	`arn:${Partition}:healthlake:${Region}:${Account}:datastore/fhir/${DatastoreId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS HealthLake

AWS HealthLake defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the presence of tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS HealthOmics

AWS HealthOmics (service prefix: `omics`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS HealthOmics

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AbortMultipartReadSetUpload	Grants permission to abort multipart read set uploads	Write	sequenceStore*		
AcceptShare	Grants permission to accept a share	Write			
BatchDeleteReadSet	Grants permission to batch delete Read Sets in the given Sequence Store	Write	sequenceStore*		
CancelAnnotationImportJob	Grants permission to cancel an Annotation Import Job	Write			
CancelRun	Grants permission to cancel a workflow run and stop all workflow tasks	Write	run*		
CancelVariantImportJob	Grants permission to cancel a Variant Import Job	Write			
CompleteMultipartReadSetUpload	Grants permission to complete a multipart read set upload	Write	sequenceStore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAnnotationStore	Grants permission to create an Annotation Store	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateAnnotationStoreVersion	Grants permission to create a Version in an Annotation Store	Write	AnnotationStore*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateConfiguration	Grants permission to create a new configuration	Write		aws:RequestTag/${TagKey} aws:TagKeys	ec2:DescribeSecurityGroups ec2:DescribeSubnets iam:CreateServiceLinkedRole
CreateMultipartReadSetUpload	Grants permission to create a multipart read set upload	Write	sequenceStore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateReferenceStore	Grants permission to create a Reference Store	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateRunCache	Grants permission to create a new workflow run cache	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateRunGroup	Grants permission to create a new workflow run group	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateSequenceStore	Grants permission to create a Sequence Store	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateShare	Grants permission to create a share	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateVariantStore	Grants permission to create a Variant Store	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateWorkflow	Grants permission to create a new workflow with a workflow definition and template of workflow parameters	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateWorkflowVersion	Grants permission to create a new workflow version with a workflow definition and template of workflow parameters	Write	workflow*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAnnotationStore	Grants permission to delete an Annotation Store	Write	AnnotationStore*		
DeleteAnnotationStoreVersions	Grants permission to delete Versions in an Annotation Store	Write	AnnotationStore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			AnnotationStoreVersion*		
DeleteConfiguration	Grants permission to delete a configuration	Write	configuration*		
DeleteReference	Grants permission to delete a Reference in the given Reference Store	Write	reference*		
			referenceStore*		
DeleteReferenceStore	Grants permission to delete a Reference Store	Write	referenceStore*		
DeleteRun	Grants permission to delete a workflow run	Write	run*		
DeleteRunCache	Grants permission to delete a workflow run cache	Write	runCache*		
DeleteRunGroup	Grants permission to delete a workflow run group	Write	runGroup*		
DeleteS3AccessPolicy	Grants permission to delete an access policy on a given store	Write	sequenceStore*		
DeleteSequenceStore	Grants permission to delete a Sequence Store	Write	sequenceStore*		
DeleteShare	Grants permission to delete a share	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteVariantStore	Grants permission to delete a Variant Store	Write	VariantStore*		
DeleteWorkflow	Grants permission to delete a workflow	Write	workflow*		
DeleteWorkflowVersion	Grants permission to delete a workflow version	Write	WorkflowVersion*		
			workflow*		
GetAnnotationImportJob	Grants permission to get the status of an Annotation Import Job	Read			
GetAnnotationStore	Grants permission to get detailed information about an Annotation Store	Read	AnnotationStore*		
GetAnnotationStoreVersion	Grants permission to get detailed information about a version in an Annotation Store	Read	AnnotationStoreVersion*		
GetConfiguration	Grants permission to retrieve configuration details	Read	configuration*		
GetReadSet	Grants permission to get a Read Set in the given Sequence Store	Read	readSet*		
			sequenceStore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetReadSetActivationJob	Grants permission to get details about a Read Set activation job for the given Sequence Store	Read	sequenceStore*		
GetReadSetExportJob	Grants permission to get details about a Read Set export job for the given Sequence Store	Read	sequenceStore*		
GetReadSetImportJob	Grants permission to get details about a Read Set import job for the given Sequence Store	Read	sequenceStore*		
GetReadSetMetadata	Grants permission to get details about a Read Set in the given Sequence Store	Read	readSet*		
			sequenceStore*		
GetReference	Grants permission to get a Reference in the given Reference Store	Read	reference*		
			referenceStore*		
GetReferenceImportJob	Grants permission to get details about a Reference import job for the given Reference Store	Read	referenceStore*		
GetReferenceMetadata	Grants permission to get details about a Reference in the given Reference Store	Read	reference*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			referenceStore*		
GetReferenceStore	Grants permission to get details about a Reference Store	Read	referenceStore*		
GetRun	Grants permission to retrieve workflow run details	Read	run*		
GetRunCache	Grants permission to retrieve workflow run cache details	Read	runCache*		
GetRunGroup	Grants permission to retrieve workflow run group details	Read	runGroup*		
GetRunTask	Grants permission to retrieve workflow task details	Read	TaskResource*		
			run*		
GetS3AccessPolicy	Grants permission to get details about an access policy on a given store	Read	sequenceStore*		
GetSequenceStore	Grants permission to get details about a Sequence Store	Read	sequenceStore*		
GetShare	Grants permission to get detailed information about a Share	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetVariantImportJob	Grants permission to get the status of a Variant Import Job	Read			
GetVariantStore	Grants permission to get detailed information about a Variant Store	Read	VariantStore*		
GetWorkflow	Grants permission to retrieve workflow details	Read	workflow*		
GetWorkflowVersion	Grants permission to retrieve workflow version details	Read	WorkflowVersion*		
			workflow*		
ListAnnotationImportJobs	Grants permission to get a list of Annotation Import Jobs	List			
ListAnnotationStoreVersions	Grants permission to retrieve a list of information about Versions in an Annotation Store	List	AnnotationStore*		
ListAnnotationStores	Grants permission to retrieve a list of information about Annotation Stores	List			
ListConfigurations	Grants permission to retrieve a list of configurations	List			
ListMultipartReadSetUploads	Grants permission to list multipart read set uploads	List	sequenceStore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

ListReadSetImportJobs	Grants permission to list Read Set import jobs for the given Sequence Store	List	sequenceStore*		
ListReadSetUploadParts	Grants permission to list read set upload parts	List	sequenceStore*		
ListReadSets	Grants permission to list Read Sets in the given Sequence Store	List	sequenceStore*		
ListReferenceImportJobs	Grants permission to list Reference import jobs for the given Reference Store	List	referenceStore*		
ListReferenceStores	Grants permission to list Reference Stores	List			
ListReferences	Grants permission to list References in the given Reference Store	List	referenceStore*		
ListRunCaches	Grants permission to retrieve a list of workflow run caches	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListRunGroups	Grants permission to retrieve a list of workflow run groups	List			
ListRunTasks	Grants permission to retrieve a list of tasks for a workflow run	List	run*		
ListRuns	Grants permission to retrieve a list of workflow runs	List			
ListSequenceStores	Grants permission to list Sequence Stores	List			
ListShares	Grants permission to retrieve a list of information about shares	List			
ListTagsForResource	Grants permission to retrieve a list of resource AWS tags	List			
ListVariantImportJobs	Grants permission to get a list of Variant Import Jobs	List			
ListVariantStores	Grants permission to retrieve a list of metadata for Variant Stores	List			
ListWorkflowVersions	Grants permission to retrieve a list of available versions for a workflow	List	workflow*		
ListWorkflows	Grants permission to retrieve a list of available workflows	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutS3AccessPolicy	Grants permission to put an access policy on a given store	Write	sequenceStore*		
StartAnnotationImportJob	Grants permission to import a list of Annotation files to an Annotation Store	Write	AnnotationStore*		
			AnnotationStoreVersion*		
StartReadSetActivationJob	Grants permission to start a Read Set activation job from the given Sequence Store	Write	sequenceStore*		
StartReadSetExportJob	Grants permission to start a Read Set export job from the given Sequence Store	Write	sequenceStore*		
StartReadSetImportJob	Grants permission to start a Read Set import job into the given Sequence Store	Write	sequenceStore*		
StartReferenceImportJob	Grants permission to start a Reference import job into the given Reference Store	Write	referenceStore*		
StartRun	Grants permission to start a workflow run	Write	run*		iam:PassRole
			configuration		
			runCache		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			runGroup		
			workflow		
				aws:RequestTag/${TagKey} aws:TagKeys	
StartVariantImportJob	Grants permission to import a list of variant files to an Variant Store	Write	VariantStore*		
TagResource	Grants permission to add AWS tags to a resource	Tagging	AnnotationStore		
			AnnotationStoreVersion		
			VariantStore		
			WorkflowVersion		
			configuration		
			readSet		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			reference		
			referenceStore		
			run		
			runCache		
			runGroup		
			sequenceStore		
			workflow		
				aws:RequestTag/${TagKey} aws:TagKeys

UpdateAnnotationStore	Grants permission to update information about the Annotation Store	Write	AnnotationStore*		
UpdateAnnotationStoreVersion	Grants permission to update information about the Version in an Annotation Store	Write	AnnotationStoreVersion*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateRunCache	Grants permission to update a workflow run cache	Write	runCache*		
UpdateRunGroup	Grants permission to update a workflow run group	Write	runGroup*		
UpdateSequenceStore	Grants permission to update details about a Sequence Store	Write	sequenceStore*		
UpdateVariantStore	Grants permission to update metadata about the Variant Store	Write	VariantStore*		
UpdateWorkflow	Grants permission to update workflow details	Write	workflow*		
UpdateWorkflowVersion	Grants permission to update workflow version details	Write	WorkflowVersion*		
			workflow*		
UploadReadSetPart	Grants permission to upload read set parts	Write	sequenceStore*		

Resource types defined by AWS HealthOmics

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
AnnotationStore	arn:${Partition}:omics:${Region}:${Account}:annotationStore/${AnnotationStoreName}	aws:ResourceTag/${TagKey}
AnnotationStoreVersion	arn:${Partition}:omics:${Region}:${Account}:annotationStore/${AnnotationStoreName}/version/${AnnotationStoreVersionName}	aws:ResourceTag/${TagKey}
configuration	arn:${Partition}:omics:${Region}:${Account}:configuration/${Name}	aws:ResourceTag/${TagKey}
readSet	arn:${Partition}:omics:${Region}:${Account}:sequenceStore/${SequenceStoreId}/readSet/${ReadSetId}	aws:ResourceTag/${TagKey}
reference	arn:${Partition}:omics:${Region}:${Account}:referenceStore/${ReferenceStoreId}/reference/${ReferenceId}	aws:ResourceTag/${TagKey}
referenceStore	arn:${Partition}:omics:${Region}:${Account}:referenceStore/${ReferenceStoreId}	aws:ResourceTag/${TagKey}
run	arn:${Partition}:omics:${Region}:${Account}:run/${Id}	aws:ResourceTag/${TagKey}
runCache	arn:${Partition}:omics:${Region}:${Account}:runCache/${Id}	aws:ResourceTag/${TagKey}
runGroup	arn:${Partition}:omics:${Region}:${Account}:runGroup/${Id}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
sequenceStore	arn:${Partition}:omics:${Region}:${Account}:sequenceStore/${SequenceStoreId}	aws:ResourceTag/${TagKey}
TaskResource	arn:${Partition}:omics:${Region}:${Account}:task/${Id}	
VariantStore	arn:${Partition}:omics:${Region}:${Account}:variantStore/${VariantStoreName}	aws:ResourceTag/${TagKey}
workflow	arn:${Partition}:omics:${Region}:${Account}:workflow/${Id}	aws:ResourceTag/${TagKey}
WorkflowVersion	arn:${Partition}:omics:${Region}:${Account}:workflow/${Id}/version/${VersionName}	aws:ResourceTag/${TagKey}

Condition keys for AWS HealthOmics

AWS HealthOmics defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by the presence of tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Honeycode

Amazon Honeycode (service prefix: honeycode) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Honeycode

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ApproveTeamAssociation [permission only]	Grants permission to approve a team association request for your AWS Account	Write			
BatchCreateTableRows	Grants permission to create new rows in a table	Write	table*		
BatchDeleteTableRows	Grants permission to delete rows from a table	Write	table*		
BatchUpdateTableRows	Grants permission to update rows in a table	Write	table*		
BatchUpsertTableRows	Grants permission to upsert rows in a table	Write	table*		
CreateTeam [permission only]	Grants permission to create a new Amazon Honeycode team for your AWS Account	Write			
CreateTenant [permission only]	Grants permission to create a new tenant within Amazon Honeycode for your AWS Account	Write			
DeleteDomains [permission only]	Grants permission to delete Amazon Honeycode domains for your AWS Account	Write			
DeregisterGroups	Grants permission to remove groups from an Amazon	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
[permission only]	Honeycode team for your AWS Account				
DescribeTableDataImportJob	Grants permission to get details about a table data import job	Read	table*		
DescribeTeam [permission only]	Grants permission to get details about Amazon Honeycode teams for your AWS Account	Read			
GetScreenData	Grants permission to load the data from a screen	Read	screen*		
InvokeScreenAutomation	Grants permission to invoke a screen automation	Write	screen-automation*		
ListDomains [permission only]	Grants permission to list all Amazon Honeycode domains and their verification status for your AWS Account	List			
ListGroups [permission only]	Grants permission to list all groups in an Amazon Honeycode team for your AWS Account	List			
ListTableColumns	Grants permission to list the columns in a table	List	table*		
ListTableRows	Grants permission to list the rows in a table	List	table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTables	Grants permission to list the tables in a workbook	List	workbook*		
ListTagsForResource	Grants permission to list all tags for a resource	Tagging			
ListTeamAssociations [permission only]	Grants permission to list all pending and approved team associations with your AWS Account	List			
ListTenants [permission only]	Grants permission to list all tenants of Amazon Honeycode for your AWS Account	List			
QueryTableRows	Grants permission to query the rows of a table using a filter	Read	table*		
RegisterDomainForVerification [permission only]	Grants permission to request verification of the Amazon Honeycode domains for your AWS Account	Write			
RegisterGroups [permission only]	Grants permission to add groups to an Amazon Honeycode team for your AWS Account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RejectTeamAssociation [permission only]	Grants permission to reject a team association request for your AWS Account	Write			
RestartDomainVerification [permission only]	Grants permission to restart verification of the Amazon Honeycode domains for your AWS Account	Write			
StartTableDataImportJob	Grants permission to start a table data import job	Write	table*		
TagResource	Grants permission to tag a resource	Tagging			
UntagResource	Grants permission to untag a resource	Tagging			
UpdateTeam [permission only]	Grants permission to update an Amazon Honeycode team for your AWS Account	Write			

Resource types defined by Amazon Honeycode

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
workbook	arn:${Partition}:honeycode:${Region}:${Account}:workbook:workbook/${WorkbookId}	
table	arn:${Partition}:honeycode:${Region}:${Account}:table:workbook/${WorkbookId}/table/${TableId}	
screen	arn:${Partition}:honeycode:${Region}:${Account}:screen:workbook/${WorkbookId}/app/${AppId}/screen/${ScreenId}	
screen-automation	arn:${Partition}:honeycode:${Region}:${Account}:screen-automation:workbook/${WorkbookId}/app/${AppId}/screen/${ScreenId}/automation/${AutomationId}	

Condition keys for Amazon Honeycode

Honeycode has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS IAM Access Analyzer

AWS IAM Access Analyzer (service prefix: `access-analyzer`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS IAM Access Analyzer

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ApplyArchiveRule	Grants permission to apply an archive rule	Write	Analyzer*		
CancelPolicyGeneration	Grants permission to cancel a policy generation	Write			
CheckAccessNotGranted	Grants permission to check that specified access is not allowed by a policy	Read			
CheckNoNewAccess	Grants permission to check that no new access is allowed when compared to an existing policy	Read			
CheckNoPublicAccess	Grants permission to check that public access is not allowed by a resource policy	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAccessPreview	Grants permission to create an access preview for the specified analyzer	Write	Analyzer*		
CreateAnalyzer	Grants permission to create an analyzer	Write	Analyzer*		iam:CreateServiceLinkedRole
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateArchiveRule	Grants permission to create an archive rule for the specified analyzer	Write	ArchiveRule*		
DeleteAnalyzer	Grants permission to delete the specified analyzer	Write	Analyzer*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteArchiveRule	Grants permission to delete archive rules for the specified analyzer	Write	ArchiveRule*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GenerateFindingRecommendation	Grants permission to generate recommendation steps to resolve a finding	Write	Analyzer*		
GetAccessPreview	Grants permission to retrieve information about an access preview	Read	Analyzer*		
GetAnalyzedResource	Grants permission to retrieve information about an analyzed resource	Read	Analyzer*		
GetAnalyzer	Grants permission to retrieve information about analyzers	Read	Analyzer*		
				aws:RequestTag/${TagKey} aws:TagKeys	
GetArchiveRule	Grants permission to retrieve information about archive rules for the specified analyzer	Read	ArchiveRule*		
GetFinding	Grants permission to retrieve findings	Read	Analyzer*

Actions defined by AWS IAM Identity Center

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddRegion	Grants permission to add a region to an IAM Identity Center instance	Write	Instance*		identitystore:AddRegion kms:Decrypt
Associate Directory	Grants permission to connect a directory to be used by AWS IAM Identity Center	Write			ds:AuthorizeApplication identitystore:CreateIdentityStore kms:Decrypt
Associate Profile	Grants permission to create an association between a directory user or group and a profile	Write			kms:Decrypt
AttachCustomerManagedPolicyReferenceToPermissionSet	Grants permission to attach a customer managed policy reference to a permission set	Permissions management	Instance* PermissionSet*		kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AttachManagedPolicyToPermissionSet	Grants permission to attach an AWS managed policy to a permission set	Permissions management	Instance*		kms:Decrypt
			PermissionSet*		
CreateAccountAssignment	Grants permission to assign access to a Principal for a specified AWS account using a specified permission set	Write	Account*		kms:Decrypt
			Instance*		
			PermissionSet*		
CreateApplication	Grants permission to create an application	Write	Application*		kms:Decrypt
			ApplicationProvider*		
			Instance*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateApplicationAssignment	Grants permission to create an application assignment	Write	Application*		kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				sso:ApplicationAccount	
CreateApplicationInstance	Grants permission to add an application instance to AWS IAM Identity Center	Write			kms:Decrypt

GetApplicationSessionConfiguration	Grants permission to get session configuration for an application	Read	Application*		kms:Decrypt
				sso:ApplicationAccount	
GetApplicationTemplate	Grants permission to retrieve application template details	Read			
GetInlinePolicyForPermissionSet	Grants permission to obtain the inline policy assigned to the permission set	Read	Instance*		kms:Decrypt
			PermissionSet*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetManagedApplicationInstance	Grants permission to retrieve details for an application instance	Read			kms:Decrypt
GetMfaDeviceManagementForDirectory	Grants permission to retrieve Mfa Device Management settings for the directory	Read			kms:Decrypt
GetPermissionSet	Grants permission to retrieve details of a permission set	Read			kms:Decrypt
GetPermissionsBoundaryForPermissionSet	Grants permission to get permissions boundary for a permission set	Read	Instance*		kms:Decrypt
			PermissionSet*		
GetProfile	Grants permission to retrieve a profile for an application instance	Read			kms:Decrypt
GetSSOStatus	Grants permission to check if AWS IAM Identity Center is enabled	Read			
GetSharedSsoConfiguration	Grants permission to retrieve shared configuration for the current SSO instance	Read			kms:Decrypt
GetSsoConfiguration	Grants permission to retrieve configuration for the current SSO instance	Read			kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTrust	Grants permission to retrieve the federation trust in a target account	Read			kms:Decrypt
ImportApplicationInstanceServiceProviderMetadata	Grants permission to update the application instance by uploading an application SAML metadata file provided by the service provider	Write			kms:Decrypt
ListAccountAssignmentCreationStatus	Grants permission to list the status of the AWS account assignment creation requests for a specified SSO instance	List	Instance*		kms:Decrypt
ListAccountAssignmentDeletionStatus	Grants permission to list the status of the AWS account assignment deletion requests for a specified SSO instance	List	Instance*		kms:Decrypt
ListAccountAssignments	Grants permission to list the assignee of the specified AWS account with the specified permission set	List	Account*		kms:Decrypt
			Instance*		
			PermissionSet*		
ListAccountAssignmentsForPrincipal	Grants permission to list accounts assigned to user or group	List	Instance*		kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAccountsForProvisionedPermissionSet	Grants permission to list all the AWS accounts where the specified permission set is provisioned	List	Instance*		kms:Decrypt
			PermissionSet*		
ListApplicationAccessScopes	Grants permission to list access scopes to an application	List	Application*		kms:Decrypt
				sso:ApplicationAccount	
ListApplicationAssignments	Grants permission to list application assignments	List	Application*		kms:Decrypt
				sso:ApplicationAccount	
ListApplicationAssignmentsForPrincipal	Grants permission to list applications assigned to user or group	List	Instance*		kms:Decrypt
				sso:ApplicationAccount	
ListApplicationAuthenticationMethods	Grants permission to list authentication methods to an application	List	Application*		kms:Decrypt
				sso:ApplicationAccount	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListApplicationGrants	Grants permission to list grants from an application	List	Application*		kms:Decrypt
				sso:ApplicationAccount	
ListApplicationInstanceCertificates	Grants permission to retrieve all of the certificates for a given application instance	Read			kms:Decrypt
ListApplicationInstances	Grants permission to retrieve all application instances	List			kms:Decrypt sso:GetApplicationInstance
ListApplicationProviders	Grants permission to list application providers	List	ApplicationProvider*		
ListApplicationTemplates	Grants permission to retrieve all supported application templates	List			sso:GetApplicationTemplate
ListApplications	Grants permission to retrieve all applications associated with the instance of IAM Identity Center	List			kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListCustomerManagedPolicyReferencesInPermissionSet	Grants permission to list the customer managed policy references that are attached to a permission set	List	Instance* PermissionSet*		kms:Decrypt
ListDirectoryAssociations	Grants permission to retrieve details about the directory connected to AWS IAM Identity Center	Read			kms:Decrypt
ListInstances	Grants permission to list the SSO Instances that the caller has access to	List			
ListManagedPoliciesInPermissionSet	Grants permission to list the AWS managed policies that are attached to a specified permission set	List	Instance* PermissionSet*		kms:Decrypt
ListPermissionSetProvisioningStatus	Grants permission to list the status of the Permission Set Provisioning requests for a specified SSO instance	List	Instance*		kms:Decrypt
ListPermissionSets	Grants permission to retrieve all permission sets	List	Instance*		kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListPermissionSetsProvisionedToAccount	Grants permission to list all the permission sets that are provisioned to a specified AWS account	List	Account*		kms:Decrypt
			Instance*		
ListProfileAssociations	Grants permission to retrieve the directory user or group associated with the profile	Read			kms:Decrypt
ListProfiles	Grants permission to retrieve all profiles for an application instance	List			kms:Decrypt sso:GetProfile
ListRegions	Grants permission to list all regions configured for an IAM Identity Center instance	List	Instance*		kms:Decrypt
ListTagsForResource	Grants permission to list the tags that are attached to a specified resource	Read	Application		kms:Decrypt
			Instance		
			PermissionSet		
			TrustedTokenIssuer		
ListTrustedTokenIssuers	Grants permission to list trusted token issuers for an instance	List	Instance*		kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ProvisionPermissionSet	Grants permission to provision a specified permission set to the specified target	Write	Account*		kms:Decrypt
			Instance*		
			PermissionSet*		
PutApplicationAccessScope	Grants permission to create/update an access scope to an application	Write	Application*		kms:Decrypt
				sso:ApplicationAccount	
PutApplicationAssignmentConfiguration	Grants permission to add assignment configurations to an application	Write	Application*		kms:Decrypt
				sso:ApplicationAccount	
PutApplicationAuthenticationMethod	Grants permission to create/update an authentication method to an application	Write	Application*		kms:Decrypt
				sso:ApplicationAccount	
PutApplicationGrant	Grants permission to create/update a grant to an application	Write	Application*		kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				sso:ApplicationAccount	
PutApplicationSessionConfiguration	Grants permission to put session configuration for an application	Write	Application*		kms:Decrypt
				sso:ApplicationAccount	
PutInlinePolicyToPermissionSet	Grants permission to attach an IAM inline policy to a permission set	Write	Instance*		kms:Decrypt
			PermissionSet*		
PutMfaDeviceManagementForDirectory	Grants permission to put Mfa Device Management settings for the directory	Write			kms:Decrypt
PutPermissionsBoundaryToPermissionSet	Grants permission to add permissions boundary to a permission set	Permissions management	Instance*		kms:Decrypt
			PermissionSet*		
PutPermissionsPolicy	Grants permission to add a policy to a permission set	Permissions management			kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RemoveRegion	Grants permission to remove a region from an IAM Identity Center instance	Write	Instance*		identitystore:RemoveRegion kms:Decrypt
SearchGroups	Grants permission to search for groups within the associated directory	Read			ds:DescribeDirectories kms:Decrypt
SearchUsers	Grants permission to search for users within the associated directory	Read			ds:DescribeDirectories kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartSSO	Grants permission to initialize AWS IAM Identity Center	Write			kms:Decrypt kms:DescribeKey kms:Encrypt kms:GenerateDataKeyWithoutPlaintext organizations:DescribeOrganization organizations:EnableAWSServiceAccess
TagResource	Grants permission to associate a set of tags with a specified resource	Tagging	Application		kms:Decrypt
			Instance		
			PermissionSet		
			TrustedTokenIssuer		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to disassociate a set of tags from a specified resource	Tagging	Application		kms:Decrypt
			Instance		
			PermissionSet		
			TrustedTokenIssuer		
				aws:TagKeys	
UpdateApplication	Grants permission to update an application	Write	Application*		kms:Decrypt
				sso:ApplicationAccount	
UpdateApplicationInstanceActiveCertificate	Grants permission to set a certificate as the active one for this application instance	Write			kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateApplicationInstanceDisplayData	Grants permission to update display data of an application instance	Write			kms:Decrypt
UpdateApplicationInstanceResponseConfiguration	Grants permission to update federation response configuration for the application instance	Write			kms:Decrypt
UpdateApplicationInstanceResponseSchemaConfiguration	Grants permission to update federation response schema configuration for the application instance	Write			kms:Decrypt
UpdateApplicationInstanceSecurityConfiguration	Grants permission to update security details for the application instance	Write			kms:Decrypt
UpdateApplicationInstanceServiceProviderConfiguration	Grants permission to update service provider related configuration for the application instance	Write			kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateApplicationInstanceStatus	Grants permission to update the status of an application instance	Write			kms:Decrypt
UpdateInstance	Grants permission to update an identity center instance	Write	Instance*		identitystore:UpdateIdentityStore kms:Decrypt kms:DescribeKey kms:Encrypt kms:GenerateDataKeyWithoutPlaintext
UpdateInstanceAccessControlAttributeConfiguration	Grants permission to update the attributes to use with the instance for ABAC	Write	Instance*		kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateManagedApplicationInstanceStatus	Grants permission to update the status of a managed application instance	Write			kms:Decrypt
UpdatePermissionSet	Grants permission to update the permission set	Permissions management	Instance*		kms:Decrypt
			PermissionSet*		
UpdateProfile	Grants permission to update the profile for an application instance	Write			kms:Decrypt
UpdateSSOConfiguration	Grants permission to update the configuration for the current SSO instance	Write			kms:Decrypt
UpdateTrust	Grants permission to update the federation trust in a target account	Write			kms:Decrypt
UpdateTrustedTokenIssuer	Grants permission to update a trusted token issuer for an instance	Write	TrustedTokenIssuer*		kms:Decrypt

Resource types defined by AWS IAM Identity Center

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
PermissionSet	`arn:${Partition}:sso:::permissionSet/${InstanceId}/${PermissionSetId}`	aws:ResourceTag/${TagKey}
Account	`arn:${Partition}:sso:::account/${AccountId}`	
Instance	`arn:${Partition}:sso:::instance/${InstanceId}`	aws:ResourceTag/${TagKey}
Application	`arn:${Partition}:sso::${AccountId}:application/${InstanceId}/${ApplicationId}`	aws:ResourceTag/${TagKey} sso:ApplicationAccount
TrustedTokenIssuer	`arn:${Partition}:sso::${AccountId}:trustedTokenIssuer/${InstanceId}/${TrustedTokenIssuerId}`	aws:ResourceTag/${TagKey}
ApplicationProvider	`arn:${Partition}:sso::aws:applicationProvider/${ApplicationProviderId}`	

Condition keys for AWS IAM Identity Center

AWS IAM Identity Center defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
identitycenter:ApplicationArn	Filters access by the ARN of the IAM Identity Center application	ARN
identitycenter:InstanceArn	Filters access by the ARN of the IAM Identity Center instance	ARN
sso:ApplicationAccount	Filters access by the account which creates the application. This condition key is not supported for customer managed SAML applications	String

Actions, resources, and condition keys for AWS IAM Identity Center directory

AWS IAM Identity Center directory (service prefix: `sso-directory`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS IAM Identity Center directory

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddMemberToGroup	Grants permission to add a member to a group in the directory that AWS IAM Identity Center provides by default	Write			kms:Decrypt
CompleteVirtualMfaDeviceRegistration	Grants permission to complete the creation process of a virtual MFA device	Write			
CompleteWebAuthnDeviceRegistration	Grants permission to complete the registration process of a WebAuthn device	Write			
CreateAlias	Grants permission to create an alias for the directory that AWS IAM Identity Center provides by default	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateBearerToken	Grants permission to create a bearer token for a given provisioning tenant	Write			kms:Decrypt
CreateExternalIdPConfigurationForDirectory	Grants permission to create an External Identity Provider configuration for the directory	Write			
CreateGroup	Grants permission to create a group in the directory that AWS IAM Identity Center provides by default	Write			kms:Decrypt
CreateProvisioningTenant	Grants permission to create a provisioning tenant for a given directory	Write			kms:Decrypt
CreateUser	Grants permission to create a user in the directory that AWS IAM Identity Center provides by default	Write			kms:Decrypt
DeleteBearerToken	Grants permission to delete a bearer token	Write			kms:Decrypt
DeleteExternalIdPCertificate	Grants permission to delete the given external IdP certificate	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteExternalIdPConfigurationForDirectory	Grants permission to delete an External Identity Provider configuration associated with the directory	Write			
DeleteGroup	Grants permission to delete a group from the directory that AWS IAM Identity Center provides by default	Write			kms:Decrypt
DeleteMfaDeviceForUser	Grants permission to delete a MFA device by device name for a given user	Write			
DeleteProvisioningTenant	Grants permission to delete the provisioning tenant	Write			kms:Decrypt
DeleteUser	Grants permission to delete a user from the directory that AWS IAM Identity Center provides by default	Write			kms:Decrypt
DescribeDirectory	Grants permission to retrieve information about the directory that AWS IAM Identity Center provides by default	Read			
DescribeGroup	Grants permission to query the group data, not including user and group members	Read			kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeGroups	Grants permission to retrieve information about groups from the directory that AWS IAM Identity Center provides by default	Read			kms:Decrypt
DescribeProvisioningTenant	Grants permission to describes the provisioning tenant	Read			kms:Decrypt
DescribeUser	Grants permission to retrieve information about a user from the directory that AWS IAM Identity Center provides by default	Read			kms:Decrypt
DescribeUserByUniqueAttribute	Grants permission to describe user with a valid unique attribute represented for the user	Read			kms:Decrypt
DescribeUsers	Grants permission to retrieve information about user from the directory that AWS IAM Identity Center provides by default	Read			kms:Decrypt
DisableExternalIdPConfigurationForDirectory	Grants permission to disable authentication of end users with an External Identity Provider	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableUser	Grants permission to deactivate a user in the directory that AWS IAM Identity Center provides by default	Write			kms:Decrypt
EnableExternalIdPConfigurationForDirectory	Grants permission to enable authentication of end users with an External Identity Provider	Write			
EnableUser	Grants permission to activate user in the directory that AWS IAM Identity Center provides by default	Write			kms:Decrypt
GetAWSSPConfigurationForDirectory	Grants permission to retrieve the AWS IAM Identity Center Service Provider configurations for the directory	Read			
GetGroupId	Grants permission to retrieve ID information about group from the directory that AWS IAM Identity Center provides by default	Read			kms:Decrypt
GetUserId	Grants permission to retrieve ID information about user from the directory that AWS IAM Identity Center provides by default	Read			kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetUserPoolInfo	(Deprecated) Grants permission to get UserPool Info	Read			
ImportExternalIdPCertificate	Grants permission to import the IdP certificate used for verifying external IdP responses	Write			
IsMemberInGroup	Grants permission to check if a member is a part of the group in the directory that AWS IAM Identity Center provides by default	Read			kms:Decrypt
IsMemberInGroups	Grants permission to check if a member is a part of multiple groups in the directory that AWS IAM Identity Center provides by default	Read			kms:Decrypt
ListBearerTokens	Grants permission to list bearer tokens for a given provisioning tenant	Read			kms:Decrypt
ListExternalIdPCertificates	Grants permission to list the external IdP certificates of a given directory and IdP	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListExternalIdPConfigurationsForDirectory	Grants permission to list all the External Identity Provider configurations created for the directory	Read			
ListGroups	Grants permission to list groups from the directory that AWS IAM Identity Center provides by default	Read			kms:Decrypt
ListGroupsForMember	Grants permission to list groups of the target member	Read			kms:Decrypt
ListGroupsForUser	Grants permission to list groups for a user from the directory that AWS IAM Identity Center provides by default	Read			kms:Decrypt
ListMembersInGroup	Grants permission to retrieve all members that are part of a group in the directory that AWS IAM Identity Center provides by default	Read			kms:Decrypt
ListMfaDevicesForUser	Grants permission to list all active MFA devices and their MFA device metadata for a user	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListProvisioningTenants	Grants permission to list provisioning tenants for a given directory	Read			kms:Decrypt
ListUsers	Grants permission to list users from the directory that AWS IAM Identity Center provides by default	Read			kms:Decrypt
RemoveMemberFromGroup	Grants permission to remove a member that is part of a group in the directory that AWS IAM Identity Center provides by default	Write			kms:Decrypt
SearchGroups	Grants permission to search for groups within the associated directory	Read			kms:Decrypt
SearchUsers	Grants permission to search for users within the associated directory	Read			kms:Decrypt
StartVirtualMfaDeviceRegistration	Grants permission to begin the creation process of virtual mfa device	Write			
StartWebAuthnDeviceRegistration	Grants permission to begin the registration process of a WebAuthn device	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateExternalIdPConfigurationForDirectory	Grants permission to update an External Identity Provider configuration associated with the directory	Write			
UpdateGroup	Grants permission to update information about a group in the directory that AWS IAM Identity Center provides by default	Write			kms:Decrypt
UpdateGroupDisplayName	Grants permission to update group display name update group display name response	Write			kms:Decrypt
UpdateMfaDeviceForUser	Grants permission to update MFA device information	Write			
UpdatePassword	Grants permission to update a password by sending password reset link via email or generating one time password for a user in the directory that AWS IAM Identity Center provides by default	Write			kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateUser	Grants permission to update user information in the directory that AWS IAM Identity Center provides by default	Write			kms:Decrypt
UpdateUserName	Grants permission to update user name update user name response	Write			kms:Decrypt
VerifyEmail	Grants permission to verify an email address of an User	Write			

Resource types defined by AWS IAM Identity Center directory

AWS IAM Identity Center directory does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS IAM Identity Center directory, specify `"Resource": "*"` in your policy.

Condition keys for AWS IAM Identity Center directory

IAM Identity Center directory has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS IAM Identity Center OIDC service

AWS IAM Identity Center OIDC service (service prefix: `sso-oauth`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS IAM Identity Center OIDC service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTokenWithIAM	Grants permission to create and return OAuth 2.0 access tokens and refresh tokens for authorized client applications. These tokens might contain defined scopes that specify permissions such as `read:profile` or `write:data`	Write	Application*		kms:Decrypt
IntrospectTokenWithIAM [permission only]	Grants permission to validate and retrieve information about active OAuth 2.0 access tokens and refresh tokens, including their associated scopes and permissions. This permission is used only by AWS managed applications	Write	Application*		kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	and is not documented in the IAM Identity Center OIDC API Reference				
RevokeTokenWithIAM [permission only]	Grants permission to revoke OAuth 2.0 access tokens and refresh tokens, invalidating them before their normal expiration. This permission is used only by AWS managed applications and is not documented in the IAM Identity Center OIDC API Reference	Write	Application*		kms:Decrypt

Resource types defined by AWS IAM Identity Center OIDC service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Application	`arn:${Partition}:sso::${AccountId}:application/${InstanceId}/${ApplicationId}`	

Condition keys for AWS IAM Identity Center OIDC service

OIDC service has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Identity and Access Management (IAM)

AWS Identity and Access Management (IAM) (service prefix: `iam`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.

Actions defined by AWS Identity and Access Management (IAM)

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptDelegationRequest	Accepts a delegation request resource, granting the requested temporary access	Write	delegation-request*		
AddClientIDToOpenIDConnectProvider	Grants permission to add a new client ID (audience) to the list of registered IDs for the specified IAM OpenID Connect (OIDC) provider resource	Write	oidc-provider*		
AddRoleToInstanceProfile	Grants permission to add an IAM role to the specified instance profile	Write	instance-profile*		iam:PassRole
AddUserToGroup	Grants permission to add an IAM user to the specified IAM group	Write	group*		
AssociateDelegationRequest	Associates a delegation request resource with the calling identity	Write	delegation-request*		
AttachGroupPolicy	Grants permission to attach a managed policy to the specified IAM group	Permissions management	group*		
				iam:PolicyARN	
AttachRolePolicy	Grants permission to attach a managed policy to the specified IAM role	Permissions management	role*		
				iam:PolicyARN	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				iam:PermissionsBoundary	
AttachUserPolicy	Grants permission to attach a managed policy to the specified IAM user	Permissions management	user*		
				iam:PolicyARN iam:PermissionsBoundary	
ChangePassword	Grants permission to an IAM user to change their own password	Write	user*		
CreateAccessKey	Grants permission to create access key and secret access key for the specified IAM user	Write	user*		
CreateAccountAlias	Grants permission to create an alias for your AWS account	Write			
CreateDelegationRequest	Creates an IAM delegation request resource for temporary access delegation	Write	delegation-request*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				iam:DelegationDuration iam:NotificationChannel iam:TemplateArn	
CreateGroup	Grants permission to create a new group	Write	group*		
CreateInstanceProfile	Grants permission to create a new instance profile	Write	instance-profile*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateLoginProfile	Grants permission to create a password for the specified IAM user	Write	user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateOpenIDConnectProvider	Grants permission to create an IAM resource that describes an identity provider (IdP) that supports OpenID Connect (OIDC)	Write	oidc-provider*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreatePolicy	Grants permission to create a new managed policy	Permissions management	policy*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreatePolicyVersion	Grants permission to create a new version of the specified managed policy	Permissions management	policy*		
CreateRole	Grants permission to create a new role	Write	role*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				iam:PermissionsBoundary aws:TagKeys aws:RequestTag/${TagKey}	
CreateSAMLProvider	Grants permission to create an IAM resource that describes an identity provider (IdP) that supports SAML 2.0	Write	saml-provider*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateServiceLinkedRole	Grants permission to create an IAM role that allows an AWS service to perform actions on your behalf	Write	role*		
				iam:AWSServiceName	
CreateServiceSpecificCredential	Grants permission to create a new service-specific credential for an IAM user	Write	user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				iam:ServiceSpecificCredentialAgeDays iam:ServiceSpecificCredentialServiceName	
CreateUser	Grants permission to create a new IAM user	Write	user*		
				iam:PermissionsBoundary aws:TagKeys aws:RequestTag/${TagKey}	
CreateVirtualMFADevice	Grants permission to create a new virtual MFA device	Write	mfa*		
				aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeactivateMFADevice	Grants permission to deactivate the specified MFA device and remove its association with the IAM user for which it was originally enabled	Write	user*		
DeleteAccessKey	Grants permission to delete the access key pair that is associated with the specified IAM user	Write	user*		
DeleteAccountAlias	Grants permission to delete the specified AWS account alias	Write			
DeleteAccountPasswordPolicy	Grants permission to delete the password policy for the AWS account	Permissions management			
DeleteCloudFrontPublicKey	Grants permission to delete an existing CloudFront public key	Write			
DeleteGroup	Grants permission to delete the specified IAM group	Write	group*		
DeleteGroupPolicy	Grants permission to delete the specified inline policy from its group	Permissions management	group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteInstanceProfile	Grants permission to delete the specified instance profile	Write	instance-profile*		
DeleteLoginProfile	Grants permission to delete the password for the specified IAM user	Write	user*		
DeleteOpenIDConnectProvider	Grants permission to delete an OpenID Connect identity provider (IdP) resource object in IAM	Write	oidc-provider*		
DeletePolicy	Grants permission to delete the specified managed policy and remove it from any IAM entities (users, groups, or roles) to which it is attached	Permissions management	policy*		
DeletePolicyVersion	Grants permission to delete a version from the specified managed policy	Permissions management	policy*		
DeleteRole	Grants permission to delete the specified role	Write	role*		
				iam:PermissionsBoundary	
DeleteRolePermissionsBoundary	Grants permission to remove the permissions boundary from a role	Permissions management	role*		
				iam:PermissionsBoundary	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteRolePolicy	Grants permission to delete the specified inline policy from the specified role	Permissions management	role*		
				iam:PermissionsBoundary	
DeleteSAMLProvider	Grants permission to delete a SAML provider resource in IAM	Write	saml-provider*		
DeleteSSHPublicKey	Grants permission to delete the specified SSH public key	Write	user*		
DeleteServerCertificate	Grants permission to delete the specified server certificate	Write	server-certificate*		
DeleteServiceLinkedRole	Grants permission to delete an IAM role that is linked to a specific AWS service, if the service is no longer using it	Write	role*		
DeleteServiceSpecificCredential	Grants permission to delete the specified service-specific credential for an IAM user	Write	user*		
				iam:ServiceSpecificCredentialServiceName	
DeleteSigningCertificate	Grants permission to delete a signing certificate that is associated with the specified IAM user	Write	user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteUser	Grants permission to delete the specified IAM user	Write	user*		
DeleteUserPermissionsBoundary	Grants permission to remove the permissions boundary from the specified IAM user	Permissions management	user*		
				iam:PermissionsBoundary	
DeleteUserPolicy	Grants permission to delete the specified inline policy from an IAM user	Permissions management	user*		
				iam:PermissionsBoundary	
DeleteVirtualMFADevice	Grants permission to delete a virtual MFA device	Write	mfa		
			sms-mfa		
DetachGroupPolicy	Grants permission to detach a managed policy from the specified IAM group	Permissions management	group*		
				iam:PolicyARN	
DetachRolePolicy	Grants permission to detach a managed policy from the specified role	Permissions management	role*		
				iam:PolicyARN	
				iam:PermissionsBoundary	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DetachUserPolicy	Grants permission to detach a managed policy from the specified IAM user	Permissions management	user*		
				iam:PolicyARN iam:PermissionsBoundary	
DisableOrganizationsRootCredentialsManagement	Grants permission to disable the management of member account root user credentials for an organization managed under the current account	Write			
DisableOrganizationsRootSessions	Grants permission to disable privileged root actions in member accounts for an organization managed under the current account	Write			
DisableOutboundWebIdentityFederation	Disables the outbound identity federation feature for the callers account	Write			
EnableMFADevice	Grants permission to enable an MFA device and associate it with the specified IAM user	Write	user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				iam:RegisterSecurityKey iam:FIDO-FIPS-140-2-certification iam:FIDO-FIPS-140-3-certification iam:FIDO-certification	
EnableOrganizationsRootCredentialsManagement	Grants permission to enable the management of member account root user credentials for an organization managed under the current account	Write			
EnableOrganizationsRootSessions	Grants permission to enable privileged root actions in member accounts for an organization managed under the current account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableOutboundWebIdentityFederation	Enables the outbound identity federation feature for the callers account	Write			
GenerateCredentialReport	Grants permission to generate a credential report for the AWS account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GenerateOrganizationsAccessReport	Grants permission to generate an access report for an AWS Organizations entity	Read	access-report*		organizations:DescribePolicy organizations:ListChildren organizations:ListParents organizations:ListPoliciesForTarget organizations:ListRoots organizations:ListTargetsForPolicy
				iam:OrganizationsPolicyId	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GenerateServiceLastAccessedDetails	Grants permission to generate a service last accessed data report for an IAM resource	Read	group*		
			policy*		
			role*		
			user*		
GetAccessKeyLastUsed	Grants permission to retrieve information about when the specified access key was last used	Read	user*		
GetAccountAuthorizationDetails	Grants permission to retrieve information about all IAM users, groups, roles, and policies in your AWS account, including their relationships to one another	Read			
GetAccountEmailAddress	Grants permission to retrieve the email address that is associated with the account	Read			
GetAccountName	Grants permission to retrieve the account name that is associated with the account	Read			
GetAccountPasswordPolicy	Grants permission to retrieve the password policy for the AWS account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAccountSummary	Grants permission to retrieve information about IAM entity usage and IAM quotas in the AWS account	List			
GetCloudFrontPublicKey	Grants permission to retrieve information about the specified CloudFront public key	Read			
GetContextKeysForCustomPolicy	Grants permission to retrieve a list of all of the context keys that are referenced in the specified policy	Read			
GetContextKeysForPrincipalPolicy	Grants permission to retrieve a list of all context keys that are referenced in all IAM policies that are attached to the specified IAM identity (user, group, or role)	Read	group role user		
GetCredentialReport	Grants permission to retrieve a credential report for the AWS account	Read			
GetDelegationRequest	Retrieves information about a specific delegation request	Read	delegation-request*		
GetGroup	Grants permission to retrieve a list of IAM users in the specified IAM group	Read	group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetGroupPolicy	Grants permission to retrieve an inline policy document that is embedded in the specified IAM group	Read	group*		
GetHumanReadableSummary	Retrieves a human readable summary for a given entity. At this time, only delegation request are supported	Read	delegation-request*		
GetInstanceProfile	Grants permission to retrieve information about the specified instance profile, including the instance profile's path, GUID, ARN, and role	Read	instance-profile*		
GetLoginProfile	Grants permission to retrieve the user name and password creation date for the specified IAM user	List	user*		
GetMFADevice	Grants permission to retrieve information about an MFA device for the specified user	Read	user*		
GetOpenIDConnectProvider	Grants permission to retrieve information about the specified OpenID Connect (OIDC) provider resource in IAM	Read	oidc-provider*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetOrganizationsAccessReport	Grants permission to retrieve an AWS Organizations access report	Read			
GetOutboundWebIdentityFederationInfo	Retrieves the configuration information for the outbound identity federation feature for the callers account	Read			
GetPolicy	Grants permission to retrieve information about the specified managed policy, including the policy's default version and the total number of identities to which the policy is attached	Read	policy*		
GetPolicyVersion	Grants permission to retrieve information about a version of the specified managed policy, including the policy document	Read	policy*		
GetRole	Grants permission to retrieve information about the specified role, including the role's path, GUID, ARN, and the role's trust policy	Read	role*		
				iam:PermissionsBoundary	
GetRolePolicy	Grants permission to retrieve an inline policy document that is embedded with the specified IAM role	Read	role*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSAMLProvider	Grants permission to retrieve the SAML provider metadocument that was uploaded when the IAM SAML provider resource was created or updated	Read	saml-provider*		
GetSSHPublicKey	Grants permission to retrieve the specified SSH public key, including metadata about the key	Read	user*		
GetServerCertificate	Grants permission to retrieve information about the specified server certificate stored in IAM	Read	server-certificate*		
GetServiceLastAccessedDetails	Grants permission to retrieve information about the service last accessed data report	Read			
GetServiceLastAccessedDetailsWithEntities	Grants permission to retrieve information about the entities from the service last accessed data report	Read			
GetServiceLinkedRoleDeletionStatus	Grants permission to retrieve an IAM service-linked role deletion status	Read	role*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetUser	Grants permission to retrieve information about the specified IAM user, including the user's creation date, path, unique ID, and ARN	Read	user*		
GetUserPolicy	Grants permission to retrieve an inline policy document that is embedded in the specified IAM user	Read	user*		
ListAccessKeys	Grants permission to list information about the access key IDs that are associated with the specified IAM user	List	user*		
ListAccountAliases	Grants permission to list the account alias that is associated with the AWS account	List			
ListAttachedGroupPolicies	Grants permission to list all managed policies that are attached to the specified IAM group	List	group*		
ListAttachedRolePolicies	Grants permission to list all managed policies that are attached to the specified IAM role	List	role*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAttachedUserPolicies	Grants permission to list all managed policies that are attached to the specified IAM user	List	user*		
ListCloudFrontPublicKeys	Grants permission to list all current CloudFront public keys for the account	List			
ListDelegationRequests	Lists delegation requests based on the specified criteria	List		iam:DelegationRequestOwner	
ListEntitiesForPolicy	Grants permission to list all IAM identities to which the specified managed policy is attached	List	policy*		
ListGroupPolicies	Grants permission to list the names of the inline policies that are embedded in the specified IAM group	List	group*		
ListGroups	Grants permission to list the IAM groups that have the specified path prefix	List			
ListGroupsForUser	Grants permission to list the IAM groups that the specified IAM user belongs to	List	user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListInstanceProfileTags	Grants permission to list the tags that are attached to the specified instance profile	List	instance-profile*		
ListInstanceProfiles	Grants permission to list the instance profiles that have the specified path prefix	List			
ListInstanceProfilesForRole	Grants permission to list the instance profiles that have the specified associated IAM role	List	role*		
ListMFADeviceTags	Grants permission to list the tags that are attached to the specified virtual mfa device	List	mfa*		
ListMFADevices	Grants permission to list the MFA devices for an IAM user	List	user		
ListOpenIDConnectProviderTags	Grants permission to list the tags that are attached to the specified OpenID Connect provider	List	oidc-provider*		
ListOpenIDConnectProviders	Grants permission to list information about the IAM OpenID Connect (OIDC) provider resource objects that are defined in the AWS account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListOrganizationsFeatures	Grants permission to list the centralized root access features enabled for your organization	List			
ListPolicies	Grants permission to list all managed policies	List			
ListPoliciesGrantingServiceAccess	Grants permission to list information about the policies that grant an entity access to a specific service	List	group*		
			role*		
			user*		
ListPolicyTags	Grants permission to list the tags that are attached to the specified managed policy	List	policy*		
ListPolicyVersions	Grants permission to list information about the versions of the specified managed policy, including the version that is currently set as the policy's default version	List	policy*		
ListRolePolicies	Grants permission to list the names of the inline policies that are embedded in the specified IAM role	List	role*		
ListRoleTags	Grants permission to list the tags that are attached to the specified IAM role	List	role*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListRoles	Grants permission to list the IAM roles that have the specified path prefix	List			
ListSAMLProviderTags	Grants permission to list the tags that are attached to the specified SAML provider	List	saml-provider*		
ListSAMLProviders	Grants permission to list the SAML provider resources in IAM	List			
ListSSHPublicKeys	Grants permission to list information about the SSH public keys that are associated with the specified IAM user	List	user*		
ListSTSRegionalEndpointsStatus	Grants permission to list the status of all active STS regional endpoints	List			
ListServerCertificateTags	Grants permission to list the tags that are attached to the specified server certificate	List	server-certificate*		
ListServerCertificates	Grants permission to list the server certificates that have the specified path prefix	List			
ListServiceSpecificCredentials	Grants permission to list the service-specific credentials that are associated with the specified IAM user	List	user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListSigningCertificates	Grants permission to list information about the signing certificates that are associated with the specified IAM user	List	user*		
ListUserPolicies	Grants permission to list the names of the inline policies that are embedded in the specified IAM user	List	user*		
ListUserTags	Grants permission to list the tags that are attached to the specified IAM user	List	user*		
ListUsers	Grants permission to list the IAM users that have the specified path prefix	List			
ListVirtualMFADevices	Grants permission to list virtual MFA devices by assignment status	List			
PassRole [permission only]	Grants permission to pass a role to a service	Write	role*		
				iam:AssociatedResourceArn iam:PassedToService	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutGroupPolicy	Grants permission to create or update an inline policy document that is embedded in the specified IAM group	Permissions management	group*		
PutRolePermissionsBoundary	Grants permission to set a managed policy as a permissions boundary for a role	Permissions management	role*		
				iam:PermissionsBoundary	
PutRolePolicy	Grants permission to create or update an inline policy document that is embedded in the specified IAM role	Permissions management	role*		
				iam:PermissionsBoundary	
PutUserPermissionsBoundary	Grants permission to set a managed policy as a permissions boundary for an IAM user	Permissions management	user*		
				iam:PermissionsBoundary	
PutUserPolicy	Grants permission to create or update an inline policy document that is embedded in the specified IAM user	Permissions management	user*		
				iam:PermissionsBoundary	
RejectDelegationRequest	Rejects a delegation request, denying the requested temporary access	Write	delegation-request*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RemoveClientIDFromOpenIDConnectProvider	Grants permission to remove the client ID (audience) from the list of client IDs in the specified IAM OpenID Connect (OIDC) provider resource	Write	oidc-provider*		
RemoveRoleFromInstanceProfile	Grants permission to remove an IAM role from the specified EC2 instance profile	Write	instance-profile*		
RemoveUserFromGroup	Grants permission to remove an IAM user from the specified group	Write	group*		
ResetServiceSpecificCredential	Grants permission to reset the password for an existing service-specific credential for an IAM user	Write	user*		
				iam:ServiceSpecificCredentialServiceName	
ResyncMFADevice	Grants permission to synchronize the specified MFA device with its IAM entity (user or role)	Write	user*		
SendDelegationToken	Sends the exchange token for an accepted delegation request	Write	delegation-request*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SetDefaultPolicyVersion	Grants permission to set the version of the specified policy as the policy's default version	Permissions management	policy*		
SetSTSRegionalEndpointStatus	Grants permission to activate or deactivate an STS regional endpoint	Write			
SetSecurityTokenServicePreferences	Grants permission to set the STS global endpoint token version	Write			
SimulateCustomPolicy	Grants permission to simulate whether an identity-based policy or resource-based policy provides permissions for specific API operations and resources	Read			
SimulatePrincipalPolicy	Grants permission to simulate whether an identity-based policy that is attached to a specified IAM entity (user or role) provides permissions for specific API operations and resources	Read	group role user		
TagInstanceProfile	Grants permission to add tags to an instance profile	Tagging	instance-profile*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
TagMFADevice	Grants permission to add tags to a virtual mfa device	Tagging	mfa*		
				aws:TagKeys aws:RequestTag/${TagKey}	
TagOpenIDConnectProvider	Grants permission to add tags to an OpenID Connect provider	Tagging	oidc-provider*		
				aws:TagKeys aws:RequestTag/${TagKey}	
TagPolicy	Grants permission to add tags to a managed policy	Tagging	policy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
TagRole	Grants permission to add tags to an IAM role	Tagging	role*		
				aws:TagKeys aws:RequestTag/${TagKey}	
TagSAMLProvider	Grants permission to add tags to a SAML Provider	Tagging	saml-provider*		
				aws:TagKeys aws:RequestTag/${TagKey}	
TagServerCertificate	Grants permission to add tags to a server certificate	Tagging	server-certificate*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
TagUser	Grants permission to add tags to an IAM user	Tagging	user*		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagInstanceProfile	Grants permission to remove the specified tags from the instance profile	Tagging	instance-profile*		
				aws:TagKeys	
UntagMFADevice	Grants permission to remove the specified tags from the virtual mfa device	Tagging	mfa*		
				aws:TagKeys	
UntagOpenIDConnectProvider	Grants permission to remove the specified tags from the OpenID Connect provider	Tagging	oidc-provider*		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UntagPolicy	Grants permission to remove the specified tags from the managed policy	Tagging	policy*		
				aws:TagKeys	
UntagRole	Grants permission to remove the specified tags from the role	Tagging	role*		
				aws:TagKeys	
UntagSAMLProvider	Grants permission to remove the specified tags from the SAML Provider	Tagging	saml-provider*		
				aws:TagKeys	
UntagServerCertificate	Grants permission to remove the specified tags from the server certificate	Tagging	server-certificate*		
				aws:TagKeys	
UntagUser	Grants permission to remove the specified tags from the user	Tagging	user*		
				aws:TagKeys	
UpdateAccessKey	Grants permission to update the status of the specified access key as Active or Inactive	Write	user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAccountEmailAddress	Grants permission to update the email address that is associated with the account	Write			
UpdateAccountName	Grants permission to update the account name that is associated with the account	Write			
UpdateAccountPasswordPolicy	Grants permission to update the password policy settings for the AWS account	Write			
UpdateAssumeRolePolicy	Grants permission to update the policy that grants an IAM entity permission to assume a role	Permissions management	role*		
				iam:PermissionsBoundary	
UpdateCloudFrontPublicKey	Grants permission to update an existing CloudFront public key	Write			
UpdateGroup	Grants permission to update the name or path of the specified IAM group	Write	group*		
UpdateLoginProfile	Grants permission to change the password for the specified IAM user	Write	user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateOpenIDConnectProviderThumbprint	Grants permission to update the entire list of server certificate thumbprints that are associated with an OpenID Connect (OIDC) provider resource	Write	oidc-provider*		
UpdateRole	Grants permission to update the description or maximum session duration setting of a role	Write	role*		
				iam:PermissionsBoundary	
UpdateRoleDescription	Grants permission to update only the description of a role	Write	role*		
				iam:PermissionsBoundary	
UpdateSAMLProvider	Grants permission to update the metadata document for an existing SAML provider resource	Write	saml-provider*		
UpdateSSHPublicKey	Grants permission to update the status of an IAM user's SSH public key to active or inactive	Write	user*		
UpdateServerCertificate	Grants permission to update the name or the path of the specified server certificate stored in IAM	Write	server-certificate*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateServiceSpecificCredential	Grants permission to update the status of a service-specific credential to active or inactive for an IAM user	Write	user*		
				iam:ServiceSpecificCredentialServiceName	
UpdateSigningCertificate	Grants permission to update the status of the specified user signing certificate to active or disabled	Write	user*		
UpdateUser	Grants permission to update the name or the path of the specified IAM user	Write	user*		
UploadCloudFrontPublicKey	Grants permission to upload a CloudFront public key	Write			
UploadSSHPublicKey	Grants permission to upload an SSH public key and associate it with the specified IAM user	Write	user*		
UploadServerCertificate	Grants permission to upload a server certificate entity for the AWS account	Write	server-certificate*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
UploadSigningCertificate	Grants permission to upload an X.509 signing certificate and associate it with the specified IAM user	Write	user*		

Resource types defined by AWS Identity and Access Management (IAM)

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
access-report	`arn:${Partition}:iam::${Account}:access-report/${EntityPath}`	
assumed-role	`arn:${Partition}:iam::${Account}:assumed-role/${RoleName}/${RoleSessionName}`	

Resource types	ARN	Condition keys
federated-user	arn:${Partition}:iam::${Account}:federated-user/${UserName}	
group	arn:${Partition}:iam::${Account}:group/${GroupNameWithPath}	
instance-profile	arn:${Partition}:iam::${Account}:instance-profile/${InstanceProfileNameWithPath}	aws:ResourceTag/${TagKey}
mfa	arn:${Partition}:iam::${Account}:mfa/${MfaTokenIdWithPath}	aws:ResourceTag/${TagKey}
oidc-provider	arn:${Partition}:iam::${Account}:oidc-provider/${OidcProviderName}	aws:ResourceTag/${TagKey}
policy	arn:${Partition}:iam::${Account}:policy/${PolicyNameWithPath}	aws:ResourceTag/${TagKey}
role	arn:${Partition}:iam::${Account}:role/${RoleNameWithPath}	aws:ResourceTag/${TagKey} iam:ResourceTag/${TagKey}
saml-provider	arn:${Partition}:iam::${Account}:saml-provider/${SamlProviderName}	aws:ResourceTag/${TagKey}
server-certificate	arn:${Partition}:iam::${Account}:server-certificate/${CertificateNameWithPath}	aws:ResourceTag/${TagKey}
sms-mfa	arn:${Partition}:iam::${Account}:sms-mfa/${MfaTokenIdWithPath}	

Resource types	ARN	Condition keys
user	arn:${Partition}:iam::${Account}:user/${UserNameWithPath}	aws:ResourceTag/${TagKey} iam:ResourceTag/${TagKey}
delegation-request	arn:${Partition}:iam::${Account}:delegation-request/${DelegationRequestId}	iam:DelegationRequestOwner

Condition keys for AWS Identity and Access Management (IAM)

AWS Identity and Access Management (IAM) defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access based on the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access based on the tags associated with the resource	String
aws:TagKeys	Filters access based on the tag keys that are passed in the request	ArrayOfString
iam:AWSServiceName	Filters access by the AWS service to which this role is attached	String

Condition keys	Description	Type
iam:AssociatedResourceArn	Filters access by the resource that the role will be used on behalf of	ARN
iam:DelegationDuration	Filters access based on the requested delegation duration	String
iam:DelegationRequestOwner	Filters access based on the delegation request owner	ARN
iam:FIDO-FIPS-140-2-certification	Filters access by the MFA device FIPS-140-2 validation certification level at the time of registration of a FIDO security key	String
iam:FIDO-FIPS-140-3-certification	Filters access by the MFA device FIPS-140-3 validation certification level at the time of registration of a FIDO security key	String
iam:FIDO-certification	Filters access by the MFA device FIDO certification level at the time of registration of a FIDO security key	String
iam:NotificationChannel	Filters access based on the requested notification channel	String
iam:OrganizationsPolicyId	Filters access by the ID of an AWS Organizations policy	String
iam:PassedToService	Filters access by the AWS service to which this role is passed	String
iam:PermissionsBoundary	Filters access if the specified policy is set as the permissions boundary on the IAM entity (user or role)	ARN
iam:PolicyARN	Filters access by the ARN of an IAM policy	ARN

Condition keys	Description	Type
iam:RegisterSecurityKey	Filters access by the current state of MFA device enablement	String
iam:ResourceTag/${TagKey}	Filters access by the tags attached to an IAM entity (user or role)	String
iam:ServiceSpecificCredentialAgeDays	Filters access by the duration until the credential's expiration	Numeric
iam:ServiceSpecificCredentialServiceName	Filters access by the service associated with the credential	String
iam:TemplateArn	Filters access based on the requested template ARN	ARN

Actions, resources, and condition keys for AWS Identity and Access Management Roles Anywhere

AWS Identity and Access Management Roles Anywhere (service prefix: `rolesanywhere`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Actions defined by AWS Identity and Access Management Roles Anywhere

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateProfile	Grants permission to create a profile	Write		aws:RequestTag/${TagKey} aws:TagKeys	iam:PassRole
CreateTrustAnchor	Grants permission to create a trust anchor	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAttributeMapping	Grants permission to delete a mapping rule from a profile	Write	profile*		
DeleteCrl	Grants permission to delete a certificate revocation list (crl)	Write	crl*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteProfile	Grants permission to delete a profile	Write	profile*		
DeleteTrustAnchor	Grants permission to delete a trust anchor	Write	trust-anchor*		
DisableCrl	Grants permission to disable a certificate revocation list (crl)	Write	crl*		
DisableProfile	Grants permission to disable a profile	Write	profile*		
DisableTrustAnchor	Grants permission to disable a trust anchor	Write	trust-anchor*		
EnableCrl	Grants permission to enable a certificate revocation list (crl)	Write	crl*		
EnableProfile	Grants permission to enable a profile	Write	profile*		iam:PassRole
EnableTrustAnchor	Grants permission to enable a trust anchor	Write	trust-anchor*		
GetCrl	Grants permission to get a certificate revocation list (crl)	Read	crl*		
GetProfile	Grants permission to get a profile	Read	profile*		
GetSubject	Grants permission to get a subject	Read	subject*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetTrustAnchor	Grants permission to get a trust anchor	Read	trust-anchor*		
ImportCrl	Grants permission to import a certificate revocation list (crl)	Write		aws:RequestTag/${TagKey} aws:TagKeys	
ListCrls	Grants permission to list certificate revocation lists (crls)	List			
ListProfiles	Grants permission to list profiles	List			
ListSubjects	Grants permission to list subjects	List			
ListTagsForResource	Grants permission to list tags for a resource	List			
ListTrustAnchors	Grants permission to list trust anchors	List			
PutAttributeMapping	Grants permission to put a mapping rule into a profile	Write	profile*		
PutNotificationSettings	Grants permission to attach notification settings to a trust anchor	Write	trust-anchor*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ResetNotificationSettings	Grants permission to reset custom notification settings to IAM Roles Anywhere defined default state	Write	trust-anchor*		
TagResource	Grants permission to tag a resource	Tagging	crl		
			profile		
			subject		
			trust-anchor		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag a resource	Tagging	crl		
			profile		
			subject		
			trust-anchor		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateCrl	Grants permission to update a certificate revocation list (crl)	Write	crl*		
UpdateProfile	Grants permission to update a profile	Write	profile*		iam:PassRole
UpdateTrustAnchor	Grants permission to update a trust anchor	Write	trust-anchor*		

Resource types defined by AWS Identity and Access Management Roles Anywhere

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
trust-anchor	`arn:${Partition}:rolesanywhere:${Region}:${Account}:trust-anchor/${TrustAnchorId}`	aws:ResourceTag/${TagKey}
profile	`arn:${Partition}:rolesanywhere:${Region}:${Account}:profile/${ProfileId}`	aws:ResourceTag/${TagKey}
subject	`arn:${Partition}:rolesanywhere:${Region}:${Account}:subject/${SubjectId}`	aws:ResourceTag/${TagKey}
crl	`arn:${Partition}:rolesanywhere:${Region}:${Account}:crl/${CrlId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Identity and Access Management Roles Anywhere

AWS Identity and Access Management Roles Anywhere defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Identity Store

AWS Identity Store (service prefix: `identitystore`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- Resource types defined by AWS Identity Store
- Condition keys for AWS Identity Store

Actions defined by AWS Identity Store

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddRegion	Grants permission to add a region to an IdentityStore	Write			kms:Decrypt
CreateGroup	Grants permission to create a group in the specified IdentityStore	Write	Identitystore*		kms:Decrypt
				identitystore:PrimaryRegion identitystore:GroupExternalIdIssuers	
CreateGroupMembership	Grants permission to create a member to a group in the specified IdentityStore	Write	Group*		kms:Decrypt
			Identitystore*		
			User*		
				identitystore:PrimaryRegion	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateIdentityStore	Grants permission to create a new IdentityStore in an AWS account	Write			kms:Decrypt kms:DescribeKey kms:Encrypt kms:GenerateDataKeyWithoutPlaintext
CreateUser	Grants permission to create a user in the specified IdentityStore	Write	Identitystore*		kms:Decrypt
				identitystore:PrimaryRegion identitystore:UserExternalIdIssuers identitystore:ReservedUserId	
DeleteGroup	Grants permission to delete a group in the specified IdentityStore	Write	Group*		kms:Decrypt

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			Identitystore*		
				identitystore:PrimaryRegion identitystore:GroupExternalIdIssuers

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateIdentityStore	Grants permission to update the configuration of an IdentityStore	Write			kms:Decrypt kms:DescribeKey kms:Encrypt kms:GenerateDataKeyWithoutPlaintext
UpdateUser	Grants permission to update user information in the specified IdentityStore	Write	Identitystore* User*	 identitystore:PrimaryRegion identitystore:UserExternalIdIssuers	kms:Decrypt

Resource types defined by AWS Identity Store

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Identitystore	`arn:${Partition}:identitystore::${Account}:identitystore/${IdentityStoreId}`	
User	`arn:${Partition}:identitystore:::user/${UserId}`	
Group	`arn:${Partition}:identitystore:::group/${GroupId}`	
GroupMembership	`arn:${Partition}:identitystore:::membership/${MembershipId}`	
AllUsers	`arn:${Partition}:identitystore:::user/*`	
AllGroups	`arn:${Partition}:identitystore:::group/*`	
AllGroupMemberships	`arn:${Partition}:identitystore:::membership/*`	

Condition keys for AWS Identity Store

AWS Identity Store defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
identitystore:GroupExternalIdIssuers	Filters access by Issuer present in ExternalIds for Group resources	ArrayOfARN
identitystore:IdentityStoreArn	Filters access by Identity Store ARN	ARN
identitystore:PrimaryRegion	Filters access by Primary Region of Identity Store	String
identitystore:ReservedUserId	Filters access by a previously reserved User ID for CreateUser operation	String
identitystore:UserExternalIdIssuers	Filters access by Issuer present in ExternalIds for User resources	ArrayOfARN
identitystore:UserId	Filters access by Identity Store User ID	String

Actions, resources, and condition keys for AWS Identity Store Auth

AWS Identity Store Auth (service prefix: `identitystore-auth`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS Identity Store Auth

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchDeleteSession [permission only]	Grants permission to delete a batch of specified sessions	Write			
BatchGetSession [permission only]	Grants permission to return session attributes for a batch of specified sessions	Read			
ListSessions [permission only]	Grants permission to retrieve a list of active sessions for the specified user	List			

Resource types defined by AWS Identity Store Auth

AWS Identity Store Auth does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Identity Store Auth, specify `"Resource": "*"` in your policy.

Condition keys for AWS Identity Store Auth

Identity Store Auth has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Identity Sync

AWS Identity Sync (service prefix: `identity-sync`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Identity Sync

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a

resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AllowVendedLogDeliveryForResource	Grants permission to configure vended log delivery for a Sync Profile	Permissions management	SyncProfileResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
[permission only]					
CreateSyncFilter	Grants permission to create a sync filter on the sync profile	Write	SyncProfileResource*		
CreateSyncProfile	Grants permission to create a sync profile for the identity source	Write			ds:AuthorizeApplication
CreateSyncTarget	Grants permission to create a sync target for the identity source	Write	SyncProfileResource*		
DeleteSyncFilter	Grants permission to delete a sync filter from the sync profile	Write	SyncProfileResource*		
DeleteSyncProfile	Grants permission to delete a sync profile from the source	Write	SyncProfileResource*		ds:UnauthorizeApplication
DeleteSyncTarget	Grants permission to delete a sync target from the source	Write	SyncProfileResource*		
			SyncTargetResource*		
GetSyncProfile	Grants permission to retrieve a sync profile by using a sync profile name	Read	SyncProfileResource*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSyncTarget	Grants permission to retrieve a sync target from the sync profile	Read	SyncProfileResource*		
			SyncTargetResource*		
ListSyncFilters	Grants permission to list the sync filters from the sync profile	List	SyncProfileResource*		
StartSync	Grants permission to start a sync process or to resume a sync process that was previously paused	Write	SyncProfileResource*		
StopSync	Grants permission to stop any planned sync process in the sync schedule from starting	Write	SyncProfileResource*		
UpdateSyncTarget	Grants permission to update a sync target on the sync profile	Write	SyncProfileResource*		
			SyncTargetResource*		

Resource types defined by AWS Identity Sync

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types

that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
SyncProfileResource	`arn:${Partition}:identity-sync:${Region}:${Account}:profile/${SyncProfileName}`	
SyncTargetResource	`arn:${Partition}:identity-sync:${Region}:${Account}:target/${SyncProfileName}/${SyncTargetName}`	

Condition keys for AWS Identity Sync

Identity Sync has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Import Export Disk Service

AWS Import Export Disk Service (service prefix: `importexport`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS Import Export Disk Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelJob	This action cancels a specified job. Only the job owner can cancel it. The action fails if the job has already started or is complete.	Write			
CreateJob	This action initiates the process of scheduling an upload or download of your data.	Write			
GetShippingLabel	This action generates a pre-paid shipping label that you will use to ship your device to AWS for processing.	Read			
GetStatus	This action returns information about a job, including where the job is in the processing pipeline, the status of the results, and the	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	signature value associated with the job.				
ListJobs	This action returns the jobs associated with the requester.	List			
UpdateJob	You use this action to change the parameters specified in the original manifest file by supplying a new manifest file.	Write			

Resource types defined by AWS Import Export Disk Service

AWS Import Export Disk Service does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Import Export Disk Service, specify `"Resource": "*"` in your policy.

Condition keys for AWS Import Export Disk Service

Import/Export has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Inspector

Amazon Inspector (service prefix: `inspector`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.

Topics

Actions defined by Amazon Inspector

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddAttributesToFindings	Grants permission to assign attributes (key and value pairs) to the findings that are specified by the ARNs of the findings	Write			
CreateAssessmentTarget	Grants permission to create a new assessment target using the ARN of the resource group that is generated by CreateResourceGroup	Write			
CreateAssessmentTemplate	Grants permission to create an assessment template for the assessment target that is specified by the ARN of the assessment target	Write			
CreateExclusionsPreview	Grants permission to start the generation of an exclusions preview for the specified assessment template	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateResourceGroup	Grants permission to create a resource group using the specified set of tags (key and value pairs) that are used to select the EC2 instances to be included in an Amazon Inspector assessment target	Write			
DeleteAssessmentRun	Grants permission to delete the assessment run that is specified by the ARN of the assessment run	Write			
DeleteAssessmentTarget	Grants permission to delete the assessment target that is specified by the ARN of the assessment target	Write			
DeleteAssessmentTemplate	Grants permission to delete the assessment template that is specified by the ARN of the assessment template	Write			
DescribeAssessmentRuns	Grants permission to describe the assessment runs that are specified by the ARNs of the assessment runs	Read			
DescribeAssessmentTargets	Grants permission to describe the assessment targets that are specified by the ARNs of the assessment targets	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeAssessmentTemplates	Grants permission to describe the assessment templates that are specified by the ARNs of the assessment templates	Read			
DescribeCrossAccountAccessRole	Grants permission to describe the IAM role that enables Amazon Inspector to access your AWS account	Read			
DescribeExclusions	Grants permission to describe the exclusions that are specified by the exclusions' ARNs	Read			
DescribeFindings	Grants permission to describe the findings that are specified by the ARNs of the findings	Read			
DescribeResourceGroups	Grants permission to describe the resource groups that are specified by the ARNs of the resource groups	Read			
DescribeRulesPackages	Grants permission to describe the rules packages that are specified by the ARNs of the rules packages	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAssessmentReport	Grants permission to produce an assessment report that includes detailed and comprehensive results of a specified assessment run	Read			
GetExclusionsPreview	Grants permission to retrieve the exclusions preview (a list of ExclusionPreview objects) specified by the preview token	Read			
GetTelemetryMetadata	Grants permission to get information about the data that is collected for the specified assessment run	Read			
ListAssessmentRunAgents	Grants permission to list the agents of the assessment runs that are specified by the ARNs of the assessment runs	List			
ListAssessmentRuns	Grants permission to list the assessment runs that correspond to the assessment templates that are specified by the ARNs of the assessment templates	List			
ListAssessmentTargets	Grants permission to list the ARNs of the assessment targets within this AWS account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAssessmentTemplates	Grants permission to list the assessment templates that correspond to the assessment targets that are specified by the ARNs of the assessment targets	List			
ListEventSubscriptions	Grants permission to list all the event subscriptions for the assessment template that is specified by the ARN of the assessment template	List			
ListExclusions	Grants permission to list exclusions that are generated by the assessment run	List			
ListFindings	Grants permission to list findings that are generated by the assessment runs that are specified by the ARNs of the assessment runs	List			
ListRulesPackages	Grants permission to list all available Amazon Inspector rules packages	List			
ListTagsForResource	Grants permission to list all tags associated with an assessment template	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PreviewAgents	Grants permission to preview the agents installed on the EC2 instances that are part of the specified assessment target	Read			
RegisterCrossAccountAccessRole	Grants permission to register the IAM role that Amazon Inspector uses to list your EC2 instances at the start of the assessment run or when you call the PreviewAgents action	Write			
RemoveAttributesFromFindings	Grants permission to remove entire attributes (key and value pairs) from the findings that are specified by the ARNs of the findings where an attribute with the specified key exists	Write			
SetTagsForResource	Grants permission to set tags (key and value pairs) to the assessment template that is specified by the ARN of the assessment template	Tagging			
StartAssessmentRun	Grants permission to start the assessment run specified by the ARN of the assessment template	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StopAssessmentRun	Grants permission to stop the assessment run that is specified by the ARN of the assessment run	Write			
SubscribeToEvent	Grants permission to enable the process of sending Amazon Simple Notification Service (SNS) notifications about a specified event to a specified SNS topic	Write			
UnsubscribeFromEvent	Grants permission to disable the process of sending Amazon Simple Notification Service (SNS) notifications about a specified event to a specified SNS topic	Write			
UpdateAssessmentTarget	Grants permission to update the assessment target that is specified by the ARN of the assessment target	Write			

Resource types defined by Amazon Inspector

Amazon Inspector does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon Inspector, specify `"Resource": "*"` in your policy.

Condition keys for Amazon Inspector

Inspector has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Inspector2

Amazon Inspector2 (service prefix: `inspector2`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon Inspector2

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which

the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Associate Member	Grants permission to associate an account with an Amazon Inspector administrator account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchAssociateCodeSecurityScanConfiguration	Grants permission to associate multiple code repositories with an Amazon Inspector code security scan configuration	Write			
BatchDisassociateCodeSecurityScanConfiguration	Grants permission to disassociate multiple code repositories from an Amazon Inspector code security scan configuration	Write			
BatchGetAccountStatus	Grants permission to retrieve information about Amazon Inspector accounts for an account	Read			
BatchGetCodeSnippet	Grants permission to retrieve code snippet information about one or more code vulnerability findings	Read			
BatchGetFindingDetails	Grants permission to let a customer get enhanced vulnerability intelligence details for findings	Read			
BatchGetFreeTrialInfo	Grants permission to retrieve free trial period eligibility about Amazon Inspector accounts for an account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetMemberEc2DeepInspectionStatus	Grants permission to delegated administrator to retrieve ec2 deep inspection status of member accounts	Read			
BatchUpdateMemberEc2DeepInspectionStatus	Grants permission to update ec2 deep inspection status by delegated administrator for its associated member accounts	Write			
CancelFindingsReport	Grants permission to cancel the generation of a findings report	Write			
CancelSbomExport	Grants permission to cancel the generation of an SBOM report	Write			
CreateCisScanConfiguration	Grants permission to create and define the settings for a CIS scan configuration	Write	CIS Scan Configuration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:ResourceTag/${TagKey} aws:RequestTag/${TagKey} aws:TagKeys	
CreateCodeSecurityIntegration	Grants permission to create a code security integration with a source code repository provider	Write	Code Security Integration*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateCodeSecurityScanConfiguration	Grants permission to create a scan configuration for code security scanning	Write	Code Security Scan Configuration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateFilter	Grants permission to create and define the settings for a findings filter	Write	Filter*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateFindingsReport	Grants permission to request the generation of a findings report	Write			
CreateSbomExport	Grants permission to request the generation of an SBOM report	Write			
DeleteCisScanConfiguration	Grants permission to delete a CIS scan configuration	Write	CIS Scan Configuration*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteCodeSecurityIntegration	Grants permission to delete a code security integration	Write	CodeSecurityIntegration*		
DeleteCodeSecurityScanConfiguration	Grants permission to delete a code security scan configuration	Write	CodeSecurityScanConfiguration*		
DeleteFilter	Grants permission to delete a findings filter	Write	Filter*		
DescribeOrganizationConfiguration	Grants permission to retrieve information about the Amazon Inspector configuration settings for an AWS organization	Read			
Disable	Grants permission to disable an Amazon Inspector account	Write			
DisableDelegatedAdminAccount	Grants permission to disable an account as the delegated Amazon Inspector administrator account for an AWS organization	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateMember	Grants permission to an Amazon Inspector administrator account to disassociate from an Inspector member account	Write			
Enable	Grants permission to enable and specify the configuration settings for a new Amazon Inspector account	Write			
EnableDelegatedAdminAccount	Grants permission to enable an account as the delegated Amazon Inspector administrator account for an AWS organization	Write			
GetCisScanReport	Grants permission to retrieve a report containing information about completed CIS scans	Read			
GetCisScanResultDetails	Grants permission to retrieve information about all details pertaining to one CIS scan and one targeted resource	List			
GetClustersForImage	Grants permission to get cluster information for a given a continuously scanned amazon Ecr image	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCodeSecurityIntegration	Grants permission to retrieve information about a code security integration	Read			
GetCodeSecurityScan	Grants permission to retrieve information about a specific code security scan	Read			
GetCodeSecurityScanConfiguration	Grants permission to retrieve information about a code security scan configuration	Read			
GetConfiguration	Grants permission to retrieve information about the Amazon Inspector configuration settings for an AWS account	Read			
GetDelegatedAdminAccount	Grants permission to retrieve information about the Amazon Inspector administrator account for an account	Read			
GetEc2DeepInspectionConfiguration	Grants permission to retrieve ec2 deep inspection configuration for standalone accounts, delegated administrator and member account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetEncryptionKey	Grants permission to retrieve information about the KMS key used to encrypt code snippets with	Read			
GetFindingsReportStatus	Grants permission to retrieve status for a requested findings report	Read			
GetMember	Grants permission to retrieve information about an account that's associated with an Amazon Inspector administrator account	Read			
GetSbomExport	Grants permission to retrieve a requested SBOM report	Read			
ListAccountPermissions	Grants permission to retrieve feature configuration permissions associated with an Amazon Inspector account within an organization	List			
ListCisScanConfigurations	Grants permission to retrieve information about all CIS scan configurations	List			
ListCisScanResultsAggregatedByChecks	Grants permission to retrieve information about all checks pertaining to one CIS scan	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListCisScanResultsAggregatedByTargetResource	Grants permission to retrieve information about all resources pertaining to one CIS scan	List			
ListCisScans	Grants permission to retrieve information about completed CIS scans	List			
ListCodeSecurityIntegrations	Grants permission to list all code security integrations in your account	List			
ListCodeSecurityScanConfigurationAssociations	Grants permission to list the associations between code repositories and Amazon Inspector code security scan configurations	List			
ListCodeSecurityScanConfigurations	Grants permission to list all code security scan configurations in your account	List			
ListCoverage	Grants permission to retrieve the types of statistics Amazon Inspector can generate for resources Inspector monitors	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListCoverageStatistics	Grants permission to retrieve statistical data and other information about the resources Amazon Inspector monitors	List			
ListDelegatedAdminAccounts	Grants permission to retrieve information about the delegated Amazon Inspector administrator account for an AWS organization	List			
ListFilters	Grants permission to retrieve information about all findings filters	List			
ListFindingAggregations	Grants permission to retrieve statistical data and other information about Amazon Inspector findings	List			
ListFindings	Grants permission to retrieve a subset of information about one or more findings	List			
ListMembers	Grants permission to retrieve information about the Amazon Inspector member accounts that are associated with an Inspector administrator account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTagsForResource	Grants permission to retrieve the tags for an Amazon Inspector resource	Read			
ListUsageTotals	Grants permission to retrieve aggregated usage data for an account	List			
ResetEncryptionKey	Grants permission to let a customer reset to use an Amazon-owned KMS key to encrypt code snippets with	Write			
SearchVulnerabilities	Grants permission to list Amazon Inspector coverage details for a specific vulnerability	Read			
SendCisSessionHealth	Grants permission to send CIS health for a CIS scan	Write			
SendCisSessionTelemetry	Grants permission to send CIS telemetry for a CIS scan	Write			
StartCisSession	Grants permission to start a CIS scan session	Write			
StartCodeSecurityScan	Grants permission to initiate a code security scan on a specified repository	Write			
StopCisSession	Grants permission to stop a CIS scan session	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to add or update the tags for an Amazon Inspector resource	Tagging	CIS Scan Configuration		
			Code Security Integration		
			Code Security Scan Configuration		
			Filter		
				aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	
UntagResource	Grants permission to remove tags from an Amazon Inspector resource	Tagging	CIS Scan Configuration		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			Code Security Integration		
			Code Security Scan Configuration		
			Filter		
				aws:ResourceTag/${TagKey} aws:TagKeys	
UpdateCisScanConfiguration	Grants permission to update the settings for a CIS scan configuration	Write	CIS Scan Configuration*		
				aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateCodeSecurityIntegration	Grants permission to update an existing code security integration	Write	Code Security Integration*		
				aws:ResourceTag/${TagKey}	
UpdateCodeSecurityScanConfiguration	Grants permission to update an existing code security scan configuration	Write	Code Security Scan Configuration*		
				aws:ResourceTag/${TagKey}	
UpdateConfiguration	Grants permission to update information about the Amazon Inspector configuration settings for an AWS account	Write			
UpdateEc2DeepInspectionConfiguration	Grants permission to update ec2 deep inspection configuration by delegated administrator, member and standalone account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateEncryptionKey	Grants permission to let a customer use a KMS key to encrypt code snippets with	Write			
UpdateFilter	Grants permission to update the settings for a findings filter	Write	Filter*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateOrgEc2DeepInspectionConfiguration	Grants permission to update ec2 deep inspection configuration by delegated administrator for its associated member accounts	Write			
UpdateOrganizationConfiguration	Grants permission to update Amazon Inspector configuration settings for an AWS organization	Write			

Resource types defined by Amazon Inspector2

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Filter	arn:${Partition}:inspector2:${Region}:${Account}:owner/${OwnerId}/filter/${FilterId}	aws:ResourceTag/${TagKey}
Finding	arn:${Partition}:inspector2:${Region}:${Account}:finding/${FindingId}	
CIS Scan Configuration	arn:${Partition}:inspector2:${Region}:${Account}:owner/${OwnerId}/cis-configuration/${CISScanConfigurationId}	aws:ResourceTag/${TagKey}
Code Security Scan Configuration	arn:${Partition}:inspector2:${Region}:${Account}:owner/${OwnerId}/codesecurity-configuration/${CodeSecurityScanConfigurationId}	aws:ResourceTag/${TagKey}
Code Security Integration	arn:${Partition}:inspector2:${Region}:${Account}:codesecurity-integration/${CodeSecurityIntegrationId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Inspector2

Amazon Inspector2 defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Inspector2 Telemetry Channel

Amazon Inspector2 Telemetry Channel (service prefix: `inspector2-telemetry`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Inspector2 Telemetry Channel

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
NotifyHeartbeat	Grants permission to notify heartbeat for an active telemetry session	Write			
SendTelemetry	Grants permission to send telemetry for an active telemetry session	Write			
StartSession	Grants permission to start a telemetry session	Write			
StopSession	Grants permission to stop a telemetry session	Write			

Resource types defined by Amazon Inspector2 Telemetry Channel

Amazon Inspector2 Telemetry Channel does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon Inspector2 Telemetry Channel, specify `"Resource": "*"` in your policy.

Condition keys for Amazon Inspector2 Telemetry Channel

Inspector2Telemtry has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon InspectorScan

Amazon InspectorScan (service prefix: `inspector-scan`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetChannel	Grants permission to get multiple channels simultaneously by channel ARN	Read	Channel*		
BatchGetStreamKey	Grants permission to get multiple stream keys simultaneously by stream key ARN	Read	Stream-Key*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchStartViewerSessionRevocation	Grants permission to perform StartViewerSessionRevocation on multiple channel ARN and viewer ID pairs simultaneously	Write	Channel*		
CreateChannel	Grants permission to create a new channel and an associated stream key	Write	Channel*		
			Stream-Key*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateEncoderConfiguration	Grants permission to create a new encoder configuration	Write	Encoder-Configuration*		
				aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateIngestConfiguration	Grants permission to create a new ingest configuration	Write	Ingest-Configuration*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateParticipantToken	Grants permission to create a participant token	Write	Stage*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreatePlaybackRestrictionPolicy	Grants permission to create a playback restriction policy	Write	Playback-Restriction-Policy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateRecordingConfiguration	Grants permission to create a a new recording configuration	Write	Recording-Configuration*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateStage	Grants permission to create a stage	Write	Stage*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateStorageConfiguration	Grants permission to create a new storage configuration	Write	Storage-Configuration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateStreamKey	Grants permission to create a stream key	Write	Stream-Key*		
				aws:TagKeys aws:RequestTag/${TagKey}	
DeleteChannel	Grants permission to delete a channel and channel's stream keys	Write	Channel*		
			Stream-Key*		
DeleteEncoderConfiguration	Grants permission to delete an encoder configuration for the specified ARN	Write	Encoder-Configuration*		
DeleteIngestConfiguration	Grants permission to delete an ingest configuration for the specified ARN	Write	Ingest-Configuration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeletePlaybackKeyPair	Grants permission to delete the playback key pair for a specified ARN	Write	Playback-Key-Pair*		
DeletePlaybackRestrictionPolicy	Grants permission to delete the playback restriction policy for a specified ARN	Write	Playback-Restriction-Policy*		
DeletePublicKey	Grants permission to delete the public key for the specified ARN	Write	Public-Key*		
DeleteRecordingConfiguration	Grants permission to delete a recording configuration for the specified ARN	Write	Recording-Configuration*		
DeleteStage	Grants permission to delete the stage for a specified ARN	Write	Stage*		
DeleteStorageConfiguration	Grants permission to delete an storage configuration for the specified ARN	Write	Storage-Configuration*		
DeleteStreamKey	Grants permission to delete the stream key for a specified ARN	Write	Stream-Key*		
DisconnectParticipant	Grants permission to disconnect a participant from for the specified stage ARN	Write	Stage*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetChannel	Grants permission to get the channel configuration for a specified channel ARN	Read	Channel*		
GetComposition	Grants permission to get the composition for the specified ARN	Read	Composition*		
GetEncoderConfiguration	Grants permission to get the encoder configuration for the specified ARN	Read	Encoder-Configuration*		
GetIngestConfiguration	Grants permission to get the ingest configuration for the specified ARN	Read	Ingest-Configuration*		
GetParticipant	Grants permission to get participant information for a specified stage ARN, session, and participant	Read	Stage*		
GetPlaybackKeyPair	Grants permission to get the playback keypair information for a specified ARN	Read	Playback-Key-Pair*		
GetPlaybackRestrictionPolicy	Grants permission to get the playback restriction policy for a specified ARN	Read	Playback-Restriction-Policy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetPublicKey	Grants permission to get the public key for the specified ARN	Read	Public-Key*		
GetRecordingConfiguration	Grants permission to get the recording configuration for the specified ARN	Read	Recording-Configuration*		
GetStage	Grants permission to get stage information for a specified ARN	Read	Stage*		
GetStageSession	Grants permission to get stage session information for a specified stage ARN and session	Read	Stage*		
GetStorageConfiguration	Grants permission to get the storage configuration for the specified ARN	Read	Storage-Configuration*		
GetStream	Grants permission to get information about the active (live) stream on a specified channel	Read	Channel*		
GetStreamKey	Grants permission to get stream-key information for a specified ARN	Read	Stream-Key*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetStreamSession	Grants permission to get information about the stream session on a specified channel	Read	Channel*		
ImportPlaybackKeyPair	Grants permission to import the public key	Write	Playback-Key-Pair*		
				aws:TagKeys aws:RequestTag/${TagKey}	
ImportPublicKey	Grants permission to import a public key	Write	Public-Key*		
				aws:TagKeys aws:RequestTag/${TagKey}

UpdateStage	Grants permission to update a stage's configuration	Write	Stage*		

Resource types defined by Amazon Interactive Video Service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Channel	`arn:${Partition}:ivs:${Region}:${Account}:channel/${ResourceId}`	aws:ResourceTag/${TagKey}
Stream-Key	`arn:${Partition}:ivs:${Region}:${Account}:stream-key/${ResourceId}`	aws:ResourceTag/${TagKey}
Playback-Key-Pair	`arn:${Partition}:ivs:${Region}:${Account}:playback-key/${ResourceId}`	aws:ResourceTag/${TagKey}
Playback-Restriction-Policy	`arn:${Partition}:ivs:${Region}:${Account}:playback-restriction-policy/${ResourceId}`	aws:ResourceTag/${TagKey}
Recording-Configuration	`arn:${Partition}:ivs:${Region}:${Account}:recording-configuration/${ResourceId}`	aws:ResourceTag/${TagKey}
Stage	`arn:${Partition}:ivs:${Region}:${Account}:stage/${ResourceId}`	aws:ResourceTag/${TagKey}
Composition	`arn:${Partition}:ivs:${Region}:${Account}:composition/${ResourceId}`	aws:ResourceTag/${TagKey}
Encoder-Configuration	`arn:${Partition}:ivs:${Region}:${Account}:encoder-configuration/${ResourceId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
Storage-Configuration	arn:${Partition}:ivs:${Region}:${Account}:storage-configuration/${ResourceId}	aws:ResourceTag/${TagKey}
Public-Key	arn:${Partition}:ivs:${Region}:${Account}:public-key/${ResourceId}	aws:ResourceTag/${TagKey}
Ingest-Configuration	arn:${Partition}:ivs:${Region}:${Account}:ingest-configuration/${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Interactive Video Service

Amazon Interactive Video Service defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags associated with the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Interactive Video Service Chat

Amazon Interactive Video Service Chat (service prefix: `ivschat`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon Interactive Video Service Chat

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateChatToken	Grants permission to create an encrypted token that is used to establish an individual WebSocket connection to a room	Write	Room*		
				aws:TagKeys aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateLoggingConfiguration	Grants permission to create a logging configuration that allows clients to record room messages	Write	Logging-Configuration*		
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateRoom	Grants permission to create a room that allows clients to connect and pass messages	Write	Room*		
				aws:TagKeys aws:RequestTag/${TagKey}	
DeleteLoggingConfiguration	Grants permission to delete the logging configuration for a specified logging configuration ARN	Write	Logging-Configuration*		
DeleteMessage	Grants permission to send an event to a specific room which directs clients to delete a specific message	Write	Room*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteRoom	Grants permission to delete the room for a specified room ARN	Write	Room*		
DisconnectUser	Grants permission to disconnect all connections using a specified user ID from a room	Write	Room*		
GetLoggingConfiguration	Grants permission to get the logging configuration for a specified logging configuration ARN	Read	Logging-Configuration*		
GetRoom	Grants permission to get the room configuration for a specified room ARN	Read	Room*		
ListLoggingConfigurations	Grants permission to get summary information about logging configurations	List	Logging-Configuration*		
ListRooms	Grants permission to get summary information about rooms	List	Room*		
ListTagsForResource	Grants permission to get information about the tags for a specified ARN	Read	Room		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
SendEvent	Grants permission to send an event to a room	Write	Room*		
TagResource	Grants permission to add or update tags for a resource with a specified ARN	Tagging	Logging-Configuration		
			Room		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove tags for a resource with a specified ARN	Tagging	Logging-Configuration		
			Room		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
UpdateLoggingConfiguration	Grants permission to update the logging configuration for a specified logging configuration ARN	Write	Logging-Configuration*		
UpdateRoom	Grants permission to update the room configuration for a specified room ARN	Write	Room*		

Resource types defined by Amazon Interactive Video Service Chat

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Room	`arn:${Partition}:ivschat:${Region}:${Account}:room/${ResourceId}`	aws:ResourceTag/${TagKey}
Logging-Configuration	`arn:${Partition}:ivschat:${Region}:${Account}:logging-configuration/${ResourceId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Interactive Video Service Chat

Amazon Interactive Video Service Chat defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags associated with the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Interconnect

AWS Interconnect (service prefix: `interconnect`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Interconnect

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptConnectionProposal	Grants permission to accept a connection proposal generated elsewhere	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateConnection	Grants permission to create a connection	Write	connection*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteConnection	Grants permission to delete an existing connection	Write	connection*		
DescribeConnectionProposal	Grants permission to describe a connection proposal	Read			
GetConnection	Grants permission to describe a connection	Read	connection*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetEnvironment	Grants permission to describe an environment	Read	environment*		
ListAttachPoints	Grants permission to list available attach points	Read			
ListConnections	Grants permission to list connections	List			
ListEnvironments	Grants permission to list available environments	List			
ListTagsForResource	Grants permission to list tags on a resource	Read			
TagResource	Grants permission to apply tags to a resource	Tagging	connection*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from a resource	Tagging	connection*		
				aws:TagKeys	
UpdateConnection	Grants permission to update an existing connection	Write	connection*		

Resource types defined by AWS Interconnect

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
connection	`arn:${Partition}:interconnect:${Region}:${Account}:connection/${Id}`	aws:ResourceTag/${TagKey}
environment	`arn:${Partition}:interconnect:${Region}:${Account}:environment/${Id}`	

Condition keys for AWS Interconnect

AWS Interconnect defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Invoicing Service

AWS Invoicing Service (service prefix: `invoicing`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS IoT

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptCertificateTransfer	Grants permission to accept a pending certificate transfer	Write	cert*		
AddThingToBillingGroup	Grants permission to add a thing to the specified billing group	Write	billinggroup*		
			thing*		
AddThingToThingGroup	Grants permission to add a thing to the specified thing group	Write	thing*		
			thinggroup*		
AssociateSbomWithPackageVersion	Grants permission to associate SBOM files to a package version	Write	packageversion*		iot:GetIndexingConfiguration
AssociateTargetsWithJob	Grants permission to associate a group with a continuous job	Write	job*		
			thing*		
			thinggroup*		
AttachPolicy	Grants permission to attach a policy to the specified target	Permissions management	cert		
			thinggroup		
AttachPrincipalPolicy	Grants permission to attach the specified policy to the	Permissions	cert		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	specified principal (certificate or other credential)	management			
AttachSecurityProfile	Grants permission to associate a Device Defender security profile with a thing group or with this account	Write	securityprofile*		
			custommetric		
			dimension		
			thinggroup		
AttachThingPrincipal	Grants permission to attach the specified principal to the specified thing	Write	cert		
				iot:thingArn	
CancelAuditMitigationActionsTask	Grants permission to cancel a mitigation action task that is in progress	Write			
CancelAuditTask	Grants permission to cancel an audit that is in progress. The audit can be either scheduled or on-demand	Write			
CancelCertificateTransfer	Grants permission to cancel a pending transfer for the specified certificate	Write	cert*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelDetectMitigationActionsTask	Grants permission to cancel a Device Defender ML Detect mitigation action	Write			
CancelJob	Grants permission to cancel a job	Write	job*		
CancelJobExecution	Grants permission to cancel a job execution on a particular device	Write	job*		
			thing*		
ClearDefaultAuthorizer	Grants permission to clear the default authorizer	Write			
CloseTunnel	Grants permission to close a tunnel	Write	tunnel*		
				iot:Delete	
ConfirmTopicRuleDestination	Grants permission to confirm a http url TopicRuleDestinationDestination	Write	destination*		
Connect	Grants permission to connect as the specified client	Write	client*		
CreateAuditSuppression	Grants permission to create a Device Defender audit suppression	Write			
CreateAuthorizer	Grants permission to create an authorizer	Write	authorizer*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateBillingGroup	Grants permission to create a billing group	Write	billinggroup*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateCertificateFromCsr	Grants permission to create an X.509 certificate using the specified certificate signing request	Write			
CreateCertificateProvider	Grants permission to create a certificate provider	Write	certificateprovider*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateCommand	Grants permission to create a command that can be used to start new executions against a device	Write	command*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateCustomMetric	Grants permission to create a custom metric for device side metric reporting and monitoring	Write	custommetric*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDimension	Grants permission to define a dimension that can be used to to limit the scope of a metric used in a security profile	Write	dimension*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDomainConfiguration	Grants permission to create a domain configuration	Write	domainconfiguration*		
				aws:RequestTag/${TagKey} aws:TagKeys iot:DomainName	
CreateDynamicThingGroup	Grants permission to create a Dynamic Thing Group	Write	dynamicthinggroup*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateFleetMetric	Grants permission to create a fleet metric	Write	fleetmetric*		
			index*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateJob	Grants permission to create a job	Write	job*		
			thing*		
			thinggroup*		
			jobtemplate		
			package		
			packageversion		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateJobTemplate	Grants permission to create a job template	Write	jobtemplate*		
			job		
			package		
			packageversion		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateKeysAndCertificate	Grants permission to create a 2048 bit RSA key pair and issues an X.509 certificate using the issued public key	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateMitigationAction	Grants permission to define an action that can be applied to audit findings by using StartAuditMitigationActions Task	Write	mitigationaction*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateOTAUpdate	Grants permission to create an OTA update job	Write	otaupdate*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreatePackage	Grants permission to create a software package that you can deploy to your devices	Write	package*		iot:GetIndexingConfiguration
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreatePackageVersion	Grants permission to create a version under the specified package	Write	package*		iot:GetIndexingConfiguration s3:GetObjectVersion
			packageversion*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreatePolicy	Grants permission to create an AWS IoT policy	Permissions management	policy*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreatePolicyVersion	Grants permission to create a new version of the specified AWS IoT policy	Permissions management	policy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateProvisioningClaim	Grants permission to create a provisioning claim	Write	provisioningtemplate*		
CreateProvisioningTemplate	Grants permission to create a fleet provisioning template	Write	provisioningtemplate*		iam:PassRole
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateProvisioningTemplateVersion	Grants permission to create a new version of a fleet provisioning template	Write	provisioningtemplate*		
CreateRoleAlias	Grants permission to create a role alias	Write	rolealias*		iam:PassRole
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateScheduledAudit	Grants permission to create a scheduled audit that is run at a specified time interval	Write	scheduledaudit*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSecurityProfile	Grants permission to create a Device Defender security profile	Write	securityprofile*		
			custommetric		
			dimension		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateStream	Grants permission to create a new AWS IoT stream	Write	stream*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateThing	Grants permission to create a thing in the thing registry	Write	thing*		
			billinggroup		
CreateThingGroup	Grants permission to create a thing group	Write	thinggroup*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateThingType	Grants permission to create a new thing type	Write	thingtype*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTopicRule	Grants permission to create a rule	Write	rule*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateTopicRuleDestination	Grants permission to create a TopicRuleDestination	Write			
DeleteAccountAuditConfiguration	Grants permission to delete the audit configuration associated with the account	Write			
DeleteAuditSuppression	Grants permission to delete a Device Defender audit suppression	Write			
DeleteAuthorizer	Grants permission to delete the specified authorizer	Write	authorizer*		
DeleteBillingGroup	Grants permission to delete the specified billing group	Write	billinggroup*		
DeleteCACertificate	Grants permission to delete a registered CA certificate	Write	cacert*		
DeleteCertificate	Grants permission to delete the specified certificate	Write	cert*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteCertificateProvider	Grants permission to delete a certificate provider	Write	certificateprovider*		
DeleteCommand	Grants permission to delete a command	Write	command*		
DeleteCommandExecution	Grants permission to delete a command execution	Write	client		
			thing		
DeleteConnection	Grants permission to disconnect the specified connection	Write	client*		
DeleteCustomMetric	Grants permission to deletes the specified custom metric from your AWS account	Write	custommetric*		
DeleteDimension	Grants permission to remove the specified dimension from your AWS account	Write	dimension*		
DeleteDomainConfiguration	Grants permission to delete a domain configuration	Write	domainconfiguration*		
DeleteDynamicThingGroup	Grants permission to delete the specified Dynamic Thing Group	Write	dynamicthinggroup*		
DeleteFleetMetric	Grants permission to delete the specified fleet metric	Write	fleetmetric*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteJob	Grants permission to delete a job and its related job executions	Write	job*		
DeleteJobExecution	Grants permission to delete a job execution	Write	job*		
			thing*		
DeleteJobTemplate	Grants permission to delete a job template	Write	jobtemplate*		
DeleteMitigationAction	Grants permission to delete a defined mitigation action from your AWS account	Write	mitigationaction*		
DeleteOTAUpdate	Grants permission to delete an OTA update job	Write	otaupdate*		
DeletePackage	Grants permission to delete a package	Write	package*		
DeletePackageVersion	Grants permission to delete a version of the specified package	Write	package*		
			packageversion*		
DeletePolicy	Grants permission to delete the specified policy	Permissions management	policy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeletePolicyVersion	Grants permission to Delete the specified version of the specified policy	Permissions management	policy*		
DeleteProvisioningTemplate	Grants permission to delete a fleet provisioning template	Write	provisioningtemplate*		
DeleteProvisioningTemplateVersion	Grants permission to delete a fleet provisioning template version	Write	provisioningtemplate*		
DeleteRegistrationCode	Grants permission to delete a CA certificate registration code	Write			
DeleteRoleAlias	Grants permission to delete the specified role alias	Write	rolealias*		
DeleteScheduledAudit	Grants permission to delete a scheduled audit	Write	scheduledaudit*		
DeleteSecurityProfile	Grants permission to delete a Device Defender security profile	Write	securityprofile*		
			custommetric		
			dimension		
DeleteStream	Grants permission to delete a specified stream	Write	stream*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteThing	Grants permission to delete the specified thing	Write	thing*		
DeleteThingGroup	Grants permission to delete the specified thing group	Write	thinggroup*		
DeleteThingShadow	Grants permission to delete the specified thing shadow	Write	thing*		
DeleteThingType	Grants permission to delete the specified thing type	Write	thingtype*		
DeleteTopicRule	Grants permission to delete the specified rule	Write	rule*		
DeleteTopicRuleDestination	Grants permission to delete a TopicRuleDestination	Write	destination*		
DeleteV2LoggingLevel	Grants permission to delete the specified v2 logging level	Write			
DeprecateThingType	Grants permission to deprecate the specified thing type	Write	thingtype*		
DescribeAccountAuditConfiguration	Grants permission to get information about audit configurations for the account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeAuditFinding	Grants permission to get information about a single audit finding. Properties include the reason for noncompliance, the severity of the issue, and when the audit that returned the finding was started	Read			
DescribeAuditMitigationActionsTask	Grants permission to get information about an audit mitigation task that is used to apply mitigation actions to a set of audit findings	Read			
DescribeAuditSuppression	Grants permission to get information about a Device Defender audit suppression	Read			
DescribeAuditTask	Grants permission to get information about a Device Defender audit	Read			
DescribeAuthorizer	Grants permission to describe an authorizer	Read	authorizer*		
DescribeBillingGroup	Grants permission to get information about the specified billing group	Read	billinggroup*		
DescribeCACertificate	Grants permission to describe a registered CA certificate	Read	cacert*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeCertificate	Grants permission to get information about the specified certificate	Read	cert*		
DescribeCertificateProvider	Grants permission to describe a certificate provider	Read	certificateprovider*		
DescribeCustomMetric	Grants permission to describe a custom metric that is defined in your AWS account	Read	custommetric*		
DescribeDefaultAuthorizer	Grants permission to describe the default authorizer	Read			
DescribeDetectMitigationActionsTask	Grants permission to describe a Device Defender ML Detect mitigation action	Read			
DescribeDimension	Grants permission to get details about a dimension that is defined in your AWS account	Read	dimension*		
DescribeDomainConfiguration	Grants permission to get information about the domain configuration	Read	domainconfiguration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeEncryptionConfiguration	Grants permission to describe the encryption configuration for the account	Read			
DescribeEndpoint	Grants permission to get a unique endpoint specific to the AWS account making the call	Read			
DescribeEventConfigurations	Grants permission to get account event configurations	Read			
DescribeFleetMetric	Grants permission to get information about the specified fleet metric	Read	fleetmetric*		
DescribeIndex	Grants permission to get information about the specified index	Read	index*		
DescribeJob	Grants permission to describe a job	Read	job*		
DescribeJobExecution	Grants permission to describe a job execution	Read	job		
			thing		
DescribeJobTemplate	Grants permission to describe a job template	Read	jobtemplate*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeManagedJobTemplate	Grants permission to describe a managed job template	Read	jobtemplate*		
DescribeMitigationAction	Grants permission to get information about a mitigation action	Read	mitigationaction*		
DescribeProvisioningTemplate	Grants permission to get information about a fleet provisioning template	Read	provisioningtemplate*		
DescribeProvisioningTemplateVersion	Grants permission to get information about a fleet provisioning template version	Read	provisioningtemplate*		
DescribeRoleAlias	Grants permission to describe a role alias	Read	rolealias*		
DescribeScheduledAudit	Grants permission to get information about a scheduled audit	Read	scheduledaudit*		
DescribeSecurityProfile	Grants permission to get information about a Device Defender security profile	Read	securityprofile*		
DescribeStream	Grants permission to get information about the specified stream	Read	stream*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeThing	Grants permission to get information about the specified thing	Read	thing*		
DescribeThingGroup	Grants permission to get information about the specified thing group	Read	thinggroup*		
DescribeThingRegistrationTask	Grants permission to get information about the bulk thing registration task	Read			
DescribeThingType	Grants permission to get information about the specified thing type	Read	thingtype*		
DescribeTunnel	Grants permission to describe a tunnel	Read	tunnel*		
DetachPolicy	Grants permission to detach a policy from the specified target	Permissions management	cert		
			thinggroup		
DetachPrincipalPolicy	Grants permission to remove the specified policy from the specified certificate	Permissions management	cert		
DetachSecurityProfile	Grants permission to disassociate a Device Defender security profile from a thing group or from this account	Write	securityprofile*		
			custommetric		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			dimension		
			thinggroup		
DetachThingPrincipal	Grants permission to detach the specified principal from the specified thing	Write	cert		
				iot:thingArn	
DisableTopicRule	Grants permission to disable the specified rule	Write	rule*		
DisassociateSbomFromPackageVersion	Grants permission to disassociate SBOM files from a package version	Write	packageversion*		
EnableTopicRule	Grants permission to enable the specified rule	Write	rule*		
GetBehaviorModelTrainingSummaries	Grants permission to fetch a Device Defender's ML Detect Security Profile training model's status	List	securityprofile		
GetBucketsAggregation	Grants permission to get buckets aggregation for IoT fleet index	Read	index*		
GetCardinality	Grants permission to get cardinality for IoT fleet index	Read	index*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCommand	Grants permission to get the information about the command	Read	command*		
GetCommandExecution	Grants permission to get the information of a command execution	Read	client		
			thing		
GetEffectivePolicies	Grants permission to get effective policies	Read	cert		
GetIndexingConfiguration	Grants permission to get current fleet indexing configuration	Read			
GetJobDocument	Grants permission to get a job document	Read	job*		
GetLoggingOptions	Grants permission to get the logging options	Read			
GetOTAUpdate	Grants permission to get the information about the OTA update job	Read	otaupdate*		
GetPackage	Grants permission to get the information about the package	Read	package*		
GetPackageConfiguration	Grants permission to get the package configuration of the account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetPackageVersion	Grants permission to get the version of the package	Read	package*		
			packageversion*		
GetPercentiles	Grants permission to get percentiles for IoT fleet index	Read	index*		
GetPolicy	Grants permission to get information about the specified policy with the policy document of the default version	Read	policy*		
GetPolicyVersion	Grants permission to get information about the specified policy version	Read	policy*		
GetRegistrationCode	Grants permission to get a registration code used to register a CA certificate with AWS IoT	Read			
GetRetainedMessage	Grants permission to get the retained message on the specified topic	Read	topic*		
GetStatistics	Grants permission to get statistics for IoT fleet index	Read	index*		
GetThingConnectivityData	Grants permission to get the thing's connectivity data	Read	thing*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetThingShadow	Grants permission to get the thing shadow	Read	thing*		
GetTopicRule	Grants permission to get information about the specified rule	Read	rule*		
GetTopicRuleDestination	Grants permission to get a TopicRuleDestination	Read	destination*		
GetV2LoggingOptions	Grants permission to get v2 logging options	Read			
ListActiveViolations	Grants permission to list the active violations for a given Device Defender security profile or Thing	List	securityprofile		
			thing		
ListAttachedPolicies	Grants permission to list the policies attached to the specified thing group	List			
ListAuditFindings	Grants permission to list the findings (results) of a Device Defender audit or of the audits performed during a specified time period	List			
ListAuditMitigationActionsExecutions	Grants permission to get the status of audit mitigation action tasks that were executed	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAuditMitigationActionsTasks	Grants permission to get a list of audit mitigation action tasks that match the specified filters	List			
ListAuditSuppressions	Grants permission to list your Device Defender audit suppressions	List			
ListAuditTasks	Grants permission to list the Device Defender audits that have been performed during a given time period	List			
ListAuthorizers	Grants permission to list the authorizers registered in your account	List			
ListBillingGroups	Grants permission to list all billing groups	List			
ListCACertificates	Grants permission to list the CA certificates registered for your AWS account	List			
ListCertificateProviders	Grants permission to list certificate providers in the account	List			
ListCertificates	Grants permission to list your certificates	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListCertificatesByCA	Grants permission to list the device certificates signed by the specified CA certificate	List			
ListCommandExecutions	Grants permission to list commands executions in the account	List	client		
			command		
			thing		
ListCommands	Grants permission to list commands in the account	List			
ListCustomMetrics	Grants permission to list the custom metrics in your AWS account	List			
ListDetectMitigationActionsExecutions	Grants permission to lists mitigation actions executions for a Device Defender ML Detect Security Profile	List	thing		
ListDetectMitigationActionsTasks	Grants permission to list Device Defender ML Detect mitigation actions tasks	List			
ListDimensions	Grants permission to list the dimensions that are defined for your AWS account	List			
ListDomainConfigurations	Grants permission to list the domain configuration created by your AWS account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListFleetMetrics	Grants permission to list the fleet metrics in your account	List			
ListIndices	Grants permission to list all indices for fleet index	List			
ListJobExecutionsForJob	Grants permission to list the job executions for a job	List	job*		
ListJobExecutionsForThing	Grants permission to list the job executions for the specified thing	List	thing*		
ListJobTemplates	Grants permission to list job templates	List			
ListJobs	Grants permission to list jobs	List			
ListManagedJobTemplates	Grants permission to list managed job templates	List			
ListMetricValues	Grants permissions to list the metric values for a thing based on the metricName, and dimension if specified	List	thing*		
ListMitigationActions	Grants permission to get a list of all mitigation actions that match the specified filter criteria	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListNamedShadowsForThing	Grants permission to list all named shadows for a given thing	List	thing*		
ListOTAUpdates	Grants permission to list OTA update jobs in the account	List			
ListOutgoingCertificates	Grants permission to list certificates that are being transfered but not yet accepted	List			
ListPackageVersions	Grants permission to list versions for a package in the account	List			
ListPackages	Grants permission to list packages in the account	List			
ListPolicies	Grants permission to list your policies	List			
ListPolicyPrincipals	Grants permission to list the principals associated with the specified policy	List			
ListPolicyVersions	Grants permission to list the versions of the specified policy, and identifies the default version	List	policy*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListPrincipalPolicies	Grants permission to list the policies attached to the specified principal. If you use an Amazon Cognito identity, the ID needs to be in Amazon Cognito Identity format	List			
ListPrincipalThings	Grants permission to list the things associated with the specified principal	List	cert		
ListPrincipalThingsV2	Grants permission to list the things associated with the specified principal	List	cert		
ListProvisioningTemplateVersions	Grants permission to get a list of fleet provisioning template versions	List	provisioningtemplate*		
ListProvisioningTemplates	Grants permission to list the fleet provisioning templates in your AWS account	List			
ListRelatedResourcesForAuditFinding	Grants permission to list related resources for a single audit finding	List			
ListRetainedMessages	Grants permission to list the retained messages for your account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListRoleAliases	Grants permission to list role aliases	List			
ListSbomValidationResults	Grants permission to list SBOM validation results of a package version	List	packageversion*		
ListScheduledAudits	Grants permission to list all of your scheduled audits	List			
ListSecurityProfiles	Grants permission to list the Device Defender security profiles you have created	List	custommetric		
			dimension		
ListSecurityProfilesForTarget	Grants permission to list the Device Defender security profiles attached to a target	List	thinggroup		
ListStreams	Grants permission to list the streams in your account	List			
ListTagsForResource	Grants permission to list all tags for a given resource	Read	authorizer		
			billinggroup		
			cacert		
			certificateprovider		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			command		
			custommetric		
			dimension		
			domainconfiguration		
			dynamicthinggroup		
			fleetmetric		
			job		
			jobtemplate		
			mitigationaction		
			otaupdate		
			policy		
			provisioningtemplate		
			rolealias		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			rule		
			scheduledaudit		
			securityprofile		
			stream		
			thinggroup		
			thingtype		
ListTargetsForPolicy	Grants permission to list targets for the specified policy	List	policy*		
ListTargetsForSecurityProfile	Grants permission to list the targets associated with a given Device Defender security profile	List	securityprofile*		
ListThingGroups	Grants permission to list all thing groups	List			
ListThingGroupsForThing	Grants permission to list thing groups to which the specified thing belongs	List	thing*		
ListThingPrincipals	Grants permission to list the principals associated with the specified thing	List	thing*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListThingPrincipalsV2	Grants permission to list the principals associated with the specified thing	List	thing*		
ListThingRegistrationTaskReports	Grants permission to list information about bulk thing registration tasks	List			
ListThingRegistrationTasks	Grants permission to list bulk thing registration tasks	List			
ListThingTypes	Grants permission to list all thing types	List			
ListThings	Grants permission to list all things	List			
ListThingsInBillingGroup	Grants permission to list all things in the specified billing group	List	billinggroup*		
ListThingsInThingGroup	Grants permission to list all things in the specified thing group	List	thinggroup*		
ListTopicRuleDestinations	Grants permission to list all TopicRuleDestinations	List			
ListTopicRules	Grants permission to list the rules for the specific topic	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTunnels	Grants permission to list tunnels	List			
ListV2LoggingLevels	Grants permission to list the v2 logging levels	List			
ListViolationEvents	Grants permission to list the Device Defender security profile violations discovered during the given time period	List	securityprofile thing		
OpenTunnel	Grants permission to open a tunnel	Write		aws:RequestTag/${TagKey} aws:TagKeys iot:ThingGroupArn iot:TunnelDestinationService	
Publish	Grants permission to publish to the specified topic	Write	topic*		
PutVerificationStateOnViolation	Grants permission to put verification state on a violation	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Receive	Grants permission to receive from the specified topic	Write	topic*		
RegisterCACertificate	Grants permission to register a CA certificate with AWS IoT	Write		aws:RequestTag/${TagKey} aws:TagKeys aws:ResourceTag/${TagKey}	iam:PassRole
RegisterCertificate	Grants permission to register a device certificate with AWS IoT	Write			
RegisterCertificateWithoutCA	Grants permission to register a device certificate with AWS IoT without a registered CA (certificate authority)	Write			
RegisterThing	Grants permission to register your thing	Write			
RejectCertificateTransfer	Grants permission to reject a pending certificate transfer	Write	cert*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RemoveThingFromBillingGroup	Grants permission to remove thing from the specified billing group	Write	billinggroup*		
			thing*		
RemoveThingFromThingGroup	Grants permission to remove thing from the specified thing group	Write	thing*		
			thinggroup*		
ReplaceTopicRule	Grants permission to replace the specified rule	Write	rule*		
RetainPublish	Grants permission to publish a retained message to the specified topic	Write	topic*		
RotateTunnelAccessToken	Grants permission to rotate the access token of a tunnel	Write	tunnel*		
				iot:ThingGroupArn iot:TunnelDestinationService iot:ClientMode	
SearchIndex	Grants permission to search IoT fleet index	Read	index*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SetDefaultAuthorizer	Grants permission to set the default authorizer. This will be used if a websocket connection is made without specifying an authorizer	Permissions management	authorizer*		
SetDefaultPolicyVersion	Grants permission to set the specified version of the specified policy as the policy's default (operative) version	Permissions management	policy*		
SetLoggingOptions	Grants permission to set the logging options	Write			
SetV2LoggingLevel	Grants permission to set the v2 logging level	Write			
SetV2LoggingOptions	Grants permission to set the v2 logging options	Write			
StartAuditMitigationActionsTask	Grants permission to start a task that applies a set of mitigation actions to the specified target	Write			
StartCommandExecution	Grants permission to start a new command execution	Write	command*		
			client		
			thing		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				iot:CommandExecutionParameterString/${CommandParameterName} iot:CommandExecutionParameterBoolean/${CommandParameterName} iot:CommandExecutionParameterNumber/${CommandParameterName}	
StartDetectMitigationActionsTask	Grants permission to start a Device Defender ML Detect mitigation actions task	Write	securityprofile		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartOnDemandAuditTask	Grants permission to start an on-demand Device Defender audit	Write			
StartThingRegistrationTask	Grants permission to start a bulk thing registration task	Write			
StopThingRegistrationTask	Grants permission to stop a bulk thing registration task	Write			
Subscribe	Grants permission to subscribe to the specified TopicFilter	Write	topicfilter*		
TagResource	Grants permission to tag a specified resource	Tagging	authorizer		
			billinggroup		
			cacert		
			certificateprovider		
			command		
			custommetric		
			dimension		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			domainconfiguration		
			dynamicthinggroup		
			fleetmetric		
			job		
			jobtemplate		
			mitigationaction		
			otaupdate		
			package		
			packageversion		
			policy		
			provisioningtemplate		
			rolealias		
			rule		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			scheduled audit		
			securityprofile		
			stream		
			thinggroup		
			thingtype		
				aws:RequestTag/${TagKey} aws:TagKeys	
TestAuthorization	Grants permission to test the policies evaluation for group policies	Read	cert		
TestInvokeAuthorizer	Grants permission to test invoke the specified custom authorizer for testing purposes	Read	authorizer*		
TransferCertificate	Grants permission to transfer the specified certificate to the specified AWS account	Write	cert*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UntagResource	Grants permission to untag a specified resource	Tagging	authorizer		
			billinggroup		
			cacert		
			certificateprovider		
			command		
			custommetric		
			dimension		
			domainconfiguration		
			dynamicthinggroup		
			fleetmetric		
			job		
			jobtemplate		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			mitigationaction		
			otaupdate		
			package		
			packageversion		
			policy		
			provisioningtemplate		
			rolealias		
			rule		
			scheduledaudit		
			securityprofile		
			stream		
			thinggroup		
			thingtype		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAccountAuditConfiguration	Grants permission to configure or reconfigure the Device Defender audit settings for this account	Write			
UpdateAuditSuppression	Grants permission to update a Device Defender audit suppression	Write			
UpdateAuthorizer	Grants permission to update an authorizer	Write	authorizer*		
UpdateBillingGroup	Grants permission to update information associated with the specified billing group	Write	billinggroup*		
UpdateCACertificate	Grants permission to update a registered CA certificate	Write	cacert*		iam:PassRole
UpdateCertificate	Grants permission to update the status of the specified certificate. This operation is idempotent	Write	cert*		
UpdateCertificateProvider	Grants permission to update a certificate provider	Write	certificateprovider*		
UpdateCommand	Grants permission to update a command	Write	command*		
UpdateCustomMetric	Grants permission to update the specified custom metric	Write	custommetric*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateDimension	Grants permission to update the definition for a dimension	Write	dimension*		
UpdateDomainConfiguration	Grants permission to update a domain configuration	Write	domainconfiguration*		
UpdateDynamicThingGroup	Grants permission to update a Dynamic Thing Group	Write	dynamicthinggroup*		
UpdateEncryptionConfiguration	Grants permission to update the encryption configuration for the account	Write			
UpdateEventConfigurations	Grants permission to update event configurations	Write			
UpdateFleetMetric	Grants permission to update a fleet metric	Write	fleetmetric* index*		
UpdateIndexingConfiguration	Grants permission to update fleet indexing configuration	Write			
UpdateJob	Grants permission to update a job	Write	job*		
UpdateMitigationAction	Grants permission to update the definition for the specified mitigation action	Write	mitigationaction*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdatePackage	Grants permission to update a package	Write	package*		iot:GetIndexingConfiguration
UpdatePackageConfiguration	Grants permission to update the package configuration of the account	Write			iam:PassRole
UpdatePackageVersion	Grants permission to update the version of the specified package	Write	package*		iot:GetIndexingConfiguration s3:GetObjectVersion
			packageversion*		
UpdateProvisioningTemplate	Grants permission to update a fleet provisioning template	Write	provisioningtemplate*		iam:PassRole
UpdateRoleAlias	Grants permission to update the role alias	Write	rolealias*		iam:PassRole
UpdateScheduledAudit	Grants permission to update a scheduled audit, including what checks are performed and how often the audit takes place	Write	scheduledaudit*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateSecurityProfile	Grants permission to update a Device Defender security profile	Write	securityprofile*		
			custommetric		
			dimension		
UpdateStream	Grants permission to update the data for a stream	Write	stream*		
UpdateThing	Grants permission to update information associated with the specified thing	Write	thing*		
UpdateThingGroup	Grants permission to update information associated with the specified thing group	Write	thinggroup*		
UpdateThingGroupsForThing	Grants permission to update the thing groups to which the thing belongs	Write	thing*		
			thinggroup		
UpdateThingShadow	Grants permission to update the thing shadow	Write	thing*		
UpdateThingType	Grants permission to update information associated with the specified thing type	Write	thingtype*		
UpdateTopicRuleDestination	Grants permission to update a TopicRuleDestination	Write	destination*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ValidateSecurityProfileBehaviors	Grants permission to validate a Device Defender security profile behaviors specification	Read			

Resource types defined by AWS IoT

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
client	`arn:${Partition}:iot:${Region}:${Account}:client/${ClientId}`	
index	`arn:${Partition}:iot:${Region}:${Account}:index/${IndexName}`	
fleetmetric	`arn:${Partition}:iot:${Region}:${Account}:fleetmetric/${FleetMetricName}`	aws:ResourceTag/${TagKey}
job	`arn:${Partition}:iot:${Region}:${Account}:job/${JobId}`	aws:ResourceTag/${TagKey}
jobtemplate	`arn:${Partition}:iot:${Region}:${Account}:jobtemplate/${JobTemplateId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
tunnel	arn:${Partition}:iot:${Region}:${Account}:tunnel/${TunnelId}	aws:ResourceTag/${TagKey}
thing	arn:${Partition}:iot:${Region}:${Account}:thing/${ThingName}	
thinggroup	arn:${Partition}:iot:${Region}:${Account}:thinggroup/${ThingGroupName}	aws:ResourceTag/${TagKey}
billinggroup	arn:${Partition}:iot:${Region}:${Account}:billinggroup/${BillingGroupName}	aws:ResourceTag/${TagKey}
dynamicthinggroup	arn:${Partition}:iot:${Region}:${Account}:thinggroup/${ThingGroupName}	aws:ResourceTag/${TagKey}
thingtype	arn:${Partition}:iot:${Region}:${Account}:thingtype/${ThingTypeName}	aws:ResourceTag/${TagKey}
topic	arn:${Partition}:iot:${Region}:${Account}:topic/${TopicName}	
topicfilter	arn:${Partition}:iot:${Region}:${Account}:topicfilter/${TopicFilter}	
rolealias	arn:${Partition}:iot:${Region}:${Account}:rolealias/${RoleAlias}	aws:ResourceTag/${TagKey}
authorizer	arn:${Partition}:iot:${Region}:${Account}:authorizer/${AuthorizerName}	aws:ResourceTag/${TagKey}
policy	arn:${Partition}:iot:${Region}:${Account}:policy/${PolicyName}	aws:ResourceTag/${TagKey}
cert	arn:${Partition}:iot:${Region}:${Account}:cert/${Certificate}	

Resource types	ARN	Condition keys
cacert	arn:${Partition}:iot:${Region}:${Account}:cacert/${CACertificate}	aws:ResourceTag/${TagKey}
stream	arn:${Partition}:iot:${Region}:${Account}:stream/${StreamId}	aws:ResourceTag/${TagKey}
otaupdate	arn:${Partition}:iot:${Region}:${Account}:otaupdate/${OtaUpdateId}	aws:ResourceTag/${TagKey}
scheduledaudit	arn:${Partition}:iot:${Region}:${Account}:scheduledaudit/${ScheduleName}	aws:ResourceTag/${TagKey}
mitigationaction	arn:${Partition}:iot:${Region}:${Account}:mitigationaction/${MitigationActionName}	aws:ResourceTag/${TagKey}
securityprofile	arn:${Partition}:iot:${Region}:${Account}:securityprofile/${SecurityProfileName}	aws:ResourceTag/${TagKey}
custommetric	arn:${Partition}:iot:${Region}:${Account}:custommetric/${MetricName}	aws:ResourceTag/${TagKey}
dimension	arn:${Partition}:iot:${Region}:${Account}:dimension/${DimensionName}	aws:ResourceTag/${TagKey}
rule	arn:${Partition}:iot:${Region}:${Account}:rule/${RuleName}	aws:ResourceTag/${TagKey}

Condition keys for AWS IoT

AWS IoT defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key that is present in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key component of a tag associated to the IoT resource in the request	String

Condition keys	Description	Type
aws:TagKeys	Filters access by a list of tag keys associated to the IoT resource in the request	ArrayOfString
iot:ClientMode	Filters access by the mode of the client for IoT Tunnel	String
iot:CommandExecutionParameterBoolean/${CommandParameterName}	Filters access by the command parameter name and boolean value	Bool
iot:CommandExecutionParameterNumber/${CommandParameterName}	Filters access by the command parameter name and numeric value	Numeric
iot:CommandExecutionParameterString/${CommandParameterName}	Filters access by the command parameter name and string value	String
iot:Delete	Filters access by a flag indicating whether or not to also delete an IoT Tunnel immediately when making iot:CloseTunnel request	Bool
iot:DomainName	Filters access by based on the domain name of an IoT DomainConfiguration	String

Condition keys	Description	Type
iot:ThingGroupArn	Filters access by a list of IoT Thing Group ARNs that the destination IoT Thing belongs to for an IoT Tunnel	ArrayOfARN
iot:TunnelDestinationService	Filters access by a list of destination services for an IoT Tunnel	ArrayOfString
iot:thingArn	Filters access by the ARN of an IoT Thing	ARN

Actions, resources, and condition keys for AWS IoT Analytics

AWS IoT Analytics (service prefix: `iotanalytics`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Condition keys for AWS IoT Analytics

Actions defined by AWS IoT Analytics

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchPutMessage	Puts a batch of messages into the specified channel	Write	channel*		
CancelPipelineReprocessing	Cancels reprocessing for the specified pipeline	Write	pipeline*		
CreateChannel	Creates a channel	Write	channel*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDataset	Creates a dataset	Write	dataset*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDatasetContent	Generates content from the specified dataset (by executing the dataset actions)	Write	dataset*		
CreateDatastore	Creates a datastore	Write	datastore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreatePipeline	Creates a pipeline	Write	pipeline*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteChannel	Deletes the specified channel	Write	channel*		
DeleteDataset	Deletes the specified dataset	Write	dataset*		
DeleteDatasetContent	Deletes the content of the specified dataset	Write	dataset*		
DeleteDatastore	Deletes the specified datastore	Write	datastore*		
DeletePipeline	Deletes the specified pipeline	Write	pipeline*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

			dataset		
			datastore		
			pipeline		
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateChannel	Updates the specified channel	Write	channel*		
UpdateDataset	Updates the specified dataset	Write	dataset*		
UpdateDatastore	Updates the specified datastore	Write	datastore*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdatePipeline	Updates the specified pipeline	Write	pipeline*		

Resource types defined by AWS IoT Analytics

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
channel	`arn:${Partition}:iotanalytics:${Region}:${Account}:channel/${ChannelName}`	aws:RequestTag/${TagKey} aws:TagKeys iotanalytics:ResourceTag/${TagKey}
dataset	`arn:${Partition}:iotanalytics:${Region}:${Account}:dataset/${DatasetName}`	aws:RequestTag/${TagKey} aws:TagKeys iotanalytics:ResourceTag/${TagKey}
datastore	`arn:${Partition}:iotanalytics:${Region}:${Account}:datastore/${DatastoreName}`	aws:RequestTag/${TagKey}

Resource types	ARN	Condition keys
		aws:TagKeys iotanalytics:ResourceTag/${TagKey}
pipeline	arn:${Partition}:iotanalytics:${Region}:${Account}:pipeline/${PipelineName}	aws:RequestTag/${TagKey} aws:TagKeys iotanalytics:ResourceTag/${TagKey}

Condition keys for AWS IoT Analytics

AWS IoT Analytics defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access based on the tags that are passed in the request	String
aws:TagKeys	Filters access based on the presence of tag keys in the request	ArrayOfString
iotanalytics:ResourceTag/${TagKey}	Filters access by the tag key-value pairs attached to the resource	String

Actions, resources, and condition keys for AWS IoT Core Device Advisor

AWS IoT Core Device Advisor (service prefix: `iotdeviceadvisor`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS IoT Core Device Advisor

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSuiteDefinition	Grants permission to create a suite definition	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteSuiteDefinition	Grants permission to delete a suite definition	Write	Suitedefinition*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetEndpoint	Grants permission to get a Device Advisor endpoint	Read			
GetSuiteDefinition	Grants permission to get a suite definition	Read	Suitedefinition*		
GetSuiteRun	Grants permission to get a suite run	Read	Suiterun*		
GetSuiteRunReport	Grants permission to get the qualification report for a suite run	Read	Suiterun*		
ListSuiteDefinitions	Grants permission to list suite definitions	List			
ListSuiteRuns	Grants permission to list suite runs	List	Suitedefinition*		
ListTagsForResource	Grants permission to list the tags (metadata) assigned to a resource	Read	Suitedefinition Suiterun		
StartSuiteRun	Grants permission to start a suite run	Write		aws:RequestTag/${TagKey} aws:TagKeys	
StopSuiteRun	Grants permission to stop a suite run	Write	Suiterun*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to add to or modify the tags of the given resource. Tags are metadata which can be used to manage a resource	Tagging	Suitedefinition		
			Suiterun		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove the given tags (metadata) from a resource	Tagging	Suitedefinition		
			Suiterun		
				aws:TagKeys	
UpdateSuiteDefinition	Grants permission to update a suite definition	Write	Suitedefinition*		

Resource types defined by AWS IoT Core Device Advisor

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Suitedefinition	`arn:${Partition}:iotdeviceadvisor:${Region}:${Account}:suitedefinition/${SuiteDefinitionId}`	aws:ResourceTag/${TagKey}
Suiterun	`arn:${Partition}:iotdeviceadvisor:${Region}:${Account}:suiterun/${SuiteDefinitionId}/${SuiteRunId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS IoT Core Device Advisor

AWS IoT Core Device Advisor defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS IoT Device Tester

AWS IoT Device Tester (service prefix: `iot-device-tester`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.

Topics

Actions defined by AWS IoT Device Tester

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CheckVersion	Grants permission to IoT Device Tester to check if a given set of product, test suite and device tester version are compatible	Read			
DownloadTestSuite	Grants permission to IoT Device Tester to download compatible test suite versions	Read			
LatestIdt	Grants permission to IoT Device Tester to get informati	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	on on latest version of device tester available				
SendMetrics	Grants permission to IoT Device Tester to send usage metrics on your behalf	Write			
Supported Version	Grants permission to IoT Device Tester to get list of supported products and test suite versions	Read			

Resource types defined by AWS IoT Device Tester

AWS IoT Device Tester does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS IoT Device Tester, specify `"Resource": "*"` in your policy.

Condition keys for AWS IoT Device Tester

IoT Device Tester has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS IoT Events

AWS IoT Events (service prefix: `iotevents`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS IoT Events

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchAcknowledgeAlarm	Grants permission to send one or more acknowledge action requests to AWS IoT Events	Write	alarmModel*		
BatchDeleteDetector	Grants permission to delete a detector instance within the AWS IoT Events system	Write	detectorModel*		
BatchDisableAlarm	Grants permission to disable one or more alarm instances	Write	alarmModel*		
BatchEnableAlarm	Grants permission to enable one or more alarm instances	Write	alarmModel*		
BatchPutMessage	Grants permission to send a set of messages to the AWS IoT Events system	Write	input*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchResetAlarm	Grants permission to reset one or more alarm instances	Write	alarmModel*		
BatchSnoozeAlarm	Grants permission to change one or more alarm instances to the snooze mode	Write	alarmModel*		
BatchUpdateDetector	Grants permission to update a detector instance within the AWS IoT Events system	Write	detectorModel*		
CreateAlarmModel	Grants permission to create an alarm model to monitor an AWS IoT Events input attribute or an AWS IoT SiteWise asset property	Write	alarmModel*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDetectorModel	Grants permission to create a detector model to monitor an AWS IoT Events input attribute	Write	detectorModel*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateInput	Grants permission to create an Input in IotEvents	Write	input*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAlarmModel	Grants permission to delete an alarm model	Write	alarmModel*		
DeleteDetectorModel	Grants permission to delete a detector model	Write	detectorModel*		
DeleteInput	Grants permission to delete an input	Write	input*		
DescribeAlarm	Grants permission to retrieve information about an alarm instance	Read	alarmModel*		
DescribeAlarmModel	Grants permission to retrieve information about an alarm model	Read	alarmModel*		
DescribeDetector	Grants permission to retriev information about a detector instance	Read	detectorModel*		
DescribeDetectorModel	Grants permission to retrieve information about a detector model	Read	detectorModel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeDetectorModelAnalysis	Grants permission to retrieve the detector model analysis information	Read			
DescribeInput	Grants permission to retrieve an information about Input	Read	input*		
DescribeLoggingOptions	Grants permission to retrieve the current settings of the AWS IoT Events logging options	Read			
GetDetectorModelAnalysisResults	Grants permission to retrieve the detector model analysis results	Read			
ListAlarmModelVersions	Grants permission to list all the versions of an alarm model	List	alarmModel*		
ListAlarmModels	Grants permission to list the alarm models that you created	List			
ListAlarms	Grants permission to retrieve information about all alarm instances per alarmModel	List	alarmModel*		
ListDetectorModelVersions	Grants permission to list all the versions of a detector model	List	detectorModel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDetectorModels	Grants permission to list the detector models that you created	List			
ListDetectors	Grants permission to retrieve information about all detector instances per detectormodel	List	detectorModel*		
ListInputRoutings	Grants permission to list one or more input routings	List			
ListInputs	Grants permission to lists the inputs you have created	List			
ListTagsForResource	Grants permission to list the tags (metadata) which you have assigned to the resource	Read	alarmModel		
			detectorModel		
			input		
PutLoggingOptions	Grants permission to set or update the AWS IoT Events logging options	Write			
StartDetectorModelAnalysis	Grants permission to start the detector model analysis	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to adds to or modifies the tags of the given resource.Tags are metadata which can be used to manage a resource	Tagging	alarmModel		
			detectorModel		
			input		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove the given tags (metadata) from the resource	Tagging	alarmModel		
			detectorModel		
			input		
				aws:TagKeys	
UpdateAlarmModel	Grants permission to update an alarm model	Write	alarmModel*		
UpdateDetectorModel	Grants permission to update a detector model	Write	detectorModel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateInput	Grants permission to update an input	Write	input*		
UpdateInputRouting	Grants permission to update input routing	Write	input*		

Resource types defined by AWS IoT Events

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
detectorModel	`arn:${Partition}:iotevents:${Region}:${Account}:detectorModel/${DetectorModelName}`	aws:ResourceTag/${TagKey}
alarmModel	`arn:${Partition}:iotevents:${Region}:${Account}:alarmModel/${AlarmModelName}`	aws:ResourceTag/${TagKey}
input	`arn:${Partition}:iotevents:${Region}:${Account}:input/${InputName}`	aws:ResourceTag/${TagKey}

Condition keys for AWS IoT Events

AWS IoT Events defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags attached to the resource	String
aws:TagKeys	Filters actions by the tag keys in the request	ArrayOfString
iotevents:keyValue	Filters access by the instanceId (key-value) of the message	String

Actions, resources, and condition keys for AWS IoT Fleet Hub for Device Management

AWS IoT Fleet Hub for Device Management (service prefix: `iotfleethub`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS IoT Fleet Hub for Device Management

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateApplication	Grants permission to create an application	Write		aws:RequestTag/${TagKey} aws:TagKeys	sso:CreateManagedApplicationInstance sso:DescribeRegisteredRegions
DeleteApplication	Grants permission to delete an application	Write	application*		sso:DeleteManagedApplicationInstance
DescribeApplication	Grants permission to describe an application	Read	application*		
ListApplications	Grants permission to list all applications	List			
ListTagsForResource	Grants permission to list all tags for a resource	Read	application		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to tag a resource	Tagging	application		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to untag a resource	Tagging	application		
				aws:TagKeys	
UpdateApplication	Grants permission to update an application	Write	application*		

Resource types defined by AWS IoT Fleet Hub for Device Management

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
application	`arn:${Partition}:iotfleethub:${Region}:${Account}:application/${ApplicationId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS IoT Fleet Hub for Device Management

AWS IoT Fleet Hub for Device Management defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags attached to the resource	String
aws:TagKeys	Filters actions by the tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS IoT FleetWise

AWS IoT FleetWise (service prefix: `iotfleetwise`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- View a list of the API operations available for this service.

- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS IoT FleetWise

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateVehicleFleet	Grants permission to associate the given vehicle to a fleet	Write	fleet*		
			vehicle*		
CreateCampaign	Grants permission to create a campaign	Write	campaign*		
			fleet*		
			signalcatalog*		
			vehicle*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				iotfleetwise:DestinationArn	
CreateDecoderManifest	Grants permission to create a decoder manifest for an existing model	Write	decodermanifest*		
			modelmanifest*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateFleet	Grants permission to create a fleet	Write	fleet*		
			signalcatalog*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateModelManifest	Grants permission to create a model manifest definition	Write	modelmanifest*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			signalcatalog*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSignalCatalog	Grants permission to create a signal catalog	Write	signalcatalog*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateStateTemplate	Grants permission to create a state template	Write	signalcatalog*		
			statetemplate*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateVehicle	Grants permission to create a vehicle	Write	decodermanifest*		iot:CreateThing iot:DescribeThing
			modelmanifest*		
			vehicle*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteCampaign	Grants permission to delete a campaign	Write	campaign*		
DeleteDecoderManifest	Grants permission to delete the given decoder manifest	Write	decodermanifest*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteFleet	Grants permission to delete a fleet	Write	fleet*		
DeleteModelManifest	Grants permission to delete the given model manifest	Write	modelmanifest*		
DeleteSignalCatalog	Grants permission to delete a specific signal catalog	Write	signalcatalog*		
DeleteStateTemplate	Grants permission to delete a state template	Write	statetemplate*		
DeleteVehicle	Grants permission to delete a vehicle	Write	vehicle*		
DisassociateVehicleFleet	Grants permission to disassociate a vehicle from an existing fleet	Write	fleet*		
			vehicle*		
GenerateCommandPayload [permission only]	Grants permission to generate the payload for running a command on a vehicle	Permissions management	vehicle*		
			statetemplate		
				iotfleetwise:Signals	
GetCampaign	Grants permission to get summary information for a given campaign	Read	campaign*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDecoderManifest	Grants permission to get summary information for a given decoder manifest definition	Read	decodermanifest*		
GetEncryptionConfiguration	Grants permission to get KMS-based encryption status for the AWS account	Read			
GetFleet	Grants permission to get summary information for a fleet	Read	fleet*		
GetLoggingOptions	Grants permission to get the logging options for the AWS account	Read			
GetModelManifest	Grants permission to get summary information for a given model manifest definition	Read	modelmanifest*		
GetRegisterAccountStatus	Grants permission to get the account registration status with IoT FleetWise	Read			
GetSignalCatalog	Grants permission to get summary information for a specific signal catalog	Read	signalcatalog*		
GetStateTemplate	Grants permission to get summary information for a given state template	Read	statetemplate*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetVehicle	Grants permission to get summary information for a vehicle	Read	vehicle*		
GetVehicleStatus	Grants permission to get the status of the campaigns running on a specific vehicle	Read	vehicle*		
ImportDecoderManifest	Grants permission to import an existing decoder manifest	Write	decodermanifest*		
ImportSignalCatalog	Grants permission to create a signal catalog by importing existing definitions	Write	signalcatalog*		
				aws:RequestTag/${TagKey} aws:TagKeys	
ListCampaigns	Grants permission to list campaigns	Read			
ListDecoderManifestNetworkInterfaces	Grants permission to list network interfaces associated to the existing decoder manifest	List	decodermanifest*		
ListDecoderManifestSignals	Grants permission to list decoder manifest signals	List	decodermanifest*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDecoderManifests	Grants permission to list all decoder manifests, with an optional filter on model manifest	Read			
ListFleets	Grants permission to list all fleets	Read			
ListFleetsForVehicle	Grants permission to list all the fleets that the given vehicle is associated with	Read	vehicle*		
ListModelManifestNodes	Grants permission to list all nodes for the given model manifest	List	modelmanifest*		
ListModelManifests	Grants permission to list all model manifests, with an optional filter on signal catalog	Read			
ListSignalCatalogNodes	Grants permission to list all nodes for a given signal catalog	Read	signalcatalog*		
ListSignalCatalogs	Grants permission to list all signal catalogs	Read			
ListStateTemplates	Grants permission to list state templates	Read			
ListTagsForResource	Grants permission to list tags for a resource	Read	campaign		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			decodermanifest		
			fleet		
			modelmanifest		
			signalcatalog		
			statetemplate		
			vehicle		
ListVehicles	Grants permission to list all vehicles, with an optional filter on model manifest	Read			
ListVehiclesInFleet	Grants permission to list vehicles in the given fleet	Read	fleet*		
PutEncryptionConfiguration	Grants permission to enable or disable KMS-based encryption for the AWS account	Write			
PutLoggingOptions	Grants permission to put the logging options for the AWS account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RegisterAccount	Grants permission to register an AWS account to IoT FleetWise	Write			iam:PassRole
TagResource	Grants permission to add tags to a resource	Tagging	campaign

				iotfleetwise:UpdateToModelManifestArn iotfleetwise:UpdateToDecoderManifestArn	

Resource types defined by AWS IoT FleetWise

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
campaign	arn:${Partition}:iotfleetwise:${Region}:${Account}:campaign/${CampaignName}	aws:ResourceTag/${TagKey}
decodermanifest	arn:${Partition}:iotfleetwise:${Region}:${Account}:decoder-manifest/${Name}	aws:ResourceTag/${TagKey}
fleet	arn:${Partition}:iotfleetwise:${Region}:${Account}:fleet/${FleetId}	aws:ResourceTag/${TagKey}
modelmanifest	arn:${Partition}:iotfleetwise:${Region}:${Account}:model-manifest/${Name}	aws:ResourceTag/${TagKey}
signalcatalog	arn:${Partition}:iotfleetwise:${Region}:${Account}:signal-catalog/${Name}	aws:ResourceTag/${TagKey}
vehicle	arn:${Partition}:iotfleetwise:${Region}:${Account}:vehicle/${VehicleId}	aws:ResourceTag/${TagKey}
statetemplate	arn:${Partition}:iotfleetwise:${Region}:${Account}:state-template/${StateTemplateId}	aws:ResourceTag/${TagKey}

Condition keys for AWS IoT FleetWise

AWS IoT FleetWise defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
iotfleetwise:DestinationArn	Filters access by campaign destination ARN, eg. an S3 bucket ARN or a Timestream ARN	ARN
iotfleetwise:Signals	Filters access by fully qualified signal names	ArrayOfString
iotfleetwise:UpdateToDecoderManifestArn	Filters access by a list of IoT FleetWise Decoder Manifest ARNs	ARN
iotfleetwise:UpdateToModelManifestArn	Filters access by a list of IoT FleetWise Model Manifest ARNs	ARN

Actions, resources, and condition keys for AWS IoT Greengrass

AWS IoT Greengrass (service prefix: `greengrass`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS IoT Greengrass

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateRoleToGroup	Grants permission to associate a role with a group. The role's permissions must allow Greengrass core Lambda functions and connectors to perform actions in other AWS services	Write	group*		
AssociateServiceRoleToAccount	Grants permission to associate a role with your account. AWS IoT Greengrass uses this role to access your Lambda functions and AWS IoT resources	Permissions management			
CreateConnectorDefinition	Grants permission to create a connector definition	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateConnectorDefinitionVersion	Grants permission to create a version of an existing connector definition	Write	connectorDefinition*		
CreateCoreDefinition	Grants permission to create a core definition	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateCoreDefinitionVersion	Grants permission to create a version of an existing core definition. Greengrass groups must each contain exactly one Greengrass core	Write	coreDefinition*		
CreateDeployment	Grants permission to create a deployment	Write	group*		
CreateDeviceDefinition	Grants permission to create a device definition	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateDeviceDefinitionVersion	Grants permission to create a version of an existing device definition	Write	deviceDefinition*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateFunctionDefinition	Grants permission to create a Lambda function definition to be used in a group that contains a list of Lambda functions and their configurations	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateFunctionDefinitionVersion	Grants permission to create a version of an existing Lambda function definition	Write	functionDefinition*		
CreateGroup	Grants permission to create a group	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateGroupCertificateAuthority	Grants permission to create a CA for the group, or rotate the existing CA	Write	group*		
CreateGroupVersion	Grants permission to create a version of a group that has already been defined	Write	group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateLoggerDefinition	Grants permission to create a logger definition	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateLoggerDefinitionVersion	Grants permission to create a version of an existing logger definition	Write	loggerDefinition*		
CreateResourceDefinition	Grants permission to create a resource definition that contains a list of resources to be used in a group	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateResourceDefinitionVersion	Grants permission to create a version of an existing resource definition	Write	resourceDefinition*		
CreateSoftwareUpdateJob	Grants permission to create an AWS IoT job that will trigger your Greengrass cores to update the software they are running	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSubscriptionDefinition	Grants permission to create a subscription definition	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateSubscriptionDefinitionVersion	Grants permission to create a version of an existing subscription definition	Write	subscriptionDefinition*		
DeleteConnectorDefinition	Grants permission to delete a connector definition	Write	connectorDefinition*		
DeleteCoreDefinition	Grants permission to delete a core definition. Deleting a definition that is currently in use in a deployment affects future deployments	Write	coreDefinition*		
DeleteDeviceDefinition	Grants permission to delete a device definition. Deleting a definition that is currently in use in a deployment affects future deployments	Write	deviceDefinition*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteFunctionDefinition	Grants permission to delete a Lambda function definition. Deleting a definition that is currently in use in a deployment affects future deployments	Write	functionDefinition*		
DeleteGroup	Grants permission to delete a group that is not currently in use in a deployment	Write	group*		
DeleteLoggerDefinition	Grants permission to delete a logger definition. Deleting a definition that is currently in use in a deployment affects future deployments	Write	loggerDefinition*		
DeleteResourceDefinition	Grants permission to delete a resource definition	Write	resourceDefinition*		
DeleteSubscription Definition	Grants permission to delete a subscription definition. Deleting a definition that is currently in use in a deployment affects future deployments	Write	subscriptionDefinition*		
DisassociateRoleFromGroup	Grants permission to disassociate the role from a group	Write	group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateServiceRoleFromAccount	Grants permission to disassociate the service role from an account. Without a service role, deployments will not work	Write			
Discover	Grants permission to retrieve information required to connect to a Greengrass core	Read	thing*		
GetAssociatedRole	Grants permission to retrieve the role associated with a group	Read	group*		
GetBulkDeploymentStatus	Grants permission to return the status of a bulk deployment	Read	bulkDeployment*		
GetConnectivityInfo	Grants permission to retrieve the connectivity information for a core	Read	connectivityInfo*		
GetConnectorDefinition	Grants permission to retrieve information about a connector definition	Read	connectorDefinition*		
GetConnectorDefinitionVersion	Grants permission to retrieve information about a connector definition version	Read	connectorDefinition*		
			connectorDefinitionVersion*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCoreDefinition	Grants permission to retrieve information about a core definition	Read	coreDefinition*		
GetCoreDefinitionVersion	Grants permission to retrieve information about a core definition version	Read	coreDefinition*		
			coreDefinitionVersion*		
GetDeploymentStatus	Grants permission to return the status of a deployment	Read	deployment*		
			group*		
GetDeviceDefinition	Grants permission to retrieve information about a device definition	Read	deviceDefinition*		
GetDeviceDefinitionVersion	Grants permission to retrieve information about a device definition version	Read	deviceDefinition*		
			deviceDefinitionVersion*		
GetFunctionDefinition	Grants permission to retrieve information about a Lambda function definition, such as its creation time and latest version	Read	functionDefinition*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetFunctionDefinitionVersion	Grants permission to retrieve information about a Lambda function definition version, such as which Lambda functions are included in the version and their configurations	Read	functionDefinition*		
			functionDefinitionVersion*		
GetGroup	Grants permission to retrieve information about a group	Read	group*		
GetGroupCertificateAuthority	Grants permission to return the public key of the CA associated with a group	Read	certificateAuthority*		
			group*		
GetGroupCertificateConfiguration	Grants permission to retrieve the current configuration for the CA used by a group	Read	group*		
GetGroupVersion	Grants permission to retrieve information about a group version	Read	group*		
			groupVersion*		
GetLoggerDefinition	Grants permission to retrieve information about a logger definition	Read	loggerDefinition*		
GetLoggerDefinitionVersion	Grants permission to retrieve information about a logger definition version	Read	loggerDefinition*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			loggerDefinitionVersion*		
GetResourceDefinition	Grants permission to retrieve information about a resource definition, such as its creation time and latest version	Read	resourceDefinition*		
GetResourceDefinitionVersion	Grants permission to retrieve information about a resource definition version, such as which resources are included in the version	Read	resourceDefinition*		
			resourceDefinitionVersion*		
GetServiceRoleForAccount	Grants permission to retrieve the service role that is attached to an account	Read			
GetSubscriptionDefinition	Grants permission to retrieve information about a subscription definition	Read	subscriptionDefinition*		
GetSubscriptionDefinitionVersion	Grants permission to retrieve information about a subscription definition version	Read	subscriptionDefinition*		
			subscriptionDefinitionVersion*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetThingRuntimeConfiguration	Grants permission to retrieve runtime configuration of a thing	Read	thingRuntimeConfig*		
ListBulkDeploymentDetailedReports	Grants permission to retrieve a paginated list of the deployments that have been started in a bulk deployment operation and their current deployment status	Read	bulkDeployment*		
ListBulkDeployments	Grants permission to retrieve a list of bulk deployments	List			
ListConnectorDefinitionVersions	Grants permission to list the versions of a connector definition	List	connectorDefinition*		
ListConnectorDefinitions	Grants permission to retrieve a list of connector definitions	List			
ListCoreDefinitionVersions	Grants permission to list the versions of a core definition	List	coreDefinition*		
ListCoreDefinitions	Grants permission to retrieve a list of core definitions	List			
ListDeployments	Grants permission to retrieve a list of all deployments for a group	List	group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDeviceDefinitionVersions	Grants permission to list the versions of a device definition	List	deviceDefinition*		
ListDeviceDefinitions	Grants permission to retrieve a list of device definitions	List			
ListFunctionDefinitionVersions	Grants permission to list the versions of a Lambda function definition	List	functionDefinition*		
ListFunctionDefinitions	Grants permission to retrieve a list of Lambda function definitions	List			
ListGroupCertificateAuthorities	Grants permission to retrieve a list of current CAs for a group	List	group*		
ListGroupVersions	Grants permission to list the versions of a group	List	group*		
ListGroups	Grants permission to retrieve a list of groups	List			
ListLoggerDefinitionVersions	Grants permission to list the versions of a logger definition	List	loggerDefinition*

			connectorDefinition		
			coreDefinition		
			deviceDefinition		
			functionDefinition		
			group		
			loggerDefinition		
			resourceDefinition		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			subscriptionDefinition		
				aws:TagKeys	
UpdateConnectivityInfo	Grants permission to update the connectivity information for a Greengrass core. Any devices that belong to the group that has this core will receive this information in order to find the location of the core and connect to it	Write	connectivityInfo*		
UpdateConnectorDefinition	Grants permission to update a connector definition	Write	connectorDefinition*		
UpdateCoreDefinition	Grants permission to update a core definition	Write	coreDefinition*		
UpdateDeviceDefinition	Grants permission to update a device definition	Write	deviceDefinition*		
UpdateFunctionDefinition	Grants permission to update a Lambda function definition	Write	functionDefinition*		
UpdateGroup	Grants permission to update a group	Write	group*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateGroupCertificateConfiguration	Grants permission to update the certificate expiry time for a group	Write	group*		
UpdateLoggerDefinition	Grants permission to update a logger definition	Write	loggerDefinition*		
UpdateResourceDefinition	Grants permission to update a resource definition	Write	resourceDefinition*		
UpdateSubscriptionDefinition	Grants permission to update a subscription definition	Write	subscriptionDefinition*		
UpdateThingRuntimeConfiguration	Grants permission to update runtime configuration of a thing	Write	thingRuntimeConfig*		

Resource types defined by AWS IoT Greengrass

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
connectivityInfo	arn:${Partition}:greengrass:${Region}:${Account}:/greengrass/things/${ThingName}/connectivityInfo	
certificateAuthority	arn:${Partition}:greengrass:${Region}:${Account}:/greengrass/groups/${GroupId}/certificateauthorities/${CertificateAuthorityId}	
deployment	arn:${Partition}:greengrass:${Region}:${Account}:/greengrass/groups/${GroupId}/deployments/${DeploymentId}	
bulkDeployment	arn:${Partition}:greengrass:${Region}:${Account}:/greengrass/bulk/deployments/${BulkDeploymentId}	aws:ResourceTag/${TagKey}
group	arn:${Partition}:greengrass:${Region}:${Account}:/greengrass/groups/${GroupId}	aws:ResourceTag/${TagKey}
groupVersion	arn:${Partition}:greengrass:${Region}:${Account}:/greengrass/groups/${GroupId}/versions/${VersionId}	
coreDefinition	arn:${Partition}:greengrass:${Region}:${Account}:/greengrass/definition/cores/${CoreDefinitionId}	aws:ResourceTag/${TagKey}
coreDefinitionVersion	arn:${Partition}:greengrass:${Region}:${Account}:/greengrass/definition/cores/${CoreDefinitionId}/versions/${VersionId}	

Resource types	ARN	Condition keys
deviceDefinition	arn:${Partition}:greengrass:${Region}:${Account}:/greengrass/definition/devices/${DeviceDefinitionId}	aws:ResourceTag/${TagKey}

Condition keys for AWS IoT Greengrass

AWS IoT Greengrass defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the

policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the allowed set of values for each of the mandatory tags	String
aws:ResourceTag/${TagKey}	Filters access by the tag value associated with the resource	String
aws:TagKeys	Filters access by the presence of mandatory tags in the request	ArrayOfString

Actions, resources, and condition keys for AWS IoT Greengrass V2

AWS IoT Greengrass V2 (service prefix: `greengrass`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Condition keys for AWS IoT Greengrass V2

Actions defined by AWS IoT Greengrass V2

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateServiceRoleToAccount	Grants permission to associate a role with your account. AWS IoT Greengrass uses this role to access your Lambda functions and AWS IoT resources	Permissions management			iam:PassRole
BatchAssociateClientDeviceWithCoreDevice	Grants permission to associate a list of client devices with a core device	Write	coreDevice*		
BatchDisassociateClientDeviceFromCoreDevice	Grants permission to disassociate a list of client devices from a core device	Write	coreDevice*		
CancelDeployment	Grants permission to cancel a deployment	Write	deployment*		iot:CancelJob iot:DeleteThingShadow

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					iot:DescribeJob iot:DescribeThing iot:DescribeThingGroup iot:GetThingShadow iot:UpdateJob iot:UpdateThingShadow
CreateComponentVersion	Grants permission to create a component	Write	component * 		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateDeployment	Grants permission to create a deployment	Write		aws:RequestTag/${TagKey} aws:TagKeys	iot:CancelJob iot:CreateJob iot:DeleteThingShadow iot:DescribeJob iot:DescribeThing iot:DescribeThingGroup iot:GetThingShadow iot:UpdateJob iot:UpdateThingShadow
DeleteComponent	Grants permission to delete a component	Write	componentVersion*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteCoreDevice	Grants permission to delete a AWS IoT Greengrass core device, which is an AWS IoT thing. This operation removes the core device from the list of core devices. This operation doesn't delete the AWS IoT thing	Write	coreDevice*		iot:DescribeJobExecution
DeleteDeployment	Grants permission to delete a deployment. To delete an active deployment, it needs to be cancelled first	Write	deployment*		iot:DeleteJob
DescribeComponent	Grants permission to retrieve metadata for a version of a component	Read	componentVersion*		
DisassociateServiceRoleFromAccount	Grants permission to disassociate the service role from an account. Without a service role, deployments will not work	Write			
GetComponent	Grants permission to get the recipe for a version of a component	Read	componentVersion*		
GetComponentVersionArtifact	Grants permission to get the pre-signed URL to download a public component artifact	Read	componentVersion*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetConnectivityInfo	Grants permission to retrieve the connectivity information for a Greengrass core device	Read	connectivityInfo*		iot:GetThingShadow
GetCoreDevice	Grants permission to retrieves metadata for a AWS IoT Greengrass core device	Read	coreDevice*		
GetDeployment	Grants permission to get a deployment	Read	deployment*		iot:DescribeJob iot:DescribeThing iot:DescribeThingGroup iot:GetThingShadow
GetServiceRoleForAccount	Grants permission to retrieve the service role that is attached to an account	Read			
ListClientDevicesAssociatedWithCoreDevice	Grants permission to retrieve a paginated list of client devices associated to a AWS IoT Greengrass core device	List	coreDevice*		
ListComponentVersions	Grants permission to retrieve a paginated list of all versions for a component	List	component*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListComponents	Grants permission to retrieve a paginated list of component summaries	List			
ListCoreDevices	Grants permission to retrieve a paginated list of AWS IoT Greengrass core devices	List			
ListDeployments	Grants permission to retrieves a paginated list of deployments	List			iot:DescribeJob iot:DescribeThing iot:DescribeThingGroup iot:GetThingShadow

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListEffectiveDeployments	Grants permission to retrieves a paginated list of deployment jobs that AWS IoT Greengrass sends to AWS IoT Greengrass core devices	List	coreDevice*		iot:DescribeJob iot:DescribeJobExecution iot:DescribeThing iot:DescribeThingGroup iot:GetThingShadow
ListInstalledComponents	Grants permission to retrieve a paginated list of the components that a AWS IoT Greengrass core device runs	List	coreDevice*		
ListTagsForResource	Grants permission to list the tags for a resource	Read	component		
			componentVersion		
			coreDevice		
			deployment		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
ResolveComponentCandidates	Grants permission to list components that meet the component, version, and platform requirements of a deployment	List	componentVersion*		
TagResource	Grants permission to add tags to a resource	Tagging	component		
			componentVersion		
			coreDevice		
			deployment		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UntagResource	Grants permission to remove tags from a resource	Tagging	component		
			componentVersion		
			coreDevice		
			deployment		
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateConnectivityInfo	Grants permission to update the connectivity information for a Greengrass core. Any devices that belong to the group that has this core will receive this information in order to find the location of the core and connect to it	Write	connectivityInfo*		iot:GetThingShadow iot:UpdateThingShadow

Resource types defined by AWS IoT Greengrass V2

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
connectivityInfo	arn:${Partition}:greengrass:${Region}:${Account}:/greengrass/things/${ThingName}/connectivityInfo	
component	arn:${Partition}:greengrass:${Region}:${Account}:components:${ComponentName}	aws:ResourceTag/${TagKey}
componentVersion	arn:${Partition}:greengrass:${Region}:${Account}:components:${ComponentName}:versions:${ComponentVersion}	aws:ResourceTag/${TagKey}
coreDevice	arn:${Partition}:greengrass:${Region}:${Account}:coreDevices:${CoreDeviceThingName}	aws:ResourceTag/${TagKey}
deployment	arn:${Partition}:greengrass:${Region}:${Account}:deployments:${DeploymentId}	aws:ResourceTag/${TagKey}

Condition keys for AWS IoT Greengrass V2

AWS IoT Greengrass V2 defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by checking tag key/value pairs included in the request	String
aws:ResourceTag/${TagKey}	Filters access by checking tag key/value pairs associated with a specific resource	String
aws:TagKeys	Filters access by checking tag keys passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS IoT Jobs DataPlane

AWS IoT Jobs DataPlane (service prefix: `iotjobsdata`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS IoT Jobs DataPlane

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeJobExecution	Grants permission to describe a job execution	Read	thing*		
				iot:JobId	
GetPendingJobExecutions	Grants permission to get the list of all jobs for a thing that are not in a terminal state	Read	thing*		
StartNextPendingJobExecution	Grants permission to get and start the next pending job execution for a thing	Write	thing*		
UpdateJobExecution	Grants permission to update a job execution	Write	thing*		
				iot:JobId	

Resource types defined by AWS IoT Jobs DataPlane

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
thing	`arn:${Partition}:iot:${Region}:${Account}:thing/${ThingName}`	

Condition keys for AWS IoT Jobs DataPlane

AWS IoT Jobs DataPlane defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
iot:JobId	Filters access by jobId for iotjobsdata:DescribeJobExecution and iotjobsdata:UpdateJobExecution APIs	String

Actions, resources, and condition keys for AWS IoT Managed Integrations

AWS IoT Managed Integrations (service prefix: `iotmanagedintegrations`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS IoT Managed Integrations

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy,

you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAccountAssociation	Grants permission to create a new account association	Write		aws:RequestTag/${TagKey} aws:TagKeys iotmanagedintegrations:connectorDestinationId	
CreateCloudConnector	Grants permission to create a new cloud connector	Write			
CreateConnectorDestination	Grants permission to create a new connector destination	Write		iotmanagedintegrations:cloudConnectorId	
CreateCredentialLocker	Grants permission to create a product credential locker	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateDestination	Grants permission to create a new destination	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

UpdateOtaTask	Grants permission to update an ota task	Write	ota-task*		

Resource types defined by AWS IoT Managed Integrations

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
account-association	`arn:${Partition}:iotmanagedintegrations:${Region}:${Account}:account-association/${AccountAssociationId}`	aws:ResourceTag/${TagKey}
credential-locker	`arn:${Partition}:iotmanagedintegrations:${Region}:${Account}:credential-locker/${Identifier}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
managed-thing	arn:${Partition}:iotmanagedintegrations:${Region}:${Account}:managed-thing/${Identifier}	aws:ResourceTag/${TagKey}
ota-task	arn:${Partition}:iotmanagedintegrations:${Region}:${Account}:ota-task/${Identifier}	aws:ResourceTag/${TagKey}
provisioning-profile	arn:${Partition}:iotmanagedintegrations:${Region}:${Account}:provisioning-profile/${Identifier}	aws:ResourceTag/${TagKey}

Condition keys for AWS IoT Managed Integrations

AWS IoT Managed Integrations defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by tag keys that are passed in the request	ArrayOfString
iotmanagedintegrat	Filters access by the CloudConnectorId	String

Condition keys	Description	Type
ions:clou dConnectorId		
iotmanage dintegrat ions:conn ectorDest inationId	Filters access by the ConnectorDestinationId	String

Actions, resources, and condition keys for AWS IoT SiteWise

AWS IoT SiteWise (service prefix: `iotsitewise`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS IoT SiteWise

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateAssets	Grants permission to associate a child asset with a parent asset through a hierarchy	Write	asset*		
AssociateTimeSeriesToAssetProperty	Grants permission to associate a time series with an asset property	Write	asset* time-series*		
BatchAssociateProjectAssets	Grants permission to associate assets to a project	Write	project*		
BatchDisassociateProjectAssets	Grants permission to disassociate assets from a project	Write	project*		
BatchGetAssetPropertyAggregates	Grants permission to retrieve computed aggregates for multiple asset properties	Read	asset time-series		
BatchGetAssetPropertyValue	Grants permission to retrieve the latest value for multiple asset properties	Read	asset time-series		
BatchGetAssetPropertyValueHistory	Grants permission to retrieve the value history for multiple asset properties	Read	asset time-series		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchPutAssetPropertyValue	Grants permission to put property values for asset properties	Write	asset		
			time-series		
CreateAccessPolicy	Grants permission to create an access policy for a portal or a project	Write	portal		
			project		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateAsset	Grants permission to create an asset from an asset model	Write	asset-model*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAssetModel	Grants permission to create an asset model	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateAssetModelCompositeModel	Grants permission to create an asset model composite model inside an asset model	Write	asset-model*		
CreateBulkImportJob	Grants permission to create bulk import job	Write			
CreateComputationModel	Grants permission to create a computation model	Write	asset		
			asset-model		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDashboard	Grants permission to create a dashboard in a project	Write	project*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDataset	Grants permission to create a dataset	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateGateway	Grants permission to create a gateway	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreatePortal	Grants permission to create a portal	Write		aws:RequestTag/${TagKey} aws:TagKeys	sso:CreateManagedApplicationInstance sso:DescribeRegisteredRegions

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateProject	Grants permission to create a project in a portal	Write	portal*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAccessPolicy	Grants permission to delete an access policy	Write	access-policy*		
DeleteAsset	Grants permission to delete an asset	Write	asset*		
DeleteAssetModel	Grants permission to delete an asset model	Write	asset-model*		
DeleteAssetModelCompositeModel	Grants permission to delete an asset model composite model	Write	asset-model*		
DeleteAssetModelInterfaceRelationship	Grants permission to delete a relationship between asset model and interface	Write	asset-model*		
DeleteComputationModel	Grants permission to delete a computation model	Write	computation-model*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteDashboard	Grants permission to delete a dashboard	Write	dashboard*		
DeleteDataset	Grants permission to delete a dataset	Write	dataset*		
DeleteGateway	Grants permission to delete a gateway	Write	gateway*		
DeletePortal	Grants permission to delete a portal	Write	portal*		sso:DeleteManagedApplicationInstance
DeleteProject	Grants permission to delete a project	Write	project*		
DeleteTimeSeries	Grants permission to delete a time series	Write	asset		
			time-series		
DescribeAccessPolicy	Grants permission to describe an access policy	Read	access-policy*		
DescribeAction	Grants permission to describe actions	Read	asset		
			computation-model		
DescribeAsset	Grants permission to describe an asset	Read	asset*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeAssetCompositeModel	Grants permission to describe an asset composite model	Read	asset*		
DescribeAssetModel	Grants permission to describe an asset model	Read	asset-model*		
DescribeAssetModelCompositeModel	Grants permission to describe an asset model composite model	Read	asset-model*		
DescribeAssetModelInterfaceRelationship	Grants permission to describe a relationship between asset model and interface	Read	asset-model*		
DescribeAssetProperty	Grants permission to describe an asset property	Read	asset*		
DescribeBulkImportJob	Grants permission to describe bulk import job	Read			
DescribeComputationModel	Grants permission to describe a computation model	Read	computation-model*		
DescribeComputationModelExecutionSummary	Grants permission to describe computation model execution summary	Read	computation-model*		
			asset		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeDashboard	Grants permission to describe a dashboard	Read	dashboard*		
DescribeDataset	Grants permission to describe dataset	Read	dataset*		
DescribeDefaultEncryptionConfiguration	Grants permission to describe the default encryption configuration for the AWS account	Read			
DescribeExecution	Grants permission to describe an execution	Read			
DescribeGateway	Grants permission to describe a gateway	Read	gateway*		
DescribeGatewayCapabilityConfiguration	Grants permission to describe a capability configuration for a gateway	Read	gateway*		
DescribeLoggingOptions	Grants permission to describe logging options for the AWS account	Read			
DescribePortal	Grants permission to describe a portal	Read	portal*		
DescribeProject	Grants permission to describe a project	Read	project*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeStorageConfiguration	Grants permission to describe the storage configuration for the AWS account	Read			
DescribeTimeSeries	Grants permission to describe a time series	Read	asset		
			time-series		
				aws:RequestTag/${TagKey} aws:TagKeys	
DisassociateAssets	Grants permission to disassociate a child asset from a parent asset by a hierarchy	Write	asset*		
DisassociateTimeSeriesFromAssetProperty	Grants permission to disassociate a time series from an asset property	Write	asset*		
			time-series*		
EnableSiteWiseIntegration [permission only]	Grants permission to allow IoT SiteWise integrate with other services	Write			
ExecuteAction	Grants permission to execute actions	Write	asset		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			computation-model		
ExecuteQuery	Grants permission to execute query	Read			
GetAssetPropertyAggregates	Grants permission to retrieve computed aggregates for an asset property	Read	asset		
			time-series		
GetAssetPropertyValue	Grants permission to retrieve the latest value for an asset property	Read	asset		
			time-series		
GetAssetPropertyValueHistory	Grants permission to retrieve the value history for an asset property	Read	asset		
			time-series		
GetInterpolatedAssetPropertyValues	Grants permission to retrieve interpolated values for an asset property	Read	asset		
			time-series		
InvokeAssistant	Grants permission to invoke an assistant	Read			
ListAccessPolicies	Grants permission to list all access policies for an identity or a resource	List	portal		
			project		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListActions	Grants permission to list all actions	List	asset		
			computation-model		
ListAssetModelCompositeModels	Grants permission to list all asset model composite models	List	asset-model*		
ListAssetModelProperties	Grants permission to list asset model properties	List	asset-model*		
ListAssetModels	Grants permission to list all asset models	List			
ListAssetProperties	Grants permission to list asset properties	List	asset*		
ListAssetRelationships	Grants permission to list the asset relationship graph for an asset	List	asset*		
ListAssets	Grants permission to list all assets	List	asset-model		
ListAssociatedAssets	Grants permission to list all assets associated with an asset through a hierarchy	List	asset*		
ListBulkImportJobs	Grants permission to list bulk import jobs	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListCompositionRelationships	Grants permission to list all asset model composition relationships	List	asset-model*		
ListComputationModelDataBindingUsages	Grants permission to list computation model data binding usages	List	asset		
			asset-model		
ListComputationModelResolveToResources	Grants permission to list computation model resolve to resources	List	computation-model*		
ListComputationModels	Grants permission to list all computation models	List			
ListDashboards	Grants permission to list all dashboards in a project	List	project*		
ListDatasets	Grants permission to list all datasets	List			
ListExecutions	Grants permission to list executions	List	asset		
			computation-model		
ListGateways	Grants permission to list all gateways	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListInterfaceRelationships	Grants permission to list all asset models that are enforced by an interface	List	asset-model*		
ListPortals	Grants permission to list all portals	List			
ListProjectAssets	Grants permission to list all assets associated with a project	List	project*		
ListProjects	Grants permission to list all projects in a portal	List	portal*		
ListTagsForResource	Grants permission to list all tags for a resource	Read	access-policy		
			asset		
			asset-model		
			computation-model		
			dashboard		
			dataset		
			gateway		
			portal		
			project		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			time-series		
				aws:ResourceTag/${TagKey}	
ListTimeSeries	Grants permission to list time series	List	asset		
PutAssetModelInterfaceRelationship	Grants permission to create a relationship between asset model and interface	Write	asset-model*		
PutDefaultEncryptionConfiguration	Grants permission to set the default encryption configuration for the AWS account	Write			
PutLoggingOptions	Grants permission to set logging options for the AWS account	Write			
PutStorageConfiguration	Grants permission to configure storage settings for the AWS account	Write			
TagResource	Grants permission to tag a resource	Tagging	access-policy		
			asset		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			asset-model		
			computation-model		
			dashboard		
			dataset		
			gateway		
			portal		
			project		
			time-series		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to untag a resource	Tagging	access-policy		
			asset		
			asset-model		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			computation-model		
			dashboard		
			dataset		
			gateway

				aws:TagKeys	
UpdateAccessPolicy	Grants permission to update an access policy	Write	access-policy*		
UpdateAsset	Grants permission to update an asset	Write	asset*		
UpdateAssetModel	Grants permission to update an asset model	Write	asset-model*		
UpdateAssetModelCompositeModel	Grants permission to update asset model composite model	Write	asset-model*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAssetModelPropertyRouting [permission only]	Grants permission to update an AssetModel property routing	Write	asset-model*		
UpdateAssetProperty	Grants permission to update an asset property	Write	asset*		
UpdateComputationModel	Grants permission to update a computation model	Write	computation-model*		
			asset		
			asset-model		
UpdateDashboard	Grants permission to update a dashboard	Write	dashboard*		
UpdateDataset	Grants permission to update a dataset	Write	dataset*		
UpdateGateway	Grants permission to update a gateway	Write	gateway*		
UpdateGatewayCapabilityConfiguration	Grants permission to update a capability configuration for a gateway	Write	gateway*		
UpdatePortal	Grants permission to update a portal	Write	portal*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateProject	Grants permission to update a project	Write	project*		

Resource types defined by AWS IoT SiteWise

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
asset	`arn:${Partition}:iotsitewise:${Region}:${Account}:asset/${AssetId}`	aws:ResourceTag/${TagKey}
asset-model	`arn:${Partition}:iotsitewise:${Region}:${Account}:asset-model/${AssetModelId}`	aws:ResourceTag/${TagKey}
time-series	`arn:${Partition}:iotsitewise:${Region}:${Account}:time-series/${TimeSeriesId}`	aws:ResourceTag/${TagKey}
gateway	`arn:${Partition}:iotsitewise:${Region}:${Account}:gateway/${GatewayId}`	aws:ResourceTag/${TagKey}
portal	`arn:${Partition}:iotsitewise:${Region}:${Account}:portal/${PortalId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
project	arn:${Partition}:iotsitewise:${Region}:${Account}:project/${ProjectId}	aws:ResourceTag/${TagKey}
dashboard	arn:${Partition}:iotsitewise:${Region}:${Account}:dashboard/${DashboardId}	aws:ResourceTag/${TagKey}
access-policy	arn:${Partition}:iotsitewise:${Region}:${Account}:access-policy/${AccessPolicyId}	aws:ResourceTag/${TagKey}
dataset	arn:${Partition}:iotsitewise:${Region}:${Account}:dataset/${DatasetId}	aws:ResourceTag/${TagKey}
computation-model	arn:${Partition}:iotsitewise:${Region}:${Account}:computation-model/${ComputationModelId}	aws:ResourceTag/${TagKey}

Condition keys for AWS IoT SiteWise

AWS IoT SiteWise defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags attached to the resource	String

Condition keys	Description	Type
aws:TagKeys	Filters access by the tag keys in the request	ArrayOfString
iotsitewise:assetHierarchyPath	Filters access by an asset hierarchy path, which is the string of asset IDs in the asset's hierarchy, each separated by a forward slash	String
iotsitewise:childAssetId	Filters access by the ID of a child asset being associated whith a parent asset	String
iotsitewise:group	Filters access by the ID of an AWS Single Sign-On group	String
iotsitewise:iam	Filters access by the ID of an AWS IAM identity	String
iotsitewise:isAssociatedWithAssetProperty	Filters access by data streams associated with or not associated with asset properties	String
iotsitewise:portal	Filters access by the ID of a portal	String
iotsitewise:project	Filters access by the ID of a project	String
iotsitewise:propertyAlias	Filters access by the property alias	String
iotsitewise:propertyId	Filters access by the ID of an asset property	String
iotsitewise:user	Filters access by the ID of an AWS Single Sign-On user	String

Actions, resources, and condition keys for AWS IoT TwinMaker

AWS IoT TwinMaker (service prefix: `iottwinmaker`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS IoT TwinMaker

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchPutPropertyValues	Grants permission to set values for multiple time series properties	Write	workspace*		iottwinmaker:GetComponentType iottwinmaker:GetEntity iottwinmaker:GetWorkspace

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			entity		
CancelMetadataTransferJob	Grants permission to cancel a metadata transfer job	Write	metadataTransferJob*		
CreateComponentType	Grants permission to create a componentType	Write	workspace*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateEntity	Grants permission to create an entity	Write	workspace*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateMetadataTransferJob	Grants permission to create a metadata transfer job	Write			
CreateScene	Grants permission to create a scene	Write	workspace*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSyncJob	Grants permission to create a sync job	Write	workspace*

Resource types defined by AWS IoT TwinMaker

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
workspace	`arn:${Partition}:iottwinmaker:${Region}:${Account}:workspace/${WorkspaceId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
entity	arn:${Partition}:iottwinmaker:${Region}:${Account}:workspace/${WorkspaceId}/entity/${EntityId}	aws:ResourceTag/${TagKey}
componentType	arn:${Partition}:iottwinmaker:${Region}:${Account}:workspace/${WorkspaceId}/component-type/${ComponentTypeId}	aws:ResourceTag/${TagKey}
scene	arn:${Partition}:iottwinmaker:${Region}:${Account}:workspace/${WorkspaceId}/scene/${SceneId}	aws:ResourceTag/${TagKey}
syncJob	arn:${Partition}:iottwinmaker:${Region}:${Account}:workspace/${WorkspaceId}/sync-job/${SyncJobId}	aws:ResourceTag/${TagKey}
metadataTransferJob	arn:${Partition}:iottwinmaker:${Region}:${Account}:metadata-transfer-job/${MetadataTransferJobId}	

Condition keys for AWS IoT TwinMaker

AWS IoT TwinMaker defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags attached to the resource	String
aws:TagKeys	Filters access by the tag keys in the request	ArrayOfString
iottwinmaker:destinationType	Filters access by destination type of metadata transfer job	ArrayOfString
iottwinmaker:linkedServices	Filters access by workspace linked to services	ArrayOfString
iottwinmaker:sourceType	Filters access by source type of metadata transfer job	ArrayOfString

Actions, resources, and condition keys for AWS IoT Wireless

AWS IoT Wireless (service prefix: `iotwireless`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS IoT Wireless

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateAwsAccountWithPartnerAccount	Grants permission to link partner accounts with AWS account	Write		aws:RequestTag/${TagKey} aws:TagKeys	
AssociateMulticastGroupWithFuotaTask	Grants permission to associate the MulticastGroup with FuotaTask	Write	FuotaTask* MulticastGroup*		
AssociateWirelessDeviceWithFuotaTask	Grants permission to associate the wireless device with FuotaTask	Write	FuotaTask* WirelessDevice*		
AssociateWirelessDeviceWithMulticastGroup	Grants permission to associate the WirelessDevice with MulticastGroup	Write	MulticastGroup* WirelessDevice*		
AssociateWirelessD	Grants permission to associate the wireless device	Write	WirelessDevice*		iot:DescribeThing

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
eviceWithThing	with AWS IoT thing for a given wirelessDeviceId		thing*		
AssociateWirelessGatewayWithCertificate	Grants permission to associate a WirelessGateway with the IoT Core Identity certificate	Write	WirelessGateway*		
			cert*		
AssociateWirelessGatewayWithThing	Grants permission to associate the wireless gateway with AWS IoT thing for a given wirelessGatewayId	Write	WirelessGateway*		iot:DescribeThing
			thing*		
CancelMulticastGroupSession	Grants permission to cancel the MulticastGroup session	Write	MulticastGroup*		
CreateDestination	Grants permission to create a Destination resource	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateDeviceProfile	Grants permission to create a DeviceProfile resource	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateFuotaTask	Grants permission to create a FuotaTask resource	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateMulticastGroup	Grants permission to create a MulticastGroup resource	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateNetworkAnalyzerConfiguration	Grants permission to create a NetworkAnalyzerConfiguration resource	Write	MulticastGroup*		
			WirelessDevice*		
			WirelessGateway*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

CreateWirelessDevice	Grants permission to create a WirelessDevice resource with given Destination	Write	Destination		
			DeviceProfile		
			ServiceProfile		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateWirelessGateway	Grants permission to create a WirelessGateway resource	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateWirelessGatewayTask	Grants permission to create a task for a given WirelessGateway	Write	WirelessGateway*		
CreateWirelessGatewayTaskDefinition	Grants permission to create a WirelessGateway task definition	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteDestination	Grants permission to delete a Destination	Write	Destination*		
DeleteDeviceProfile	Grants permission to delete a DeviceProfile	Write	DeviceProfile*		
DeleteFuotaTask	Grants permission to delete the FuotaTask	Write	FuotaTask*		
DeleteMulticastGroup	Grants permission to delete the MulticastGroup	Write	MulticastGroup*		
DeleteNetworkAnalyzerConfiguration	Grants permission to delete the NetworkAnalyzerConfiguration	Write	NetworkAnalyzerConfiguration*		
DeleteQueuedMessages	Grants permission to delete QueuedMessages	Write			
DeleteServiceProfile	Grants permission to delete a ServiceProfile	Write	ServiceProfile*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteWirelessDevice	Grants permission to delete a WirelessDevice	Write	WirelessDevice*		
DeleteWirelessDeviceImportTask	Grants permission to delete the wireless device import task	Write	ImportTask*		
DeleteWirelessGateway	Grants permission to delete a WirelessGateway	Write	WirelessGateway*		
DeleteWirelessGatewayTask	Grants permission to delete task for a given WirelessGateway	Write	WirelessGateway*		
DeleteWirelessGatewayTaskDefinition	Grants permission to delete a WirelessGateway task definition	Write	WirelessGatewayTaskDefinition*		
DeregisterWirelessDevice	Grants permission to deregister wireless device	Write	WirelessDevice*		
DisassociateAwsAccountFromPartnerAccount	Grants permission to disassociate an AWS account from a partner account	Write	SidewalkAccount*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisassociateMulticastGroupFromFuotaTask	Grants permission to disassociate the MulticastGroup from FuotaTask	Write	FuotaTask*		
			MulticastGroup*		
DisassociateWirelessDeviceFromFuotaTask	Grants permission to disassociate the wireless device from FuotaTask	Write	FuotaTask*		
			WirelessDevice*		
DisassociateWirelessDeviceFromMulticastGroup	Grants permission to disassociate the wireless device from MulticastGroup	Write	MulticastGroup*		
			WirelessDevice*		
DisassociateWirelessDeviceFromThing	Grants permission to disassociate a wireless device from a AWS IoT thing	Write	WirelessDevice*		iot:DescribeThing
			thing*		
DisassociateWirelessGatewayFromCertificate	Grants permission to disassociate a WirelessGateway from a IoT Core Identity certificate	Write	WirelessGateway*		
			cert*		
DisassociateWirelessGatewayFromThing	Grants permission to disassociate a WirelessGateway from a IoT Core thing	Write	WirelessGateway*		iot:DescribeThing
			thing*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDestination	Grants permission to get the Destination	Read	Destination*		
GetDeviceProfile	Grants permission to get the DeviceProfile	Read	DeviceProfile*		
GetEventConfigurationByResourceTypes	Grants permission to get event configuration by resource types	Read			
GetFuotaTask	Grants permission to get the FuotaTask	Read	FuotaTask*		
GetLogLevelsByResourceTypes	Grants permission to get log levels by resource types	Read			
GetMetricConfiguration	Grants permission to get metric configuration	Read			
GetMetrics	Grants permission to get metrics	Read			
GetMulticastGroup	Grants permission to get the MulticastGroup	Read	MulticastGroup*		
GetMulticastGroupSession	Grants permission to get the MulticastGroup session	Read	MulticastGroup*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetNetworkAnalyzerConfiguration	Grants permission to get the NetworkAnalyzerConfiguration	Read	NetworkAnalyzerConfiguration*		
GetPartnerAccount	Grants permission to get the associated PartnerAccount	Read	SidewalkAccount*		
GetPosition	Grants permission to get position for a given resource	Read	WirelessDevice		
			WirelessGateway		
GetPositionConfiguration	Grants permission to get position configuration for a given resource	Read	WirelessDevice		
			WirelessGateway		
GetPositionEstimate	Grants permission to get position estimate	Read			
GetResourceEventConfiguration	Grants permission to get an event configuration for an identifier	Read	SidewalkAccount		
			WirelessDevice		
			WirelessGateway		
GetResourceLogLevel	Grants permission to get resource log level	Read	WirelessDevice		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			WirelessGateway		
GetResourcePosition	Grants permission to get position for a given resource	Read	WirelessDevice		
			WirelessGateway		
GetServiceEndpoint	Grants permission to retrieve the customer account specific endpoint for CUPS protocol connection or LoRaWAN Network Server (LNS) protocol connection, and optionally server trust certificate in PEM format	Read			
GetServiceProfile	Grants permission to get the ServiceProfile	Read	ServiceProfile*		
GetWirelessDevice	Grants permission to get the WirelessDevice	Read	WirelessDevice*		
GetWirelessDeviceImportTask	Grants permission to get the wireless device import task	Read	ImportTask*		
GetWirelessDeviceStatistics	Grants permission to get statistics info for a given WirelessDevice	Read	WirelessDevice*		
GetWirelessGateway	Grants permission to get the WirelessGateway	Read	WirelessGateway*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetWirelessGatewayCertificate	Grants permission to get the IoT Core Identity certificate id associated with the WirelessGateway	Read	WirelessGateway*		
GetWirelessGatewayFirmwareInformation	Grants permission to get Current firmware version and other information for the WirelessGateway	Read	WirelessGateway*		
GetWirelessGatewayStatistics	Grants permission to get statistics info for a given WirelessGateway	Read	WirelessGateway*		
GetWirelessGatewayTask	Grants permission to get the task for a given WirelessGateway	Read	WirelessGateway*		
GetWirelessGatewayTaskDefinition	Grants permission to get the given WirelessGateway task definition	Read	WirelessGatewayTaskDefinition*		
ListDestinations	Grants permission to list information of available Destinations based on the AWS account	Read			
ListDeviceProfiles	Grants permission to list information of available DeviceProfiles based on the AWS account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDevicesForWirelessDeviceImportTask	Grants permission to list information of devices by wireless device import task based on the AWS account	Read	ImportTask*		
ListEventConfigurations	Grants permission to list information of available event configurations based on the AWS account	Read			
ListFuotaTasks	Grants permission to list information of available FuotaTasks based on the AWS account	Read			
ListMulticastGroups	Grants permission to list information of available MulticastGroups based on the AWS account	Read			
ListMulticastGroupsByFuotaTask	Grants permission to list information of available MulticastGroups by FuotaTask based on the AWS account	Read	FuotaTask*		
ListNetworkAnalyzerConfigurations	Grants permission to list information of available NetworkAnalyzerConfigurations based on the AWS account	Read			
ListPartnerAccounts	Grants permission to list the available partner accounts	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListPositionConfigurations	Grants permission to list information of available position configurations based on the AWS account	Read			
ListQueuedMessages	Grants permission to list the Queued Messages	Read			
ListServiceProfiles	Grants permission to list information of available ServiceProfiles based on the AWS account	Read			
ListTagsForResource	Grants permission to list all tags for a given resource	Read	Destination		
			DeviceProfile		
			FuotaTask		
			ImportTask		
			MulticastGroup		
			NetworkAnalyzerConfiguration		
			ServiceProfile		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

Resource types defined by AWS IoT Wireless

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
WirelessDevice	arn:${Partition}:iotwireless:${Region}:${Account}:WirelessDevice/${WirelessDeviceId}	aws:ResourceTag/${TagKey}
WirelessGateway	arn:${Partition}:iotwireless:${Region}:${Account}:WirelessGateway/${WirelessGatewayId}	aws:ResourceTag/${TagKey}
DeviceProfile	arn:${Partition}:iotwireless:${Region}:${Account}:DeviceProfile/${DeviceProfileId}	aws:ResourceTag/${TagKey}
ServiceProfile	arn:${Partition}:iotwireless:${Region}:${Account}:ServiceProfile/${ServiceProfileId}	aws:ResourceTag/${TagKey}
Destination	arn:${Partition}:iotwireless:${Region}:${Account}:Destination/${DestinationName}	aws:ResourceTag/${TagKey}
SidewalkAccount	arn:${Partition}:iotwireless:${Region}:${Account}:SidewalkAccount/${SidewalkAccountId}	aws:ResourceTag/${TagKey}
WirelessGatewayTaskDefinition	arn:${Partition}:iotwireless:${Region}:${Account}:WirelessGatewayTaskDefinition/${WirelessGatewayTaskDefinitionId}	aws:ResourceTag/${TagKey}
FuotaTask	arn:${Partition}:iotwireless:${Region}:${Account}:FuotaTask/${FuotaTaskId}	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
Multicast Group	arn:${Partition}:iotwireless:${Region}:${Account}:MulticastGroup/${MulticastGroupId}	aws:ResourceTag/${TagKey}
NetworkAnalyzerConfiguration	arn:${Partition}:iotwireless:${Region}:${Account}:NetworkAnalyzerConfiguration/${NetworkAnalyzerConfigurationName}	aws:ResourceTag/${TagKey}
thing	arn:${Partition}:iot:${Region}:${Account}:thing/${ThingName}	
cert	arn:${Partition}:iot:${Region}:${Account}:cert/${Certificate}	
ImportTask	arn:${Partition}:iotwireless:${Region}:${Account}:ImportTask/${ImportTaskId}	aws:ResourceTag/${TagKey}

Condition keys for AWS IoT Wireless

AWS IoT Wireless defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key that is present in the request that the user makes to IoT Wireless	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by tag key component of a tag attached to an IoT Wireless resource	String
aws:TagKeys	Filters access by the list of all the tag key names associated with the resource in the request	ArrayOfString
iotwireless:DestinationName	Filters access by destination name associated with the IoT Wireless resource	String
iotwireless:DeviceProfileId	Filters access by device profile id associated with the IoT Wireless resource	String
iotwireless:ServiceProfileId	Filters access by service profile id associated with the IoT Wireless resource	String

Actions, resources, and condition keys for AWS IQ

AWS IQ (service prefix: `iq`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

- Condition keys for AWS IQ

Actions defined by AWS IQ

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptCall	Grants permission to accept an incoming voice/video call	Write	call*		
ApprovePaymentRequest	Grants permission to approve a payment request	Write	paymentRequest*		
ApproveProposal	Grants permission to approve a proposal	Write	proposal*		
ArchiveConversation	Grants permission to archive a conversation	Write	conversation*		
CompleteProposal	Grants permission to complete a proposal	Write	proposal*		
CreateConversation	Grants permission to respond to a request or send a direct message to initiate a conversation	Write			
CreateExpert	Grants permission to create an expert profile	Write			
CreateListing	Grants permission to create a listing	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateMilestoneProposal	Grants permission to create a milestone proposal	Write			
CreatePaymentRequest	Grants permission to create a payment request	Write			
CreateProject	Grants permission to submit new requests	Write			
CreateRequest	Grants permission to submit new requests	Write			
CreateScheduledProposal	Grants permission to create a scheduled proposal	Write			
CreateSeller	Grants permission to create a seller profile	Write			
CreateUpfrontProposal	Grants permission to create an upfront proposal	Write			
DeclineCall	Grants permission to decline an incoming voice/video call	Write	call*		
DeleteAttachment	Grants permission to delete an existing attachment	Write	attachment*		
DisableIndividualPublicProfile	Grants permission to disable individual public profile page	Write	expert*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DownloadAttachment	Grants permission to download existing attachment	Read	attachment*		
EnableIndividualPublicProfile	Grants permission to enable individual public profile page	Write	expert*		
EndCall	Grants permission to end a voice/video call	Write	call*		
GetBuyer	Grants permission to read buyer information	Read	buyer*		
GetCall	Grants permission to read details of a voice/video call	Read	call*		
GetChatInfo	Grants permission to read the chat environment details about a conversation	Read	conversation*		
GetChatMessages	Grants permission to read chat messages in a conversation	Read	conversation*		
GetChatToken	Grants permission to request a websocket token for the conversation notifications	Read	token*		
GetCompanyChatMessages	Grants permission to read chat messages in a company conversation	Read	conversation*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCompanyProfile	Grants permission to read a company profile	Read	company*		
GetConversation	Grants permission to read details of a conversation	Read	conversation*		
GetExpert	Grants permission to read expert information	Read	expert*		
GetListing	Grants permission to read a listing	Read	listing*		
GetMarketplaceSeller	Grants permission to read a seller profile information	Read	seller*		
GetPaymentRequest	Grants permission to read a payment request	Read	paymentRequest*		
GetProposal	Grants permission to read a proposal	Read	proposal*		
GetRequest	Grants permission to get a created request	Read	request*		
GetReview	Grants permission to read a review for an expert	Read	seller*		
HideRequest	Grants permission to hide a request	Write	request*		
InitiateCall	Grants permission to start a voice/video call	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
LinkAwsCertification	Grants permission to link an AWS certification to individual profile	Write	expert*		
ListAttachments	Grants permission to list existing attachments	List	attachment*		
ListConversations	Grants permission to list existing conversations	Read	conversation*		
ListExpertAccessLogs	Grants permission to list access logs of expert activity	Read	permission*		
ListListings	Grants permission to list listings	Read	listing*		
ListPaymentRequests	Grants permission to list payment requests	Read	paymentRequest		
			paymentSchedule		
ListProposals	Grants permission to list proposals	Read	proposal*		
ListRequests	Grants permission to list requests that are created	Read	request*		
ListReviews	Grants permission to list reviews for an expert	Read	seller*		
MarkChatMessageRead	Grants permission to mark a message as read in a conversation	Write	conversation*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RejectPaymentRequest	Grants permission to reject a payment request	Write	paymentRequest*		
RejectProposal	Grants permission to reject a proposal	Write	proposal*		
SendCompanyChatMessage	Grants permission to send a message in a conversation as a company	Write	conversation*		
SendIndividualChatMessage	Grants permission to send a message in a conversation as an individual	Write	conversation*		
UnarchiveConversation	Grants permission to unarchive a conversation	Write	conversation*		
UnlinkAwsCertification	Grants permission to unlink an AWS certification from individual profile	Write	expert*		
UpdateCompanyProfile	Grants permission to update a company profile	Write	company*		
UpdateConversationMembers	Grants permission to add more participants into a conversation	Write	conversation*		
UpdateExpert	Grants permission to update an expert information	Write	expert*		
UpdateListing	Grants permission to update a listing	Write	listing*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateRequest	Grants permission to update a request	Write	request*		
UploadAttachment	Grants permission to upload an attachment	Write			
WithdrawPaymentRequest	Grants permission to withdraw a payment request	Write	paymentRequest*		
WithdrawProposal	Grants permission to withdraw a proposal	Write	proposal*		
WriteReview	Grants permission to write a review for an expert	Write	seller*		

Resource types defined by AWS IQ

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
conversation	`arn:${Partition}:iq:${Region}::conversation/${ConversationId}`	
buyer	`arn:${Partition}:iq:${Region}::buyer/${BuyerId}`	

Resource types	ARN	Condition keys
expert	arn:${Partition}:iq:${Region}::expert/${ExpertId}	
call	arn:${Partition}:iq:${Region}::call/${CallId}	
token	arn:${Partition}:iq:${Region}::token/${TokenId}	
proposal	arn:${Partition}:iq:${Region}::proposal/${ConversationId}/${ProposalId}	
paymentRequest	arn:${Partition}:iq:${Region}::paymentRequest/${ConversationId}/${ProposalId}/${PaymentRequestId}	
paymentSchedule	arn:${Partition}:iq:${Region}::paymentSchedule/${ConversationId}/${ProposalId}/${VersionId}	
seller	arn:${Partition}:iq:${Region}::seller/${SellerAwsAccountId}	
company	arn:${Partition}:iq:${Region}::company/${CompanyId}	
request	arn:${Partition}:iq:${Region}::request/${RequestId}	
listing	arn:${Partition}:iq:${Region}::listing/${ListingId}	
attachment	arn:${Partition}:iq:${Region}::attachment/${AttachmentId}	

Resource types	ARN	Condition keys
permission	arn:${Partition}:iq-permission:${Region}::permission/${PermissionRequestId}	

Condition keys for AWS IQ

IQ has no service-specific context keys that can be used in the Condition element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS IQ Permissions

AWS IQ Permissions (service prefix: iq-permission) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by AWS IQ Permissions

You can specify the following actions in the Action element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ApproveAccessGrant	Grants permission to approve a permission request	Write	permission*		
ApprovePermissionRequest	Grants permission to approve a permission request	Write	permission*		
AssumePermissionRole	Grants permission to obtain a set of temporary security credentials for experts which they can use to access buyers' AWS resources	Write	permission*		
CreatePermissionRequest	Grants permission to create a permission request	Write	permission*		
GetPermissionRequest	Grants permission to get a permission request	Read	permission*		
ListPermissionRequests	Grants permission to list permission requests	Read	permission*		
RejectPermissionRequest	Grants permission to reject a permission request	Write	permission*		
RevokePermissionRequest	Grants permission to revoke a permission request which was previously approved	Write	permission*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
WithdrawPermissionRequest	Grants permission to withdraw a permission request that has not been approved or declined	Write	permission*		

Resource types defined by AWS IQ Permissions

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
permission	`arn:${Partition}:iq-permission:${Region}::permission/${PermissionRequestId}`	

Condition keys for AWS IQ Permissions

IQ Permission has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Kendra

Amazon Kendra (service prefix: `kendra`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.

Topics

Actions defined by Amazon Kendra

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateEntitiesToExperience	Grants permission to put principal mapping in index	Write	experience*		
			index*		
AssociatePersonasToEntities	Defines the specific permissions of users or groups in your AWS SSO identity source with access to your Amazon Kendra experience	Write	experience*		
			index*		
BatchDeleteDocument	Grants permission to batch delete document	Write	index*		
BatchDeleteFeaturedResultsSet	Grants permission to delete a featured results set	Write	featured-results-set*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			index*		
BatchGetDocumentStatus	Grants permission to do batch get document status	Read	index*		
BatchPutDocument	Grants permission to batch put document	Write	index*		
ClearQuerySuggestions	Grants permission to clear out the suggestions for a given index, generated so far	Write	index*		
CreateAccessControlConfiguration	Grants permission to create an access control configuration	Write	index*		
CreateDataSource	Grants permission to create a data source	Write	index*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateExperience	Creates an Amazon Kendra experience such as a search application	Write	index*		
CreateFaq	Grants permission to create an Faq	Write	index*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateFeaturedResultsSet	Grants permission to create a featured results set	Write	index*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateIndex	Grants permission to create an Index	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateQuerySuggestionsBlockList	Grants permission to create a QuerySuggestions BlockList	Write	index*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys

Resource types defined by Amazon Kendra

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
index	`arn:${Partition}:kendra:${Region}:${Account}:index/${IndexId}`	aws:ResourceTag/${TagKey}
data-source	`arn:${Partition}:kendra:${Region}:${Account}:index/${IndexId}/data-source/${DataSourceId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
faq	arn:${Partition}:kendra:${Region}:${Account}:index/${IndexId}/faq/${FaqId}	aws:ResourceTag/${TagKey}
experience	arn:${Partition}:kendra:${Region}:${Account}:index/${IndexId}/experience/${ExperienceId}	
thesaurus	arn:${Partition}:kendra:${Region}:${Account}:index/${IndexId}/thesaurus/${ThesaurusId}	aws:ResourceTag/${TagKey}
query-suggestions-block-list	arn:${Partition}:kendra:${Region}:${Account}:index/${IndexId}/query-suggestions-block-list/${QuerySuggestionsBlockListId}	aws:ResourceTag/${TagKey}
featured-results-set	arn:${Partition}:kendra:${Region}:${Account}:index/${IndexId}/featured-results-set/${FeaturedResultsSetId}	aws:ResourceTag/${TagKey}
access-control-configuration	arn:${Partition}:kendra:${Region}:${Account}:index/${IndexId}/access-control-configuration/${AccessControlConfigurationId}	

Condition keys for Amazon Kendra

Amazon Kendra defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Kendra Intelligent Ranking

Amazon Kendra Intelligent Ranking (service prefix: `kendra-ranking`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon Kendra Intelligent Ranking

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateRescoreExecutionPlan	Grants permission to create a RescoreExecutionPlan	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteRescoreExecutionPlan	Grants permission to delete a RescoreExecutionPlan	Write	rescore-execution-plan*		
DescribeRescoreExecutionPlan	Grants permission to describe a RescoreExecutionPlan	Read	rescore-execution-plan*		
ListRescoreExecutionPlans	Grants permission to list all RescoreExecutionPlans	List			
ListTagsForResource	Grants permission to list tags for a resource	Read	rescore-execution-plan		
Rescore	Grants permission to Rescore documents with Kendra Intelligent Ranking	Read	rescore-execution-plan*		
TagResource	Grants permission to tag a resource with given key value pairs	Tagging	rescore-execution-plan		
				aws:RequestTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove the tag with the given key from a resource	Tagging	rescore-execution-plan		
				aws:TagKeys	
UpdateRescoreExecutionPlan	Grants permission to update a RescoreExecutionPlan	Write	rescore-execution-plan*		

Resource types defined by Amazon Kendra Intelligent Ranking

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
rescore-execution-plan	`arn:${Partition}:kendra-ranking:${Region}:${Account}:rescore-execution-plan/${RescoreExecutionPlanId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Kendra Intelligent Ranking

Amazon Kendra Intelligent Ranking defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for AWS Key Management Service

AWS Key Management Service (service prefix: `kms`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Key Management Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelKeyDeletion	Controls permission to cancel the scheduled deletion of an AWS KMS key	Write	key*		
				kms:CallerAccount kms:ViaService	
ConnectCustomKeyStore	Controls permission to connect or reconnect a custom key store to its associated AWS CloudHSM cluster or external key manager outside of AWS	Write		kms:CallerAccount	
CreateAlias	Controls permission to create an alias for an AWS KMS key. Aliases are optional friendly names that you can associate with KMS keys	Write	alias*		
			key*

				kms:RecipientAttestation:PCR24 kms:RecipientAttestation:PCR25 kms:RecipientAttestation:PCR26 kms:RecipientAttestation:PCR27 kms:RecipientAttestation:PCR28 kms:RecipientAttestation:PCR29 kms:RecipientAttestation:PCR30	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				kms:RecipientAttestation:PCR31	
GetKeyPolicy	Controls permission to view the key policy for the specified AWS KMS key	Read	key*		
				kms:CallerAccount kms:ViaService	
GetKeyRotationStatus	Controls permission to view the key rotation status for an AWS KMS key	Read	key*		
				kms:CallerAccount kms:ViaService	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetParametersForImport	Controls permission to get data that is required to import cryptographic material into a customer managed key, including a public key and import token	Read	key*		
				kms:CallerAccount kms:ViaService kms:WrappingAlgorithm kms:WrappingKeySpec	
GetPublicKey	Controls permission to download the public key of an asymmetric AWS KMS key	Read	key*		
				kms:CallerAccount kms:RequestAlias kms:ViaService	
ImportKeyMaterial	Controls permission to import cryptographic material into an AWS KMS key	Write	key*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				kms:CallerAccount kms:ExpirationModel kms:ValidTo kms:ViaService	
ListAliases	Controls permission to view the aliases that are defined in the account. Aliases are optional friendly names that you can associate with AWS KMS keys	List			
ListGrants	Controls permission to view all grants for an AWS KMS key	List	key*		
				kms:CallerAccount kms:GrantIsForAWSResource kms:ViaService	
ListKeyPolicies		List	key*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	Controls permission to view the names of key policies for an AWS KMS key			kms:CallerAccount kms:ViaService	
ListKeyRotations	Controls permission to view the list of key materials for an AWS KMS key	List	key*		
				kms:CallerAccount kms:ViaService	
ListKeys	Controls permission to view the key ID and Amazon Resource Name (ARN) of all AWS KMS keys in the account	List			
ListResourceTags	Controls permission to view all tags that are attached to an AWS KMS key	List	key*		
				kms:CallerAccount kms:ViaService	
ListRetirableGrants	Controls permission to view grants in which the specified principal is the retiring principal. Other principals might be able to retire the grant and this principal might be able to retire other grants	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutKeyPolicy	Controls permission to replace the key policy for the specified AWS KMS key	Permissions management	key*		
				kms:BypassPolicyLockoutSafetyCheck kms:CallerAccount kms:ViaService	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ReEncryptFrom	Controls permission to decrypt data as part of the process that decrypts and reencrypts the data within AWS KMS	Write	key*		
				kms:CallerAccount kms:EncryptionAlgorithm kms:EncryptionContext:${EncryptionContextKey} kms:EncryptionContextKeys kms:ReEncryptOnSameKey kms:RequestAlias kms:ViaService	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ReEncryptTo	Controls permission to encrypt data as part of the process that decrypts and reencrypts the data within AWS KMS	Write	key*		
				kms:CallerAccount kms:EncryptionAlgorithm kms:EncryptionContext:${EncryptionContextKey} kms:EncryptionContextKeys kms:ReEncryptOnSameKey kms:RequestAlias kms:ViaService	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ReplicateKey	Controls permission to replicate a multi-Region primary key	Write	key*		iam:CreateServiceLinkedRole kms:CreateKey kms:PutKeyPolicy kms:TagResource
				kms:CallerAccount kms:ReplicaRegion kms:ViaService	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RetireGrant	Controls permission to retire a grant. The RetireGrant operation is typically called by the grant user after they complete the tasks that the grant allowed them to perform	Permissions management	key*		
				kms:CallerAccount kms:EncryptionContext:${EncryptionContextKey} kms:EncryptionContextKeys kms:GrantConstraintType kms:ViaService	
RevokeGrant	Controls permission to revoke a grant, which denies permission for all operations that depend on the grant	Permissions management	key*		
				kms:CallerAccount kms:GrantIsForAWSResource kms:ViaService	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RotateKeyOnDemand	Controls permission to invoke on-demand rotation of the cryptographic material in an AWS KMS key	Write	key*		
				kms:CallerAccount kms:ViaService	
ScheduleKeyDeletion	Controls permission to schedule deletion of an AWS KMS key	Write	key*		
				kms:CallerAccount kms:ScheduleKeyDeletionPendingWindowInDays kms:ViaService	
Sign	Controls permission to produce a digital signature for a message	Write	key*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				kms:CallerAccount kms:MessageType kms:RequestAlias kms:SigningAlgorithm kms:ViaService	
SynchronizeMultiRegionKey [permission only]	Controls access to internal APIs that synchronize multi-Region keys	Write	key*		
TagResource	Controls permission to create or update tags that are attached to an AWS KMS key	Tagging	key*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys kms:CallerAccount kms:ViaService	
UntagResource	Controls permission to delete tags that are attached to an AWS KMS key	Tagging	key*		
				aws:TagKeys kms:CallerAccount kms:ViaService	
UpdateAlias	Controls permission to associate an alias with a different AWS KMS key. An alias is an optional friendly name that you can associate with a KMS key	Write	alias*		
			key*		
				kms:CallerAccount kms:ViaService	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateCustomKeyStore	Controls permission to change the properties of a custom key store	Write		kms:CallerAccount	ec2:DescribeVpcEndpointServices
UpdateKeyDescription	Controls permission to delete or change the description of an AWS KMS key	Write	key*		
				kms:CallerAccount kms:ViaService	
UpdatePrimaryRegion	Controls permission to update the primary Region of a multi-Region primary key	Write	key*		
				kms:CallerAccount kms:PrimaryRegion kms:ViaService	
Verify	Controls permission to use the specified AWS KMS key to verify digital signatures	Write	key*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				kms:CallerAccount kms:MessageType kms:RequestAlias kms:SigningAlgorithm kms:ViaService	
VerifyMac	Controls permission to use the AWS KMS key to verify message authentication codes	Write	key*		
				kms:CallerAccount kms:MacAlgorithm kms:RequestAlias kms:ViaService	

Resource types defined by AWS Key Management Service

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types

that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
alias	`arn:${Partition}:kms:${Region}:${Account}:alias/${Alias}`	
key	`arn:${Partition}:kms:${Region}:${Account}:key/${KeyId}`	aws:ResourceTag/${TagKey} kms:KeyOrigin kms:KeySpec kms:KeyUsage kms:MultiRegion kms:MultiRegionKeyType kms:ResourceAliases

Condition keys for AWS Key Management Service

AWS Key Management Service defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access to the specified AWS KMS operations based on both the key and value of the tag in the request	String
aws:ResourceTag/${TagKey}	Filters access to the specified AWS KMS operations based on tags assigned to the AWS KMS key	String
aws:TagKeys	Filters access to the specified AWS KMS operations based on tag keys in the request	ArrayOfString
kms:BypassPolicyLockoutSafetyCheck	Filters access to the CreateKey and PutKeyPolicy operations based on the value of the BypassPolicyLockoutSafetyCheck parameter in the request	Bool
kms:CallerAccount	Filters access to specified AWS KMS operations based on the AWS account ID of the caller. You can use this condition key to allow or deny access to all IAM users and roles in an AWS account in a single policy statement	String
kms:CustomerMasterKeySpec	The kms:CustomerMasterKeySpec condition key is deprecated. Instead, use the kms:KeySpec condition key	String
kms:CustomerMasterKeyUsage	The kms:CustomerMasterKeyUsage condition key is deprecated. Instead, use the kms:KeyUsage condition key	String
kms:DataKeyPairSpec	Filters access to GenerateDataKeyPair and GenerateDataKeyPairWithoutPlaintext operations based on the value of the KeyPairSpec parameter in the request	String
kms:EncryptionAlgorithm	Filters access to encryption operations based on the value of the encryption algorithm in the request	String

Condition keys	Description	Type
kms:EncryptionContext:${EncryptionContextKey}	Filters access to a symmetric AWS KMS key based on the encryption context in a cryptographic operation. This condition evaluates the key and value in each key-value encryption context pair	String
kms:EncryptionContextKeys	Filters access to a symmetric AWS KMS key based on the encryption context in a cryptographic operation. This condition key evaluates only the key in each key-value encryption context pair	ArrayOfString
kms:ExpirationModel	Filters access to the ImportKeyMaterial operation based on the value of the ExpirationModel parameter in the request	String
kms:GrantConstraintType	Filters access to the CreateGrant operation based on the grant constraint in the request	String
kms:GrantIsForAWSResource	Filters access to the CreateGrant operation when the request comes from a specified AWS service	Bool
kms:GrantOperations	Filters access to the CreateGrant operation based on the operations in the grant	ArrayOfString
kms:GranteePrincipal	Filters access to the CreateGrant operation based on the grantee principal in the grant	String
kms:KeyAgreementAlgorithm	Filters access to the DeriveSharedSecret operation based on the value of the KeyAgreementAlgorithm parameter in the request	String
kms:KeyOrigin	Filters access to an API operation based on the Origin property of the AWS KMS key created by or used in the operation. Use it to qualify authorization of the CreateKey operation or any operation that is authorized for a KMS key	String

Condition keys	Description	Type
kms:KeySpec	Filters access to an API operation based on the KeySpec property of the AWS KMS key that is created by or used in the operation. Use it to qualify authorization of the CreateKey operation or any operation that is authorized for a KMS key resource	String
kms:KeyUsage	Filters access to an API operation based on the KeyUsage property of the AWS KMS key created by or used in the operation. Use it to qualify authorization of the CreateKey operation or any operation that is authorized for a KMS key resource	String
kms:MacAlgorithm	Filters access to the GenerateMac and VerifyMac operations based on the MacAlgorithm parameter in the request	String
kms:MessageType	Filters access to the Sign and Verify operations based on the value of the MessageType parameter in the request	String
kms:MultiRegion	Filters access to an API operation based on the MultiRegion property of the AWS KMS key created by or used in the operation. Use it to qualify authorization of the CreateKey operation or any operation that is authorized for a KMS key resource	Bool
kms:MultiRegionKeyType	Filters access to an API operation based on the MultiRegionKeyType property of the AWS KMS key created by or used in the operation. Use it to qualify authorization of the CreateKey operation or any operation that is authorized for a KMS key resource	String
kms:PrimaryRegion	Filters access to the UpdatePrimaryRegion operation based on the value of the PrimaryRegion parameter in the request	String

Condition keys	Description	Type
kms:ReEncryptOnSameKey	Filters access to the ReEncrypt operation when it uses the same AWS KMS key that was used for the Encrypt operation	Bool
kms:RecipientAttestation:ImageSha384	Filters access to the API operations based on the image hash in the attestation document in the request	String
kms:RecipientAttestation:NitroTPMPCR0	Filters access by the platform configuration register (PCR) 0 in the attestation document in the request. PCR0 is a contiguous measure of core system firmware executable code	String
kms:RecipientAttestation:NitroTPMPCR1	Filters access by the platform configuration register (PCR) 1 in the attestation document in the request. PCR1 is a contiguous measure of core system firmware data/ host platform configuration, typically including serial and model numbers	String
kms:RecipientAttestation:NitroTPMPCR10	Filters access by the platform configuration register (PCR) 10 in the attestation document in the request. PCR10 is a contiguous measure of protection of the IMA measurement log	String
kms:RecipientAttestation:NitroTPMPCR11	Filters access by the platform configuration register (PCR) 11 in the attestation document in the request. PCR11 is a contiguous measure of all components of unified kernel images (UKIs)	String
kms:RecipientAttestation:NitroTPMPCR12	Filters access by the platform configuration register (PCR) 12 in the attestation document in the request. PCR12 is a contiguous measure of kernel command line, system credentials and system configuration images	String

Condition keys	Description	Type
kms:RecipientAttestation:NitroTPMPCR13	Filters access by the platform configuration register (PCR) 13 in the attestation document in the request. PCR13 is a contiguous measure of all system extension images for the initrd	String
kms:RecipientAttestation:NitroTPMPCR14	Filters access by the platform configuration register (PCR) 14 in the attestation document in the request. PCR14 is a contiguous measure of "MOK" certificates and hashes	String
kms:RecipientAttestation:NitroTPMPCR15	Filters access by the platform configuration register (PCR) 15 in the attestation document in the request. PCR15 is a contiguous measure of root file system volume encryption key	String
kms:RecipientAttestation:NitroTPMPCR16	Filters access by the platform configuration register (PCR) 16 in the attestation document in the request. PCR16 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:NitroTPMPCR17	Filters access by the platform configuration register (PCR) 17 in the attestation document in the request. PCR17 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:NitroTPMPCR18	Filters access by the platform configuration register (PCR) 18 in the attestation document in the request. PCR18 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:NitroTPMPCR19	Filters access by the platform configuration register (PCR) 19 in the attestation document in the request. PCR19 is a custom PCR that can be defined by the user for specific use cases	String

Condition keys	Description	Type
kms:RecipientAttestation:NitroTPMPCR2	Filters access by the platform configuration register (PCR) 2 in the attestation document in the request. PCR2 is a contiguous measure of extended or pluggable executable code, including option ROMs on pluggable hardware	String
kms:RecipientAttestation:NitroTPMPCR20	Filters access by the platform configuration register (PCR) 20 in the attestation document in the request. PCR20 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:NitroTPMPCR21	Filters access by the platform configuration register (PCR) 21 in the attestation document in the request. PCR21 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:NitroTPMPCR22	Filters access by the platform configuration register (PCR) 22 in the attestation document in the request. PCR22 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:NitroTPMPCR23	Filters access by the platform configuration register (PCR) 23 in the attestation document in the request. PCR23 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:NitroTPMPCR3	Filters access by the platform configuration register (PCR) 3 in the attestation document in the request. PCR3 is a contiguous measure of extended or pluggable firmware data, including information about pluggable hardware	String

Condition keys	Description	Type
kms:RecipientAttestation:NitroTPMPCR4	Filters access by the platform configuration register (PCR) 4 in the attestation document in the request. PCR4 is a contiguous measure of boot loader and additional drivers, including binaries and extensions loaded by the boot loader	String
kms:RecipientAttestation:NitroTPMPCR5	Filters access by the platform configuration register (PCR) 5 in the attestation document in the request. PCR5 is a contiguous measure of GPT/Partition table	String
kms:RecipientAttestation:NitroTPMPCR6	Filters access by the platform configuration register (PCR) 6 in the attestation document in the request. PCR6 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:NitroTPMPCR7	Filters access by the platform configuration register (PCR) 7 in the attestation document in the request. PCR7 is a contiguous measure of SecureBoot state	String
kms:RecipientAttestation:NitroTPMPCR8	Filters access by the platform configuration register (PCR) 8 in the attestation document in the request. PCR8 is a contiguous measure of commands and kernel command line	String
kms:RecipientAttestation:NitroTPMPCR9	Filters access by the platform configuration register (PCR) 9 in the attestation document in the request. PCR9 is a contiguous measure of all files read (including kernel image)	String
kms:RecipientAttestation:PCR0	Filters access by the platform configuration register (PCR) 0 in the attestation document in the request. PCR0 is a contiguous measure of the contents of the enclave image file, without the section data	String

Condition keys	Description	Type
kms:RecipientAttestation:PCR1	Filters access by the platform configuration register (PCR) 1 in the attestation document in the request. PCR1 is a contiguous measurement of the Linux kernel and bootstrap data	String
kms:RecipientAttestation:PCR10	Filters access by the platform configuration register (PCR) 10 in the attestation document in the request. PCR10 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR11	Filters access by the platform configuration register (PCR) 11 in the attestation document in the request. PCR11 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR12	Filters access by the platform configuration register (PCR) 12 in the attestation document in the request. PCR12 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR13	Filters access by the platform configuration register (PCR) 13 in the attestation document in the request. PCR13 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR14	Filters access by the platform configuration register (PCR) 14 in the attestation document in the request. PCR14 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR15	Filters access by the platform configuration register (PCR) 15 in the attestation document in the request. PCR15 is a custom PCR that can be defined by the user for specific use cases	String

Condition keys	Description	Type
kms:RecipientAttestation:PCR16	Filters access by the platform configuration register (PCR) 16 in the attestation document in the request. PCR16 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR17	Filters access by the platform configuration register (PCR) 17 in the attestation document in the request. PCR17 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR18	Filters access by the platform configuration register (PCR) 18 in the attestation document in the request. PCR18 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR19	Filters access by the platform configuration register (PCR) 19 in the attestation document in the request. PCR19 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR2	Filters access by the platform configuration register (PCR) 2 in the attestation document in the request. PCR2 is a contiguous, in-order measurement of the user applications, without the boot ramfs	String
kms:RecipientAttestation:PCR20	Filters access by the platform configuration register (PCR) 20 in the attestation document in the request. PCR20 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR21	Filters access by the platform configuration register (PCR) 21 in the attestation document in the request. PCR21 is a custom PCR that can be defined by the user for specific use cases	String

Condition keys	Description	Type
kms:RecipientAttestation:PCR22	Filters access by the platform configuration register (PCR) 22 in the attestation document in the request. PCR22 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR23	Filters access by the platform configuration register (PCR) 23 in the attestation document in the request. PCR23 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR24	Filters access by the platform configuration register (PCR) 24 in the attestation document in the request. PCR24 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR25	Filters access by the platform configuration register (PCR) 25 in the attestation document in the request. PCR25 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR26	Filters access by the platform configuration register (PCR) 26 in the attestation document in the request. PCR26 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR27	Filters access by the platform configuration register (PCR) 27 in the attestation document in the request. PCR27 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR28	Filters access by the platform configuration register (PCR) 28 in the attestation document in the request. PCR28 is a custom PCR that can be defined by the user for specific use cases	String

Condition keys	Description	Type
kms:RecipientAttestation:PCR29	Filters access by the platform configuration register (PCR) 29 in the attestation document in the request. PCR29 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR3	Filters access by the platform configuration register (PCR) 3 in the attestation document in the request. PCR3 is a contiguous measurement of the IAM role assigned to the parent instance	String
kms:RecipientAttestation:PCR30	Filters access by the platform configuration register (PCR) 30 in the attestation document in the request. PCR30 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR31	Filters access by the platform configuration register (PCR) 31 in the attestation document in the request. PCR31 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR4	Filters access by the platform configuration register (PCR) 4 in the attestation document in the request. PCR4 is a contiguous measurement of the ID of the parent instance	String
kms:RecipientAttestation:PCR5	Filters access by the platform configuration register (PCR) 5 in the attestation document in the request. PCR5 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR6	Filters access by the platform configuration register (PCR) 6 in the attestation document in the request. PCR6 is a custom PCR that can be defined by the user for specific use cases	String

Condition keys	Description	Type
kms:RecipientAttestation:PCR7	Filters access by the platform configuration register (PCR) 7 in the attestation document in the request. PCR7 is a custom PCR that can be defined by the user for specific use cases	String
kms:RecipientAttestation:PCR8	Filters access by the platform configuration register (PCR) 8 in the attestation document in the request. PCR8 is a measure of the signing certificate specified for the enclave image file	String
kms:RecipientAttestation:PCR9	Filters access by the platform configuration register (PCR) 9 in the attestation document in the request. PCR9 is a custom PCR that can be defined by the user for specific use cases	String
kms:ReplicaRegion	Filters access to the ReplicateKey operation based on the value of the ReplicaRegion parameter in the request	String
kms:RequestAlias	Filters access to cryptographic operations, DescribeKey, and GetPublicKey based on the alias in the request	String
kms:ResourceAliases	Filters access to specified AWS KMS operations based on aliases associated with the AWS KMS key	ArrayOfString
kms:RetiringPrincipal	Filters access to the CreateGrant operation based on the retiring principal in the grant	String
kms:RotationPeriodInDays	Filters access to the EnableKeyRotation operation based on the value of the RotationPeriodInDays parameter in the request	Numeric
kms:ScheduleKeyDeletionPendingWindowInDays	Filters access to the ScheduleKeyDeletion operation based on the value of the PendingWindowInDays parameter in the request	Numeric

Condition keys	Description	Type
kms:SigningAlgorithm	Filters access to the Sign and Verify operations based on the signing algorithm in the request	String
kms:ValidTo	Filters access to the ImportKeyMaterial operation based on the value of the ValidTo parameter in the request. You can use this condition key to allow users to import key material only when it expires by the specified date	Date
kms:ViaService	Filters access when a request made on the principal's behalf comes from a specified AWS service	String
kms:WrappingAlgorithm	Filters access to the GetParametersForImport operation based on the value of the WrappingAlgorithm parameter in the request	String
kms:WrappingKeySpec	Filters access to the GetParametersForImport operation based on the value of the WrappingKeySpec parameter in the request	String

Actions, resources, and condition keys for Amazon Keyspaces (for Apache Cassandra)

Amazon Keyspaces (for Apache Cassandra) (service prefix: `cassandra`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- Resource types defined by Amazon Keyspaces (for Apache Cassandra)

- Condition keys for Amazon Keyspaces (for Apache Cassandra)

Actions defined by Amazon Keyspaces (for Apache Cassandra)

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Alter	Grants permission to alter a keyspace or table	Write	keyspace		
			table		
				aws:RequestTag/${TagKey} aws:TagKeys	
AlterMultiRegionResource	Grants permission to alter a multiregion keyspace or table	Write	keyspace		
			table		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Create	Grants permission to create a keyspace or table	Write	keyspace		
			table		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateMultiRegionResource	Grants permission to create a multiregion keyspace or table	Write	keyspace		
			table		
				aws:RequestTag/${TagKey} aws:TagKeys	
Drop	Grants permission to drop a keyspace or table	Write	keyspace		
			table		
DropMultiRegionResource	Grants permission to drop a multiregion keyspace or table	Write	keyspace		
			table		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetRecords	Grants permission to retrieve the CDC stream records from a given shard	Read	stream*		
GetShardIterator	Grants permission to return a shard iterator	Read	stream*		
GetStream	Grants permission to return information about a CDC stream, including the composition of its shards	Read	stream*		
ListStreams	Grants permission to return an array of CDC stream ARNs associated with the current account and endpoint	List			
Modify	Grants permission to INSERT, UPDATE or DELETE data in a table	Write	table*		
ModifyMultiRegionResource	Grants permission to INSERT, UPDATE or DELETE data in a multiregion table	Write	table*		
Restore	Grants permission to restore table from a backup	Write	table*		
RestoreMultiRegionTable	Grants permission to restore multiregion table from a backup	Write	table*		
Select	Grants permission to SELECT data from a table	Read	table*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SelectMultiRegionResource	Grants permission to SELECT data from a multiregion table	Read	table*		
TagMultiRegionResource	Grants permission to tag a multiregion keyspace or table	Tagging	keyspace		
			table		
				aws:RequestTag/${TagKey} aws:TagKeys	
TagResource	Grants permission to tag a keyspace, table, or stream	Tagging	keyspace		
			stream		
			table		
				aws:RequestTag/${TagKey} aws:TagKeys	
UnTagMultiRegionResource	Grants permission to untag a multiregion keyspace or table	Tagging	keyspace		
			table		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
UntagResource	Grants permission to untag a keyspace, table or stream	Tagging	keyspace		
			stream		
			table		
				aws:TagKeys	
UpdatePartitioner	Grants permission to UPDATE the partitioner in a system table	Write	table*		

Resource types defined by Amazon Keyspaces (for Apache Cassandra)

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
keyspace	`arn:${Partition}:cassandra:${Region}:${Account}:/keyspace/${KeyspaceName}/`	aws:ResourceTag/${TagKey}
table	`arn:${Partition}:cassandra:${Region}:${Account}:/keyspace/${KeyspaceName}/table/${TableName}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
stream	`arn:${Partition}:cassandra:${Region}:${Account}:/keyspace/${KeyspaceName}/table/${TableName}/stream/${StreamLabel}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Keyspaces (for Apache Cassandra)

Amazon Keyspaces (for Apache Cassandra) defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters actions based on the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters actions based on tag key-value pairs attached to the resource	String
aws:TagKeys	Filters actions based on the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Kinesis Analytics

Amazon Kinesis Analytics (service prefix: `kinesisanalytics`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Kinesis Analytics

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddApplicationInput	Grants permission to add input to the application	Write	application*		
AddApplicationOutput	Grants permission to add output to the application	Write	application*		
AddApplicationReferenceDataSource	Grants permission to add reference data source to the application	Write	application*		
CreateApplication	Grants permission to create an application	Write		aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
DeleteApplication	Grants permission to delete the application	Write	application*		
DeleteApplicationOutput	Grants permission to delete the specified output of the application	Write	application*		
DeleteApplicationReferenceDataSource	Grants permission to delete the specified reference data source of the application	Write	application*		
DescribeApplication	Grants permission to describe the specified application	Read	application*		
DiscoverInputSchema	Grants permission to discover the input schema for the application	Read			
GetApplicationState [permission only]	Grants permission to Kinesis Data Analytics console to display stream results for Kinesis Data Analytics SQL runtime applications	Read	application*		
ListApplications	Grants permission to list applications for the account	List			
ListTagsForResource	Grants permission to fetch the tags associated with the application	Read	application*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartApplication	Grants permission to start the application	Write	application*		
StopApplication	Grants permission to stop the application	Write	application*		
TagResource	Grants permission to add tags to the application	Tagging	application*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove the specified tags from the application	Tagging	application*		
				aws:TagKeys	
UpdateApplication	Grants permission to update the application	Write	application*		

Resource types defined by Amazon Kinesis Analytics

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
application	`arn:${Partition}:kinesisanalytics:${Region}:${Account}:application/${ApplicationName}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Kinesis Analytics

Amazon Kinesis Analytics defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters access by tag-value assoicated with the resource	String
aws:TagKeys	Filters access by the presence of mandatory tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Kinesis Analytics V2

Amazon Kinesis Analytics V2 (service prefix: `kinesisanalytics`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Kinesis Analytics V2

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddApplicationCloudWatchLoggingOption	Grants permission to add cloudwatch logging option to the application	Write	application*		
AddApplicationInput	Grants permission to add input to the application	Write	application*		
AddApplicationInputProcessingConfiguration	Grants permission to add input processing configuration to the application	Write	application*		
AddApplicationOutput	Grants permission to add output to the application	Write	application*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddApplicationReferenceDataSource	Grants permission to add reference data source to the application	Write	application*		
AddApplicationVpcConfiguration	Grants permission to add VPC configuration to the application	Write	application*		
CreateApplication	Grants permission to create an application	Write		aws:RequestTag/${TagKey} aws:TagKeys	iam:PassRole
CreateApplicationPresignedUrl	Grants permission to create and return a URL that you can use to connect to an application's extension	Read	application*		
CreateApplicationSnapshot	Grants permission to create a snapshot for an application	Write	application*		
DeleteApplication	Grants permission to delete the application	Write	application*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteApplicationCloudWatchLoggingOption	Grants permission to delete the specified cloudwatch logging option of the application	Write	application*		
DeleteApplicationInputProcessingConfiguration	Grants permission to delete the specified input processing configuration of the application	Write	application*		
DeleteApplicationOutput	Grants permission to delete the specified output of the application	Write	application*		
DeleteApplicationReferenceDataSource	Grants permission to delete the specified reference data source of the application	Write	application*		
DeleteApplicationSnapshot	Grants permission to delete a snapshot for an application	Write	application*		
DeleteApplicationVpcConfiguration	Grants permission to delete the specified VPC configuration of the application	Write	application*		
DescribeApplication	Grants permission to describe the specified application	Read	application*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeApplicationOperation	Grants permission to describe an application operation of an application	Read	application*		
DescribeApplicationSnapshot	Grants permission to describe an application snapshot	Read	application*

Actions defined by Amazon Kinesis Data Streams

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddTagsToStream	Grants permission to add or update tags for the specified Amazon Kinesis stream. Each stream can have up to 50 tags	Tagging	stream*	aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
CreateStream	Grants permission to create a Amazon Kinesis stream	Write	stream*	aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
DecreaseStreamRetentionPeriod	Grants permission to decrease the stream's retention period, which is the length of time data records are accessible after they are added to the stream	Write	stream*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteResourcePolicy	Grants permission to delete a resource policy associated with a specified stream or consumer	Write	consumer*	aws:ResourceTag/${TagKey}	
			stream*	aws:ResourceTag/${TagKey}	
DeleteStream	Grants permission to delete a stream and all its shards and data	Write	stream*	aws:ResourceTag/${TagKey}	
DeregisterStreamConsumer	Grants permission to deregister a stream consumer with a Kinesis data stream	Write	consumer*	aws:ResourceTag/${TagKey}	
DescribeAccountSettings	Grants permission to describe the account-level settings for Amazon Kinesis Data Streams	Read			
DescribeLimits	Grants permission to describe the shard limits and usage for the account	Read			
DescribeStream	Grants permission to describe the specified stream	Read	stream*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeStreamConsumer	Grants permission to get the description of a registered stream consumer	Read	consumer*	aws:ResourceTag/${TagKey}	
DescribeStreamSummary	Grants permission to provide a summarized description of the specified Kinesis data stream without the shard list	Read	stream*	aws:ResourceTag/${TagKey}	
DisableEnhancedMonitoring	Grants permission to disables enhanced monitoring	Write			
EnableEnhancedMonitoring	Grants permission to enable enhanced Kinesis data stream monitoring for shard-level metrics	Write			
GetRecords	Grants permission to get data records from a shard	Read	stream*	aws:ResourceTag/${TagKey}	
GetResourcePolicy	Grants permission to get a resource policy associated with a specified stream or consumer	Read	consumer*	aws:ResourceTag/${TagKey}	
			stream*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetShardIterator	Grants permission to get a shard iterator. A shard iterator expires five minutes after it is returned to the requester	Read	stream*	aws:ResourceTag/${TagKey}	
IncreaseStreamRetentionPeriod	Grants permission to increase the stream's retention period, which is the length of time data records are accessible after they are added to the stream	Write	stream*	aws:ResourceTag/${TagKey}	
InjectApiError [permission only]	Grants permission to temporarily inject errors for target API requests	Write		kinesis:FisActionId kinesis:FisTargetArns kinesis:FisInjectPercentage	
ListShards	Grants permission to list the shards in a stream and provides information about each shard	List	stream*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListStreamConsumers	Grants permission to list the stream consumers registered to receive data from a Kinesis stream using enhanced fan-out, and provides information about each consumer	List	stream*	aws:ResourceTag/${TagKey}	
ListStreams	Grants permission to list your streams	List			
ListTagsForResource	Grants permission to list the tags for the specified Amazon Kinesis resource	Read	consumer*	aws:ResourceTag/${TagKey}	
			stream*	aws:ResourceTag/${TagKey}	
ListTagsForStream	Grants permission to list the tags for the specified Amazon Kinesis stream	Read	stream*	aws:ResourceTag/${TagKey}	
MergeShards	Grants permission to merge two adjacent shards in a stream and combines them into a single shard to reduce the stream's capacity to ingest and transport data	Write	stream*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutRecord	Grants permission to write a single data record from a producer into an Amazon Kinesis stream	Write	stream*	aws:ResourceTag/${TagKey}	
PutRecords	Grants permission to write multiple data records from a producer into an Amazon Kinesis stream in a single call (also referred to as a PutRecords request)	Write	stream*	aws:ResourceTag/${TagKey}	
PutResourcePolicy	Grants permission to attach a resource policy to a specified stream or consumer	Write	consumer*	aws:ResourceTag/${TagKey}	
			stream*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RegisterStreamConsumer	Grants permission to register a stream consumer with a Kinesis data stream	Write	stream*	aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
RemoveTagsFromStream	Grants permission to remove tags from the specified Kinesis data stream. Removed tags are deleted and cannot be recovered after this operation successfully completes	Tagging	stream*	aws:TagKeys aws:ResourceTag/${TagKey}	
SplitShard	Grants permission to split a shard into two new shards in the Kinesis data stream, to increase the stream's capacity to ingest and transport data	Write	stream*	aws:ResourceTag/${TagKey}	
StartStreamEncryption	Grants permission to enable or update server-side encryption using an AWS KMS key for a specified stream	Write	kmsKey*		
			stream*	aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StopStreamEncryption	Grants permission to disable server-side encryption for a specified stream	Write	kmsKey*		
			stream*	aws:ResourceTag/${TagKey}	
SubscribeToShard	Grants permission to listen to a specific shard with enhanced fan-out	Read	consumer*	aws:ResourceTag/${TagKey}	
TagResource	Grants permission to add or update tags for the specified Amazon Kinesis resource. Each resource can have up to 50 tags	Tagging	consumer*	aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			stream*	aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
UntagResource	Grants permission to remove tags from the specified Kinesis data resource. Removed tags are deleted and cannot be recovered after this operation successfully completes	Tagging	consumer*	aws:TagKeys aws:ResourceTag/${TagKey}	
			stream*	aws:TagKeys aws:ResourceTag/${TagKey}	
UpdateAccountSettings	Grants permission to update the account-level settings for Amazon Kinesis Data Streams	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateMaxRecordSize	Grants permission to update the maximum record size for a Kinesis data stream	Write	stream*	aws:ResourceTag/${TagKey}	
UpdateShardCount	Grants permission to update the shard count of the specified stream to the specified number of shards	Write			
UpdateStreamMode	Grants permission to update the capacity mode of the data stream	Write			
UpdateStreamWarmThroughput	Grants permission to update the warm throughput for a Kinesis on-demand data stream	Write	stream*	aws:ResourceTag/${TagKey}	

Resource types defined by Amazon Kinesis Data Streams

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
stream	`arn:${Partition}:kinesis:${Region}:${Account}:stream/${StreamName}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
consumer	arn:${Partition}:kinesis:${Region}:${Account}:${StreamType}/${StreamName}/consumer/${ConsumerName}:${ConsumerCreationTimpstamp}	aws:ResourceTag/${TagKey}
kmsKey	arn:${Partition}:kms:${Region}:${Account}:key/${KeyId}	

Condition keys for Amazon Kinesis Data Streams

Amazon Kinesis Data Streams defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
kinesis:FisActionId	Filters access by the ID of an AWS FIS action	String
kinesis:FisInjectPercentage	Filters access by the percentage of calls being affected by an AWS FIS action	Numeric

Condition keys	Description	Type
kinesis:FisTargetArns	Filters access by the ARN of an AWS FIS target	ArrayOfARN

Actions, resources, and condition keys for Amazon Kinesis Firehose

Amazon Kinesis Firehose (service prefix: `firehose`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Kinesis Firehose

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which

the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateDeliveryStream	Grants permission to create a delivery stream	Write	deliverystream*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteDeliveryStream	Grants permission to delete a delivery stream and its data	Write	deliverystream*		
DescribeDeliveryStream	Grants permission to describe the specified delivery stream and gets the status	Read	deliverystream*		
ListDeliveryStreams	Grants permission to list your delivery streams	List			
ListTagsForDeliveryStream	Grants permission to list the tags for the specified delivery stream	List	deliverystream*		
PutRecord	Grants permission to write a single data record into an Amazon Kinesis Firehose delivery stream	Write	deliverystream*		
PutRecordBatch	Grants permission to write multiple data records into a delivery stream in a single call, which can achieve higher throughput per producer than when writing single records	Write	deliverystream*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartDeliveryStreamEncryption	Grants permission to enable server-side encryption (SSE) for the delivery stream	Write	deliverystream*		
StopDeliveryStreamEncryption	Grants permission to disable the specified destination of the specified delivery stream	Write	deliverystream*		
TagDeliveryStream	Grants permission to add or update tags for the specified delivery stream	Tagging	deliverystream*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagDeliveryStream	Grants permission to remove tags from the specified delivery stream	Tagging	deliverystream*		
				aws:TagKeys	
UpdateDestination	Grants permission to update the specified destination of the specified delivery stream	Write	deliverystream*		

Resource types defined by Amazon Kinesis Firehose

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types

that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
deliverystream	`arn:${Partition}:firehose:${Region}:${Account}:deliverystream/${DeliveryStreamName}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Kinesis Firehose

Amazon Kinesis Firehose defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Kinesis Video Streams

Amazon Kinesis Video Streams (service prefix: `kinesisvideo`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Kinesis Video Streams

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ConnectAsMaster	Grants permission to connect as a master to the signaling channel specified by the endpoint	Write	channel*		
ConnectAsViewer	Grants permission to connect as a viewer to the signaling channel specified by the endpoint	Write	channel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateSignalingChannel	Grants permission to create a signaling channel	Write	channel*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateStream	Grants permission to create a Kinesis video stream	Write	stream*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteEdgeConfiguration	Grants permission to delete the edge configuration of your Kinesis Video Stream	Write	stream*		
DeleteSignalingChannel	Grants permission to delete an existing signaling channel	Write	channel*		
DeleteStream	Grants permission to delete an existing Kinesis video stream	Write	stream*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeEdgeConfiguration	Grants permission to describe the edge configuration of your Kinesis Video Stream	Read	stream*		
DescribeImageGenerationConfiguration	Grants permission to describe the image generation configuration of your Kinesis video stream	Read	stream*		
DescribeMappedResourceConfiguration	Grants permission to describe the resource mapped to the Kinesis video stream	List	stream*		
DescribeMediaStorageConfiguration	Grants permission to describe the media storage configuration of a signaling channel	Read	channel*		
DescribeNotificationConfiguration	Grants permission to describe the notification configuration of your Kinesis video stream	Read	stream*		
DescribeSignalingChannel	Grants permission to describe the specified signaling channel	List	channel*		
DescribeStream	Grants permission to describe the specified Kinesis video stream	List	stream*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeStreamStorageConfiguration	Grants permission to describe the stream storage configuration of your Kinesis Video Stream	Read	stream*		
GetClip	Grants permission to get a media clip from a video stream	Read	stream*		
GetDASHStreamingSessionURL	Grants permission to create a URL for MPEG-DASH video streaming	Read	stream*		
GetDataEndpoint	Grants permission to get an endpoint for a specified stream for either reading or writing media data to Kinesis Video Streams	Read	stream*		
GetHLSStreamingSessionURL	Grants permission to create a URL for HLS video streaming	Read	stream*		
GetIceServerConfig	Grants permission to get the ICE server configuration	Read	channel*		
GetImages	Grants permission to get generated images from your Kinesis video stream	Read	stream*		
GetMedia	Grants permission to return media content of a Kinesis video stream	Read	stream*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetMediaForFragmentList	Grants permission to read and return media data only from persisted storage	Read	stream*		
GetSignalingChannelEndpoint	Grants permission to get endpoints for a specified combination of protocol and role for a signaling channel	Read	channel*		
JoinStorageSession	Grants permission to join a storage session for a channel	Write	channel*		
JoinStorageSessionAsViewer	Grants permission to join a storage session for a channel as viewer	Write	channel*		
ListEdgeAgentConfigurations	Grants permission to list an edge agent configurations	List			
ListFragments	Grants permission to list the fragments from archival storage based on the pagination token or selector type with range specified	List	stream*		
ListSignalingChannels	Grants permission to list your signaling channels	List			
ListStreams	Grants permission to list your Kinesis video streams	List			
ListTagsForResource		Read	channel		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	Grants permission to fetch the tags associated with your resource		stream		
ListTagsForStream	Grants permission to fetch the tags associated with Kinesis video stream	Read	stream*		
PutMedia	Grants permission to send media data to a Kinesis video stream	Write	stream*		
SendAlexaOfferToMaster	Grants permission to send the Alexa SDP offer to the master	Write	channel*		
StartEdgeConfigurationUpdate	Grants permission to start edge configuration update of your Kinesis Video Stream	Write	stream*		
TagResource	Grants permission to attach set of tags to your resource	Tagging	channel		
			stream		
				aws:RequestTag/${TagKey} aws:TagKeys	
TagStream	Grants permission to attach set of tags to your Kinesis video streams	Tagging	stream*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove one or more tags from your resource	Tagging	channel		
			stream		
				aws:TagKeys	
UntagStream	Grants permission to remove one or more tags from your Kinesis video streams	Tagging	stream*		
				aws:TagKeys	
UpdateDataRetention	Grants permission to update the data retention period of your Kinesis video stream	Write	stream*		
UpdateImageGenerationConfiguration	Grants permission to update the image generation configuration of your Kinesis video stream	Write	stream*		
UpdateMediaStorageConfiguration	Grants permission to create or update an mapping between a signaling channel and stream	Write	channel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateNotificationConfiguration	Grants permission to update the notification configuration of your Kinesis video stream	Write	stream*		
UpdateSignalingChannel	Grants permission to update an existing signaling channel	Write	channel*		
UpdateStream	Grants permission to update an existing Kinesis video stream	Write	stream*		
UpdateStreamStorageConfiguration	Grants permission to update the stream storage configuration of your Kinesis Video Stream	Write	stream*		

Resource types defined by Amazon Kinesis Video Streams

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
stream	`arn:${Partition}:kinesisvideo:${Region}:${Account}:stream/${StreamName}/${CreationTime}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
channel	arn:${Partition}:kinesisvideo:${Region}:${Account}:channel/${ChannelName}/${CreationTime}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Kinesis Video Streams

Amazon Kinesis Video Streams defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters requests based on the allowed set of values for each of the tags	String
aws:ResourceTag/${TagKey}	Filters actions based on tag-value assoicated with the stream	String
aws:TagKeys	Filters requests based on the presence of mandatory tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS Lake Formation

AWS Lake Formation (service prefix: lakeformation) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Lake Formation

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddLFTagsToResource	Grants permission to attach Lake Formation tags to catalog resources	Tagging			
BatchGrantPermissions	Grants permission to data lake permissions to one or more principals in a batch	Permissions management			
BatchRevokePermissions	Grants permission to revoke data lake permissions from one or more principals in a batch	Permissions management			
CancelTransaction	Grants permission to cancel the given transaction	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CommitTransaction	Grants permission to commit the given transaction	Write			
CreateDataCellsFilter	Grants permission to create a Lake Formation data cell filter	Write			
CreateLFTag	Grants permission to create a Lake Formation tag	Write			
CreateLFTagExpression	Grants permission to create a Lake Formation tag expression	Write			
CreateLakeFormationIdentityCenterConfiguration	Grants permission to create an IAM Identity Center connection with Lake Formation to allow IAM Identity Center users and groups to access Data Catalog resources	Write			
CreateLakeFormationOptIn	Grants permission to enforce Lake Formation permissions for the given databases, tables, and principals	Write			
DeleteDataCellsFilter	Grants permission to delete a Lake Formation data cell filter	Write			
DeleteLFTag	Grants permission to delete a Lake Formation tag	Write			
DeleteLFTagExpression	Grants permission to delete a Lake Formation expression	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteLakeFormationIdentityCenterConfiguration	Grants permission to delete an IAM Identity Center connection with Lake Formation	Write			
DeleteLakeFormationOptIn	Grants permission to remove the Lake Formation permissions enforcement of the given databases, tables, and principals	Write			
DeleteObjectsOnCancel	Grants permission to delete the specified objects if the transaction is canceled	Write			
DeregisterResource	Grants permission to deregister a registered location	Write			
DescribeLakeFormationIdentityCenterConfiguration	Grants permission to describe the IAM Identity Center connection with Lake Formation	Read			
DescribeResource	Grants permission to describe a registered location	Read			
DescribeTransaction	Grants permission to get status of the given transaction	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ExtendTransaction	Grants permission to extend the timeout of the given transaction	Write			
GetDataAccess	Grants permission to virtual data lake access	Write		lakeformation:EnabledOnlyForMetaDataAccess	
GetDataCellsFilter	Grants permission to retrieve a Lake Formation data cell filter	Read			
GetDataLakePrincipal	Grants permission to retrieve the identity of the invoking principal				
GetDataLakeSettings	Grants permission to retrieve data lake settings such as the list of data lake administrators and database and table default permissions	Read			
GetEffectivePermissionsForPath	Grants permission to retrieve permissions attached to resources in the given path	Read			
GetLFTag	Grants permission to retrieve a Lake Formation tag	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetLFTagExpression	Grants permission to retrieve a Lake Formation tag expression	Read			
GetQueryState	Grants permission to retrieve the state of the given query	Read			lakeformation:StartQueryPlanning
GetQueryStatistics	Grants permission to retrieve the statistics for the given query	Read			lakeformation:StartQueryPlanning
GetResourceLFTags	Grants permission to retrieve lakeformation tags on a catalog resource	Read			
GetTableObjects	Grants permission to retrieve objects from a table	Read			
GetTemporaryGluePartitionCredentials	Grants permission to get temporary credentials to access Glue partition data through Lake Formation	Read			
GetTemporaryGlueTableCredentials	Grants permission to get temporary credentials to access Glue table data through Lake Formation	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetWorkUnitResults	Grants permission to retrieve the results for the given work units	Read			lakeformation:GetWorkUnits lakeformation:StartQueryPlanning
GetWorkUnits	Grants permission to retrieve the work units for the given query	Read			lakeformation:StartQueryPlanning
GrantPermissions	Grants permission to data lake permissions to a principal	Permissions management			
ListDataCellsFilter	Grants permission to list cell filters	List			
ListLFTagExpressions	Grants permission to list Lake Foramtion tag expressions	Read			
ListLFTags	Grants permission to list Lake Formation tags	Read			
ListLakeFormationOptIns	Grants permission to retrieve the current list of resources and principals that are opt in to enforce Lake Formation permissions	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListPermissions	Grants permission to list permissions filtered by principal or resource	List			
ListResources	Grants permission to List registered locations	List			
ListTableStorageOptimizers	Grants permission to list all the storage optimizers for the Governed table	List			
ListTransactions	Grants permission to list all transactions in the system	List			
PutDataLakeSettings	Grants permission to overwrite data lake settings such as the list of data lake administrators and database and table default permissions	Permissions management			
RegisterResource	Grants permission to register a new location to be managed by Lake Formation	Write			
RegisterResourceWithPrivilegedAccess	Grants permission to register a new location to be managed by Lake Formation, with privileged access	Write			
RemoveLFTagsFromResource	Grants permission to remove lakeformation tags from catalog resources	Tagging			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RevokePermissions	Grants permission to revoke data lake permissions from a principal	Permissions management			
SearchDatabasesByLFTags	Grants permission to list catalog databases with Lake Formation tags	Read			
SearchTablesByLFTags	Grants permission to list catalog tables with Lake Formation tags	Read			
StartQueryPlanning	Grants permission to initiate the planning of the given query	Write			
StartTransaction	Grants permission to start a new transaction	Write			
UpdateDataCellsFilter	Grants permission to update a Lake Formation data cell filter	Write			
UpdateLFTag	Grants permission to update a Lake Formation tag	Write			
UpdateLFTagExpression	Grants permission to update a Lake Formation expression	Write			
UpdateLakeFormationIdentityCenterConfiguration	Grants permission to update the IAM Identity Center connection parameters	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateResource	Grants permission to update a registered location	Write			
UpdateTableObjects	Grants permission to add or delete the specified objects to or from a table	Write			
UpdateTableStorageOptimizer	Grants permission to update the configuration of the storage optimizer for the Governed table	Write			

Resource types defined by AWS Lake Formation

AWS Lake Formation does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Lake Formation, specify `"Resource": "*"` in your policy.

Condition keys for AWS Lake Formation

AWS Lake Formation defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
lakeformation:Enab	Filters access by the presence of the key configured for role's identity-based policy	Bool

Condition keys	Description	Type
ledOnlyFo rMetaDataAccess		

Actions, resources, and condition keys for AWS Lambda

AWS Lambda (service prefix: `lambda`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Lambda

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which

the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddLayerVersionPermission	Grants permission to add permissions to the resource-based policy of a version of an AWS Lambda layer	Permissions management	layerVersion*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AddPermission	Grants permission to give an AWS service or another account permission to use an AWS Lambda function	Permissions management	function*		
				lambda:Principal lambda:FunctionUrlAuthType	
CheckpointDurableExecution	Grants permission to save the progress of an AWS Lambda durable execution	Write	durable execution*		
CreateAlias	Grants permission to create an alias for a Lambda function version	Write	function*		
CreateCapacityProvider	Grants permission to create an AWS Lambda capacity provider	Write	capacityProvider*		iam:CreateServiceLinkedRole iam:PassRole kms:DescribeKey

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys lambda:SecurityGroupIds lambda:SubnetIds	
CreateCodeSigningConfig	Grants permission to create an AWS Lambda code signing config	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateEventSourceMapping	Grants permission to create a mapping between an event source and an AWS Lambda function	Write		lambda:FunctionArn aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateFunction	Grants permission to create an AWS Lambda function	Write	function*		iam:PassRole lambda:PassCapacityProvider
				lambda:Layer lambda:VpcIds lambda:SubnetIds lambda:SecurityGroupIds lambda:CodeSigningConfigArn aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateFunctionUrlConfig	Grants permission to create a function url configuration for a Lambda function	Write	function*		
				lambda:FunctionUrlAuthType lambda:FunctionArn	
DeleteAlias	Grants permission to delete an AWS Lambda function alias	Write	function*		
DeleteCapacityProvider	Grants permission to delete an AWS Lambda capacity provider	Write	capacityProvider*		
DeleteCodeSigningConfig	Grants permission to delete an AWS Lambda code signing config	Write	code signing config*		
DeleteEventSourceMapping	Grants permission to delete an AWS Lambda event source mapping	Write	eventSourceMapping*		
				lambda:FunctionArn	
DeleteFunction	Grants permission to delete an AWS Lambda function	Write	function*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteFunctionCodeSigningConfig	Grants permission to detach a code signing config from an AWS Lambda function	Write	function*		
DeleteFunctionConcurrency	Grants permission to remove a concurrent execution limit from an AWS Lambda function	Write	function*		
DeleteFunctionEventInvokeConfig	Grants permission to delete the configuration for asynchronous invocation for an AWS Lambda function, version, or alias	Write	function*		
DeleteFunctionUrlConfig	Grants permission to delete function url configuration for a Lambda function	Write	function*		
				lambda:FunctionUrlAuthType lambda:FunctionArn	
DeleteLayerVersion	Grants permission to delete a version of an AWS Lambda layer	Write	layerVersion*		
DeleteProvisionedConcurrencyConfig	Grants permission to delete the provisioned concurrency configuration for an AWS Lambda function	Write	function alias		
			function version		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableReplication [permission only]	Grants permission to disable replication for a Lambda@Edge function	Permissions management	function*		
EnableReplication [permission only]	Grants permission to enable replication for a Lambda@Edge function	Permissions management	function*		
GetAccountSettings	Grants permission to view details about an account's limits and usage in an AWS Region	Read			
GetAlias	Grants permission to view details about an AWS Lambda function alias	Read	function*		
GetCapacityProvider	Grants permission to view details about an AWS Lambda capacity provider	Read	capacityProvider*		
GetCodeSigningConfig	Grants permission to view details about an AWS Lambda code signing config	Read	code signing config*		
GetDurableExecution	Grants permission to view details of an AWS Lambda durable execution	Read	durable execution*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDurableExecutionHistory	Grants permission to view execution history of an AWS Lambda durable execution	Read	durable execution*		
GetDurableExecutionState	Grants permission to view current state of an AWS Lambda durable execution	Read	durable execution*		
GetEventSourceMapping	Grants permission to view details about an AWS Lambda event source mapping	Read	eventSourceMapping*		
				lambda:FunctionArn	
GetFunction	Grants permission to view details about an AWS Lambda function	Read	function*		
GetFunctionCodeSigningConfig	Grants permission to view the code signing config arn attached to an AWS Lambda function	Read	function*		
GetFunctionConcurrency	Grants permission to view details about the reserved concurrency configuration for a function	Read	function*		
GetFunctionConfiguration	Grants permission to view details about the version-specific settings of an AWS Lambda function or version	Read	function*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetFunctionEventInvokeConfig	Grants permission to view the configuration for asynchronous invocation for a function, version, or alias	Read	function*		
GetFunctionRecursionConfig	Grants permission to view the recursion configuration of an AWS Lambda function	Read	function*		
GetFunctionScalingConfig	Grants permission to view the scaling configuration of an AWS Lambda function running on a capacity provider	Read	function*		
GetFunctionUrlConfig	Grants permission to read function url configuration for a Lambda function	Read	function*		
				lambda:FunctionUrlAuthType lambda:FunctionArn	
GetLayerVersion	Grants permission to view details about a version of an AWS Lambda layer. Note this action also supports GetLayerVersionByArn API	Read	layerVersion*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetLayerVersionPolicy	Grants permission to view the resource-based policy for a version of an AWS Lambda layer	Read	layerVersion*		
GetPolicy	Grants permission to view the resource-based policy for an AWS Lambda function, version, or alias	Read	function*		
GetProvisionedConcurrencyConfig	Grants permission to view the provisioned concurrency configuration for an AWS Lambda function's alias or version	Read	function alias		
			function version		
GetRuntimeManagementConfig	Grants permission to view the runtime management configuration of an AWS Lambda function	Read	function*		
InvokeAsync	Grants permission to invoke a function asynchronously (Deprecated)	Write	function*		
InvokeFunction	Grants permission to invoke an AWS Lambda function	Write	function*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				lambda:EventSourceToken lambda:InvokedViaFunctionUrl	
InvokeFunctionUrl [permission only]	Grants permission to invoke an AWS Lambda function through url	Write	function*		
				lambda:FunctionUrlAuthType lambda:FunctionArn lambda:EventSourceToken	
ListAliases	Grants permission to retrieve a list of aliases for an AWS Lambda function	List	function*		
ListCapacityProviders	Grants permission to retrieve a list of AWS Lambda capacity providers	List			
ListCodeSigningConfigs	Grants permission to retrieve a list of AWS Lambda code signing configs	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListDurableExecutionsByFunction	Grants permission to retrieve a list of AWS Lambda durable executions of an AWS Lambda function	List	function*		
ListEventSourceMappings	Grants permission to retrieve a list of AWS Lambda event source mappings	List			
ListFunctionEventInvokeConfigs	Grants permission to retrieve a list of configurations for asynchronous invocation for a function	List	function*		
ListFunctionUrlConfigs	Grants permission to read function url configurations for a function	List	function*		
				lambda:FunctionUrlAuthType	
ListFunctionVersionsByCapacityProvider	Grants permission to retrieve a list of AWS Lambda function versions by the capacity provider assigned	List	capacityProvider*		
ListFunctions	Grants permission to retrieve a list of AWS Lambda functions, with the version-specific configuration of each function	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListFunctionsByCodeSigningConfig	Grants permission to retrieve a list of AWS Lambda functions by the code signing config assigned	List	code signing config*		
ListLayerVersions	Grants permission to retrieve a list of versions of an AWS Lambda layer	List			
ListLayers	Grants permission to retrieve a list of AWS Lambda layers, with details about the latest version of each layer	List			
ListProvisionedConcurrencyConfigs	Grants permission to retrieve a list of provisioned concurrency configurations for an AWS Lambda function	List	function*		
ListTags	Grants permission to retrieve a list of tags for an AWS Lambda function, event source mapping, capacity provider, or code signing configuration resource	Read	capacityProvider		
			code signing config		
			eventSourceMapping		
			function		
ListVersionsByFunction	Grants permission to retrieve a list of versions for an AWS Lambda function	List	function*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PassCapacityProvider [permission only]	Grants permission to pass an AWS Lambda capacity provider to a service	Write	capacityProvider*		
PublishLayerVersion	Grants permission to create an AWS Lambda layer	Write	layer*		
PublishVersion	Grants permission to create an AWS Lambda function version	Write	function*		
PutFunctionCodeSigningConfig	Grants permission to attach a code signing config to an AWS Lambda function	Write	code signing config*		
			function*		
				lambda:CodeSigningConfigArn	
PutFunctionConcurrency	Grants permission to configure reserved concurrency for an AWS Lambda function	Write	function*		
PutFunctionEventInvokeConfig	Grants permission to configures options for asynchronous invocation on an AWS Lambda function, version, or alias	Write	function*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutFunctionRecursionConfig	Grants permission to update the recursion configuration of an AWS Lambda function	Write	function*		
PutFunctionScalingConfig	Grants permission to update the scaling configuration of an AWS Lambda function running on a capacity provider	Write	function*		
PutProvisionedConcurrencyConfig	Grants permission to configure provisioned concurrency for an AWS Lambda function's alias or version	Write	function alias		
			function version		
PutRuntimeManagementConfig	Grants permission to update the runtime management configuration of an AWS Lambda function	Write	function*		
RemoveLayerVersionPermission	Grants permission to remove a statement from the permissions policy for a version of an AWS Lambda layer	Permissions management	layerVersion*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RemovePermission	Grants permission to revoke function-use permission from an AWS service or another account	Permissions management	function*		
				lambda:PrincipalLambda:FunctionUrlAuthType	
SendDurableExecutionCallbackFailure	Grants permission to send a failure response for a callback operation in an AWS Lambda durable execution	Write	durable execution*		
SendDurableExecutionCallbackHeartbeat	Grants permission to send a heartbeat for a callback operation in an AWS Lambda durable execution	Write	durable execution*		
SendDurableExecutionCallbackSuccess	Grants permission to send a successful response for a callback operation in an AWS Lambda durable execution	Write	durable execution*		
StopDurableExecution	Grants permission to stop an AWS Lambda durable execution	Write	durable execution*		
TagResource	Grants permission to add tags to an AWS Lambda function, event source mapping, capacity provider, or code signing configuration resource	Tagging	capacityProvider		
			code signing config		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			eventSourceMapping		
			function		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from an AWS Lambda function, event source mapping, capacity provider, or code signing configuration resource	Tagging	capacityProvider		
			code signing config		
			eventSourceMapping		
			function		
				aws:TagKeys	
UpdateAlias	Grants permission to update the configuration of an AWS Lambda function's alias	Write	function*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateCapacityProvider	Grants permission to update an AWS Lambda capacity provider	Write	capacityProvider*		
UpdateCodeSigningConfig	Grants permission to update an AWS Lambda code signing config	Write	codesigningconfig*		
UpdateEventSourceMapping	Grants permission to update the configuration of an AWS Lambda event source mapping	Write	eventSourceMapping*		
				lambda:FunctionArn	
UpdateFunctionCode	Grants permission to update the code of an AWS Lambda function	Write	function*		
UpdateFunctionCodeSigningConfig	Grants permission to update the code signing config of an AWS Lambda function	Write	codesigningconfig*		
			function*		
UpdateFunctionConfiguration	Grants permission to modify the version-specific settings of an AWS Lambda function	Write	function*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				lambda:Layer lambda:VpcIds lambda:SubnetIds lambda:SecurityGroupIds	
UpdateFunctionEventInvokeConfig	Grants permission to modify the configuration for asynchronous invocation for an AWS Lambda function, version, or alias	Write	function*		
UpdateFunctionUrlConfig	Grants permission to update a function url configuration for a Lambda function	Write	function*		
				lambda:FunctionUrlAuthType lambda:FunctionArn	

Resource types defined by AWS Lambda

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
capacityProvider	arn:${Partition}:lambda:${Region}:${Account}:capacity-provider:${CapacityProviderName}	aws:ResourceTag/${TagKey}
code signing config	arn:${Partition}:lambda:${Region}:${Account}:code-signing-config:${CodeSigningConfigId}	aws:ResourceTag/${TagKey}
durable execution	arn:${Partition}:lambda:${Region}:${Account}:function:${FunctionName}:${Version}/durable-execution/${ExecutionName}/${ExecutionId}	
eventSourceMapping	arn:${Partition}:lambda:${Region}:${Account}:event-source-mapping:${UUID}	aws:ResourceTag/${TagKey}
function	arn:${Partition}:lambda:${Region}:${Account}:function:${FunctionName}	aws:ResourceTag/${TagKey}
function alias	arn:${Partition}:lambda:${Region}:${Account}:function:${FunctionName}:${Alias}	aws:ResourceTag/${TagKey}
function version	arn:${Partition}:lambda:${Region}:${Account}:function:${FunctionName}:${Version}	aws:ResourceTag/${TagKey}
layer	arn:${Partition}:lambda:${Region}:${Account}:layer:${LayerName}	

Resource types	ARN	Condition keys
layerVersion	`arn:${Partition}:lambda:${Region}:${Account}:layer:${LayerName}:${LayerVersion}`	

Condition keys for AWS Lambda

AWS Lambda defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
lambda:CodeSigningConfigArn	Filters access by the ARN of an AWS Lambda code signing config	ARN
lambda:EventSourceToken	Filters access by the ID from a non-AWS event source configured for the AWS Lambda function	String
lambda:FunctionArn	Filters access by the ARN of an AWS Lambda function	ARN

Condition keys	Description	Type
lambda:FunctionUrlAuthType	Filters access by authorization type specified in request. Available during CreateFunctionUrlConfig, UpdateFunctionUrlConfig, DeleteFunctionUrlConfig, GetFunctionUrlConfig, ListFunctionUrlConfig, AddPermission and RemovePermission operations	String
lambda:InvokedViaFunctionUrl	Limits the scope of lambda:InvokeFunction action to Function URLs only. Available during AddPermission operation	Bool
lambda:Layer	Filters access by the ARN of a version of an AWS Lambda layer	ArrayOfString
lambda:Principal	Filters access by restricting the AWS service or account that can invoke a function	String
lambda:SecurityGroupIds	Filters access by the ID of security groups configured for the AWS Lambda function	ArrayOfString
lambda:SourceFunctionArn	Filters access by the ARN of the AWS Lambda function from which the request originated	ARN
lambda:SubnetIds	Filters access by the ID of subnets configured for the AWS Lambda function	ArrayOfString
lambda:VpcIds	Filters access by the ID of the VPC configured for the AWS Lambda function	String

Actions, resources, and condition keys for AWS Launch Wizard

AWS Launch Wizard (service prefix: `launchwizard`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Learn how to configure this service.
- View a list of the API operations available for this service.

- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS Launch Wizard

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAdditionalNode [permission only]	Grants permission to create an additional node	Write			
CreateDeployment	Grants permission to create a deployment	Write	deployment*	aws:RequestTag/${TagKey} aws:TagKeys	
CreateSettingsSet [permission only]	Grants permission to create an application settings set	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteAdditionalNode [permission only]	Grants permission to delete an additional node	Write			
DeleteApp [permission only]	Grants permission to delete an application	Write			
DeleteDeployment	Grants permission to delete a deployment	Write	deployment*	aws:ResourceTag/${TagKey}	
DeleteSettingsSet [permission only]	Grants permission to delete a settings set	Write			
DescribeAdditionalNode [permission only]	Grants permission to describe an additional node	Read			
DescribeProvisionedApp [permission only]	Grants permission to describe provisioning applications	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeProvisioningEvents [permission only]	Grants permission to describe provisioning events	Read			
DescribeSettingsSet [permission only]	Grants permission to describe an application settings set	Read			
GetDeployment	Grants permission to get a deployment	Read	deployment*	aws:ResourceTag/${TagKey}	
GetDeploymentPatternVersion	Grants permission to get a version of a deployment pattern	Read			
GetInfrastructureSuggestion [permission only]	Grants permission to get infrastructure suggestion	Read			
GetIpAddress [permission only]	Grants permission to get customer's ip address	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetResourceCostEstimate [permission only]	Grants permission to get resource cost estimate	Read			
GetResourceRecommendation [permission only]	Grants permission to get recommendation for a resource	Read			
GetSettingsSet [permission only]	Grants permission to get a settings set	Read			
GetWorkload	Grants permission to get a workload	Read			
GetWorkloadAsset [permission only]	Grants permission to get a workload's asset	Read			
GetWorkloadAssets [permission only]	Grants permission to get workload assets	Read			
GetWorkloadDeploymentPattern	Grants permission to get a deployment pattern	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAdditionalNodes [permission only]	Grants permission to list additional nodes	List			
ListAllowedResources [permission only]	Grants permission to list the allowed resources	List			
ListDeploymentEvents	Grants permission to list the events that occured during a deployment	List			
ListDeploymentPatternVersions	Grants permission to list the versions of a deployment pattern	List			
ListDeployments	Grants permission to list deployments	List			
ListProvisionedApps [permission only]	Grants permission to list provisioning applications	List			
ListResourceCostEstimates [permission only]	Grants permission to list the cost estimates of resources	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListSettingsSets [permission only]	Grants permission to list settings sets	List			
ListTagsForResource	Grants permission to list tags for a LaunchWizard resource	Read	deployment	aws:ResourceTag/${TagKey}	
ListWorkloadDeploymentOptions [permission only]	Grants permission to list deployment options of a given workload	List			
ListWorkloadDeploymentPatterns	Grants permission to list the deployment patterns of a workload	List			
ListWorkloads	Grants permission to list workloads	List			
PutSettingsSet [permission only]	Grants permission to create a settings set	Write			
StartProvisioning [permission only]	Grants permission to start a provisioning	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to tag a LaunchWizard resource	Tagging	deployment	aws:TagKeys aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}	
UntagResource	Grants permission to untag a LaunchWizard resource	Tagging	deployment	aws:TagKeys	
UpdateDeployment	Grants permission to update a deployment	Write	deployment*	aws:ResourceTag/${TagKey}	
UpdateSettingsSet [permission only]	Grants permission to update an application settings set	Write			

Resource types defined by AWS Launch Wizard

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
deployment	`arn:${Partition}:launchwizard:${Region}:${Account}:deployment/${DeploymentId}`	aws:ResourceTag/${TagKey}

Condition keys for AWS Launch Wizard

AWS Launch Wizard defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Lex

Amazon Lex (service prefix: `lex`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateBotVersion	Creates a new version based on the $LATEST version of the specified bot	Write	bot version*		
CreateIntentVersion	Creates a new version based on the $LATEST version of the specified intent	Write	intent version*		
CreateSlotTypeVersion	Creates a new version based on the $LATEST version of the specified slot type	Write	slottype version*		
DeleteBot	Deletes all versions of a bot	Write	bot version*		
DeleteBotAlias	Deletes an alias for a specific bot	Write	bot alias*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteBotChannelAssociation	Deletes the association between a Amazon Lex bot alias and a messaging platform	Write	channel*		
DeleteBotVersion	Deletes a specific version of a bot	Write	bot version*		
DeleteIntent	Deletes all versions of an intent	Write	intent version*		
DeleteIntentVersion	Deletes a specific version of an intent	Write	intent version*		
DeleteSession	Removes session information for a specified bot, alias, and user ID	Write	bot alias		
			bot version		
DeleteSlotType	Deletes all versions of a slot type	Write	slottype version*		
DeleteSlotTypeVersion	Deletes a specific version of a slot type	Write	slottype version*		
DeleteUtterances	Deletes the information Amazon Lex maintains for utterances on a specific bot and userId	Write	bot version*		
GetBot	Returns information for a specific bot. In addition to the bot name, the bot version or alias is required	Read	bot alias		
			bot version		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetBotAlias	Returns information about a Amazon Lex bot alias	Read	bot alias*		
GetBotAliases	Returns a list of aliases for a given Amazon Lex bot	List			
GetBotChannelAssociation	Returns information about the association between a Amazon Lex bot and a messaging platform	Read	channel*		
GetBotChannelAssociations	Returns a list of all of the channels associated with a single bot	List	channel*		
GetBotVersions	Returns information for all versions of a specific bot	List	bot version*		
GetBots	Returns information for the $LATEST version of all bots, subject to filters provided by the client	List			
GetBuiltinIntent	Returns information about a built-in intent	Read			
GetBuiltinIntents	Gets a list of built-in intents that meet the specified criteria	Read			
GetBuiltinSlotTypes	Gets a list of built-in slot types that meet the specified criteria	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetExport	Exports Amazon Lex Resource in a requested format	Read	bot version*		
GetImport	Gets information about an import job started with StartImport	Read			
GetIntent	Returns information for a specific intent. In addition to the intent name, you must also specify the intent version	Read	intent version*		
GetIntentVersions	Returns information for all versions of a specific intent	List	intent version*		
GetIntents	Returns information for the $LATEST version of all intents, subject to filters provided by the client	List			
GetMigration	Grants permission to view an ongoing or completed migration	Read			
GetMigrations	Grants permission to view list of migrations from Amazon Lex v1 to Amazon Lex v2	List			
GetSession	Returns session information for a specified bot, alias, and user ID	Read	bot alias		
			bot version		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSlotType	Returns information about a specific version of a slot type. In addition to specifying the slot type name, you must also specify the slot type version	Read	slottype version*		
GetSlotTypeVersions	Returns information for all versions of a specific slot type	List	slottype version*		
GetSlotTypes	Returns information for the $LATEST version of all slot types, subject to filters provided by the client	List			
GetUtterancesView	Returns a view of aggregate utterance data for versions of a bot for a recent time period	List	bot version*		
ListTagsForResource	Lists tags for a Lex resource	Read	bot		
			bot alias		
			channel		
PostContent	Sends user input (text or speech) to Amazon Lex	Write	bot alias		
			bot version		
PostText	Sends user input (text-only) to Amazon Lex	Write	bot alias		
			bot version		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutBot	Creates or updates the $LATEST version of a Amazon Lex conversational bot	Write	bot version*		
				aws:TagKeys aws:RequestTag/${TagKey}	
PutBotAlias	Creates or updates an alias for the specific bot	Write	bot alias*		
				aws:TagKeys aws:RequestTag/${TagKey}	
PutIntent	Creates or updates the $LATEST version of an intent	Write	intent version*		
PutSession	Creates a new session or modifies an existing session with an Amazon Lex bot	Write	bot alias		
			bot version		
PutSlotType	Creates or updates the $LATEST version of a slot type	Write	slottype version*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartImport	Starts a job to import a resource to Amazon Lex	Write			
StartMigration	Grants permission to migrate a bot from Amazon Lex v1 to Amazon Lex v2	Write	bot version*		
TagResource	Adds or overwrites tags to a Lex resource	Tagging	bot		
			bot alias		
			channel		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Removes tags from a Lex resource	Tagging	bot		
			bot alias		
			channel		
				aws:TagKeys aws:RequestTag/${TagKey}	

Resource types defined by Amazon Lex

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
bot	`arn:${Partition}:lex:${Region}:${Account}:bot:${BotName}`	aws:ResourceTag/${TagKey}
bot version	`arn:${Partition}:lex:${Region}:${Account}:bot:${BotName}:${BotVersion}`	aws:ResourceTag/${TagKey}
bot alias	`arn:${Partition}:lex:${Region}:${Account}:bot:${BotName}:${BotAlias}`	aws:ResourceTag/${TagKey}
channel	`arn:${Partition}:lex:${Region}:${Account}:bot-channel:${BotName}:${BotAlias}:${ChannelName}`	aws:ResourceTag/${TagKey}
intent version	`arn:${Partition}:lex:${Region}:${Account}:intent:${IntentName}:${IntentVersion}`	
slottype version	`arn:${Partition}:lex:${Region}:${Account}:slottype:${SlotName}:${SlotVersion}`	

Condition keys for Amazon Lex

Amazon Lex defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access based on the tags in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags attached to a Lex resource	String
aws:TagKeys	Filters access based on the set of tag keys in the request	ArrayOfString
lex:associatedIntents	Enables you to control access based on the intents included in the request	ArrayOfString
lex:associatedSlotTypes	Enables you to control access based on the slot types included in the request	ArrayOfString
lex:channelType	Enables you to control access based on the channel type included in the request	String

Actions, resources, and condition keys for Amazon Lex V2

Amazon Lex V2 (service prefix: `lex`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Lex V2

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchCreateCustomVocabularyItem	Grants permission to create new items in an existing custom vocabulary	Write	bot*		
BatchDeleteCustomVocabularyItem	Grants permission to delete existing items in an existing custom vocabulary	Write	bot*		
BatchUpdateCustomVocabularyItem	Grants permission to update existing items in an existing custom vocabulary	Write	bot*		
BuildBotLocale	Grants permission to build an existing bot locale in a bot	Write	bot*		
CreateBot	Grants permission to create a new bot and a test bot alias pointing to the DRAFT bot version	Write	bot*		
			bot alias*		
				aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey}	
CreateBotAlias	Grants permission to create a new bot alias in a bot	Write	bot alias*

UpdateTestSet	Grants permission to update an existing test set	Write	test set*		

Resource types defined by Amazon Lex V2

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
bot	`arn:${Partition}:lex:${Region}:${Account}:bot/${BotId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
bot alias	`arn:${Partition}:lex:${Region}:${Account}:bot-alias/${BotId}/${BotAliasId}`	aws:ResourceTag/${TagKey}
test set	`arn:${Partition}:lex:${Region}:${Account}:test-set/${TestSetId}`	aws:ResourceTag/${TagKey}

Condition keys for Amazon Lex V2

Amazon Lex V2 defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags attached to a Lex resource	String
aws:TagKeys	Filters access by the set of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS License Manager

AWS License Manager (service prefix: `license-manager`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS License Manager

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptGrant	Grants permission to accept a grant	Write	grant*		
CheckInLicense	Grants permission to check in license entitlements back to pool	Write			
CheckoutBorrowLicense	Grants permission to check out license entitlements for borrow use case	Write	license*		
CheckoutLicense	Grants permission to check out license entitlements	Write			
CreateGrant	Grants permission to create a new grant for license	Write	license*		
				aws:RequestTag/	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				${TagKey} aws:TagKeys	
CreateGrantVersion	Grants permission to create new version of grant	Write	grant*

Actions defined by AWS License Manager User Subscriptions

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateUser	Grants permission to associate a subscribed user to an instance launched with license manager user subscriptions products	Write	identity-provider*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateLicenseServerEndpoint	Grants permission to create a license server endpoint for a given server type for a given Identity Provider	Write	identity-provider*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteLicenseServerEndpoint	Grants permission to delete a license server endpoint for a given server type for a given Identity Provider	Write	identity-provider*		
			license-server-endpoint*		
DeregisterIdentityProvider	Grants permission to deregister Microsoft Active Directory with license-m	Write	identity-provider*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	anager-user-subscriptions for a product				
DisassociateUser	Grants permission to disassociate a subscribed user from an instance launched with license manager user subscriptions products	Write	identity-provider* instance-user*		
ListIdentityProviders	Grants permission to list all the identity providers on license manager user subscriptions	List			
ListInstances	Grants permission to list all the instances launched with license manager user subscription products	List			
ListLicenseServerEndpoints	Grants permission to list license server endpoints	List			
ListProductSubscriptions	Grants permission to lists all the product subscriptions for a product and identity provider	List	identity-provider*		
ListTagsForResource	Grants permission to list tags for a selected resource	Read	identity-provider* instance-user*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			license-server-endpoint*		
			product-subscription*		
ListUserAssociations	Grants permission to list all the users associated to an instance launched for a product	List	identity-provider*		
RegisterIdentityProvider	Grants permission to registers Microsoft Active Directory with license-manager-user-subscriptions for a product	Write		aws:RequestTag/${TagKey} aws:TagKeys	
StartProductSubscription	Grants permission to start product subscription for a user on a registered active directory for a product	Write	identity-provider*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StopProductSubscription	Grants permission to stop product subscription for a user on a registered active directory for a product	Write	identity-provider*		
			product-subscription*		
TagResource	Grants permission to tag a selected resource	Tagging	identity-provider*		
			instance-user*		
			license-server-endpoint*		
			product-subscription*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to untag a selected resource	Tagging	identity-provider*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			instance-user*		
			license-server-endpoint*		
			product-subscription*		
UpdateIdentityProviderSettings	Grants permission to update the identity provider configuration	Write	identity-provider*		

Resource types defined by AWS License Manager User Subscriptions

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
identity-provider	`arn:${Partition}:license-manager-user-subscriptions:${Region}:${Account}:identity-provider/${IdentityProviderId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
product-subscription	arn:${Partition}:license-manager-user-subscriptions:${Region}:${Account}:product-subscription/${ProductSubscriptionId}	aws:ResourceTag/${TagKey}
instance-user	arn:${Partition}:license-manager-user-subscriptions:${Region}:${Account}:instance-user/${InstanceUserId}	aws:ResourceTag/${TagKey}
license-server-endpoint	arn:${Partition}:license-manager-user-subscriptions:${Region}:${Account}:license-server-endpoint/${LicenseServerEndpointId}	aws:ResourceTag/${TagKey}

Condition keys for AWS License Manager User Subscriptions

AWS License Manager User Subscriptions defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Lightsail

Amazon Lightsail (service prefix: `lightsail`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon Lightsail

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AllocateStaticIp	Grants permission to create a static IP address that can be attached to an instance	Write			
AttachCertificateToDistribution	Grants permission to attach an SSL/TLS certificate to your Amazon Lightsail content delivery network (CDN) distribution	Write	Certificate* Distribution*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AttachDisk	Grants permission to attach a disk to an instance	Write	Disk*		
AttachInstancesToLoadBalancer	Grants permission to attach one or more instances to a load balancer	Write	LoadBalancer*		
AttachLoadBalancerTlsCertificate	Grants permission to attach a TLS certificate to a load balancer	Write	LoadBalancer*		
AttachStaticIp	Grants permission to attach a static IP address to an instance	Write	Instance*		
			StaticIp*		
CloseInstancePublicPorts	Grants permission to close a public port of an instance	Write	Instance*		
CopySnapshot	Grants permission to copy a snapshot from one AWS Region to another in Amazon Lightsail	Write			
CreateBucket	Grants permission to create an Amazon Lightsail bucket	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateBucketAccessKey	Grants permission to create a new access key for the specified bucket	Write	Bucket*		
CreateCertificate	Grants permission to create an SSL/TLS certificate	Write		aws:RequestTag/${TagKey} aws:TagKeys	lightsail:CreateDomainEntry lightsail:GetDomains
CreateCloudFormationStack	Grants permission to create a new Amazon EC2 instance from an exported Amazon Lightsail snapshot	Write			
CreateContactMethod	Grants permission to create an email or SMS text message contact method	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateContainerService	Grants permission to create an Amazon Lightsail container service	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateContainerServiceDeployment	Grants permission to create a deployment for your Amazon Lightsail container service	Write	ContainerService*		
CreateContainerServiceRegistryLogin	Grants permission to create a temporary set of log in credentials that you can use to log in to the Docker process on your local machine	Write			
CreateDisk	Grants permission to create a disk	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateDiskFromSnapshot	Grants permission to create a disk from snapshot	Write	DiskSnapshot*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDiskSnapshot	Grants permission to create a disk snapshot	Write	Disk		
			Instance		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateDistribution	Grants permission to create an Amazon Lightsail content delivery network (CDN) distribution	Write		aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateDomain	Grants permission to create a domain resource for the specified domain name	Write		aws:RequestTag/${TagKey} aws:TagKeys	route53:DeleteHostedZone route53:GetHostedZone route53:ListHostedZonesByName route53domains:GetDomainDetail route53domains:GetOperationDetail route53domains:ListDomains route53domains:ListOperations route53domains:Upd

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
					ateDomainNameservers
CreateDomainEntry	Grants permission to create one or more DNS record entries for a domain resource: Address (A), canonical name (CNAME), mail exchanger (MX), name server (NS), start of authority (SOA), service locator (SRV), or text (TXT)	Write	Domain*		
CreateGUISessionAccessDetails	Grants permission to create URLs that are used to access an instance's graphical user interface (GUI) session	Write	Instance*		
CreateInstanceSnapshot	Grants permission to create an instance snapshot	Write	Instance*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateInstances	Grants permission to create one or more instances	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateInstancesFromSnapshot	Grants permission to create one or more instances based on an instance snapshot	Write	InstanceSnapshot*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateKeyPair	Grants permission to create a key pair used to authenticate and connect to an instance	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateLoadBalancer	Grants permission to create a load balancer	Write		aws:RequestTag/${TagKey} aws:TagKeys	lightsail:CreateDomainEntry lightsail:GetDomains

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateLoadBalancerTlsCertificate	Grants permission to create a load balancer TLS certificate	Write	LoadBalancer*		lightsail:CreateDomainEntry lightsail:GetDomains
CreateRelationalDatabase	Grants permission to create a new relational database	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateRelationalDatabaseFromSnapshot	Grants permission to create a new relational database from a snapshot	Write	RelationalDatabaseSnapshot*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateRelationalDatabaseSnapshot	Grants permission to create a relational database snapshot	Write		aws:RequestTag/${TagKey} aws:TagKeys	
DeleteAlarm	Grants permission to delete an alarm	Write	Alarm*		
DeleteAutoSnapshot	Grants permission to delete an automatic snapshot of an instance or disk	Write			
DeleteBucket	Grants permission to delete an Amazon Lightsail bucket	Write	Bucket*		
DeleteBucketAccessKey	Grants permission to delete an access key for the specified Amazon Lightsail bucket	Write	Bucket*		
DeleteCertificate	Grants permission to delete an SSL/TLS certificate	Write	Certificate*		
DeleteContactMethod	Grants permission to delete a contact method	Write			
DeleteContainerImage	Grants permission to delete a container image that is registered to your Amazon Lightsail container service	Write	ContainerService*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteContainerService	Grants permission to delete your Amazon Lightsail container service	Write	ContainerService*		
DeleteDisk	Grants permission to delete a disk	Write	Disk*		
DeleteDiskSnapshot	Grants permission to delete a disk snapshot	Write	DiskSnapshot*		
DeleteDistribution	Grants permission to delete your Amazon Lightsail content delivery network (CDN) distribution	Write	Distribution*		
DeleteDomain	Grants permission to delete a domain resource and all of its DNS records	Write	Domain*		
DeleteDomainEntry	Grants permission to delete a DNS record entry for a domain resource	Write	Domain*		
DeleteInstance	Grants permission to delete an instance	Write	Instance*		
DeleteInstanceSnapshot	Grants permission to delete an instance snapshot	Write	InstanceSnapshot*		
DeleteKeyPair	Grants permission to delete a key pair used to authenticate and connect to an instance	Write	KeyPair*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteKnownHostKeys	Grants permission to delete the known host key or certificate used by the Amazon Lightsail browser-based SSH or RDP clients to authenticate an instance	Write	Instance*		
DeleteLoadBalancer	Grants permission to delete a load balancer	Write	LoadBalancer*		
DeleteLoadBalancerTlsCertificate	Grants permission to delete a load balancer TLS certificate	Write	LoadBalancer*		
DeleteRelationalDatabase	Grants permission to delete a relational database	Write	RelationalDatabase*		
DeleteRelationalDatabaseSnapshot	Grants permission to delete a relational database snapshot	Write	RelationalDatabaseSnapshot*		
DetachCertificateFromDistribution	Grants permission to detach an SSL/TLS certificate from your Amazon Lightsail content delivery network (CDN) distribution	Write	Distribution*		
DetachDisk	Grants permission to detach a disk from an instance	Write	Disk*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DetachInstancesFromLoadBalancer	Grants permission to detach one or more instances from a load balancer	Write	LoadBalancer*		
DetachStaticIp	Grants permission to detach a static IP from an instance to which it is attached	Write	StaticIp*		
DisableAddOn	Grants permission to disable an add-on for an Amazon Lightsail resource	Write			
DownloadDefaultKeyPair	Grants permission to download the default key pair used to authenticate and connect to instances in a specific AWS Region	Write			
EnableAddOn	Grants permission to enable or modify an add-on for an Amazon Lightsail resource	Write			
ExportSnapshot	Grants permission to export an Amazon Lightsail snapshot to Amazon EC2	Write	DiskSnapshot		iam:CreateServiceLinkedRole iam:PutRolePolicy
			InstanceSnapshot		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetActiveNames	Grants permission to get the names of all active (not deleted) resources	Read			
GetAlarms	Grants permission to view information about the configured alarms	Read			
GetAutoSnapshots	Grants permission to view the available automatic snapshots for an instance or disk	Read			
GetBlueprints	Grants permission to get a list of instance images, or blueprints. You can use a blueprint to create a new instance already running a specific operating system, as well as a pre-installed application or development stack. The software that runs on your instance depends on the blueprint you define when creating the instance	Read			
GetBucketAccessKeys	Grants permission to get the existing access key IDs for the specified Amazon Lightsail bucket	Read			
GetBucketBundles	Grants permission to get the bundles that can be applied to an Amazon Lightsail bucket	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetBucketMetricData	Grants permission to get the data points of a specific metric for an Amazon Lightsail bucket	Read			
GetBuckets	Grants permission to get information about one or more Amazon Lightsail buckets	Read			
GetBundles	Grants permission to get a list of instance bundles. You can use a bundle to create a new instance with a set of performance specifications, such as CPU count, disk size, RAM size, and network transfer allowance. The cost of your instance depends on the bundle you define when creating the instance	Read			
GetCertificates	Grants permission to view information about one or more Amazon Lightsail SSL/TLS certificates	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetCloudFormationStackRecords	Grants permission to get information about all CloudFormation stacks used to create Amazon EC2 resources from exported Amazon Lightsail snapshots	Read			
GetContactMethods	Grants permission to view information about the configured contact methods	Read			
GetContainerAPIMetadata	Grants permission to view information about Amazon Lightsail containers, such as the current version of the Lightsail Control (lightsailctl) plugin	Read			
GetContainerImages	Grants permission to view the container images that are registered to your Amazon Lightsail container service	Read			
GetContainerLog	Grants permission to view the log events of a container of your Amazon Lightsail container service	Read			
GetContainerServiceDeployments	Grants permission to view the deployments for your Amazon Lightsail container service	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetContainerServiceMetricData	Grants permission to view the data points of a specific metric of your Amazon Lightsail container service	Read			
GetContainerServicePowers	Grants permission to view the list of powers that can be specified for your Amazon Lightsail container services	Read			
GetContainerServices	Grants permission to view information about one or more of your Amazon Lightsail container services	Read			
GetCostEstimate	Grants permission to get the information about the cost estimate for a specified resource	Read	Disk Instance		
GetDisk	Grants permission to get information about a disk	Read			
GetDiskSnapshot	Grants permission to get information about a disk snapshot	Read			
GetDiskSnapshots	Grants permission to get information about all disk snapshots	Read			
GetDisks	Grants permission to get information about all disks	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetDistributionBundles	Grants permission to view the list of bundles that can be applied to you Amazon Lightsail content delivery network (CDN) distributions	Read			
GetDistributionLatestCacheReset	Grants permission to view the timestamp and status of the last cache reset of a specific Amazon Lightsail content delivery network (CDN) distribution	Read			
GetDistributionMetricData	Grants permission to view the data points of a specific metric for an Amazon Lightsail content delivery network (CDN) distribution	Read			
GetDistributions	Grants permission to view information about one or more of your Amazon Lightsail content delivery network (CDN) distributions	Read			
GetDomain	Grants permission to get DNS records for a domain resource	Read			
GetDomains	Grants permission to get DNS records for all domain resources	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetExportSnapshotRecords	Grants permission to get information about all records of exported Amazon Lightsail snapshots to Amazon EC2	Read			
GetInstance	Grants permission to get information about an instance	Read			
GetInstanceAccessDetails	Grants permission to get temporary keys you can use to authenticate and connect to an instance	Write	Instance*		
GetInstanceMetricData	Grants permission to get the data points for the specified metric of an instance	Read			
GetInstancePortStates	Grants permission to get the port states of an instance	Read			
GetInstanceSnapshot	Grants permission to get information about an instance snapshot	Read			
GetInstanceSnapshots	Grants permission to get information about all instance snapshots	Read			
GetInstanceState	Grants permission to get the state of an instance	Read			
GetInstances	Grants permission to get information about all instances	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetKeyPair	Grants permission to get information about a key pair	Read			
GetKeyPairs	Grants permission to get information about all key pairs	Read			
GetLoadBalancer	Grants permission to get information about a load balancer	Read			
GetLoadBalancerMetricData	Grants permission to get the data points for the specified metric of a load balancer	Read			
GetLoadBalancerTlsCertificates	Grants permission to get information about a load balancer's TLS certificates	Read			
GetLoadBalancerTlsPolicies	Grants permission to get a list of TLS security policies that you can apply to Lightsail load balancers	Read			
GetLoadBalancers	Grants permission to get information about load balancers	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetOperation	Grants permission to get information about an operation. Operations include events such as when you create an instance, allocate a static IP, attach a static IP, and so on	Read			
GetOperations	Grants permission to get information about all operations. Operations include events such as when you create an instance, allocate a static IP, attach a static IP, and so on	Read			
GetOperationsForResource	Grants permission to get operations for a resource	Read			
GetRegions	Grants permission to get a list of all valid AWS Regions for Amazon Lightsail	Read			
GetRelationalDatabase	Grants permission to get information about a relational database	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetRelationalDatabaseBlueprints	Grants permission to get a list of relational database images, or blueprints. You can use a blueprint to create a new database running a specific database engine. The database engine that runs on your database depends on the blueprint you define when creating the relational database	Read			
GetRelationalDatabaseBundles	Grants permission to get a list of relational database bundles. You can use a bundle to create a new database with a set of performance specifications, such as CPU count, disk size, RAM size, network transfer allowance, and standard of high availability. The cost of your database depends on the bundle you define when creating the relational database	Read			
GetRelationalDatabaseEvents	Grants permission to get events for a relational database	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetRelationalDatabaseLogEvents	Grants permission to get events for the specified log stream of a relational database	Read			
GetRelationalDatabaseLogStreams	Grants permission to get the log streams available for a relational database	Read			
GetRelationalDatabaseMasterUserPassword	Grants permission to get the master user password of a relational database	Write	RelationalDatabase*		
GetRelationalDatabaseMetricData	Grants permission to get the data points for the specified metric of a relational database	Read			
GetRelationalDatabaseParameters	Grants permission to get the parameters of a relational database	Read			
GetRelationalDatabaseSnapshot	Grants permission to get information about a relational database snapshot	Read			
GetRelationalDatabaseSnapshots	Grants permission to get information about all relational database snapshots	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetRelationalDatabases	Grants permission to get information about all relational databases	Read			
GetSetupHistory	Grants permission to get detailed information for setup requests that were run on the specified resource	Read	Instance		
GetStaticIp	Grants permission to get information about a static IP	Read			
GetStaticIps	Grants permission to get information about all static IPs	Read			
ImportKeyPair	Grants permission to import a public key from a key pair	Write			
IsVpcPeered	Grants permission to get a boolean value indicating whether the Amazon Lightsail virtual private cloud (VPC) is peered	Read			
OpenInstancePublicPorts	Grants permission to add, or open a public port of an instance	Write	Instance*		
PeerVpc	Grants permission to try to peer the Amazon Lightsail virtual private cloud (VPC) with the default VPC	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
PutAlarm	Grants permission to creates or update an alarm, and associate it with the specified metric	Write	Alarm*		
PutInstancePublicPorts	Grants permission to set the specified open ports for an instance, and closes all ports for every protocol not included in the request	Write	Instance*		
RebootInstance	Grants permission to reboot an instance that is in a running state	Write	Instance*		
RebootRelationalDatabase	Grants permission to reboot a relational database that is in a running state	Write	RelationalDatabase*		
RegisterContainerImage	Grants permission to register a container image to your Amazon Lightsail container service	Write	ContainerService*		
ReleaseStaticIp	Grants permission to delete a static IP	Write	StaticIp*		
ResetDistributionCache	Grants permission to delete currently cached content from your Amazon Lightsail content delivery network (CDN) distribution	Write	Distribution*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
SendContactMethodVerification	Grants permission to send a verification request to an email contact method to ensure it's owned by the requester	Write			
SetIpAddressType	Grants permission to set the IP address type for a Amazon Lightsail resource	Write	Distribution		
			Instance		
			LoadBalancer		
SetResourceAccessForBucket	Grants permission to set the Amazon Lightsail resources that can access the specified Amazon Lightsail bucket	Write	Bucket*		
			Instance*		
SetupInstanceHttps	Grants permission to create an SSL/TLS certificate and install it on a specified instance	Write	Instance*		lightsail:GetInstanceAccessDetails
StartGUISession	Grants permission to initiate a graphical user interface (GUI) session used to access an instance's operating system or application	Write	Instance*		
StartInstance	Grants permission to start an instance that is in a stopped state	Write	Instance*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartRelationalDatabase	Grants permission to start a relational database that is in a stopped state	Write	RelationalDatabase*		
StopGUISession	Grants permission to terminate a graphical user interface (GUI) session used to access an instance's operating system or application	Write	Instance*		
StopInstance	Grants permission to stop an instance that is in a running state	Write	Instance*		
StopRelationalDatabase	Grants permission to stop a relational database that is in a running state	Write	RelationalDatabase*		
TagResource	Grants permission to tag a resource	Tagging	Bucket		
			Certificate		
			ContactMethod		
			ContainerService		
			Disk		
			DiskSnapshot		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			Distribution		
			Domain		
			Instance		
			InstanceSnapshot		
			KeyPair		
			LoadBalancer		
			RelationalDatabase		
			RelationalDatabaseSnapshot		
			StaticIp		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TestAlarm	Grants permission to test an alarm by displaying a banner on the Amazon Lightsail console or if a notification trigger is configured for the specified alarm, by sending a notification to the notification protocol	Write	Alarm*		
UnpeerVpc	Grants permission to try to unpeer the Amazon Lightsail virtual private cloud (VPC) from the default VPC	Write			
UntagResource	Grants permission to untag a resource	Tagging	Bucket		
			Certificate		
			ContactMethod		
			ContainerService		
			Disk		
			DiskSnapshot		
			Distribution		
			Domain		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			Instance		
			InstanceSnapshot		
			KeyPair		
			LoadBalancer		
			RelationalDatabase		
			RelationalDatabaseSnapshot		
			StaticIp		
				aws:TagKeys	
UpdateBucket	Grants permission to update an existing Amazon Lightsail bucket	Write	Bucket*		
UpdateBucketBundle	Grants permission to update the bundle, or storage plan, of an existing Amazon Lightsail bucket	Write	Bucket*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateContainerService	Grants permission to update the configuration of your Amazon Lightsail container service, such as its power, scale, and public domain names	Write	ContainerService*		
UpdateDistribution	Grants permission to update an existing Amazon Lightsail content delivery network (CDN) distribution or its configuration	Write	Distribution*		
UpdateDistributionBundle	Grants permission to update the bundle of your Amazon Lightsail content delivery network (CDN) distribution	Write	Distribution*		
UpdateDomainEntry	Grants permission to update a domain recordset after it is created	Write	Domain*		
UpdateInstanceMetadataOptions	Grants permission to update metadata options for an instance	Write	Instance*		
UpdateLoadBalancerAttribute	Grants permission to update a load balancer attribute, such as the health check path and session stickiness	Write	LoadBalancer*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateRelationalDatabase	Grants permission to update a relational database	Write	RelationalDatabase*		
UpdateRelationalDatabaseParameters	Grants permission to update the parameters of a relational database	Write	RelationalDatabase*		

Resource types defined by Amazon Lightsail

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Domain	`arn:${Partition}:lightsail:${Region}:${Account}:Domain/${Id}`	aws:ResourceTag/${TagKey}
Instance	`arn:${Partition}:lightsail:${Region}:${Account}:Instance/${Id}`	aws:ResourceTag/${TagKey}
InstanceSnapshot	`arn:${Partition}:lightsail:${Region}:${Account}:InstanceSnapshot/${Id}`	aws:ResourceTag/${TagKey}
KeyPair	`arn:${Partition}:lightsail:${Region}:${Account}:KeyPair/${Id}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
StaticIp	arn:${Partition}:lightsail:${Region}:${Account}:StaticIp/${Id}	aws:ResourceTag/${TagKey}
Disk	arn:${Partition}:lightsail:${Region}:${Account}:Disk/${Id}	aws:ResourceTag/${TagKey}
DiskSnapshot	arn:${Partition}:lightsail:${Region}:${Account}:DiskSnapshot/${Id}	aws:ResourceTag/${TagKey}
LoadBalancer	arn:${Partition}:lightsail:${Region}:${Account}:LoadBalancer/${Id}	aws:ResourceTag/${TagKey}
LoadBalancerTlsCertificate	arn:${Partition}:lightsail:${Region}:${Account}:LoadBalancerTlsCertificate/${Id}

Condition keys for Amazon Lightsail

Amazon Lightsail defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by a list of tag keys that are allowed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Location

Amazon Location (service prefix: geo) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by Amazon Location

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type

is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateTrackerConsumer	Grants permission to create an association between a geofence-collection and a tracker resource	Write	tracker*		
BatchDeleteDevicePositionHistory	Grants permission to delete a batch of device position histories from a tracker resource	Write	tracker*		
				geo:DeviceIds	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchDeleteGeofence	Grants permission to delete a batch of geofences from a geofence collection	Write	geofence-collection*		
				geo:GeofenceIds	
BatchEvaluateGeofences	Grants permission to evaluate device positions against the position of geofences in a given geofence collection	Write	geofence-collection*		
BatchGetDevicePosition	Grants permission to send a batch request to retrieve device positions	Read	tracker*		
				geo:DeviceIds	
BatchPutGeofence	Grants permission to send a batch request for adding geofences into a given geofence collection	Write	geofence-collection*		
				geo:GeofenceIds	
BatchUpdateDevicePosition	Grants permission to upload a position update for one or more devices to a tracker resource	Write	tracker*		
				geo:DeviceIds	
CalculateRoute	Grants permission to calculate routes using a given route calculator resource	Read	route-calculator*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CalculateRouteMatrix	Grants permission to calculate a route matrix using a given route calculator resource	Read	route-calculator*		
CreateGeofenceCollection	Grants permission to create a geofence-collection	Write	geofence-collection*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateKey	Grants permission to create an API key resource	Write	api-key*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateMap	Grants permission to create a map resource	Write	map*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
CreatePlaceIndex	Grants permission to create a place index resource	Write	place-index*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateRouteCalculator	Grants permission to create a route calculator resource	Write	route-calculator*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateTracker	Grants permission to create a tracker resource	Write	tracker*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
DeleteGeofenceCollection	Grants permission to delete a geofence-collection	Write	geofence-collection*		
DeleteKey	Grants permission to delete an API key resource	Write	api-key*		
DeleteMap	Grants permission to delete a map resource	Write	map*		
DeletePlaceIndex	Grants permission to delete a place index resource	Write	place-index*		
DeleteRouteCalculator	Grants permission to delete a route calculator resource	Write	route-calculator*		
DeleteTracker	Grants permission to delete a tracker resource	Write	tracker*		
DescribeGeofenceCollection	Grants permission to retrieve geofence collection details	Read	geofence-collection*		
DescribeKey	Grants permission to retrieve API key resource details and secret	Read	api-key*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeMap	Grants permission to retrieve map resource details	Read	map*		
DescribePlaceIndex	Grants permission to retrieve place-index resource details	Read	place-index*		
DescribeRouteCalculator	Grants permission to retrieve route calculator resource details	Read	route-calculator*		
DescribeTracker	Grants permission to retrieve a tracker resource details	Read	tracker*		
DisassociateTrackerConsumer	Grants permission to remove the association between a tracker resource and a geofence-collection	Write	tracker*		
ForecastGeofenceEvents	Grants permission to forecast events for geofences stored in a given geofence collection	Read	geofence-collection*		
GetDevicePosition	Grants permission to retrieve the latest device position	Read	tracker*		
				geo:DeviceIds	
GetDevicePositionHistory	Grants permission to retrieve the device position history	Read	tracker*		
				geo:DeviceIds	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetGeofence	Grants permission to retrieve the geofence details from a geofence-collection	Read	geofence-collection*		
				geo:GeofenceIds	
GetMapGlyphs	Grants permission to retrieve the glyph file for a map resource	Read	map*		
GetMapSprites	Grants permission to retrieve the sprite file for a map resource	Read	map*		
GetMapStyleDescriptor	Grants permission to retrieve the map style descriptor from a map resource	Read	map*		
GetMapTile	Grants permission to retrieve the map tile from the map resource	Read	map*		
GetPlace	Grants permission to find a place by its unique ID	Read	place-index*		
ListDevicePositions	Grants permission to retrieve a list of devices and their latest positions from the given tracker resource	Read	tracker*		
ListGeofenceCollections	Grants permission to lists geofence-collections	List	geofence-collection*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListGeofences	Grants permission to list geofences stored in a given geofence collection	Read	geofence-collection*		
ListKeys	Grants permission to list API key resources	List	api-key*		
ListMaps	Grants permission to list map resources	List	map*		
ListPlaceIndexes	Grants permission to return a list of place index resources	List	place-index*		
ListRouteCalculators	Grants permission to return a list of route calculator resources	List	route-calculator*		
ListTagsForResource	Grants permission to list the tags (metadata) which you have assigned to the resource	Read	api-key		
			geofence-collection		
			map		
			place-index		
			route-calculator		
			tracker		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListTrackerConsumers	Grants permission to retrieve a list of geofence collections currently associated to the given tracker resource	Read	tracker*		
ListTrackers	Grants permission to return a list of tracker resources	List	tracker*		
PutGeofence	Grants permission to add a new geofence or update an existing geofence to a given geofence-collection	Write	geofence-collection*		
				geo:GeofenceIds	
SearchPlaceIndexForPosition	Grants permission to reverse geocodes a given coordinate	Read	place-index*		
SearchPlaceIndexForSuggestions	Grants permission to generate suggestions for addresses and points of interest based on partial or misspelled free-form text	Read	place-index*		
SearchPlaceIndexForText	Grants permission to geocode free-form text, such as an address, name, city or region	Read	place-index*		
TagResource	Grants permission to adds to or modifies the tags of the given resource. Tags are metadata which can be used to manage a resource	Tagging	api-key		
			geofence-collection		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			map		
			place-index		
			route-calculator		
			tracker		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove the given tags (metadata) from the resource	Tagging	api-key		
			geofence-collection		
			map		
			place-index		
			route-calculator		
			tracker		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
UpdateGeofenceCollection	Grants permission to update a geofence collection	Write	geofence-collection*		
UpdateKey	Grants permission to update an API key resource	Write	api-key*		
UpdateMap	Grants permission to update a map resource	Write	map*		
UpdatePlaceIndex	Grants permission to update a place index resource	Write	place-index*		
UpdateRouteCalculator	Grants permission to update a route calculator resource	Write	route-calculator*		
UpdateTracker	Grants permission to update a tracker resource	Write	tracker*		
VerifyDevicePosition	Grants permission to verify a device position	Read	tracker*		
				geo:DeviceIds	

Resource types defined by Amazon Location

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you

can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
api-key	arn:${Partition}:geo:${Region}:${Account}:api-key/${KeyName}	aws:ResourceTag/${TagKey}
geofence-collection	arn:${Partition}:geo:${Region}:${Account}:geofence-collection/${GeofenceCollectionName}	aws:ResourceTag/${TagKey} geo:GeofenceIds
map	arn:${Partition}:geo:${Region}:${Account}:map/${MapName}	aws:ResourceTag/${TagKey}
place-index	arn:${Partition}:geo:${Region}:${Account}:place-index/${IndexName}	aws:ResourceTag/${TagKey}
route-calculator	arn:${Partition}:geo:${Region}:${Account}:route-calculator/${CalculatorName}	aws:ResourceTag/${TagKey}
tracker	arn:${Partition}:geo:${Region}:${Account}:tracker/${TrackerName}	aws:ResourceTag/${TagKey} geo:DeviceIds

Condition keys for Amazon Location

Amazon Location defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag's key and value in a request	String
aws:ResourceTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:TagKeys	Filters access by the tag keys in a request	ArrayOfString
geo:DeviceIds	Filters access by the presence of device ids in the request	ArrayOfString
geo:GeofenceIds	Filters access by the presence of geofence ids in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Location Service Maps

Amazon Location Service Maps (service prefix: `geo-maps`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Location Service Maps

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetStaticMap	Grants permission to retrieve the static map	Read	provider*		
GetTile	Grants permission to retrieve the map tile	Read	provider*		

Resource types defined by Amazon Location Service Maps

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
provider	`arn:${Partition}:geo-maps:${Region}::provider/default`	

Condition keys for Amazon Location Service Maps

Geo Maps has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Location Service Places

Amazon Location Service Places (service prefix: `geo-places`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

UpdateRetrainingScheduler	Grants permission to update a retraining scheduler of a trained model	Write	model*		

Resource types defined by Amazon Lookout for Equipment

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
dataset	`arn:${Partition}:lookoutequipment:${Region}:${Account}:dataset/${DatasetName}/${DatasetId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
model	arn:${Partition}:lookoutequipment:${Region}:${Account}:model/${ModelName}/${ModelId}	aws:ResourceTag/${TagKey}
model-version	arn:${Partition}:lookoutequipment:${Region}:${Account}:model/${ModelName}/${ModelId}/model-version/${ModelVersionNumber}	aws:ResourceTag/${TagKey}
inference-scheduler	arn:${Partition}:lookoutequipment:${Region}:${Account}:inference-scheduler/${InferenceSchedulerName}/${InferenceSchedulerId}	aws:ResourceTag/${TagKey}
label-group	arn:${Partition}:lookoutequipment:${Region}:${Account}:label-group/${LabelGroupName}/${LabelGroupId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Lookout for Equipment

Amazon Lookout for Equipment defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
lookoutequipment:IsImportingData	Filters access by the import strategy of underlying data	Bool

Actions, resources, and condition keys for Amazon Lookout for Metrics

Amazon Lookout for Metrics (service prefix: `lookoutmetrics`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Lookout for Metrics

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ActivateAnomalyDetector	Grants permission to activate an anomaly detector	Write	AnomalyDetector*		
BackTestAnomalyDetector	Grants permission to run a backtest with an anomaly detector	Write	AnomalyDetector*		
CreateAlert	Grants permission to create an alert for an anomaly detector	Write	Alert*		
			AnomalyDetector*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateAnomalyDetector	Grants permission to create an anomaly detector	Write	AnomalyDetector*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateMetricSet	Grants permission to create a dataset	Write	AnomalyDetector*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			MetricSet*		
				aws:RequestTag/${TagKey} aws:TagKeys	
DeactivateAnomalyDetector	Grants permission to deactivate an anomaly detector	Write	AnomalyDetector*		
DeleteAlert	Grants permission to delete an alert	Write	Alert*		
DeleteAnomalyDetector	Grants permission to delete an anomaly detector	Write	AnomalyDetector*		
DescribeAlert	Grants permission to get details about an alert	Read	Alert*		
DescribeAnomalyDetectionExecutions	Grants permission to get information about an anomaly detection job	Read	AnomalyDetector*		
DescribeAnomalyDetector	Grants permission to get details about an anomaly detector	Read	AnomalyDetector*

DescribeEvaluations	Returns a list of DescribeEvaluations that match the search criteria in the request	List			
DescribeMLModels	Returns a list of MLModel that match the search criteria in the request	List			
DescribeTags	Describes one or more of the tags for your Amazon ML object	List	batchprediction		
			datasource		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			evaluation		
			mlmodel		
GetBatchPrediction	Returns a BatchPrediction that includes detailed metadata, status, and data file information	Read	batchprediction*		
GetDataSource	Returns a DataSource that includes metadata and data file information, as well as the current status of the DataSource	Read	datasource*		
GetEvaluation	Returns an Evaluation that includes metadata as well as the current status of the Evaluation	Read	datasource*		
GetMLModel	Returns an MLModel that includes detailed metadata, and data source information as well as the current status of the MLModel	Read	mlmodel*		
Predict	Generates a prediction for the observation using the specified ML Model	Write	mlmodel*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateBatchPrediction	Updates the BatchPredictionName of a BatchPrediction	Write	batchprediction*		
UpdateDataSource	Updates the DataSourceName of a DataSource	Write	datasource*		
UpdateEvaluation	Updates the EvaluationName of an Evaluation	Write	evaluation*		
UpdateMLModel	Updates the MLModelName and the ScoreThreshold of an MLModel	Write	mlmodel*		

Resource types defined by Amazon Machine Learning

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
batchprediction	`arn:${Partition}:machinelearning:${Region}:${Account}:batchprediction/${BatchPredictionId}`	
datasource	`arn:${Partition}:machinelearning:${Region}:${Account}:datasource/${DatasourceId}`	

Resource types	ARN	Condition keys
evaluation	arn:${Partition}:machinelearning:${Region}:${Account}:evaluation/${EvaluationId}	
mlmodel	arn:${Partition}:machinelearning:${Region}:${Account}:mlmodel/${MlModelId}	

Condition keys for Amazon Machine Learning

Machine Learning has no service-specific context keys that can be used in the Condition element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Macie

Amazon Macie (service prefix: macie2) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon Macie

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the

Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Note

The DisassociateFromMasterAccount and GetMasterAccount actions have been deprecated. We recommend that you specify the DisassociateFromAdministratorAccount and GetAdministratorAccount actions respectively instead.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptInvitation	Grants permission to accept an Amazon Macie membership invitation	Write			
BatchGetCustomDataIdentifiers	Grants permission to retrieve information about one or more custom data identifiers	Read	CustomDataIdentifier*		
BatchUpdateAutomatedDiscoveryAccounts	Grants permission to an Amazon Macie administrator to change the status of automated sensitive data discovery for one or more accounts in their organization	Write			
CreateAllowList	Grants permission to create and define the settings for an allow list	Write		aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
CreateClassificationJob	Grants permission to create and define the settings for a sensitive data discovery job	Write	ClassificationJob*		
				aws:RequestTag/${TagKey} aws:TagKeys	
CreateCustomDataIdentifier	Grants permission to create and define the settings for a custom data identifier	Write	CustomDataIdentifier*		
				aws:RequestTag/${TagKey} aws:TagKeys

				aws:RequestTag/${TagKey} aws:TagKeys	
CreateSampleFindings	Grants permission to create sample findings	Write			
DeclineInvitations	Grants permission to decline Amazon Macie membership invitations	Write			
DeleteAllowList	Grants permission to delete an allow list	Write	AllowList*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteCustomDataIdentifier	Grants permission to delete a custom data identifier	Write	CustomDataIdentifier*		
DeleteFindingsFilter	Grants permission to delete a findings filter	Write	FindingsFilter*		
DeleteInvitations	Grants permission to delete Amazon Macie membership invitations	Write			
DeleteMember	Grants permission to delete the association between an Amazon Macie administrator account and an account	Write	Member*		
DescribeBuckets	Grants permission to retrieve statistical data and other information about S3 buckets that Amazon Macie monitors and analyzes	Read			
DescribeClassificationJob	Grants permission to retrieve information about the status and settings for a sensitive data discovery job	Read	ClassificationJob*		
DescribeOrganizationConfiguration	Grants permission to retrieve information about the Amazon Macie configuration settings for an AWS organization	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DisableMacie	Grants permission to disable an Amazon Macie account, which also deletes Macie resources for the account	Write			
DisableOrganizationAdminAccount	Grants permission to disable an account as the delegated Amazon Macie administrator account for an AWS organization	Write			
DisassociateFromAdministratorAccount	Grants permission to an Amazon Macie member account to disassociate from its Macie administrator account	Write			
DisassociateFromMasterAccount	Grants permission to an Amazon Macie member account to disassociate from its Macie administrator account	Write			
DisassociateMember	Grants permission to an Amazon Macie administrator account to disassociate from a Macie member account	Write	Member*		
EnableMacie	Grants permission to enable and specify the configuration settings for a new Amazon Macie account	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
EnableOrganizationAdminAccount	Grants permission to enable an account as the delegated Amazon Macie administrator account for an AWS organization	Write			
GetAdministratorAccount	Grants permission to retrieve information about the Amazon Macie administrator account for an account	Read			
GetAllowList	Grants permission to retrieve the settings and status of an allow list	Read	AllowList *		
GetAutomatedDiscoveryConfiguration	Grants permission to retrieve the configuration settings and status of automated sensitive data discovery for an Amazon Macie administrator account, organization, or standalone account	Read			
GetBucketStatistics	Grants permission to retrieve aggregated statistical data for all the S3 buckets that Amazon Macie monitors and analyzes	Read			
GetClassificationExportConfiguration	Grants permission to retrieve the settings for exporting sensitive data discovery results	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetClassificationScope	Grants permission to retrieve the classification scope settings for an account	Read			
GetCustomDataIdentifier	Grants permission to retrieve information about the settings for a custom data identifier	Read	CustomDataIdentifier*		
GetFindingStatistics	Grants permission to retrieve aggregated statistical data about findings	Read			
GetFindings	Grants permission to retrieve the details of one or more findings	Read			
GetFindingsFilter	Grants permission to retrieve information about the settings for a findings filter	Read	FindingsFilter*		
GetFindingsPublicationConfiguration	Grants permission to retrieve the configuration settings for publishing findings to AWS Security Hub	Read			
GetInvitationsCount	Grants permission to retrieve the count of Amazon Macie membership invitations that were received by an account	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetMacieSession	Grants permission to retrieve information about the status and configuration settings for an Amazon Macie account	Read			
GetMasterAccount	Grants permission to retrieve information about the Amazon Macie administrator account for an account	Read			
GetMember	Grants permission to retrieve information about an account that's associated with an Amazon Macie administrator account	Read	Member*		
GetResourceProfile	Grants permission to retrieve sensitive data discovery statistics and the sensitivity score for an S3 bucket	Read			
GetRevealConfiguration	Grants permission to retrieve the status and configuration settings for retrieving occurrences of sensitive data reported by findings	Read			
GetSensitiveDataOccurrences	Grants permission to retrieve occurrences of sensitive data reported by a finding	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetSensitiveDataOccurrencesAvailability	Grants permission to check whether occurrences of sensitive data can be retrieved for a finding	Read			
GetSensitivityInspectionTemplate	Grants permission to retrieve the sensitivity inspection template settings for an account	Read			
GetUsageStatistics	Grants permission to retrieve quotas and aggregated usage data for one or more accounts	Read			
GetUsageTotals	Grants permission to retrieve aggregated usage data for an account	Read			
ListAllowLists	Grants permission to retrieve a subset of information about all the allow lists for an account	List			
ListAutomatedDiscoveryAccounts	Grants permission to retrieve the status of automated sensitive data discovery for an account	List			
ListClassificationJobs	Grants permission to retrieve a subset of information about the status and settings for one or more sensitive data discovery jobs	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListClassificationScopes	Grants permission to retrieve a subset of information about the classification scope for an account	List			
ListCustomDataIdentifiers	Grants permission to retrieve information about all custom data identifiers	List			
ListFindings	Grants permission to retrieve a subset of information about one or more findings	List			
ListFindingsFilters	Grants permission to retrieve information about all findings filters	List			
ListInvitations	Grants permission to retrieve information about all the Amazon Macie membership invitations that were received by an account	List			
ListManagedDataIdentifiers	Grants permission to retrieve information about managed data identifiers	List			
ListMembers	Grants permission to retrieve information about the Amazon Macie member accounts that are associated with a Macie administrator account	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListOrganizationAdminAccounts	Grants permission to retrieve information about the delegated Amazon Macie administrator account for an AWS organization	List			
ListResourceProfileArtifacts	Grants permission to retrieve information about objects that Amazon Macie selected from an S3 bucket for automated sensitive data discovery	List			
ListResourceProfileDetections	Grants permission to retrieve information about the types and amount of sensitive data that Amazon Macie found in an S3 bucket	List			
ListSensitivityInspectionTemplates	Grants permission to retrieve a subset of information about the sensitivity inspection template for an account	List			
ListTagsForResource	Grants permission to retrieve the tags for an Amazon Macie resource	Read	AllowList		
			ClassificationJob		
			CustomDataIdentifier		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			FindingsFilter		
			Member		
PutClassificationExportConfiguration	Grants permission to create or update the settings for storing sensitive data discovery results	Write			
PutFindingsPublicationConfiguration	Grants permission to update the configuration settings for publishing findings to AWS Security Hub	Write			
SearchResources	Grants permission to retrieve statistical data and other information about AWS resources that Amazon Macie monitors and analyzes	Read			
TagResource	Grants permission to add or update the tags for an Amazon Macie resource	Tagging	AllowList		
			ClassificationJob		
			CustomDataIdentifier		
			FindingsFilter		
			Member		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey} aws:TagKeys	
TestCustomDataIdentifier	Grants permission to test a custom data identifier	Write			
UntagResource	Grants permission to remove tags from an Amazon Macie resource	Tagging	AllowList		
			ClassificationJob		
			CustomDataIdentifier		
			FindingsFilter		
			Member		
				aws:TagKeys	
UpdateAllowList	Grants permission to update the settings for an allow list	Write	AllowList*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateAutomatedDiscoveryConfiguration	Grants permission to change the status of automated sensitive data discovery for an Amazon Macie administrator account, organization, or standalone account	Write			
UpdateClassificationJob	Grants permission to change the status of a sensitive data discovery job	Write	ClassificationJob*		
				aws:RequestTag/${TagKey} aws:TagKeys	
UpdateClassificationScope	Grants permission to update the classification scope settings for an account	Write			
UpdateFindingsFilter	Grants permission to update the settings for a findings filter	Write	FindingsFilter*		
				aws:RequestTag/${TagKey} aws:TagKeys	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateMacieSession	Grants permission to an Amazon Macie administrator account to suspend or re-enable Macie for a member account	Write			
UpdateMemberSession	Grants permission to an Amazon Macie administrator account to suspend or re-enable a Macie member account	Write			
UpdateOrganizationConfiguration	Grants permission to update Amazon Macie configuration settings for an AWS organization	Write			
UpdateResourceProfile	Grants permission to update the sensitivity score for an S3 bucket	Write			
UpdateResourceProfileDetections	Grants permission to update the sensitivity scoring settings for an S3 bucket	Write			
UpdateRevealConfiguration	Grants permission to update the status and configuration settings for retrieving occurrences of sensitive data reported by findings	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateSensitivityInspectionTemplate	Grants permission to update the sensitivity inspection template settings for an account	Write			

Resource types defined by Amazon Macie

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
AllowList	`arn:${Partition}:macie2:${Region}:${Account}:allow-list/${ResourceId}`	aws:ResourceTag/${TagKey}
ClassificationJob	`arn:${Partition}:macie2:${Region}:${Account}:classification-job/${ResourceId}`	aws:ResourceTag/${TagKey}
CustomDataIdentifier	`arn:${Partition}:macie2:${Region}:${Account}:custom-data-identifier/${ResourceId}`	aws:ResourceTag/${TagKey}
FindingsFilter	`arn:${Partition}:macie2:${Region}:${Account}:findings-filter/${ResourceId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
Member	arn:${Partition}:macie2:${Region}:${Account}:member/${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Macie

Amazon Macie defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by a tag key and value pair that is allowed in the request	String
aws:ResourceTag/${TagKey}	Filters access by a tag key and value pair of a resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for AWS Mainframe Modernization Application Testing

AWS Mainframe Modernization Application Testing (service prefix: apptest) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

- View a list of the API operations available for this service.

- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by AWS Mainframe Modernization Application Testing

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateTestCase	Grants permission to create a test case	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateTestConfiguration	Grants permission to create a test configuration	Write		aws:RequestTag/${TagKey} aws:TagKeys	
CreateTestSuite	Grants permission to create a test suite	Write		aws:RequestTag/${TagKey}	

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	
DeleteTestCase	Grants permission to delete a test case	Write	TestCase*		
DeleteTestConfiguration	Grants permission to delete a test configuration	Write	TestConfiguration*		
DeleteTestRun	Grants permission to delete a test run	Write	TestRun*		s3:DeleteObject s3:ListBucket
DeleteTestSuite	Grants permission to delete a test suite	Write	TestSuite*		
GetTestCase	Grants permission to get a test case	Read	TestCase*

Actions defined by Amazon Managed Blockchain

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAccessor	Grants permission to create an Amazon Managed Blockchain accessor	Write		aws:TagKeys aws:RequestTag/${TagKey}	
CreateMember	Grants permission to create a member of an Amazon Managed Blockchain network	Write	network*		iam:CreateServiceLinkedRole
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateNetwork	Grants permission to create an Amazon Managed Blockchain network	Write		aws:TagKeys aws:RequestTag/${TagKey}	iam:CreateServiceLinkedRole
CreateNode	Grants permission to create a node within a member of an Amazon Managed Blockchain network	Write	member		iam:CreateServiceLinkedRole
			network		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
CreateProposal	Grants permission to create a proposal that other blockchain network members can vote on to add or remove a member in an Amazon Managed Blockchain network	Write	network*		
				aws:TagKeys aws:RequestTag/${TagKey}	
DeleteAccessor	Grants permission to delete an Amazon Managed Blockchain accessor	Write	accessor*		
DeleteMember	Grants permission to delete a member and all associated resources from an Amazon Managed Blockchain network	Write	member*		
DeleteNode	Grants permission to delete a node from a member of an Amazon Managed Blockchain network	Write	node*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GET [permission only]	Grants permission to send HTTP GET requests to an Ethereum node	Permissions management			
GetAccessor	Grants permission to return detailed information about an Amazon Managed Blockchain accessor	Read	accessor*		
GetMember	Grants permission to return detailed information about a member of an Amazon Managed Blockchain network	Read	member*		
GetNetwork	Grants permission to return detailed information about an Amazon Managed Blockchain network	Read	network*		
GetNode	Grants permission to return detailed information about a node within a member of an Amazon Managed Blockchain network	Read	node*		
GetProposal	Grants permission to return detailed information about a proposal of an Amazon Managed Blockchain network	Read	proposal*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Invoke [permission only]	Grants permission to create WebSocket connections to an Ethereum node	Permissions management			
InvokeRpcBitcoinMainnet	Grants permission to invoke the Bitcoin Mainnet RPCs	Read			
InvokeRpcBitcoinTestnet	Grants permission to invoke the Bitcoin Testnet RPCs	Read			
InvokeRpcPolygonMainnet	Grants permission to invoke the Polygon Mainnet RPCs	Read			
InvokeRpcPolygonMumbaiTestnet	Grants permission to invoke the Polygon Mumbai Testnet RPCs	Read			
ListAccessors	Grants permission to list the Amazon Managed Blockchain accessors owned by the current AWS account	List			
ListInvitations	Grants permission to list the invitations extended to the active AWS account from any Managed Blockchain network	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListMembers	Grants permission to list the members of an Amazon Managed Blockchain network and the properties of their memberships	List	network*		
ListNetworks	Grants permission to list the Amazon Managed Blockchain networks in which the current AWS account participates	List			
ListNodes	Grants permission to list the nodes within a member of an Amazon Managed Blockchain network	List	member network		
ListProposalVotes	Grants permission to list all votes for a proposal, including the value of the vote and the unique identifier of the member that cast the vote for the given Amazon Managed Blockchain network	Read	proposal*		
ListProposals	Grants permission to list proposals for the given Amazon Managed Blockchain network	List	network*		
ListTagsForResource	Grants permission to view tags associated with an Amazon Managed Blockchain resource	Read	accessor invitation		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			member		
			network		
			node		
			proposal		
POST [permission only]	Grants permission to send HTTP POST requests to an Ethereum node	Permissions management			
RejectInvitation	Grants permission to reject the invitation to join the blockchain network	Write	invitation*		
TagResource	Grants permission to add tags to an Amazon Managed Blockchain resource	Tagging	accessor		
			invitation		
			member		
			network		
			node		
			proposal		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove tags from an Amazon Managed Blockchain resource	Tagging	accessor		
			invitation		
			member		
			network		
			node		
			proposal		
				aws:TagKeys	
UpdateMember	Grants permission to update a member of an Amazon Managed Blockchain network	Write	member*		iam:CreateServiceLinkedRole
UpdateNode	Grants permission to update a node from a member of an Amazon Managed Blockchain network	Write	node*		iam:CreateServiceLinkedRole

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
VoteOnProposal	Grants permission to cast a vote for a proposal on behalf of the blockchain network member specified	Write	proposal*		

Resource types defined by Amazon Managed Blockchain

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
network	`arn:${Partition}:managedblockchain:${Region}::networks/${NetworkId}`	aws:ResourceTag/${TagKey}
member	`arn:${Partition}:managedblockchain:${Region}:${Account}:members/${MemberId}`	aws:ResourceTag/${TagKey}
node	`arn:${Partition}:managedblockchain:${Region}:${Account}:nodes/${NodeId}`	aws:ResourceTag/${TagKey}
proposal	`arn:${Partition}:managedblockchain:${Region}::proposals/${ProposalId}`	aws:ResourceTag/${TagKey}
invitation	`arn:${Partition}:managedblockchain:${Region}:${Account}:invitations/${InvitationId}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
accessor	arn:${Partition}:managedblockchain:${Region}:${Account}:accessors/${AccessorId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Managed Blockchain

Amazon Managed Blockchain defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters actions based on the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters actions based on the tags associated with an Amazon Managed Blockchain resource	String
aws:TagKeys	Filters actions based on the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Managed Blockchain Query

Amazon Managed Blockchain Query (service prefix: managedblockchain-query) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- View a list of the API operations available for this service.
- Learn how to secure this service and its resources by using IAM permission policies.

Topics

Actions defined by Amazon Managed Blockchain Query

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchGetTokenBalance	Grants permission to batch calls for GetTokenBalance API	Read			
GetAssetContract	Grants permission to fetch information about a contract on the blockchain	Read			
GetTokenBalance	Grants permission to retrieve balance of a token for an address on the blockchain	Read			
GetTransaction	Grants permission to retrieve a transaction on the blockchain	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAssetContracts	Grants permission to fetch multiple contracts on the blockchain	List			
ListFilteredTransactionEvents	Grants permission to retrieve events on the blockchain with additional filters	List			
ListTokenBalances	Grants permission to retrieve multiple balances on the blockchain	List			
ListTransactionEvents	Grants permission to retrieve events in a transaction on the blockchain	List			
ListTransactions	Grants permission to retrieve a multiple transactions on a blockchain	List			

Resource types defined by Amazon Managed Blockchain Query

Amazon Managed Blockchain Query does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon Managed Blockchain Query, specify `"Resource": "*"` in your policy.

Condition keys for Amazon Managed Blockchain Query

Managed Blockchain Query has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for Amazon Managed Grafana

Amazon Managed Grafana (service prefix: `grafana`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Topics

Actions defined by Amazon Managed Grafana

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern

for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateLicense	Grants permission to upgrade a workspace with a license	Write	workspace*		aws-marketplace:ViewSubscriptions
CreateWorkspace	Grants permission to create a workspace	Write		aws:TagKeys	ec2:DescribeSecurityGroups

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:RequestTag/${TagKey}	ec2:DescribeSubnets ec2:GetManagedPrefixListEntries iam:CreateServiceLinkedRole organizations:DescribeOrganization sso:CreateManagedApplicationInstance sso:DescribeRegisteredRegions sso:GetSharedSsoConfiguration

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateWorkspaceApiKey	Grants permission to create API keys for a workspace	Write	workspace*		
CreateWorkspaceServiceAccount	Grants permission to create service accounts for a workspace	Write	workspace*		
CreateWorkspaceServiceAccountToken	Grants permission to create service account tokens for a workspace	Write	workspace*		
DeleteWorkspace	Grants permission to delete a workspace	Write	workspace*		sso:DeleteManagedApplicationInstance
DeleteWorkspaceApiKey	Grants permission to delete API keys from a workspace	Write	workspace*		
DeleteWorkspaceServiceAccount	Grants permission to delete service accounts for a workspace	Write	workspace*		
DeleteWorkspaceServiceAccountToken	Grants permission to delete service account tokens for a workspace	Write	workspace*		
DescribeWorkspace	Grants permission to describe a workspace	Read	workspace*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeWorkspaceAuthentication	Grants permission to describe authentication providers on a workspace	Read	workspace*		
DescribeWorkspaceConfiguration	Grants permission to describe the current configuration string for the given workspace	Read	workspace*		
DisassociateLicense	Grants permission to remove a license from a workspace	Write	workspace*		
ListPermissions	Grants permission to list the permissions on a wokspace	List	workspace*		
ListTagsForResource	Grants permission to list tags associated with a workspace	Read	workspace		
ListVersions	Grants permission to list all available supported Grafana versions. Optionally, include a workspace to list the versions to which it can be upgraded	List	workspace		
ListWorkspaceServiceAccountTokens	Grants permission to list service account tokens for a workspace	Read	workspace*		
ListWorkspaceServiceAccounts	Grants permission to list service accounts for a workspace	Read	workspace*		
ListWorkspaces	Grants permission to list workspaces	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
TagResource	Grants permission to add tags to, or update tag values of, a workspace	Tagging	workspace*		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to remove tags from a workspace	Tagging	workspace*		
				aws:TagKeys	
UpdatePermissions	Grants permission to modify the permissions on a workspace	Permissions management	workspace*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateWorkspace	Grants permission to modify a workspace	Write	workspace*		ec2:DescribeSecurityGroups ec2:DescribeSubnets ec2:GetManagedPrefixListEntries iam:CreateServiceLinkedRole
UpdateWorkspaceAuthentication	Grants permission to modify authentication providers on a workspace	Write	workspace*		
UpdateWorkspaceConfiguration	Grants permission to update the configuration string for the given workspace	Write	workspace*		

Resource types defined by Amazon Managed Grafana

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
workspace	arn:${Partition}:grafana:${Region}:${Account}:/workspaces/${ResourceId}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Managed Grafana

Amazon Managed Grafana defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by actions based on the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by actions based on tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by actions based on the presence of tag keys in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Managed Service for Prometheus

Amazon Managed Service for Prometheus (service prefix: aps) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Resource types defined by Amazon Managed Service for Prometheus

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
workspace	`arn:${Partition}:aps:${Region}:${Account}:workspace/${WorkspaceId}`	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys
rulegroupsnamespace	`arn:${Partition}:aps:${Region}:${Account}:rulegroupsnamespace/${WorkspaceId}/${Namespace}`	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
		aws:TagKeys
anomalydetector	arn:${Partition}:aps:${Region}:${Account}:anomalydetector/${WorkspaceId}/${AnomalyDetectorId}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys
scraper	arn:${Partition}:aps:${Region}:${Account}:scraper/${ScraperId}	aws:RequestTag/${TagKey} aws:ResourceTag/${TagKey} aws:TagKeys
cluster	arn:${Partition}:eks:${Region}:${Account}:cluster/${ClusterName}	aws:ResourceTag/${TagKey}

Condition keys for Amazon Managed Service for Prometheus

Amazon Managed Service for Prometheus defines the following condition keys that can be used in the Condition element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access based on the tags that are passed in the request	String

Condition keys	Description	Type
aws:ResourceTag/${TagKey}	Filters access based on the tags associated with the resource	String
aws:TagKeys	Filters access based on the tag keys that are passed in the request	ArrayOfString

Actions, resources, and condition keys for Amazon Managed Streaming for Apache Kafka

Amazon Managed Streaming for Apache Kafka (service prefix: `kafka`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by Amazon Managed Streaming for Apache Kafka

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of

access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
BatchAssociateScramSecret	Grants permission to associate one or more Scram Secrets with an Amazon MSK cluster	Write	cluster*		kms:CreateGrant kms:RetireGrant
BatchDisassociateScramSecret	Grants permission to disassociate one or more Scram Secrets from an Amazon MSK cluster	Write	cluster*		kms:RetireGrant
CreateCluster	Grants permission to create an MSK cluster	Write	cluster*		ec2:DescribeSecurityGroups ec2:DescribeSubnets ec2:DescribeVpcs iam:AttachRolePolicy iam:CreateServiceLinkedRole iam:PutRolePolicy

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions

DeleteCluster	Grants permission to delete an MSK cluster	Write	cluster*		ec2:DeleteVpcEndpoints ec2:DescribeVpcAttribute ec2:DescribeVpcEndpoints
DeleteClusterPolicy	Grants permission to delete a cluster resource-based policy	Write	cluster*		
DeleteConfiguration	Grants permission to delete the specified MSK configuration	Write	configuration*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DeleteReplicator	Grants permission to delete a MSK replicator	Write	replicator*		
DeleteTopic	Grants permission to delete a Kafka topic from an MSK cluster	Write	topic*		kafka-cluster:Connect kafka-cluster:DeleteTopic kafka-cluster:DescribeTopic
DeleteVpcConnection	Grants permission to delete a MSK VPC connection	Write	vpc-connection*		ec2:DeleteVpcEndpoints ec2:DescribeVpcEndpoints
DescribeCluster	Grants permission to describe an MSK cluster	Read	cluster*		
DescribeClusterOperation	Grants permission to describe the cluster operation that is specified by the given ARN	Read			
DescribeClusterOperationV2	Grants permission to describe the cluster operation that is specified by the given ARN	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeClusterV2	Grants permission to describe an MSK cluster	Read	cluster*		
DescribeConfiguration	Grants permission to describe an MSK configuration	Read	configuration*		
DescribeConfigurationRevision	Grants permission to describe an MSK configuration revision	Read	configuration*		
DescribeReplicator	Grants permission to describe a MSK replicator	Read	replicator*		
DescribeTopic	Grants permission to return metadata details about a specific Kafka topic	Read	topic*		kafka-cluster:Connect kafka-cluster:DescribeTopic kafka-cluster:DescribeTopicDynamicConfiguration

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
DescribeTopicPartitions	Grants permission to list all partitions of a specific topic	Read	topic*		kafka-cluster:Connect kafka-cluster:DescribeTopic kafka-cluster:DescribeTopicDynamicConfiguration
DescribeVpcConnection	Grants permission to describe a MSK VPC connection	Read	vpc-connection*		
GetBootstrapBrokers	Grants permission to get connection details for the brokers in an MSK cluster	Read			
GetClusterPolicy	Grants permission to describe a cluster resource-based policy	Read	cluster*		
GetCompatibleKafkaVersions	Grants permission to get a list of the Apache Kafka versions to which you can update an MSK cluster	List			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListClientVpcConnections	Grants permission to list all MSK VPC connections created for a cluster	List	cluster*		
ListClusterOperations	Grants permission to return a list of all the operations that have been performed on the specified MSK cluster	List	cluster*		
ListClusterOperationsV2	Grants permission to return a list of all the operations that have been performed on the specified MSK cluster	List	cluster*		
ListClusters	Grants permission to list all MSK clusters in this account	List			
ListClustersV2	Grants permission to list all MSK clusters in this account	List			
ListConfigurationRevisions	Grants permission to list all revisions for an MSK configuration in this account	List	configuration*		
ListConfigurations	Grants permission to list all MSK configurations in this account	List			
ListKafkaVersions	Grants permission to list all Apache Kafka versions supported by Amazon MSK	List			
ListNodes	Grants permission to list brokers in an MSK cluster	List	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListReplicators	Grants permission to list all MSK replicators in this account	List			
ListScramSecrets	Grants permission to list the Scram Secrets associated with an Amazon MSK cluster	List	cluster*		
ListTagsForResource	Grants permission to list tags of an MSK resource	Read	cluster*		
ListTopics	Grants permission to list all Kafka topics for a specified MSK cluster	List	cluster*		kafka-cluster:Connect kafka-cluster:DescribeTopic
ListVpcConnections	Grants permission to list all MSK VPC connections that this account uses	List			
PutClusterPolicy	Grants permission to create or update the resource-based policy for a cluster	Write	cluster*		
RebootBroker	Grants permission to reboot broker	Write	cluster*		
RejectClientVpcConnection	Grants permission to reject a MSK VPC connection	Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
			vpc-connection*		
TagResource	Grants permission to tag an MSK resource	Tagging	cluster		
			vpc-connection		
				aws:RequestTag/${TagKey} aws:TagKeys	
UntagResource	Grants permission to remove tags from an MSK resource	Tagging	cluster		
			vpc-connection		
				aws:TagKeys	
UpdateBrokerCount	Grants permission to update the number of brokers of the MSK cluster	Write	cluster*		
UpdateBrokerStorage	Grants permission to update the storage size of the brokers of the MSK cluster	Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateBrokerType	Grants permission to update the broker type of an Amazon MSK cluster	Write	cluster*		
UpdateClusterConfiguration	Grants permission to update the configuration of the MSK cluster	Write	cluster*		
			configuration*		
UpdateClusterKafkaVersion	Grants permission to update the MSK cluster to the specified Apache Kafka version	Write	cluster*		
UpdateConfiguration	Grants permission to create a new revision of the MSK configuration	Write	configuration*		
UpdateConnectivity	Grants permission to update the connectivity settings for the MSK cluster	Write	cluster*		ec2:DescribeRouteTables ec2:DescribeSubnets
				kafka:publicAccessEnabled	
UpdateMonitoring	Grants permission to update the monitoring settings for the MSK cluster	Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateRebalancing	Grants permission to update the intelligent rebalancing status of the MSK cluster	Write	cluster*		
UpdateReplicationInfo	Grants permission to update the replication info of the MSK replicator	Write	replicator*		
UpdateSecurity	Grants permission to update the security settings for the MSK cluster	Write	cluster*		kms:RetireGrant
UpdateStorage	Grants permission to update the EBS storage (size or provisioned throughput) associated with MSK brokers or set cluster storage mode to TIERED	Write	cluster*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
UpdateTopic	Grants permission to update the configuration of a Kafka topic in an MSK cluster	Write	topic*		kafka-cluster:AlterTopic kafka-cluster:AlterTopicDynamicConfiguration kafka-cluster:Connect kafka-cluster:DescribeTopic

Resource types defined by Amazon Managed Streaming for Apache Kafka

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
cluster	`arn:${Partition}:kafka:${Region}:${Account}:cluster/${ClusterName}/${Uuid}`	aws:ResourceTag/${TagKey}

Resource types	ARN	Condition keys
configuration	arn:${Partition}:kafka:${Region}:${Account}:configuration/${ConfigurationName}/${Uuid}	
vpc-connection	arn:${Partition}:kafka:${Region}:${VpcOwnerAccount}:vpc-connection/${ClusterOwnerAccount}/${ClusterName}/${Uuid}	aws:ResourceTag/${TagKey}
replicator	arn:${Partition}:kafka:${Region}:${Account}:replicator/${ReplicatorName}/${Uuid}	aws:ResourceTag/${TagKey}
topic	arn:${Partition}:kafka:${Region}:${Account}:topic/${ClusterName}/${ClusterUuid}/${TopicName}	
group	arn:${Partition}:kafka:${Region}:${Account}:group/${ClusterName}/${ClusterUuid}/${GroupName}	
transactional-id	arn:${Partition}:kafka:${Region}:${Account}:transactional-id/${ClusterName}/${ClusterUuid}/${TransactionalId}	

Condition keys for Amazon Managed Streaming for Apache Kafka

Amazon Managed Streaming for Apache Kafka defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws:RequestTag/${TagKey}	Filters access by the presence of tag key-value pairs in the request	String
aws:ResourceTag/${TagKey}	Filters access by tag key-value pairs attached to the resource	String
aws:TagKeys	Filters access by the presence of tag keys in the request	ArrayOfString
kafka:publicAccessEnabled	Filters access by the presence of public access enabled in the request	Bool

Actions, resources, and condition keys for Amazon Managed Streaming for Kafka Connect

Amazon Managed Streaming for Kafka Connect (service prefix: `kafkaconnect`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

Actions defined by Amazon Managed Streaming for Kafka Connect

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy,

you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateConnector	Grants permission to create an MSK Connect connector	Write			ec2:CreateNetworkInterface ec2:DescribeSecurityGroups ec2:DescribeSubnets ec2:DescribeVpcs firehose:TagDeliveryStream iam:AttachRolePolicy iam:CreateServiceLinkedRole iam:PassRole iam:PutRolePolicy

Actions defined by AWS Marketplace

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name.

However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AcceptAgreementApprovalRequest	Grants permission to users to approve an incoming subscription request (for providers who provide products that require subscription verification)	Write			
AcceptAgreementPaymentRequest	Grants permission to users to accept a payment request	Write			
AcceptAgreementRequest	Grants permission to users to accept their agreement requests. Note that this action is not applicable to Marketplace purchases	Write			
CancelAgreement	Grants permission to users to cancel their agreements. Note that this action is not applicable to Marketplace purchases	Write			
CancelAgreementPaymentRequest	Grants permission to users to cancel a payment request	Write			
CancelAgreementRequest	Grants permission to users to cancel pending subscription requests for products that require subscription verification	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CreateAgreementRequest	Grants permission to users to create an agreement request. Note that this action is not applicable to Marketplace purchases	Write			
DescribeAgreement	Grants permission to users to describe the metadata about the agreement	Read			
GetAgreementApprovalRequest	Grants permission to users to view the details of their incoming subscription requests (for providers who provide products that require subscription verification)	Read			
GetAgreementEntitlements	Grants permission to users to view the entitlements associated with an agreement	Read			
GetAgreementPaymentRequest	Grants permission to users to view details for a payment request	Read			
GetAgreementRequest	Grants permission to users to view the details of their subscription requests for data products that require subscription verification	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GetAgreementTerms	Grants permission to users to get a list of terms for an agreement	List			
ListAgreementApprovalRequests	Grants permission to users to list their incoming subscription requests (for providers who provide products that require subscription verification)	List			
ListAgreementCharges	Grants permission to users to view charges associated with their agreements	List			
ListAgreementPaymentRequests	Grants permission to users to list payment requests for an agreement	List			
ListAgreementRequests	Grants permission to users to list their subscription requests for products that require subscription verification	List			
ListEntitlementDetails	Grants permission to users to view details of the entitlements associated with an agreement. Note that this action is not applicable to Marketplace purchases	Read			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
RejectAgreementApprovalRequest	Grants permission to users to decline an incoming subscription requests (for providers who provide products that require subscription verification)	Write			
RejectAgreementPaymentRequest	Grants permission to users to reject a payment request	Write			
SearchAgreements	Grants permission to users to search their agreements	List			
SendAgreementPaymentRequest	Grants permission to users to send payment request	Write			
Subscribe	Grants permission to users to subscribe to AWS Marketplace products. Includes the ability to send a subscription request for products that require subscription verification. Includes the ability to enable auto-renewal for an existing subscription	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
Unsubscribe	Grants permission to users to remove subscriptions to AWS Marketplace products. Includes the ability to disable auto-renewal for an existing subscription	Write			
UpdateAgreementApprovalRequest	Grants permission to users to make changes to an incoming subscription request, including the ability to delete the prospective subscriber's information (for providers who provide products that require subscription verification)	Write			
UpdatePurchaseOrders	Grants permission to users to update purchase orders for charges associated with their agreements	Write			
ViewSubscriptions	Grants permission to users to see their account's subscriptions	List			

Resource types defined by AWS Marketplace

AWS Marketplace does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Marketplace, specify `"Resource": "*"` in your policy.

Condition keys for AWS Marketplace

AWS Marketplace defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws-marketplace:AgreementType	Filters access by the type of the agreement	ArrayOfString
aws-marketplace:PartyType	Filters access by the party type of the agreement	String
aws-marketplace:ProductId	Filters access by product id for AWS Marketplace RedHat OpenShift and Bedrock Products. Note: Using this condition key will not restrict access to products in AWS Marketplace	ArrayOfString

Actions, resources, and condition keys for AWS Marketplace Catalog

AWS Marketplace Catalog (service prefix: `aws-marketplace`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

References:

- Condition keys for AWS Marketplace Catalog

Actions defined by AWS Marketplace Catalog

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
CancelChangeSet	Grants permission to cancel a running change set	Write	ChangeSet*		
DeleteResourcePolicy	Grants permission to delete the resource policy of an existing entity	Permissions management	Entity*		
DescribeAssessment	Grants permission to return the details of an existing assessment	Read	Assessment		
DescribeChangeSet	Grants permission to return the details of an existing change set	Read	ChangeSet*		
DescribeEntity	Grants permission to return the details of an existing entity	Read	Entity*		
GetResourcePolicy	Grants permission to get the resource policy of an existing entity	Read	Entity*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListAssessments	Grants permission to list existing assessments	List			
ListChangeSets	Grants permission to list existing change sets	List			
ListEntities	Grants permission to list existing entities	List			
ListTagsForResource	Grants permission to list tags on an existing entity or a change set	Read	ChangeSet		
			Entity		
PutResourcePolicy	Grants permission to attach a resource policy to an existing entity	Permissions management	Entity*		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
StartChangeSet	Grants permission to request a new change set (Note: resource-level permissions for this action and condition context keys for this action are only supported when used with Catalog API and are not supported when used with AWS Marketplace Management Portal)	Write	Entity*		
				catalog:ChangeType aws-marketplace:Intent aws:RequestTag/${TagKey} aws:TagKeys	
TagResource	Grants permission to tag an existing entity or a change set	Tagging	ChangeSet		
			Entity		
				aws:TagKeys aws:RequestTag/${TagKey}	
UntagResource	Grants permission to untag an existing entity or a change set	Tagging	ChangeSet		
			Entity		

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
				aws:TagKeys	

Resource types defined by AWS Marketplace Catalog

The following resource types are defined by this service and can be used in the `Resource` element of IAM permission policy statements. Each action in the Actions table identifies the resource types that can be specified with that action. A resource type can also define which condition keys you can include in a policy. These keys are displayed in the last column of the Resource types table. For details about the columns in the following table, see Resource types table.

Resource types	ARN	Condition keys
Entity	`arn:${Partition}:aws-marketplace:${Region}:${Account}:${Catalog}/${EntityType}/${ResourceId}`	aws:ResourceTag/${TagKey} catalog:ChangeType
ChangeSet	`arn:${Partition}:aws-marketplace:${Region}:${Account}:${Catalog}/ChangeSet/${ResourceId}`	aws:ResourceTag/${TagKey} catalog:ChangeType
Assessment	`arn:${Partition}:aws-marketplace:${Region}::${Catalog}/Assessment/${ResourceId}`	

Condition keys for AWS Marketplace Catalog

AWS Marketplace Catalog defines the following condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the

policy statement applies. For details about the columns in the following table, see Condition keys table.

To view the global condition keys that are available to all services, see AWS global condition context keys.

Condition keys	Description	Type
aws-marketplace:Intent	Filters access by the Intent parameter in the StartChangeSet request	String
aws:RequestTag/${TagKey}	Filters access by the tags that are passed in the request	String
aws:ResourceTag/${TagKey}	Filters access by the tags associated with the resource	String
aws:TagKeys	Filters access by the tag keys that are passed in the request	ArrayOfString
catalog:ChangeType	Filters access by the change type in the StartChangeSet request	String

Actions, resources, and condition keys for AWS Marketplace Commerce Analytics Service

AWS Marketplace Commerce Analytics Service (service prefix: `marketplacecommerceanalytics`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Actions defined by AWS Marketplace Commerce Analytics Service

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

Note

Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
GenerateDataSet	Request a data set to be published to your Amazon S3 bucket.	Write			
StartSupportDataExport	Request a support data set to be published to your Amazon S3 bucket.	Write			

Resource types defined by AWS Marketplace Commerce Analytics Service

AWS Marketplace Commerce Analytics Service does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Marketplace Commerce Analytics Service, specify `"Resource": "*"` in your policy.

Condition keys for AWS Marketplace Commerce Analytics Service

CAS has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Marketplace Deployment Service

AWS Marketplace Deployment Service (service prefix: `aws-marketplace`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.

Topics

Actions defined by AWS Marketplace Private Marketplace

You can specify the following actions in the `Action` element of an IAM policy statement. Use policies to grant permissions to perform an operation in AWS. When you use an action in a policy, you usually allow or deny access to the API operation or CLI command with the same name. However, in some cases, a single action controls access to more than one operation. Alternatively, some operations require several different actions.

The **Access level** column of the Actions table describes how the action is classified (List, Read, Permissions management, or Tagging). This classification can help you understand the level of access that an action grants when you use it in a policy. For more information about access levels, see Access levels in policy summaries.

The **Resource types** column of the Actions table indicates whether each action supports resource-level permissions. If there is no value for this column, you must specify all resources ("*") to which the policy applies in the `Resource` element of your policy statement. If the column includes a resource type, then you can specify an ARN of that type in a statement with that action. If the action has one or more required resources, the caller must have permission to use the action with those resources. Required resources are indicated in the table with an asterisk (*). If you limit resource access with the `Resource` element in an IAM policy, you must include an ARN or pattern for each required resource type. Some actions support multiple resource types. If the resource type is optional (not indicated as required), then you can choose to use one of the optional resource types.

The **Condition keys** column of the Actions table includes keys that you can specify in a policy statement's `Condition` element. For more information on the condition keys that are associated with resources for the service, see the **Condition keys** column of the Resource types table.

The **Dependent actions** column of the Actions table shows additional permissions that may be required to successfully call an action. These permissions may be needed in addition to the

permission for the action itself. When an action specifies dependent actions, those dependencies may apply to additional resources defined for that action, not only the first resource listed in the table.

> **Note**
>
> Resource condition keys are listed in the Resource types table. You can find a link to the resource type that applies to an action in the **Resource types (*required)** column of the Actions table. The resource type in the Resource types table includes the **Condition keys** column, which are the resource condition keys that apply to an action in the Actions table.

For details about the columns in the following table, see Actions table.

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
AssociateProductsWithPrivateMarketplace [permission only]	Grants permission to approve a request for a product to be associated with the Private Marketplace. This action can be performed by any account in an AWS Organization, provided the user has permissions to do so, and the Organization's Service Control Policies allow it	Write			
CreatePrivateMarketplaceRequests [permission only]	Grants permission to create a new request for a product or products to be associated with the Private Marketplace. This action can be performed by any account in an in an AWS Organization, provided the user has permissions to	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
	do so, and the Organization's Service Control Policies allow it				
DescribePrivateMarketplaceRequests [permission only]	Grants permission to describe requests and associated products in the Private Marketplace. This action can be performed by any account in an AWS Organization, provided the user has permissions to do so, and the Organization's Service Control Policies allow it	List			
DisassociateProductsFromPrivateMarketplace [permission only]	Grants permission to decline a request for a product to be associated with the Private Marketplace. This action can be performed by any account in an AWS Organization, provided the user has permissions to do so, and the Organization's Service Control Policies allow it	Write			

Actions	Description	Access level	Resource types (*required)	Condition keys	Dependent actions
ListPrivateMarketplaceRequests [permission only]	Grants permission to get a queryable list for requests and associated products in the Private Marketplace. This action can be performed by any account in an AWS Organization, provided the user has permissions to do so, and the Organization's Service Control Policies allow it	List			

Resource types defined by AWS Marketplace Private Marketplace

AWS Marketplace Private Marketplace does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to AWS Marketplace Private Marketplace, specify `"Resource": "*"` in your policy.

Condition keys for AWS Marketplace Private Marketplace

Private Marketplace has no service-specific context keys that can be used in the `Condition` element of policy statements. For the list of the global context keys that are available to all services, see AWS global condition context keys.

Actions, resources, and condition keys for AWS Marketplace Procurement Systems Integration

AWS Marketplace Procurement Systems Integration (service prefix: `aws-marketplace`) provides the following service-specific resources, actions, and condition context keys for use in IAM permission policies.
